The career uncertainty that these bureaucratic reforms injected into the department coincided with the chilling effect on creativity and responsiveness caused by McCarthyism's assault on the foreign service. Unfounded allegations of communist sympathies cost many veteran diplomats their jobs in the 1950s. McCarthyism was a grotesque extreme of a problem that had plagued State in the past and would burden it in the future, namely the tension between careerists and politicians. Foreign service officers were trained to suppress their personal views, but political appointees to posts in the department or partisan leaders outside often put pressure on careerists for political or ideological loyalty. Caution and conformity became the order of the day in the diplomatic service, with a resultant weakening of State's leadership role in foreign policy.

Forgetting, or perhaps choosing not to remember, that organizational reform enthusiasm similar to Wristonization had failed to deter and might be blamed for the bad situation now at hand, the brightest people in and out of the Department of State continued to talk of what could be done to increase management efficiency and policy effectiveness. Thus, one had come almost full circle from Remsen to Kissinger. The larger and more complex the State Department and the world became, the less important was the role of the department in making foreign policy. Instead of individual advice, the department became expert in institutional adjustments and its influence shrunk proportionally. A Rand Corporation think-tank study, United States Policy and the Third World (1967), never once mentioned the State Department.

As State's structure grew and its power vanished in the mid-twentieth century, its once high and mighty place became almost laughable. Thus, satires of departmental memoranda about such things as waste-power removal were not uncommon, nor were genuine titles such as chief of the administrative management and personnel division of the Bureau of Educational and Cultural Affairs. While some flirted with participative management and Dean Rusk instituted a department suggestion box, few shared the Kissinger or Villard view that perhaps the goal might once again be "top-notch organization in which the human equation is not sacrificed to the Moloch of bureaucracy.”

**LEADERSHIP OR MANAGEMENT?**

In the 1780s, Benjamin Franklin's diplomatic dispatches from France sometimes took months to cross the Atlantic. Two centuries later, flash cables or secure e-mail messages could be in the hands of the secretary of state within moments. Can, in short, the modern secretary of state, however talented and qualified, break free as Kissinger suggested from the management ethos?

The obstacles to such freedom were rather clear in duties and responsibilities of the secretary of state at the beginning of the twenty-first century. The secretary was a senior personal adviser to the president and the only cabinet officer primarily charged with looking at the nation as a whole in its relations with the outside world. The secretary of state was also the ranking diplomat in dealing with foreign governments at the same time that he served as an administration spokesman on American foreign policy to Congress, the country, and abroad. As chief of the State Department, the secretary was responsible to the president and accountable to Congress. Finally, the secretary was also in direct line to presidential succession. The modern secretary of state was thus adviser, negotiator, reporter of trouble, spokesperson, manager, and coordinator. One thinks of days filled with calls, conferences, talks with senators, ambassadors, delegations of private citizens, journalists, and bankers, not to mention the increasingly frequent global troubleshooting, all the time while running a department.

Secretary Stimson's biographer reports on one day, even in the more serene pre–World War II world, as follows:

A conference at ten o'clock with Silas Strawn, the United States delegate to a conference at Peking on Chinese tariffs. At 10:30 a press conference followed at 10:45 by an appointment with Dr. McClaren of the Williamstown Institute. Between 11:00 and 12:00 receiving the Spanish Ambassador and a representative from the Bolivian delegation. They were followed by Senator Howell at 12:00, Congressman Keyes at 12:40
and General Allen at 12:55. After lunch at 2:30 he began to sign the official mail, a task he had finished by 3:30 when Congressmen Robinson, Thatcher, Walker, Newhill, Kendall and Blackburn called upon him and talked for an hour. Elihu Root, Jr., appeared at 4:30 and remained until 5:00. Just before going home the Secretary called James M. Beck, then a congressman, in New York. That evening he attended a dinner given by the Chilean Ambassador in honor of the Chilean Minister of Finance.

How against these activities does one formulate the basic strategies and plans of action required? Even if time and attention are found, more myriad problems await in terms of the delegation of authority to bureaus that distrust each other's prerogatives or to individuals anxious for good assignments and promotions. Each bureau, each office within a bureau, each officer, is improvising from day-to-day, unaware, unprepared, or uninspired in the work of partners, neighbors, and colleagues.

Against this setting, some post–World War II secretaries of state have stood out in the effort to orchestrate the department's activities. Most notably mentioned by those in the State Department, George C. Marshall, accustomed to command, and Dean Acheson, experienced on the Hoover Commission for government reorganization, brought about a sense of planning amidst the chaos. Most secretaries of state since World War II, however, have been less engaged with the department itself and more in touch with the White House. Some, such as Dulles, Kissinger, and Christopher, were out of town a lot. Baker was George H. W. Bush's closest personal friend. Shultz stayed in the post for seven years in part because he was a better organization man than most, but he often clashed with Ronald Reagan's conservative loyalists, who thought Shultz was too close to foreign service liberals.

The task for secretaries of state has been difficult because the role of the State Department is, in the last analysis, so weak. Primacy in coordinating foreign policy itself, the lifeblood of the State Department's leadership in the days of Adams and Seward, has been challenged and the counterattack has had few bases for claims to legitimacy. The Constitution says nothing of the State Department and refers only to "executive" and "presidential" responsibilities. Congress has never helped. The original legislation setting up the State Department also recognized the president as supreme. Even when granting power to the secretary of state, it has always been understood that he or she "shall act under the direction of the President." Such direction has wandered from giving State considerable room to those who have wanted State out of foreign affairs.

Some analysts of American diplomacy go even further to suggest that the State Department, while it never had a constitutional or legislative claim to primacy, did, at one time in the nineteenth century, come to hold such a position by tradition and that the department itself gradually allowed such power to erode. One of the first four departments to be established (along with War, Treasury, and Justice), the State Department came to view itself as the first among equals. This, in turn, led to an attitude of general superiority in the federal establishment—an attitude that, regardless of ability, the State Department had a special dispensation to control foreign policy. If other valid interests arose in other departments, the State Department worked for too long not to foster them but to cut them off. Thus began a movement to place control of foreign policy in more reasonable and responsive hands. Also, the "legal mind" and "administrative efficiency" movement made State more introspective and took it further from the center of integrated policy.

As the State Department failed to keep abreast and federal agencies multiplied, new voices emerged to decide, negotiate, and implement foreign policy. When the State Department cried "foul" but showed little aptitude, foreign policymaking moved elsewhere. The emergency experience of World War II, in particular, put personal presidential policy in the forefront. Self-defensively, the State Department took to eulogizing its establishment, and the American people had to be reminded frequently after the war that "the Department of State, under the direction of the President," such direction has wandered from giving State considerable room to those who have wanted State out of foreign affairs. Such direction has wandered from giving State considerable room to those who have wanted State out of foreign affairs.

In reality, however, such leadership moved most directly to the National Security Council. Created by the National Security Act of 1947 (the same statute that established the Central Intelligence Agency), the National Security Council was, in fact, charged with the responsibility of "effectively coordinating the policies and functions of the departments and agencies of the Government relating to the national security." It was provided with a staff and set about operating, close to the White House, as an interdepartmental committee with functions most immediately related to ques-
tions of foreign policy. Thus was created what the State Department had once been, a coordinating, orchestrating mechanism for the various elements of policy at the highest level. The State Department, at least in the contemporary United States, was not a part of the primary machinery by which the nation would set about to meet the demands of increased world leadership.

In the competitive world of Washington's bureaucratic politics, the State Department is one of the smallest players. Its annual budget and number of employees are dwarfed by such behemoths as Defense and Health and Human Services. Although the total amount is secret, the annual funds for the CIA far exceed those of State. With a lack of resources and an increasing centralization of foreign policymaking in the White House, it is not surprising that other departments and agencies in Washington often have more influence in shaping U.S. foreign policy than does the State Department.

Despite these challenges, the State Department has made various efforts to revitalize its headquarters' operations in the somewhat aptly named Foggy Bottom section of Washington. The program Diplomacy for the 1970s, embarked on by Secretary of State William P. Rogers and his chief assistant, Elliot L. Richardson, was one of the most publicized and professional. Yet it must be noted that when one scratches underneath the rhetoric of the program, it was, in short, still another management reform package, not unlike in design, if not in definition, the earlier programs that had failed and, in part, led to disaster for the department.

The Rogers-Richardson proposals at least incorporated the knowledge, which had begun with Wristonization, that structural reforms were not universally productive. Indeed, they noted, "substance can suffer at the hands of technique; spirit can be alienated from operation." The lessons of the participative managers, more serious than the mere superficiality of a suggestion box, were also deeply ingrained. A prime focus of Diplomacy for the 1970s was a new era in management—employee relations. Openness and creativity were encouraged. There was even concern, for the first time, for ensuring equal employment opportunities and new openings for women. The role of the foreign service wife was redefined, giving her more training and staff support for her unique position as an unofficial representative of the United States.

Still, characteristically, the new proposals clung to the same brass rings. First was the commitment to a belief that this was the only real, sig-

significant reform where all the acknowledged previous attempts were specious and superficial. All previous reformers of management guidelines had believed similarly about their proposals, from Huntington Wilson's geopolitical divisions through Wriston's merger. Second was a still-unshattered faith in techniques, no matter what the preamble, to solve problems. Demonstrating this faith was a program called Policy Analysis and Resource Allocation (PARA), under the aegis of the secretary's Planning and Coordination Staff (S/PC). One of the tasks of the program was to provide a structural way back into the top echelons of decision making for the department by writing annual reviews designed to serve as common denominators for discussion in the department, the Inter-Agency Group of the National Security Council, and the White House. In turn, Policy Analysis and Resource Allocation was to feed into an even more centralized executive council known as the Secretariat. The authors of Diplomacy for the 1970s proudly acclaimed this Secretariat, at the "heartbeat" of department operations, as "thoroughly modernized" and ready with "up-to-date techniques and equipment for high-speed telecommunications and automated information handling." Thus, Secretary Rogers urged development of a new operations center and improved information management known as Secretariat Automated Data Indexing System (SADI).

Into this nerve center of the Department of State in 1973 moved Kissinger, who had challenged the hegemony of efficiency while an outsider. It is difficult to perceive how a Kissinger or certainly a Remsen, Adams, Seward, Adee, or Evarts could function in the kingdom of PARA and SADI, that is, an environment where "substantive problems are transformed into administrative ones." What was the remaining role of leadership and policy in a department that could issue forth Airgram 5399, concerning the use of the title "Ms."? The message read in part: "The Department has added 'Ms.' to the personnel title codes . . . maintained in the automated master personnel file. All documents which access these codes and which are printed by the computer may now employ this form of address."

The "Ms." example reveals not only a preoccupation with management details but also a diversity problem in State. For the department specifically charged with representing the United States to the various peoples of the world, the career officers in State had always been remarkably homogeneous. In the 1970s the department
made great strides to catch up with other government offices in the area of diversity. The number of new female foreign service officers doubled during the decade, and by the end of the decade the department was actively recruiting African-American candidates. As a result, by the end of the century the number of female and African-American ambassadors had noticeably increased even before the nation had its first woman as secretary of state with Madeleine Albright and its first African-American secretary of state with Colin Powell.

During the last quarter of the twentieth century, the State Department continued its parade of re-reorganizations that had begun with creation of the first geographic division in 1908 and the professionalization of the foreign service with the Rogers Act of 1924. The Foreign Service Officers Act of 1980 aimed to make career officers more effective through reform of the promotion and recognition system. The bureaucratic pyramid of functional and geographic divisions was continually readjusted, but the process of getting a policy recommendation through this maze of specialists remained time-consuming and an obstacle to policy innovation. During the Clinton administration a new undersecretary of state for global issues was added to make the department more responsive to contemporary world problems, such as the environment and population growth. One of the most significant changes of the 1990s was to bring the previously independent U.S. Information Agency and the Arms Control and Disarmament Agency into the department to save costs and enhance management efficiency.

The explanation of the shifting power of the secretary of state and the department itself since World War II was not in internal organization, or in major historical events like the Vietnam War and the end of the Cold War, or in scandals like Iran-Contra. The key was in the growth of power and complexity of the modern presidency, beginning with Franklin D. Roosevelt and continuing thereafter. Much public discussion focused on the relative balance of power between the National Security Council after its creation in 1947 and the State Department. During the Johnson years, Secretary of Defense Robert McNamara and national security advisers McGeorge Bundy and Walt Rostow were seen as overshadowing Dean Rusk. Under Nixon, Kissinger dominated the policy process through his NSC staff and his direct access to the president within the White House. Reagan claimed that George Shultz would restore the primacy of the State Department, but Shultz was often in conflict with Secretary of Defense Caspar Weinberger and later the NSC staff over dealings with Iran and Central America. With the end of the Cold War, Bill Clinton elevated another player in the policy game, the secretary of commerce, as he gave priority to economic competitiveness. The determining consideration in all of these cases was how the president chose to exercise his executive prerogatives.

Despite efforts to improve its own organization, the State Department was unable to reclaim the leadership and coordination of foreign policy of which it had once been able to boast. The centralization of policymaking in the White House that had begun during World War II and increased during the Cold War remained. The National Security Council staff had the advantages of greater access to the president, more rapid response to changing situations, and more domestic political awareness than State. Indeed, bureaucratic battles between the department and the NSC staff at times—such as in the Iran-Contra scandal of the 1980s—wrecked the policy process. No national security adviser after Kissinger ever equaled his level of control over decisions, but policy unity was always difficult. The Defense Department, CIA, NSC, and other departments often had as much or more input into foreign policy than did the State Department.

The juxtaposition of Airgram 5399 about the use of “Ms.” and Remsen’s original instructions put one in mind of a debate between two diplomatic historians about the utility of speedy publication of foreign policy files by the Department of State. While both scholars supported such a policy, their reasons differed dramatically. The first argued the administratively defensible position that quick access to such documents and the resulting historical monographs, sure to follow, would teach contemporary diplomats how to do a better job. More reflectively, the second historian suggested that while scholarship and research demanded quick access, better policy would emerge not from monographs, but from “wisdom.”

Leadership, the quality of greatness inherent in the work of an Adams or a Seward, is still possible. The Department of State is not beyond its grasp. Yet one must conclude that its achievement slips further and further out of reach in the wake of those variables the department has come to identify as progress since the mid-twentieth century: complexity, bigness, and accelerated change.

In one form or another, deterrence is a motivational force in many everyday relationships: a child learns not to misbehave for fear of being scolded by its parents; a potential criminal might decide against committing a crime for fear of being caught and punished; a nation may choose one foreign policy course over another out of fear of military or economic retaliation; or an international alliance may threaten war if any one of its members is attacked. In each case, one party has influenced the choice of another by threatening consequences that outweigh gains.

In the field of foreign policy, the threat and fear of retaliation has been a powerful force. Imperial powers have found that making an example of an enemy or lawbreaker ultimately provided a cheaper and easier method of controlling peoples than maintaining a large standing police or armed forces, conforming to the common adage that prevention is usually better than cure. To that end, Roman legions deliberately cultivated a reputation for ruthlessness to promote stability, and European imperial powers did everything they could to impress their technological and military prowess upon the peoples they commanded. But it is in the nuclear age that deterrence assumed a special significance and was refined from a mostly instinctive practice to a deliberate, if still inexact, science. Throughout the nuclear age, deterrence has been a dynamic concept propelled by technological and historical developments. In turn, the concept of deterrence came to influence those technological and historical developments.

THE THEORY OF DETERRENCE

In its most basic theoretical form, deterrence is an equation involving two parties, where one party weighs the gain it may make by pursuing a course of action against the price it may pay by the retaliation of the other party. By way of illustration, it is useful to consider two nations, Nation A and Nation B, whose interests collide on a particular issue. If Nation A is known to be considering a course of action contrary to the interests of Nation B, Nation B may signal its intent to retaliate if Nation A does indeed choose that course of action. This leaves Nation A with a decision. First, it must decide whether Nation B has the capability to carry out its threat, and, second, it must decide whether Nation B has the will to carry out its threat. And the deciding factor in both of these judgments is the credibility of Nation B's capability and will to carry out the threat. If, as a result of this cost-benefit calculation, Nation A decides not to go ahead with the course of action, then deterrence has been successful; but if Nation A decides that the gains outweigh the risk or price, and goes ahead regardless of the threat, then deterrence has failed. This example, though, provides only the barest outline sketch of how deterrence operates in the foreign policy arena.

The simplicity of the theoretical formula belies the complexity of international diplomacy in practice and critics of deterrence have focused on the relative rigidity of the formula compared to the fluidity and unpredictability of international diplomacy. Furthermore, deterrence rests heavily on certain assumptions about the parties involved and the way they will react. First, deterrence rests heavily on the belief that rationality will prevail throughout the process. Not only do the various parties have to behave in fundamentally rational ways, but each party must perceive the other as behaving in a fundamentally rational way. In practice, this leads to a complicated process of perception and counterperception as policymakers and intelligence bodies from each nation estimate and try to influence what the other is thinking.

Critics of deterrence rightly point out that the decisions of political leaders often do not fall
into neatly explainable categories and that however carefully the deterrence situation may be controlled, ultimately the decision is a subjective one. In foreign affairs as in everyday life, behavior in deterrence situations is based on instinct as well as reason and this instinctive element can never be confidently discounted. Moreover, the way both parties view the situation can be influenced qualitatively by any number of factors, including irrationality, misperception, poor judgment, or even just wishful thinking. In short, what may seem an unacceptable price to one person or under some circumstances could well be judged by another under different circumstances to be acceptable. Moreover, since history is filled with events that were quite simply unpredictable, it is clearly difficult to account with any certainty for the myriad of accidents, mistakes, and emotions that may play a part in a decision. At best, employing deterrence is an approximation, but in the thermonuclear age, with weapons capable of global annihilation, the stakes are higher than ever before.

Because deterrence is very much in the eye of the beholder, and actual intentions and capabilities are less important than the other side's estimate of those intentions and capabilities, the process of communicating and interpreting information is crucial. Known as signaling, this two-way discourse is open to a wide range of possible scenarios. One involves explicit communications, including public speeches and classified diplomatic correspondence. Another is implicit measures such as partial mobilization or the placing of forces on alert or more subtle measures designed to be detected by foreign intelligence bodies. Ideally, each method is designed to exploit the complex interplay of perceptions and counterperceptions.

Sometimes deterrence fails. Often in the history of international affairs the cost-benefit calculation has led to an unexpected result. In 1904 Russia ignored Japanese warnings that its policies would lead to retaliation, resulting ultimately in the Russo-Japanese War. In 1914 the Central Powers recognized that their policies risked drawing the Entente into war in Europe, but continued regardless. During World War II, Nazi Germany persisted with U-boat attacks on American transatlantic merchant shipping despite President Franklin D. Roosevelt's explicit warnings that it would likely provoke U.S. retaliation. In December 1941, despite U.S. military strength, Japan calculated that its interests were best served by a surprise attack on the U.S. fleet at Pearl Harbor. In mid-1962 Soviet premier Nikita Khrushchev installed nuclear missiles in Cuba despite President John F. Kennedy's explicit warnings that doing so would provoke U.S. retaliation. And in 1991 the Middle East erupted in violence as Saddam Hussein ignored the threat of U.S. intervention should Iraq invade Kuwait.

**STRATEGIC BOMBING**

In diplomacy, threats that act as a deterrent have most often come in military form and have therefore implied the capability to project military power. Possessing a powerful navy gave Britain such a capability, but for much of its early history, the United States was not able to project military power and therefore made threats rarely and with questionable success. One notable deterrent effort was President James Monroe's unilateral declaration on 2 December 1823 of the independence of the Western Hemisphere, issued in order to deter Spanish intervention in Latin America and Russian expansion on to the American continent. Monroe's threat was twofold. First, he implied local military resistance if Spain tried to reestablish its colonies in Latin America or Russia expanded onto the American Northwest Coast. Second, he implied that if the European powers chose to interfere in the affairs of the Western Hemisphere then the United States would be forced to revoke its longstanding tradition of non-interference in European affairs. Ultimately, Spain did not try to reestablish its colonies, although this probably had less to do with Monroe's threats than it did with similar threats issued by Britain.

The advent of strategic bombing in the early twentieth century vastly increased the ability to project military force, and consequently led to the transformation of deterrence into its modern form. The twin technological developments of high explosives and aircraft that could deliver them to their targets made strategic bombing a decisive factor in modern warfare. It was first used in limited form in World War I in Germany's zeppelin (airship) attacks against Britain. German scientists had not only developed a way to incorporate poison gas into a bomb, thereby creating the first type of the weapons now classed as weapons of mass destruction, but had also developed a way to float zeppelins over enemy lines and drop their payloads on British cities. Although not widely recognized at the time, this ability to move beyond the confines of the battlefield and to attack an enemy's cities directly revo-
lutionized modern warfare as offensive strategic bombing threatened to break the defensive deadlock that had evolved from tanks, machine guns, and trench warfare.

At the same time it introduced a new factor that, although intangible, was no less powerful. Like the German V-1 and V-2 rocket strikes during World War II, the German zeppelin of World War I resulted in few deaths, but the potential that the technology seemed to hold for extending the battlefront from the trenches to civilian homes captured the British public’s imagination to an extent that far outweighed objective casualty counts. For the first time a military weapon was used not only for the tactical calculations of policymakers, but also to strike terror into the home front, which had become an increasingly vital component of modern warfare. The fluid variable of civilian morale suddenly became as important as military morale as the civilian population reacted to the new threat to their homes and lives. Moreover, during World War II, as strategic bombing became vastly more effective (and deadly), the industrial and economic hearts of an enemy became additional viable targets. Allied long-range bombers all but destroyed the German industrial city of Dresden, while the American firebombing of Tokyo started fires that raged out of control for days at a time. With the development of the atomic bomb, a weapon blatantly unable to discriminate between military and civilian targets, strategic bombing was taken to its extreme.

The development of the atomic bomb was the culmination of the top secret Manhattan Project, an extraordinary collaboration of international scientists headed by J. Robert Oppenheimer that was backed by vast resources provided by the U.S. government. Stringent security precluded public debate about what role the new weapon would have, but among those few who had information about the project’s overall objective and progress, there was growing awareness that the new weapon would be unlike anything that had come before; it would perhaps even create “a new relationship of man to the universe,” as a committee chaired by Secretary of War Henry L. Stimson put it. Such an unconventional weapon clearly required unconventional thinking. As Oppenheimer recognized, the elements of surprise and terror were as intrinsic to it as fissionable nuclei. In a top-secret report submitted to the War Department on 11 June 1945, a small committee chaired by physicist James Franck suggested that the psychological impact of the explosion might be more valuable to U.S. military objectives than the immediate physical destruction. In the hope that a demonstration of the destructive potential of the atomic bomb might be enough to compel the Japanese to surrender, the Franck Committee proposed a public demonstration in an uninhabited region.

After considering the various proposals, President Harry S. Truman concluded that a demonstration in an uninhabited region would likely be ineffective, and therefore ordered that the bomb be used against Japanese cities, a decision that has been passionately debated ever since. Some have argued that Truman’s motivation was less the war in the Pacific than the impending contest with the Soviet Union and that as such it represented the opening gambit of so-called “atomic diplomacy,” while others argue that the decision was not only militarily sound but necessary, and that it ultimately saved hundreds of thousands of American and Japanese lives. But whatever Truman’s motives, at 8:15 A.M. on 6 August 1945, an American B-29 Superfortress long-range bomber named the Enola Gay delivered its single atomic bomb to the target of Hiroshima, the second most important military-industrial center in Japan. Upward of seventy thousand people were killed instantly in the blast. Three days later another bomb was dropped on Nagasaki, killing at least twenty thousand. In the following weeks the death counts in both cities rose as the populations succumbed to radiation-related illnesses.

As the wire services flashed the story around the globe, journalists who had witnessed the Trinity test blast at Alamogordo, New Mexico, three weeks earlier on 16 July, were now free to write about what they had seen and help a startled world comprehend what had happened. The American public’s reaction was a mixture of relief that the end of the war was in sight, satisfaction that revenge had been exacted upon the perpetrators of the Pearl Harbor attack, and a sober recognition of the responsibility the new weapon carried with it. In strategic terms, there was not yet such a thing as a U.S. atomic stockpile, despite President Truman’s implication in his press statement announcing the Hiroshima bombing that atomic bombs were rolling off the production line. Had the first two atomic bombs failed to bring a Japanese surrender, some time would have passed before more were ready. Within days of the Nagasaki bombing, however, the Japanese leaders finally succumbed to the inevitable and formally
surrendered to General Douglas MacArthur's forces on 2 September 1945. From that moment, the priority for U.S. military forces was not building more bombs, but going home.

As the United States demobilized in the postwar period, relations with the Soviet Union deteriorated. The coincidence of the beginning of the Cold War and the dawn of the nuclear age ensured that the history of the two would become inextricably entwined. During the early Cold War, the primary strategic contest was for Europe, and Germany in particular, but throughout the continent evidence mounted of a clash of interests and ideology. Within a few short years of the end of World War II, the U.S. government had publicly identified the Soviet Union as its primary strategic threat. And if war did break out in Europe, the Soviets had vastly more conventional forces and the geographical advantage as well. The challenge for U.S. defense planners, therefore, was to find a way to project the U.S. atomic force. Nevertheless, the planners moved slowly to devise a coherent nuclear strategy to serve foreign policy interests. Although fully recognizing that the Soviets would sooner or later develop the atomic bomb, American policymakers struggled to find a way to take advantage of the atomic monopoly. However, the American population was still weary from World War II and constrained military budgets were shrinking, so atomic development was a low priority. It was not until Dwight D. Eisenhower became president that a coherent deterrent role was found for the U.S. nuclear arsenal. But by the end of the Truman administration, defense budgets were growing rapidly, and that administration made some effort to bring military policy into the atomic age. Having recently witnessed how much sacrifice Soviet leader Joseph Stalin was willing to impose on his countrymen in the defense of the USSR, it was clear to U.S. policymakers that if war should break out between the two superpowers, the small stockpile of American atomic bombs that had been built up since Nagasaki would not guarantee victory.

In use, the atomic bomb was an offensive weapon. For the American atomic monopoly to be cast in a defensive role, that role had to be to prevent war altogether through the very threat of retaliation. Bernard Brodie, one of the first defense intellectuals to engage publicly the implications of the atomic bomb, succinctly summarized the momentous shift in military affairs that the bomb had sparked. “Thus far the chief purpose of our military establishment has been to win wars,” Brodie commented in The Absolute Weapon (1946). “From now on its chief purpose must be to avert them.” To that end, and recognizing that atomic weapons did not fall easily under the existing military force structure, the Truman administration in March 1946 created the Strategic Air Command (SAC) headed by General George Kenny. Adopting the motto “Peace is our profession,” SAC’s mission was to give the United States a long-term capability to project U.S. nuclear force anywhere on the globe. SAC’s existence exemplified the paradox of deterrence strategies as summarized in the Latin adage *Qui desiderat pacem, praeparet bellum* (Let him who desires peace, prepare for war). Unlike the case with conventional military forces, for the remainder of its existence SAC’s success would be measured not by its performance in battle, but by its never having actually to engage in combat.

The Cold War contest was ultimately a strategic one, but it was more often manifested in a series of short-term political contests. Committed to a policy of containing communist expansion, the Truman administration found itself having to rethink its assumption that atomic weapons would deter simply because they existed. By the end of 1948 there was mounting evidence that the American atomic monopoly was having little success in deterring communist political expansion through Europe; the threat of communist subversion in Greece and Turkey in 1947, the communist coup in Czechoslovakia in February 1948, and the strong communist presence during the Italian election of April 1948 all seemed to provide evidence to that effect. And in the first truly nuclear crisis of the Cold War, the Berlin blockade of 1948–1949, the Truman administration could manage only a half-hearted atomic threat that, if Stalin had pushed the matter, would likely have been revealed as a bluff. In a move with the twin objectives of temporarily bolstering the flagging British strategic bombing force and sending an atomic threat to Stalin, American B-29s were deployed in Britain at the height of the Berlin blockade crisis. But this early attempt at nuclear coercion was unconvincing. The B-29s initially sent were not modified to carry atomic bombs; furthermore, it was public knowledge that there was no procedure in place to store atomic warheads overseas. By mid-1948 even Secretary of Defense James Forrestal had to admit that American military planning, including its nuclear strategy, was “patchwork” at best. If America’s national security was to realize the full
potential of the atomic bomb for deterrence, a thorough rethinking would be needed.

One solution preferred by many was for the United States to exploit the window of opportunity by launching a preemptive strike against the Soviet Union. Former British prime minister Winston Churchill suggested sending Stalin an ultimatum stating that if he did not desist from his expansionist policies, U.S. planes would use atomic bombs against Soviet cities. The U.S. commander in Germany, General Lucius Clay, agreed. Other military voices in Washington lamented the wasting of an opportunity. The calls became more urgent as that window of opportunity seemed to be closing.

When the Soviet Union detonated its first atomic device in August 1949, it caught the West by surprise. The mastering of the atomic process by Soviet scientists was not unexpected in a general sense, but beyond the inner sanctum of intelligence officials and defense planners, the Soviet achievement was never seriously anticipated beyond the vaguest of timetables. To make matters more alarming, two months later, in October 1949, Mao Zedong's Communist Party emerged victorious in China's civil war, a development seen in Washington as proof that Moscow's ambitions were not confined to Europe but were global.

THE THERMONUCLEAR REVOLUTION

The twin developments of thermonuclear weapons and long-range missiles ushered in a new phase of nuclear deterrence. Now, thermonuclear warheads hundreds or even thousands of times more powerful than atomic bombs could be attached to missiles capable of reaching other continents and destroying cities in minutes. In these circumstances, deterrence became not just a policy imperative but a necessity for the survival of the human race. It was clear that a new stage had been reached not only in the history of international affairs, but also in the history of humankind. J. Robert Oppenheimer famously
likened the situation to “two scorpions in a bottle, each capable of killing the other, but only at the risk of his own life.” In delivering a comprehensive evaluation of British and NATO nuclear forces to the British House of Commons in March 1955, Prime Minister Winston Churchill observed that a paradox was likely to define international affairs in the future: “After a certain point has been passed it may be said, ‘The worse things get the better.’... Then it may well be that we shall by a process of sublime irony have reached a stage in this story where safety will be the sturdy child of terror, and survival the twin brother of annihilation.” Begun by technological innovation, the thermonuclear revolution aroused the most basic human fears and instincts.

In view of the apparently intensifying communist threat, and particularly in light of the recent development of Soviet atomic power, Truman in late January 1950 ordered a reexamination of U.S. strategic policy. Secretary of State Dean Acheson delegated the task to the new director of the State Department’s Policy Planning Staff, Paul Nitze. The result, a document known as NSC 68, was a lengthy and dramatic call to arms. Before long, the report concluded, the Soviet Union would have the capability to launch a surprise atomic attack on the United States. To deter such an attack, NSC 68 recommended a massive buildup in conventional and atomic forces and that, moreover, the United States should commit resources to developing a new type of weapon, a “super” bomb harnessing the power generated by fusing hydrogen atoms rather than splitting them. Preliminary research into such a weapon had been undertaken within the Manhattan Project by a team of scientists headed by physicist Edward Teller. But with no hope of immediate success and with military budgets shrinking in the postwar economic environment, the research was halted. Based on theoretical data, Teller predicted that a hydrogen bomb would be several hundred times more powerful than the Hiroshima bomb and capable of devastating an area hundreds of square miles, with radiation traveling much farther. NSC 68 now proposed to resume H-bomb research at a greatly accelerated rate. After heated debate over the feasibility and morality of such a weapon, Truman ordered the project to proceed.

At the height of the debate about whether to proceed with the H-bomb project, communist North Korea launched an attack on pro-Western South Korea on 25 June 1950. Truman reacted by committing U.S. troops under the auspices of the United Nations. Since the deterrent had clearly lapsed or failed, General Douglas MacArthur, commander of UN forces in the theater, and General Curtis Le May, head of SAC, both recommended revitalizing it by using atomic weapons against Communist China. Truman, however, refused to expand the war and committed the United States to a limited conflict with limited objectives, a novel mission for American military forces.

For both political parties, Korea confirmed beyond a doubt that communist forces were on the offensive and that existing U.S. strategy was inadequate to stop them. The Democratic administration reacted by embracing NSC 68 and the massive military buildup it entailed, including the development of the H-bomb. For Republicans, Korea seemed to provide ample evidence for their charge that the Truman administration’s approach to national security policy was based too heavily on reaction rather than prevention and therefore was putting the United States on track for financial bankruptcy. They argued that the primary failure lay not in the logistical difficulties of projecting U.S. military force to the distant shores of the Korean Peninsula, but in the administration’s failure to prevent the war in the first place. The debate reached a crescendo in the presidential election campaign of 1952, as General Dwight D. Eisenhower, the Republican candidate, and his foreign policy adviser, John Foster Dulles, launched a sustained political attack on the Truman administration’s foreign policy record.

Eisenhower and Dulles promised to take a new look at American national security policy and formulate a better plan for what was clearly going to be a long struggle with the Soviet Union. Dulles declared that the United States could not afford to keep fighting expensive “brushfire” wars like Korea and that what was required instead was an economically sustainable military posture designed to deter communist aggression over the long term. Since the United States could not in all likelihood compete with the Soviet Union in amassing conventional forces, Eisenhower and Dulles contended that the best use of American resources would be to invest in the next generation of nuclear weaponry and declare the intention to react to communist aggression “where it hurts, by means of our choosing.” To illustrate Eisenhower’s proposed deterrent strategy to the voters, Dulles called on the analogy of municipal police forces: “We do not station armed guards at every house to stop aggressors—that would be economic suicide—but we deter potential aggressors
by making it probable that if they aggress, they will lose in punishment more than they can gain by aggression.” Massive retaliation, as Eisenhower’s deterrent strategy came to be called, was designed to impose upon would-be aggressors a blunt choice: either to desist, or to persist with the risk of nuclear annihilation. The primary challenge for U.S. policymakers, therefore, was to make the other side believe that aggression carried a high risk of nuclear retaliation. To that end, Dulles declared that the administration would be prepared to engage in diplomatic “brinkmanship,” a diplomatic policy some observers likened to the youthful, and often deadly, test of nerves known as “chicken.” Eisenhower and Dulles argued that only by being ready to push the crisis to a point where the opponent backed down first would the United States be able to protect its interests. And in order to give communist leaders reason to pause, Eisenhower employed calculated ambiguity in responding to the question of whether a nuclear response would be automatic.

Once in office, Eisenhower and Dulles were confronted with the challenge of implementing the results of their promised New Look. Some of it was clearly impractical, even dangerous. Campaign promises of the political “liberation” of Eastern Europe were quickly abandoned after the June 1953 uprisings in East Germany. The deterrence strategy proved somewhat easier, although perhaps even more dangerous. Increasing the relative emphasis on nuclear technology as opposed to maintaining large standing conventional forces allowed the administration to cut defense expenditures by about 25 percent compared to the late Truman years, leading Secretary of Defense Charles Wilson to declare proudly that the Pentagon now had “more bang for the buck.”

Having adopted massive retaliation as a long-term Cold War strategy, Eisenhower and Dulles found that strategy tested in the short term by a series of crises. Nevertheless, Eisenhower threatened massive retaliation in times of crisis sparingly and deliberately. In a series of confrontations with Communist China ranging from bringing an end to the Korean War in 1953 to the Taiwan Straits crisis of 1958, Eisenhower several times threatened nuclear attack. The primary focus of U.S. foreign policy, however, remained Europe. The struggle for Germany continued to manifest itself in crises over Berlin, which in turn presented U.S. deterrence strategies with perhaps their most serious test. Given the superior strength of Soviet conventional forces in Europe and the location of West Berlin deep inside communist territory, that city was militarily indefensible. The situation was, as Senate Foreign Relations Committee chairman J. William Fulbright put it, “a strategic nightmare.”

---

**DETERRENCE REDUCES COSTS**

Secretary of State John Foster Dulles’s comments on massive retaliation were published in the Department of State Bulletin on 25 January 1954:

“In the face of this strategy [of Soviet expansion], measures cannot be judged adequate merely because they ward off an immediate danger. It is essential to do this, but it is also essential to do so without exhausting ourselves.

“When the Eisenhower administration applied this test, we felt that some transformations were needed.

“It is not sound military strategy permanently to commit U.S. land forces to Asia to a degree that leaves us no strategic reserves.

“It is not sound economics, or good foreign policy, to support permanently other countries; for in the long run, that creates as much ill will as good will.

“Also, it is not sound to become permanently committed to military expenditures so vast that they lead to ‘practical bankruptcy.’ . . .

“We need allies and collective security. Our purpose is to make these relations more effective, less costly. This can be done by placing more reliance on deterrent power and less dependence on local defensive power.

“This is accepted practice so far as local communities are concerned. We keep locks on our doors, but we do not have an armed guard in every home. We rely principally on a community security system so well equipped to punish any who break in and steal that, in fact, would-be aggressors are generally deterred. That is the modern way of getting maximum protection at a bearable cost.

“What the Eisenhower administration seeks is a similar international security system. We want, for ourselves and the other free nations, a maximum deterrent at bearable cost. . . .

“The way to deter aggression is for the free community to be willing and able to respond vigorously at places and with means of its own choosing.”
viable option available to the United States short of thermonuclear war was to deter the Soviets from moving against the city.

Simultaneous to these crises, the strategic balance was in a state of flux, which in turn affected thinking about deterrence. Although the Soviets had successfully tested their first atomic device as early as 1949, thoughtful observers recognized that one successful test did not make a deployable arsenal. By 1955, however, Soviet scientists had largely overcome the initial four-year lag and, particularly in the field of thermonuclear weapons, was on a par with the West. The Soviets still lagged far behind the United States both in quantity and quality of nuclear weapons, but the former's strategic arsenal was more than adequate to inflict considerable damage on the West and to play its own deterrent role. Furthermore, the accelerating arms race made it clear that the gap was narrowing. On 3 October 1952, Great Britain detonated its first atomic device on islands off the coast of Australia. Only weeks later, on 31 October, the United States detonated its first thermonuclear weapon. Less than a year after that, on 12 August 1953, the Soviet Union completed its first successful detonation of a thermonuclear device. In 1956 the first American tactical nuclear weapons were deployed in Europe. These new weapons, designed for battlefield use in localized action, came in the form of army artillery shells, each with explosive power roughly equivalent to the Hiroshima bomb.

This rapidly accelerating arms race confronted defense planners with a new question: How much was enough to deter? During the Eisenhower administration two main schools of thought defined the debate. The first held that the U.S. stockpile should consist of just enough weapons to play a deterrent role, a concept that became known as minimum deterrence. The opposing school of thought held that the United States should maintain a large and constantly growing nuclear arsenal in order to be able to engage in redundant targeting, or allocating several weapons to each target. Known as “overkill,” it was this approach of building up an overwhelming nuclear force that prevailed, largely as a result of unchecked bureaucratic politics. As a result, for the remainder of the decade, the Eisenhower administration invested deeply in building up the U.S. nuclear stockpile.

On 3 August 1957 the successful Soviet test of a new type of missile, with the potential capability of reaching the continental United States from a launch-point in the USSR, augured in a new phase of deterrence. This was dramatically confirmed two months later, on 4 October 1957, when Soviet Strategic Rocket Forces used the same type of intercontinental ballistic missile (ICBM) to propel the world’s first artificial satellite into space. That satellite, known as Sputnik, was in itself harmless, being little more than a nitrogen-filled aluminum sphere fitted with a rudimentary transmitter that emitted a distinctive “beep” every few seconds, but it would nevertheless have profound ramifications. For the world public, it offered a dramatic demonstration that suggested Soviet missile technology was ahead of the West’s, especially when contrasted with a stale of well-publicized American test failures. The American public’s fears were manifested in accusations that the Eisenhower administration had allowed first a “bomber gap” and then a “missile gap” to develop. In reality, neither gap existed, but the administration’s critics made considerable political mileage of the issue. For deterrence theorists and practitioners, Sputnik also demonstrated that the mainland United States was for the first time vulnerable to direct missile attack, potentially opening a window of vulnerability that introduced new challenges to the viability of massive retaliation as a deterrent strategy. In response to Sputnik, the American government put new emphasis on missile technology and the space race. By the late 1950s U.S. intermediate-range ballistic missiles (IRBMs) and medium-range ballistic missiles (MRBMs) were based in Turkey and Italy, aimed at targets in the Soviet Union. In 1959 the first generation of American ICBMs, Atlas D missiles with a range of 7,500 miles, were deployed in California. The following year the Polaris submarine-launched ballistic missiles (SLBMs), the final leg of what became known as the U.S. nuclear triad, were added to the U.S. arsenal to complement the strategic bomber and missile forces. By the early 1960s the Corona intelligence satellite program was sending back its first photographs of Soviet military installations, promising a quantum leap in the collection of military intelligence. Meanwhile, development continued of the massive Saturn V rockets that, by the end of the 1960s, would finally shatter any concept of safety in geography by propelling Americans to the moon.

Once again, technological developments introduced new challenges for deterrence strategy. Since missiles reduced to minutes the time available to respond to a nuclear strike, then conceiv-
ably the side that struck first would have an advantage if it could neutralize the enemy's retaliatory capability in that strike. Accordingly, the Eisenhower administration implemented new procedures to protect its retaliatory capability. Beginning in 1952, SACs primary strike forces were on twenty-four-hour alert to guard against surprise attack and so-called fail-safe procedures had been implemented. In highly classified Chrome Dome missions, B-52 Stratofortress bombers flew to within striking distance of enemy targets and waited for a signal to proceed. If no signal came, the planes returned to base. The procedures were designed partly to improve the response time of the nuclear strike force, but more importantly to ensure that the strike force could not be destroyed in Soviet first-strike attacks on airfields. Scattered and airborne, the strike force was less vulnerable. The same principle was also applied to command and control procedures. To reduce the risk that a Soviet first strike on a few central underground command centers might disable the entire U.S. nuclear strike force—possibly an incentive for a Soviet preemptive first strike—a fleet of air force planes were specially outfitted with command and communications equipment to be able to take control of the American nuclear arsenal in the event the central underground command center was destroyed or disabled. From 3 February 1961 through 24 July 1990, a Looking Glass plane was in the air at all times. Protected by mobility, these Looking Glass missions, along with the Chrome Dome missions, became key elements of the U.S. deterrent in the missile age by protecting America's second-strike capability.

MASSIVE RETALIATION QUESTIONED

From the mid-1950s, criticism of massive retaliation became increasingly vocal. As Eisenhower well knew, the most challenging aspect of implementing massive retaliation was that it required a leap of faith on the part of the adversary that the United States would respond to localized and small-scale aggression by launching a nuclear strike, a reaction that was increasingly akin to suicide because of the rapid advances the Soviets were making in nuclear technology. As a consequence, there were a growing number of calls for the United States and NATO to bridge that leap of faith by modifying the strategy of massive retaliation to what retired British Rear Admiral Sir Anthony W. Buzzard called “graduated deterrence.” Only by being capable of responding in proportion to the threat, critics of massive retaliation argued, would nuclear threats become credible. Implicit here was a distinction between the tactical and strategic use of nuclear weapons, a distinction that massive retaliation explicitly disavowed. In 1957 Harvard professor Henry Kissinger elaborated on this argument by calling for increased investment in tactical nuclear weapons and acceptance of the possibility of limited nuclear war. The observations of Buzzard and Kissinger were part of a trend toward public debate over nuclear policy. The increasing frequency of nuclear crises in the late 1950s and early 1960s and the growing absurdity of both superpowers' nuclear postures led to increased public concern with nuclear policy. For the first decade of the nuclear age, the American public had for the most part treated nuclear policy as “something best left to the experts,” but by the end of the 1950s nuclear strategy had become a topic of public debate led by a cadre of increasingly visible professional strategists. Often civilians associated with think tanks such as the RAND Corporation, these professional strategists began to assume a new place in the U.S. military hierarchy and, in turn, in the public imagination. Scientists like Robert Oppenheimer, Edward Teller, and Werner von Braun had all become national figures through their contributions to the technology of the nuclear age, and by the late 1950s civilian professional strategists like Bernard Brodie, Henry Kissinger, Albert Wohlstetter, and Herman Kahn were becoming just as famous for their theorizing about how to use that technology. Although their fame most often came in the form of notoriety for their ability to discuss the absurdity of nuclear war in cold, calculating terms, they were nevertheless crucial for fueling the public debate. In the absence of hard evidence concerning Soviet decision making, these strategists were forced to form judgments about nuclear war without having any experience to draw on; thus, they substituted deductive hypotheses derived from the fields of political science, psychology, and economics for inductive historical experience. In a series of books, the most well-known of which is On Thermonuclear War (1960), Kahn challenged policymakers and the general public to get beyond what he called “ostrichlike behavior” and to “think the unthinkable.” His central point, as he put it in Thinking the Unthinkable (1962), was that “ther-
monuclear war may seem unthinkable, impossible, insane, hideous, or highly unlikely, but it is not impossible.”

The presidential election of 1960 further propelled the public debate on deterrence. Since Buzzard’s call for “graduated deterrence” in 1956, Eisenhower’s political opponents had adopted the strategy under a revised name: flexible response. Maxwell Taylor, the army chief of staff in the Eisenhower administration, had for some time been a voice of dissent on massive retaliation and had expressed his concerns in his book *The Uncertain Trumpet* (1960), in which he called for a reprioritizing of U.S. defense spending to place more emphasis on the ability to control the escalation of crises. When John F. Kennedy was nominated as the Democratic Party’s presidential nominee, he quickly adopted flexible response as the basis of his military program.

The Kennedy administration thus came to office basing much of its military program on a political refutation of the Eisenhower administration’s strategy of massive retaliation. Despite campaign promises to institute ways to control escalation and thereby make crises “safer,” the Kennedy administration quickly assumed an aura of being in perpetual emergency. From the failed invasion of Cuba in April 1961, the renewed Berlin crisis just months later, and the civil rights crisis at the University of Mississippi in the fall of 1962, it appeared to many that the administration was careening from crisis to crisis. The first practical test of flexible response came in the summer of 1961, when Soviet premier Nikita Khrushchev revived his ultimatum to end Western rights in West Berlin and thereby once again provided U.S. deterrence strategy with perhaps its most difficult challenge. With the crisis brewing, and concerned that he had undermined his own credibility through the Bay of Pigs imbroglio a few months earlier, Kennedy responded with a massive buildup of conventional forces in Europe in order, in his words, “to have a wider choice than humiliation or all-out nuclear action.” At the same time, he reaffirmed NATO’s nuclear guarantee to the city. In turn, Khrushchev quietly lifted his deadline, as he had two years earlier.

Of all the crises confronted during Kennedy’s short presidency, the Cuban missile crisis proved the most dangerous, with the United States and the Soviet Union coming closer to the brink of nuclear war than ever before or since. When Khrushchev decided to deploy Soviet MRBMs, IRBMs, tactical nuclear weapons, and nuclear-capable medium-range bombers secretly in Cuba, where they would be positioned to strike most of the continental United States within minutes, his reasoning was to bolster the Soviet deterrent. Whether he wanted to use this deterrent in an offensive or defensive role has been debated by historians ever since. Once the deployments were discovered, Kennedy responded to the challenge by implementing a naval blockade of the island and threatening military action if the missiles and bombers were not removed. After a weeklong standoff, during which SAC’s forces went on airborne alert, Khrushchev agreed to remove the missiles and a month later agreed to remove the bombers.

The crisis was resolved peacefully, but those who had witnessed the secret negotiations and the classified near misses had seen all too clearly how command and control might break down under crisis conditions. On the one hand, the resolution of the Cuban missile crisis without global destruction seemed to enhance the credibility of the deterrent on both sides. On the other hand, the missile crisis demonstrated that brinkmanship and ambiguity were simply too dangerous. Consequently, the crisis accelerated the momentum toward East-West détente. Formal negotiations to limit nuclear testing, which had been under way since 1958, finally bore fruit on 5 August 1963 in the form of the Limited Test Ban Treaty that effectively imposed mutual restraint on large-scale, above-ground nuclear weapons tests. And to reduce the risk of miscalculation and misinterpretation in a crisis, a communications hotline was established between the White House and the Kremlin.

**MUTUAL ASSURED DESTRUCTION (MAD)**

Paradoxically, however, one interpretation of the missile crisis held that the decisive factor in its resolution had been America’s nuclear superiority—that if the American nuclear arsenal had not been more powerful than the Soviet arsenal, the crisis might have turned out differently. Both sides subscribed to this interpretation at least in part, which led to a new round in the arms race just as both sides were moving closer to agreements on nuclear testing. During the mid- and late 1960s, the Soviet Union expanded its military expenditures so that by the end of the decade, Soviet Strategic Rocket Forces had a new generation of even more power-
ful ICBMs at their disposal. At the same time, the administration of President Lyndon B. Johnson abandoned the idea of seeking an overwhelming nuclear superiority and settled upon a new measure of nuclear striking power called “sufficiency.” As defined by the administration it meant having the ability to survive a Soviet first strike with enough forces intact to retaliate with a devastating second strike. To do so, the emphasis would be placed on a better balanced triad structure of U.S. nuclear forces, consisting of missile, air, and naval strategic forces, together leading to the power to “assure destruction” to an adversary without engaging in a destabilizing arms race. Secretary of Defense Robert S. McNamara argued that such a structure was both cost effective and stable, and it was retained as the structure of the U.S. nuclear force until the end of the Cold War.

By the beginning of the 1970s, the nuclear forces of the Soviet Union and the United States were at relative parity. In terms of sheer explosive power the USSR had surpassed the United States and was in the process of developing weapons with even larger payloads and greater accuracy, but the United States retained the technological lead. With this parity came new challenges to deterrence theory. No longer did one side have a preponderance of strategic power, and it appeared doubtful that even a preemptive first strike would hold the advantage, since it was increasingly clear that neither side would survive a nuclear exchange without casualties measured in the millions. American policymakers quickly found, however, that the promise of mutual destruction in the bipolar contest with the Soviet Union was frustratingly ineffective in conflicts such as Vietnam, which fell outside of the strictly defined U.S.–USSR relationship.

Mutual assured destruction (MAD) lay at the heart of the Strategic Arms Limitation Talks (SALT) that began in Helsinki, Finland, in November 1969. The objective of the talks was not to reduce the arsenals of either side but rather to negotiate limits on future growth of those arsenals precisely to preserve mutual vulnerability. Two technological developments of the late 1960s threatened to destabilize the nuclear status quo: antiballistic missile (ABM) systems and the development of multiple, independently targetable, reentry vehicles (MIRVs) technology. ABM systems, as they were conceived at the time, were designed to protect cities from incoming missiles. Both the United States and the Soviet Union had developed first-generation ABM systems that could in theory, if not yet in practice, offer protection against first strikes. Partly to overcome such an advantage, both sides had invested considerable resources in developing the technology of MIRVs, a system whereby one missile could deliver several warheads to independent targets. Although these new technologies were designed to cancel each other out, in truth they threatened to destabilize the mutual destruction deterrent and spark off a new arms race, a race that would not only be dangerous, but expensive. The SALT process, therefore, was designed to limit these technologies and keep each side vulnerable to attack by the other.

With strategic nuclear war finally recognized as unwinnable, President Richard M. Nixon ordered Secretary of Defense James Schlesinger to review the military posture of the United States in light of recent technology. The result, known as the Schlesinger Doctrine, was essentially a refinement of flexible response, designed to balance Soviet bloc capabilities by threatening retaliation commensurate with the threat. Specifically, it enhanced the role of tactical nuclear weapons in a three-layered defense structure: conventional forces for conventional threats; tactical nuclear forces to counter tactical nuclear threats; and strategic nuclear forces to counter strategic threats. In essence, the Schlesinger Doctrine embraced what Henry Kissinger had proposed in the late 1950s: that a limited nuclear war was possible and was a desirable capability to have.

Despite President Jimmy Carter’s efforts to further détente and continue the focus on nuclear sufficiency rather than superiority, the international and domestic political environments of the late 1970s actually pressured the administration to increase military spending drastically. During the presidential election campaign of 1980, the Republican candidate Ronald Reagan seized upon accusations made by prominent groups such as the Committee on the Present Danger, headed by Eugene Rostow and Paul Nitze, to accuse the Carter administration of allowing a window of vulnerability to open, claiming that détente had allowed the Soviets to gain a dangerous lead in the arms race to the point that even the hardened-silo Minuteman forces, the mainstay of the U.S. strategic missile force, were vulnerable to high-yield Soviet missiles. Reagan promised not only to neutralize that gap, but also to restore American military superiority and, to that end, deliberately strove to upset the balance of terror by focusing on defense rather than deterrence. The shift had important ramifications for the Cold War. Reagan
reauthorized the development of the B-1 bomber and the next generation of highly accurate and MIRV-equipped Peacekeeper missiles to replace the aging Minuteman forces. He also authorized development of a controversial radiation-enhanced weapon, the neutron bomb, which killed living matter but left nonliving matter relatively unscathed. At the same time, Reagan endorsed the recommendations of a high-level commission chaired by Brent Scowcroft calling for an evolution toward small, single-warhead ICBMs backed up by Peacekeeper missiles.

In 1983 President Reagan ordered a large-scale scientific and military project to examine the feasibility of a new generation of ABM defenses. Officially labeled the Strategic Defense Initiative (SDI), but more commonly known as Star Wars after the popular science-fiction movie, the objective was to develop a multilayered shield capable of stopping thousands of incoming ballistic missiles. In theory, lasers mounted on satellites, electromagnetic guns, and charged particle beam weapons would be used to shoot down incoming ballistic missiles anywhere from boost phase (soon after launch) to reentry (final descent to target). In championing the project, Edward Teller, the reputed “father of the H-bomb,” made a dramatic and controversial return to the public debate of deterrence. Not only was the technology unproven, but it quickly became apparent that the price tag of such a system was almost impossible to predict and entirely impossible to pay. Not surprisingly, the Soviet Union reacted angrily to what seemed a blatant disavowal of the 1972 SALT Treaty. Nevertheless, Reagan ordered the project to proceed. For the remainder of the 1980s, the Reagan administration struggled to find a way to make SDI a reality while at the same time continuing to pursue meaningful arms reduction.

AFTER THE COLD WAR

With the end of the Cold War and the disintegration of the USSR from 1989 to 1991, the bipolar balance of terror suddenly collapsed, and it became clear that the Soviet nuclear strength had been disguising severe internal weakness. Almost overnight, it seemed, the international environment had changed almost beyond recognition. But the U.S. and NATO defense postures, built up so carefully and at such expense over the previous half century, could not change so quickly; U.S. foreign and military policies relied heavily on deterrence and they would need time to adjust. For deterrence, this had profound and often unforeseen challenges.

As it happened, cutting forces was relatively straightforward; the more difficult stage of adapting military strategy to the post–Cold War situation was that of reducing reliance on nuclear weapons. The problem was approached in two steps. First, the progress made over the previous decade in arms reduction was to be consolidated and advanced. The United States and Russia were committed to deep cuts in their strategic arsenals; under the terms of the START (Strategic Arms Reduction Talks) II treaty, those arsenals would be reduced to approximately one-third their size at the height of the Cold War, and both sides would eliminate the most destabilizing of the first-strike weapons, the MIRVed ICBMs. NATO, still formally committed to the defense posture of flexible response, concluded that it had to move away from a forward defense posture and that, accordingly, in the post–Warsaw Pact strategic landscape, substrategic, short-range nuclear weapons—that is, tactical ICBMs and MRBMs—no longer had a viable deterrent role. Consequently, at the NATO heads of state meeting in London on 5–6 July 1990, NATO committed itself to eliminating all nuclear artillery shells in Europe. At the same time NATO declared that it now regarded nuclear forces as “truly weapons of last resort.” Simultaneously, negotiations were under way for what became the Conventional Forces in Europe (CFE) Treaty, which provided for drastic cuts in both NATO and Warsaw Pact conventional forces stationed in Central Europe. In September 1991, President George H. W. Bush declared that the forward deployment of tactical nuclear forces was no longer a useful part of the U.S. deterrent and that he was therefore ordering the removal of all tactical nuclear weapons from the U.S. Navy. Never fully abandoning Reagan’s dream of an impenetrable shield against incoming missiles, the Bush administration quietly proceeded with a scaled-down version of SDI.

If the end of the Cold War drastically reduced the likelihood of strategic nuclear war, it nevertheless increased the risk of a small-scale nuclear exchange, mainly because of the growing problem of nuclear proliferation. In an effort to bring nuclear policy up to date and to confront head-on the problem that nuclear proliferation and the equalization of power that it created might one day work against the United States, the Clinton administration in late
1993 announced that it planned to redefine “deterrence.” No longer would the emphasis be on preventing the use of weapons of mass destruction, since that risk had declined markedly; instead, the focus would be on preventing the acquisition of those weapons. The announcement was followed up in September of the following year with a formal replacement of the MAD doctrine with “mutual assured safety” (MAS), a long-term program designed primarily to make Russia’s military reductions irreversible by reducing not only the number of weapons themselves but also reducing the technological and industrial infrastructures needed for nuclear weapons development. Through economic incentives and technological aid, steps were taken to dismantle what Soviet leader Mikhail Gorbachev called the “infrastructure of fear.” By November 1997, in the first formal presidential directive on the actual employment of nuclear weapons since the Carter administration, President Clinton formally abandoned the Cold War tenet that the U.S. military forces must be prepared to fight a protracted nuclear war. Nuclear weapons would still play an important deterrent role, but the emphasis on them would be reduced in keeping with the changing nature of the threats in the post–Cold War international environment.

While the role of nuclear weapons in the U.S. military posture was reducing, the role of conventional weapons was increasing. Confronting crises in the Balkans and the Middle East, the United States and its allies demonstrated that they could now project conventional military force with great effectiveness. Exploiting the so-called “revolution in military affairs” of superior intelligence information coupled with technologically advanced conventional weapons, the United States and NATO were able to strike with overwhelming conventional military force in a precise and controlled manner, leading to successful combat in both regions while suffering few casualties. Such capability, demonstrated convincingly and publicly, became an important part of U.S. efforts to confront and deter what the defense community called “asymmetrical threats,” or threats from rogue nations or terrorist organizations.

The role played by nuclear weapons and the deterrence strategies they bred since 1945 is a controversial issue. Many historians have argued that the very existence of nuclear weapons deterred the outbreak of another global war and kept what the historian John Lewis Gaddis called “the long peace” since 1945, while others have argued that other factors rendered major wars obsolete and that nuclear weapons were a largely irrelevant factor. Many others have argued that the sometimes absurd military postures that the existence of nuclear weapons encouraged greatly and needlessly increased the risk of global destruction and that the peace was maintained despite the existence of nuclear weapons. But whether a positive, negative, or irrelevant force, deterrence has made indelible impressions on the practice of foreign policy and the public imagination.

Modernization theory, sometimes called development doctrine, supplied the working concepts through which the United States understood its obligations to unindustrialized, newly independent nations in the last half of the twentieth century. Described as both an ideology and a discourse, modernization comprised a changeable set of ideas and strategies that guided policies toward foreign aid, trade, nationalism, and counterinsurgency. Among its core precepts was the idea that the state of economic and political advancement enjoyed by the United States and the industrialized West was normative, and that it was in the U.S. national interest, as well as the general interest of all people, that steps be taken to bring the other two-thirds of humanity up to a comparable level. Social science theories explained the causes of Asian, Latin American, and African backwardness and suggested appropriate remedies.

Historians have traced modernization theory's intellectual lineage back to Aristotle, who first suggested that states followed a natural pattern of growth, like plants. But while linear progress is a recurrent theme in Western thought, it existed alongside Christian doubts about man's fallen state. Americans in the early Republic believed (as did Aristotle) that if societies grow naturally, they also decay. The idea that the process of human progress could be understood and controlled dates to the early nineteenth century, when France and Britain were struggling to reestablish their mercantile empires on a secular, commercial basis, and just before technology and scientific racism ushered in an era of guiltless imperialism. Since then it has tended to recur at times and places where systems of dominance required justification and explanation.

**PROGRESS BECOMES MODERNIZATION**

European liberals reconciled universalism and imperialism by arguing that although all men were not yet equal, they were ruled by universal economic laws and followed a common historical path. The philosophers Jean-Baptiste Say, John Stuart Mill, and Auguste Comte each contended that societies passed through successive stages from savagery through barbarism to finally reach a developed state that resembled industrial Europe. "Whoever knows the political economy of England, or even of Yorkshire," Mill claimed, "knows that of all nations, actual or possible." Comte called the science of human evolution "sociology" and proposed that the highest stage would be a "positive" society governed by science. American scientists similarly concluded that their own society was advanced relative to the surrounding peoples, who might with help "catch up." Lewis H. Morgan, a founder of American anthropology, speculated in 1877 that "American Indian tribes represent, more or less nearly, the history and experience of our own remote ancestors."

From this perspective the United States, as well as Germany—among the youngest of countries—could be seen as the oldest of societies, advanced beyond India or China in the arts of civilization. Seniority implied a duty to instruct and uplift, and a concept of trusteeship was integral to liberal developmentalism. In the latter part of the nineteenth century, German social theorists—George Friedrich List, Karl Marx, and Max Weber—debated the obligations and causes of economic progress. List asserted that the state held the primary developmental role; its true mission was to "furnish the economical education of the nation." Marx authored one of the boldest theoretical statements of the developmental vision, describing the "iron necessity" of historical laws that required the successive destruction of feudalism and bourgeois capitalism to make way for communism. He attacked the liberal developmentalists' assumption of trusteeship, which subordinated colonial subjects and domes-
tic labor and furnished a disguise for exploitation. Marx’s and later Lenin’s critiques of imperial trusteeship were so appealing to anticolonial insurgents that Cold War–era modernization theorists would conceive their project as an attempt to devise an alternative to communist development.

Nationalists in the subject states constructed their own visions of modernity, and by the 1920s development was the subject of a global debate among disparate factions of anticolonial modernizers, primitivists, jingoists, and reformers. Two members of the Indian National Congress, Dadabhai Naoroji and Romesh C. Dutt, wielding British statistics and a historical perspective, demolished claims that the Raj acted for India’s economic welfare. Dutt (using what would later be called a structuralist or dependency approach) showed that imperial taxes and terms of trade systematically milked India for England’s benefit. “When I read Mr. Dutt’s economic history of India,” Mohandas Gandhi wrote, “I wept . . . It is machinery that has impoverished India.” Indian nationalists drew different conclusions as to the proper response. For Gandhi, development was the antithesis of community, and he urged a restoration of a preindustrial village economy. But Jawaharlal Nehru, insisting there was “only one-way traffic in Time,” ruled out a return to communalism or Islamic theocracy. He represented a majority of Congress Party members who wanted to build an industrial India by wresting development planning from British control. In China, too, development became a principal rationale for the nationalist struggle. Sun Yat-sen authored an elaborate scheme that promised to cure China’s backwardness as well as the global crisis of overproduction by using Western technology to dam rivers, build cities, and overlay China with a modern transport grid.

In the United States, “development” came into official use at the beginning of the twentieth century to distinguish the American Civilizing mission from European colonial policy, which it resembled. “The Philippines are not ours to exploit,” President William McKinley asserted, “but to develop, to civilize, to educate.” Woodrow Wilson attested that the Allies were “fighting for the liberty, the self-government, and the undictated development of all peoples.” In practice, the line between exploitation and development was porous. Gifts of science and technology facilitated economic and imperial penetration. Commodore Matthew C. Perry had presented the Japanese shogun with machinery and seeds, and by 1900, American agricultural missions, mining surveys, and sanitation experts made frequent stops in Japan and China. Professor Edwin W. Kemmerer circulated through South America in the 1920s modernizing currency and banking systems while opening new ground for U.S. investment. Educational and medical establishments, including the early work of the Rockefeller Foundation, were an extension of Christian evangelical missions.

An evangelical sensibility distinguished the American approach to development from the high-modernist ambitions of European colonizers and Asian nationalists. Early technical missions found their work “was not merely a matter of transferring scientific principles and factual data,” Merle Curti observed, “it was more largely a problem of developing attitudes.” Rockefeller initiatives in China in the 1920s and 1930s emphasized the transplantation of institutions and ways of thinking. American social science supported a perception of modernity as a kind of conversion experience. John Dewey, who defined American pragmatism in the 1920s and 1930s, conceived of freedom as development, as the realization of latent potential. The anthropologist Robert Redfield, writing in 1930, was the first to use the term “modernization” to describe linked processes of urbanization, literacy, secularization, and familial dismemberment. Although these were all concomitants of economic disruption, Redfield noted that modernization was fundamentally a cognitive, even spiritual event: A peasant, encountering a city for the first time, “develops a correspondingly new organ, a new mind.” From the start, American modernization initiatives would measure achievement not by kilowatts or gross national product but by hearts and minds.

A TOOL FOR MANAGING DECOLONIZATION

New techniques devised during the 1930s and 1940s gave the sociology of modernization a harder, scientific edge. Demographers discovered the “demographic transition,” a sudden drop in birthrate that served as a statistical marker of the arrival of modernity. National incomes accounting, invented by economists during World War II, measured the economic efficiency of nations relative to one another and across time. Talcott Parsons, a Harvard sociologist, served as advocate and symbol of the statistical, comparative turn in
the social sciences, sometimes called the “Parsonian revolution.” To Parsons, societies and nations were integrated systems that could be disassembled and compared. The results of empirical observations, fed into theoretical models, would allow social scientists to predict the trajectory of a society, and to plot alternate outcomes given the introduction of variables like industry, mass communications, the cash nexus, or Western contact.

Thinking in Washington moved along a parallel track. The experiences of the New Deal and World War II, particularly the Tennessee Valley Authority (TVA) and the Manhattan Project, reinforced confidence in the ability of science and planning to transform whole societies. Many in the Roosevelt administration believed such work would be essential to achieving a stable peace. David Lilienthal, co-director of the TVA, noted “a definite sequence in history from primitive or non-industrial conditions to more highly developed modern industrial conditions.” American assistance could help societies avoid “wasted steps” in the transition. By the end of World War II, a number of suppositions about the nature of modernization were widely shared in academic and philanthropic communities and were gaining attention in government, although they had yet to be codified as theory or policy. Among these were the following precepts:

1. Development begins from a stable, uniform state of tradition. Since, as Redfield observed, peasants in Tepoztlan, Mexico, Melanesian islanders, and “the southern negro” are fundamentally identical in outlook and relationship to modernity, their developmental problems (and the solutions) would also be the same, regardless of geographic or historic differences.

2. All societies follow a common, linear path to modernity, passing through recognizable stages along the way. The final destination (known to development economists as “convergence”) is a high plateau of industrialism and consumerism enjoyed by the urban societies of North America and Europe. Regardless of their point of origin, all cultures have the same trajectory. Nations with tragic histories could be assured they would not have a tragic destiny.

3. The journey can be accelerated in a number of ways but chiefly by contact with developed societies and through state interventions. Centralized planning was the essential feature of development work.

4. The most difficult part of the transition is psychological. Once the comforts of custom and old patterns of thought are rejected progress would follow its natural course. Development is thus not a process of accumulation but of release, the freeing of restrained energies and resources.

5. Development is above politics but has the capacity to create political gains and risks. Since states, regardless of political form or ideology, share an impulse to modernize, there would be a chance for the United States, as well as for rival powers, to take the lead in the global movement.

These ideas served as a template for the management of the decolonizing world. The sudden collapse of the European and Japanese empires following the Allied victory confronted the United States with the immense problem of redirecting the political and economic alignment of two-thirds of the world’s population. The Soviet military triumph displayed the fruits of Stalin’s industrialization drives, and newly independent regimes looked to the USSR as a model of rapid modernization. New international organizations—the United Nations and the World Bank—lent expertise and institutional backing to the development of postcolonial areas. Nonetheless, the United States faced its greatest problems in Europe and Japan, where reconstruction took first priority. Although the Marshall Plan was often mentioned as the inspiration for later modernization schemes, no attempts were made to duplicate its formula elsewhere. American officials felt its reliance on heavy industry, labor unions, and the welfare state could not be adapted to Asia or Latin America, where more fundamental issues—education, health, low productivity—had to be dealt with. These issues became more imperative as the Cold War intensified. Nationalist China’s sudden collapse, despite a hastily arranged aid package, revealed the dangers of failing to address the poverty and corruption that seemed to accelerate the communist advance.

President Harry Truman’s dramatic announcement in January 1949 of Point Four, a “bold new program . . . for the improvement of underdeveloped areas,” placed development at the top of the national agenda and simultaneously galvanized a worldwide movement. Like McKinley, Truman contrasted development against “the old imperialism,” but he was the first world leader
to apply the term “underdeveloped” to the sub-
jects of the modernization process. The con-
frontation between colonizer and colonized, rich
and poor, was, with one rhetorical gesture, re-
placed by a world order in which all nations
were either developed or becoming so. Point Four
affirmed the fundamental equality of nations rec-
ognized by the United Nations Charter while at
the same time licensing interventions on an
unprecedented scale.

Truman explicitly linked Point Four to
American strategic and economic objectives.
Poverty was a threat not just to the poor but to
their richer neighbors, he argued, and alleviating
misery would assure a general prosperity, lessen-
ing the chances of war. Moreover, the “triumphant
action” of development superseded the merely
ideological conflict of the Cold War. Communism
and democracy were different routes to the same
destination. Development in this sense was a hege-
monic idea, presented not as the best but as the
only possible course of action. (David Riesman
observed in 1958 that alternatives to the Western
and Soviet paths were simply unimaginable.) The
response was startling. Truman “hit the jackpot of
the world’s political emotions,” Fortune magazine
noted. National delegations lined up to receive
planning and assistance that a few years earlier
might have been seen as a colonial intrusion.

The assignment of a World Bank technical
assistance mission to Colombia in November 1949
reveals how this paradigm shift enabled an entirely
new approach to managing the internal affairs of
another country. Fifty years earlier it would have
required gunboats for European and American
creditors to seize Colombia’s customhouses, but
this delegation of European and American econom-
ists took charge of much more—foreign
exchange, finance, banking, agriculture, transport,
health, education, social welfare, and oil explo-
ation—all at the invitation of the Colombian gov-
ernment, which assured implementation of the
delegation’s detailed plans. Development justified
interventions on a grand scale and made accepting
the instructions of foreign advisers the duty of
every responsible government.

Point Four officials expected sudden, dra-
natic results from the introduction of American
advice and technology. Norris Dodd, a Point Four
agriculture adviser who later headed the UN Food
and Agriculture Organization, described the sen-
sation he created in northern Thailand by dis-
pensing a few commonsense suggestions. “If I had
been able to stay in that village another few
hours,” he believed, “we might have changed the
fundamental agricultural methods for hundreds
of miles around.” Truman claimed there were
“untold resources” in the underdeveloped regions
needing only “somebody who knows the techni-
cal approach.” He emphasized technology
because of its mystique and the absence of alter-
natives. High rates of return on domestic invest-
ment and the chronic imbalance of payments
known as the “dollar gap” made it nearly impossi-
ble to mobilize private capital for development,
but engineering talent could easily be dispatched
abroad. Point Four began by sending American
engineering firms to Iran, Indonesia, Taiwan, and
Korea, where they acted as purchasing agents,
identifying applications for American technology
and designing industrial, hydroelectric, and
chemical plants and public works.

**IMPORT SUBSTITUTION**

In these early, untheorized foreign aid projects,
American advisers worked out an impromptu
strategy that came to be called import substitu-
tion industrialization (ISI). Engineers in Taiwan,
noting that fertilizer imports consumed a large
share of the island’s scarce foreign exchange,
imported equipment to manufacture artificial fer-
tilizers domestically. They constructed hydroelec-
tric dams to fuel the plants, and one by one they
substituted domestically made articles for
imported ones, freeing more capital for industrial
expansion. In the Philippines and Turkey, U.S.
financial missions imposed tax and exchange laws
that accomplished the same result by placing bar-
riers on the importation of products that could be
made domestically. Import substitution policies
shifted imports toward capital goods, equipment,
and technologies and away from consumer goods
and commodities, and in the process they
enlarged state control over the economy. The suc-
cess of such strategies often depended on the
state’s ability to administer controls effectively
and without corruption.

Import substitution suited many new
nations’ vision of a gleaming industrial future.
Nehru famously remarked in 1954 that dams
were the temples of modern India and industry its
religion. Surveying the immense Bhakra-Nangal
canal, he observed that “when we see big works
our stature grows with them, and our minds open
out a little.” Modernity was the goal and justifica-
tion for many independence movements, and the
erection of a new steelworks or railway span hailed the arrival of full nationhood. The Olympian planning commissions that met at the Yojana Bhavan in New Delhi or at the Central Bank in Manila exercised an authority over the national economy that few colonial viceroys could equal. Import substitution policies also partially counteracted international trade patterns that kept newly independent states in the subordinate role of exporting raw materials to the industrial nations and importing finished goods.

In the early 1950s, structuralist theories located the causes of underdevelopment in lingering colonial trade patterns and recommended import substitution as a solution. Raul Prebisch, secretary-general of the UN Economic Commission for Latin America (ECLA), pointed to the deterioration of the terms of trade between the industrial and nonindustrial areas. Beginning in the 1930s, the value of commodity and raw materials exports declined steadily relative to the value of manufactured imports. Left unchecked, the “Prebisch effect” would widen the gap between rich and poor nations. Gunnar Myrdal, a Swedish economist who had worked with the Rockefeller Foundation, delivered a series of lectures in 1955 at the Egyptian Central Bank in Cairo in which he explained that market expansion would cause inequality to increase, both internationally and within nations, unless counteracted by comprehensive planning and European-style state welfare programs. In Truman’s usage, “underdevelopment” was a noun describing an age-old condition to be remedied with modern technology. Structuralists changed it into a transitive verb. Underdevelopment was a process; it was what the rich nations were doing to the poor nations.

Although the structuralist formula originated abroad, the United States endorsed the import substitution approach until the late 1950s. The State Department sympathized with nationalist ambitions short of expropriation or discrimination against U.S. investment, and preferred Prebisch’s doctrine to the “extreme” economic nationalism of Argentine president Juan Perón. American support for import substitution stemmed from concern about the overdevelopment of U.S. heavy industry as a result of wartime mobilization. Capital goods purchases by industrializing nations provided a badly needed outlet for American production and a stimulus to European recovery. Import substitution aroused considerable opposition within the United States from congressional conservatives, adversely affected industries, and the Wall Street Journal, but the economic and strategic benefits outweighed the political costs, at least until 1958. When criticism prevented the Eisenhower administration from participating directly in drafting economic plans, private companies and foundations stepped in. A U.S. engineering firm drafted Taiwan’s first four-year plan, and the Ford Foundation dispatched a team of economists to advise India’s planning commission. As the United States turned against import substitution, structuralism survived as a critique of American development policies that ignored the built-in inequities of the world system.

**DEVELOPMENT AND THE SOCIAL SCIENCES**

In few places did Truman’s bold new program generate as much excitement as in American universities, and by the end of the 1950s an enormous body of homegrown theory was poised to replace Point Four’s ad hoc strategy. For social scientists in the 1950s, the economist John Kenneth Galbraith remembers, “no economic subject more quickly captured the attention of so many as the rescue of the people of the poor countries from their poverty.” The federal government’s growing defense and intelligence establishments opened a new sphere of activity for researchers skilled in statistical and comparative methods. As prominent practitioners rotated between federal appointments, foundation boards, and faculty positions, professional codes adapted. Government collaboration, and even direction, aroused few concerns about objectivity. Faculties adopted the Area Studies organizational scheme devised by the wartime Office of Strategic Studies and took on an agenda of applied research useful to government. Much of this work focused on the “Third World,” a term coined to describe a new academic division of labor that segregated work on industrialized democracies (First World), problems of communism (Second), and the underdeveloped (Third) world.

Political as well as professional motives drew academics to the Point Four mission. The social sciences came under particularly heavy attack from McCarthyite inquisitions, as did their institutional sponsors, such as the newly capitalized Ford Foundation. A 1954 congressional investigation accused the Ford Foundation of financing
“the promotion of Socialism and collective ideas” in the United States. Development provided a safe outlet for social engineers whose New Dealism had become suspect. Sanctioned by development’s anticommunist agenda, economists, planners, and researchers could apply abroad practices they were afraid to advance at home. The United States, in effect, exported its liberalism in the form of the energy and ideas of its best social thinkers and the funds of its largest philanthropies.

Within the national security establishment social scientists enjoyed prestige of a kind accorded in a later era only to software designers. Military and intelligence officials expected modeling techniques to be able to forecast the intentions and capabilities of foreign actors with increasing reliability. Psychology offered a particularly useful set of conceptual tools for engineering bloodless revolutions. Nuclear deadlock guaranteed that the Cold War would be fought largely in the Third World through techniques of subversion, propaganda, and attraction. In this atmosphere of expectancy and risk, government agencies and private foundations enlisted researchers to learn the secrets of modernization.

Foundations, government agencies, and universities jointly created institutional arrangements for generating theories of modernization. In 1953, with Ford Foundation assistance, the Social Science Research Council created a Committee on Comparative Politics among whose members Gabriel Almond, Lucian Pye, and George Kahin would make significant contributions to the modernization canon through the publication of the “Studies in Political Development” series. At the Massachusetts Institute of Technology, a State Department–sponsored research program on psychological warfare, Project Troy, evolved into the Center for International Studies (CENIS) in 1951. Its founder was Max Millikan, an economist in the new field of national incomes accounting who had just returned to the Massachusetts Institute of Technology after a year as assistant director of the Central Intelligence Agency. Millikan recruited an interdisciplinary team that featured Paul Rosenstein-Rodan and Walt W. Rostow (economics), Edward Shils (sociology), Daniel Lerner (communications), Clifford Geertz (anthropology), and Lucian Pye and Ithiel Pool (political science). Millikan also designed a budget formula that channeled State Department money funneled through the CIA into studies on the Second World, while research on the Third World was financed by the Ford and Rockefeller foundations.

CENIS mimicked the institutional style and “problem-oriented” work habits of the Manhattan Project in its development of the atomic bomb, breaking into teams to devise specific solutions that would then be subject to general discussion and criticism by the whole group. Millikan put an emphasis on finding answers to the practical problems of policymakers, and CENIS’s work product typically appeared first as classified memoranda distributed to federal agencies and later as book-length monographs. Benjamin Higgins described it as “a community of scholars arriving at the same broad analytical framework.” Its principal achievements were the creation of a rationale for an enlarged foreign aid effort, along with a set of concepts—“technology transfer,” “takeoff,” the “expectation gap,” “self-help”—that informed aid policy and scholarship for the next two decades.

THE ROSTOVIAN REVOLUTION

If Millikan was CENIS’s organizer, Rostow was its inspiration, its “shining light,” according to Higgins. The son of Jewish immigrants from Russia, Rostow went to Yale at age sixteen, finished in three years, and went to Oxford on a Rhodes scholarship. While still in his teens he decided with characteristic prepossession to devote his life to “two large ideas: one is the application of modern economic theory and statistical analysis to economic history; and the other is the relationship between economic factors and society as a whole.” The force of his ideas was magnified by his gusto for expressing them. “Walt can write faster than I can read,” President John Kennedy quipped.

As an army captain in World War II, Rostow had participated in an operation that foreshadowed his later work in development. Along with Charles P. Kindleberger and Carl Kaysen, both of whom would also be leading figures in postwar economics, he served as a bombing targeter in the Economic Warfare Division of the London embassy. There the young economists debated how best to dismantle the German economy from the air, whether the whole system had to be taken down together or if there might be specific points—a ball bearing factory or a refinery—that could be removed, bringing the entire war machine to a halt. “We sought target systems where the destruction of the minimum number of targets would have the greatest, most prompt, and most long-lasting direct military effect,” Rostow
later remembered. In the run-up to the Normandy invasion, the targeters oscillated—just as development theorists later would—between a “systems” approach and a “bottleneck” approach, with Rostow on the systems side arguing for a comprehensive attack on German oil refineries and bridges. He lost the argument when General Dwight D. Eisenhower opted to hit the railroad marshaling yards in northern France. CENIS gave him a chance to prove his original judgment. Development was simply the opposite of bombardment, involving dropping in ingredients that would produce the quickest and longest-lasting economic (and political) gains.

Through CENIS, Rostow forged a consensus behind a developmental strategy known as the Big Push, “a development effort on all fronts,” according to Higgins, “on a scale large enough to bring increases in productivity that would outrun population growth and promote structural change.” Instead of targeting the industrial sector as import substitution did, large amounts of aid should go into “social overhead capital” such as education, administration, transport, and law. Properly timed, aid could generate a systemwide disruption that would shake a society from its traditional torpor and lift it into the modern age. The Big Push, sometimes called “balanced” development, was also a critique of President Eisenhower’s aid programs, which were regarded as piecemeal efforts aimed at frontline states and with political strings attached. Development had to be an unconditional, massive, sustained effort, conveying the message, Rostow argued, “that we are in Asia to stay, not merely in a military sense, but politically and economically as well.”

In memoranda and articles during the 1950s and in two seminal books, The Process of Economic Growth (1952) and The Stages of Economic Growth (1960), Rostow elaborated a vision of development rooted in American history and national interest. Updating Comte’s formula, he observed that each society passes through five identifiable stages. In the opening phase, tradition, society’s tranquil rhythms are regulated by the harvest and disturbed only by natural calamity. As pre-Newtonian attitudes give way to a scientific understanding of the natural world, societies enter a stage of accumulation. The fund of social overhead capital grows unevenly. Social investments are “lumpy,” he argued, and private investors are unwilling to tolerate the high initial costs, long gestation periods, and indirect returns. The state, therefore, has the primary role in nurturing social capital, as state and local governments did in the United States between 1815 and 1840.

As obstacles to growth are cleared and modern habits and attitudes gain momentum, the society reaches a stage Rostow memorably named “takeoff.” “During the takeoff,” he wrote in Stages, “new industries expand rapidly, yielding profits a large proportion of which are reinvested in new plant. . . . The new class of entrepreneurs expands; and it directs the enlarging flows of investment.” Modernization planes along the lumpy surface of social overhead capital, bearing itself aloft on the force of its own acceleration. Rostow’s aeronautical image highlighted not only his sense of the sharpness of the transition, a change in both the kind and direction of growth, but the dangers of this stage, for it is at the moment of takeoff that crosswinds, mechanical flaws, or pilot error are most likely to prove fatal. Takeoff, for Rostow, was a period of cultural, technological, and political upheaval, and its forward trajectory could either continue toward maturity (the fourth stage) or suffer a violent interruption or diversion onto a dysfunctional nationalist or communist route to modernity.

By measuring the ratio of investment to national income, Rostow could calculate when a nation would reach takeoff and how much aid it could usefully absorb. Within a few years the National Security Council used “absorptive capacity” as its principle criterion for aid. The United States passed into takeoff just prior to the Civil War, and it appeared to Rostow in the 1950s that both India and the People’s Republic of China were entering this stage. He anticipated that the contest between the two nations, “the one under Communism, the one under democratic rule—would constitute a kind of pure ideological test of great significance” for the United States and the world. Rostow’s theory redefined the Cold War as a contest fought on the terrain of development, and he advanced a number of arguments for a stronger American effort. By easing the transition to modernity, he told CIA director Allen Dulles, the United States could steal a march on history by creating an “environment in which societies which directly or indirectly menace ours will not evolve.” Failing to do so would concede “to Moscow and Peking the dangerous mystique that only Communism can transform underdeveloped societies.” The cost would also be limited. By targeting nations just reaching takeoff, the United States could exercise a decisive influence without incurring an indefinite obligation.
The United States own level of development provided another imperative for action. Rostow concluded that the United States had reached the terminal stage of the modernization process, the stage of high mass consumption, but its position there was insecure. High population growth, a deficit of social overhead capital, and the cost of the arms race created drags that might cause it to lose altitude. A steady flow of raw materials was essential. Preserving the U.S. fragile forward momentum required expanding world trade and energizing external markets for U.S. products. Rostow warned policymakers not to draw a false dichotomy between humanitarianism and selfishness. In development, the national interest and the interest of mankind were inseparable.

Rostow assigned an important role to soldiers during the transitional period. Assembling the preconditions for takeoff, he believed, required the efforts of an elite coalition of landowners, merchants, and politicians who favored centralization and were “prepared to deal with the enemies of this objective.” Military men were the natural leaders of this movement, and throughout his career Rostow argued that military regimes could supply the stability and administrative competence needed for development. The Mann Doctrine of 1964, which made stability rather than democracy the prime goal of U.S. policy in Latin America during the Johnson administration, would later echo Rostow’s reasoning.

Extending the stages-of-growth framework to the Soviet Union, Rostow refuted assumptions that Soviet development presented an alternative to the model of the capitalist West. By his reckoning, Stalin’s forced modernization resembled the path taken by the United States some thirty years earlier; the principal difference was in its “abnormal” emphasis on the military and industrial sectors. To Rostow, communism was not the agent of modernization but a side effect of it. It was a “disease of the transitional process” likely to spread in any nation during the early, difficult stages of development. Instead of accelerating growth, it disfigured it, producing an unbalanced and dysfunctional modernity. Rostow’s avowed aim was to supplant Marx as the inspiration for revolutionary intellectuals (the subtitle of Stages is A Non-Communist Manifesto), and he presented his doctrine as a universal theory of history.

Rostow’s syntheses standardized the vocabulary used by the CENIS and Social Science Research Council groups, and the theories they produced are appropriately referred to as “Rostovian,” although other members contributed significant innovations. Lucian Pye placed newly independent regimes on the psychoanalyst’s couch and interpreted Southeast Asian communism in light of Erik Erikson’s concept of “identity crisis.” Both nationalist leaders and their constituents suffered from incoherent, immature identities that made them resentful of their modernized elders. Because “individuals can become reasonably acculturated far faster than societies can be reconstructed,” modernizing societies underwent a “revolution of rising expectations,” allowing communists to recruit impatient young men. The psychoanalytic perspective, Nils Gilman has pointed out, “positioned the social scientist as a dispassionate physician, lording his wisdom over a post-colonial nation bereft of legitimate subjectivity.” CENIS and Social Science Research Council studies borrowed across disciplinary lines in ways that disregarded the objectivity standards of any single discipline. The medley of terminologies threw a protective screen around political or cultural presuppositions and tendentious reasoning.

The format of CENIS dialogue encouraged participants to theorize from an interlocking set of reified concepts. Much like the Marxist doctrine it responded to, Rostovian theory achieved its plausibility and explanatory power from the tight fit between its conceptual parts, rather than from the correspondence between any of the parts and the actual conditions they were meant to describe. David Lerner’s pithy Passing of Traditional Society reveals the appeal and versatility of the CENIS schema. Lerner framed his study in a parable of modernization in the Turkish village of Balgat, where in 1950 a U.S. Information Agency interviewer recorded the opinions of several hundred villagers. Of these, three stood out: the village chief, a grocer, and a shepherd. The very act of soliciting opinions disturbed the chief and the shepherd, who balked at stating their views of distant leaders and nations. The grocer, on the other hand, was brimming with opinions, particularly regarding other people’s business. Moreover, the interviewer learned that villagers sought out the grocer’s opinions on such issues as what movies to watch when they visited Ankara. The chief and the shepherd, at opposite ends of the social spectrum, were pious, contented, and cautious; the grocer, a marginal figure, was skeptical, self-conscious, and with an eye for the main chance.

Lerner’s theme is the psychology of the “transitional personality,” the grocers whose restlessness would unsettle established orders and
lifeways, hastening the advent of modernity. When Lerner first visited Balgat in 1954 he found the village transformed. A new road and bus line, as well as municipal water and electricity, made it a suburb of the capital. The shepherd and his sheep had moved on, the chief’s sons were now grocers, and the original grocer was dead but remembered as a prophet. For Lerner, the human instrument of modernization was the “mobile personality,” the individual with a capacity to envision himself in another’s place, a place better than his own. “Empathy,” as Lerner called this quality, stirred people from traditional apathy, leading them to question old ways and hierarchies and making them full participants in the economic and political life of the new nation. Lerner’s theory later provided a conceptual foundation for the strategic hamlet program and the forced depopulation of the Vietnamese countryside as a counterinsurgency measure. Pacification specialists expected relocation to generate mobile personalities among the refugees, stimulating them to discard village loyalties in favor of participation in national life.

With interviews and charts, Lerner established a relationship between the spread of mass media and the proliferation of the mobile psyche, but his empirical observations actually contradicted the implied link between psychology and material improvement. Lerner noted that neither the grocer nor anyone in Balgat had a hand in decisions about the bus service, water lines, or electricity. Balgatis ratified the changes by voting for the new ruling party and by preserving social hierarchies within the village and between the village and the center of power. Modernization came without help or hindrance from mobile personalities. Such discrepancies, however, did not disturb the model or its conclusions, which concern correlations among abstract variables (mass media, participation, satisfaction). The Rostovian approach answered structuralism by making structural inequities into one variable among many and eliding questions of causation and proportion. The result was a uniquely resilient theory, capable of absorbing and explaining away nearly any failure or challenge. Even nation building in Vietnam, Rostow later wrote, was a developmental triumph marred by “a difficult war.”

Rostovian doctrine drew fire within social science disciplines (Stages got hammered by reviewers in economics journals) and from some generalists and policymakers who saw political agendas beneath the elaborate taxonomies. Ambassador to India John Kenneth Galbraith noted that claims of aid’s ability to induce takeoff were “convenient” considering that “once we admit that it is not the case, we become trapped in a series of previously complex problems.” Louis Halle, a former State Department planner, found Stages to be “one long boast” about an idealized America leading the world into the future. It also evoked a suspiciously tidy vision of history: “this great, multifarious, fluid, and largely unknown world of ours is conceived as a child’s plaything made up of a very few building blocks, all square and solid.”

The CENIS framework gained the status of an orthodoxy almost overnight, an achievement that can be attributed to factors other than its strengths as theory. First, it furnished academic analysts and policymakers with a common language and a set of criteria for evaluating foreign aid as something other than a bribe offered in exchange for cooperation with U.S. policies. Second, it was a culmination of the social scientific enterprise initiated by Mill and Comte. While academics were eager to point out its imperfections, they were reluctant to question its perfectibility, because to do so was to challenge fundamental parts of the social scientific method (the comparability of societies, the application of reason to social change, the nature of progress). Finally, Rostovian theory resonated with American myths of national mission. It gave the United States the power and privilege of stepping in at the decisive moment in each nation’s history to dispense the vital ingredients of progress. By touching societies that mirrored its own past, the United States could rescue itself from the decay and boredom of mass-consumption society. Two slogans Rostow contributed to the Kennedy campaign—the New Frontier and Let’s Get America Moving Again—carried this message of regeneration. Development, in this formulation, was able for the first time to capture the popular imagination.

THE DEVELOPMENT DECADE

The new science of modernization arrived in Washington’s hour of need. Following Stalin’s death in 1953, Soviet leaders eagerly pursued diplomatic overtures toward uncommitted nations. Premier Nikita Khrushchev theorized a division of the world between a “zone of war,” comprising the industrialized states, and a “zone of peace,” the principle arena of Cold War compe-
tion. In December 1955 he captured the international spotlight with a bold tour of Afghanistan, India, and Burma, the first visit by a Soviet leader outside of the communist bloc. In Calcutta the Soviets were greeted by a throng of more than two million. Along the way he offered trade and aid, and India accepted Soviet assistance in the construction of the Bhilai steel works, its flagship development project. The Soviet move stunned the Eisenhower administration, which concluded that Soviet aid would create bandwagon effects that would draw the rest of Eurasia into the communist orbit. Having made “neutralism” a dirty word, John Foster Dulles was chagrined at the resistance in Congress to any American-aid counteroffensive directed at nonaligned nations. To its growing alarm, the administration found itself faced with a new danger against which it was powerless to act.

The deadlock was broken in 1958 with the appearance of The Ugly American, a book that has been described as the Uncle Tom’s Cabin of the Cold War. It was the work of William Lederer, a publicist working for the U.S. Navy and the CIA, and Eugene Burdick, a University of California political scientist. At Lederer’s home in Honolulu in 1957, the two men decided that a novel was the best device for warning the American people that the Soviets were gaining an upper hand in the poor countries of Asia. The narrative is a collection of vignettes set in a fictional Southeast Asian nation where communist economic and political offensives are winning the allegiance of a disgruntled peasantry. Sophisticated Americans, diplomats with Boston accents and courtly manners, are pouring U.S. aid into dams, roads, and colossal engineering projects that alienate the local populace. Meanwhile, the ugly American, Homer Atkins, an agricultural adviser and the hero of the story, is making a genuine connection. The simple presence of Homer and his wife, two mobile psyches, in an Asian village creates a productive stir. Women come to marvel at the tidy home kept by Mrs. Atkins, and men watch as Homer applies his instrumental view of nature to ancient problems. Homer soon finds a counterpart, Jeepo, an empathetic, mechanically minded native, and the pair harness a bicycle to a pump, creating an irrigation-driven economic takeoff. Atkins offered readers a counterpart to Pyle, the guileless title character of Graham Greene’s The Quiet American, who was “like a dumb leper who has lost his bell, wandering the world, meaning no harm.” Lederer and Burdick reassured readers that “average Americans, in their natural state . . . are the best ambassadors a country can have.” The Ugly American bitingly attacked the administration’s inaction and import substitution—style development aid, but its real achievement was to enfold Rostovian theory in myths of national identity and innocence.

Defying expectations that it would drop into an ocean of public indifference, The Ugly American remained on the New York Times best-seller list for seventy-eight weeks, sold an astonishing four million copies, and was made into a blockbuster movie starring Marlon Brando. The ensuing media frenzy put development on a par with the space race and created a new strand of populist internationalism that Senator John F. Kennedy seized to boost his presidential bid. Kennedy sponsored legislation to increase aid to India and announced the existence of an “economic gap” in Asia that was being filled by Soviet aid. In February 1938, Kennedy first met Rostow, and the modernization theorist moved into Kennedy’s inner circle of advisers. Kennedy was drawn to the diagnostic precision of the CENIS model, and he adopted its language in his own critiques of foreign aid. The alliance of Rostovian theory and Kennedy-Johnson foreign policy ushered in the golden age of modernization theory in the 1960s. George Ball, undersecretary of state from 1961 to 1966, recalled in his memoirs the vogue for development economics in 1961 and “the professors swarming into Washington” who “talked tendentiously of ‘self-sustaining growth,’ ‘social development,’ the ‘search for nationhood,’ ‘self-help,’ and ‘nation building.’”

In the first year of his presidency, Kennedy launched the Alliance for Progress, the Peace Corps, Food for Peace, and the Agency for International Development (AID). He declared the 1960s the “Development Decade” and substantially increased the budget for foreign assistance. Modernization theory supplied the design, rationale, and justification for these programs. Stages had called for an expanded foreign aid effort organized exclusively around the development mission. Rostow implied and Kennedy had declared during the campaign that State Department bureaucrats used aid for short-run diplomatic advantage, making the separation of the Agency for International Development from State an essential first step. Likewise, Food for Peace took established agricultural surplus disposal programs and organized them around a development mission. Rather than dumping the excess produced by federal price supports (or using the
surplus to alleviate famine), the program’s primary purpose was the generation of “counterpart” funds that could be steered into social overhead investment. At the administration’s urging, the United Nations put food assistance on the same basis in its World Food Programme.

The Peace Corps institutionalized a belief (traceable through The Ugly American to Lerner and Redfield) that exposure to modern personali- ties could induce change. Kennedy announced the Peace Corps during the campaign and asked Rostow and Millikan to draft the proposal. Volunteers were expected to create a catalytic effect by introducing ideas from a higher point on the developmental arc. The Peace Corps sought not specialists but “representative Americans” who could transmit values by example. Theory informed expectations of what volunteers should achieve. Performing their assigned jobs as teachers or agronomists was considered secondary to the task of catalyzing community involvement in a spontaneous project. Many volunteers experienced at first hand the chasm between the theory and reality of development.

The most ambitious of Kennedy’s development schemes, the Alliance for Progress, was planned along rigidly Rostovian lines. In anticipation of imminent takeoff in the Latin American countries, the Alliance for Progress called for a Big Push to raise investment rates, foster social capital, and induce thorough reforms in institutions, land tenure, and distribution of income. Once plans and institutions were in place, the alliance would ride a wave of rising expectations into the next stage of growth in which the Americas would be safe from the temptations of the Cuban model. Rostow predicted a transition to self-sustaining growth within the decade, allowing the administration to keep the problem of underdevelopment “off our necks as we try to clean up the spots of bad trouble.” The anticipated follow-on effects, however, failed to materialize, and $20 billion in aid disappeared into the continent without leaving a noticeable accumulation of social capital. After the first year, growth rates were far below the ambitious target figures, and the press and Congress grew impatient with the alliance. As Michael Latham points out, Rostovian theory was never held to account for the alliance’s failures. Instead, setbacks only reinforced the validity of concepts that provided explanations and remedies for failure. Theorists chalked up the alliance’s problems to bureaucratic ineptitude, personnel problems, and stubbornly antimodern Latin leaders who refused to carry forward the reforms. Since the theory was rooted in the historical experience of the industrial core, it could not be invalidated by contradictory experience in periphery nations. Modernization funneled dissent into its own framework, where it could challenge the execution but not the conception of the plan.

Throughout the 1950s and 1960s, academic theorists continued to dispute within the overall consensus a number of issues that affected policy design. The balanced or Big Push approach saddled government with an almost unreachable standard for effective policy and encouraged a revived effort to identify “bottlenecks” that could be removed to stimulate disproportionate returns. Albert O. Hirschman reconfigured this debate with a theory that gained popularity after 1964 as the Johnson administration faced tighter budgets. In The Strategy of Economic Development (1958), Hirschman explained that small inputs, “induce- ment mechanisms,” could push one sector into the lead, forcing others to catch up. Rather than using aid to advance an economy to a new equi- librium, as in classic Rostovian theory, aid programs should try to create disequilibria that, like loose electrons in an atomic pile, would trigger chain reactions. The difference between the two approaches can be seen in the Ford Foundation’s efforts to reform agriculture in India. In the 1950s and early 1960s, the foundation sponsored a “package program” to improve conditions in fifteen rural districts on a broad front, including advances in education, health, farm equipment, irrigation, and crop diversification. Disappointed with the results, the foundation shifted in the mid-1960s to a strategy built around development and dissemination of dwarf wheat and rice varieties (the inducement mechanism). Since the new plant strains required chemical fertilizer, irrigation, and modern transport and distribution networks, other sectors would be pulled along by success, stimulating a “green revolution.”

Another controversy concerned whether there was a single route to modernity and whether the experiences of Europe and the United States, the “first movers,” represented the best model. Alexander Gerschenkron, William Lockwood, Clark Kerr, and others argued that the require- ments of “late” developers differed and that cul- tural proclivities, particularly an authoritarian tradition, might dictate alternative paths. At the height of his influence, Rostow felt he was fight- ing a rearguard battle against those who esteemed
China's Great Leap Forward. But the "developmental state" school, while persistent, lacked policy clout until the 1980s, when the manifest success of Japan, South Korea, and Taiwan (and the clear disparity between their strategies and development orthodoxy) led the World Bank to endorse an alternate "export-led" growth model.

Population was a third contested area. In both classical and Keynesian theory, a growing population accelerates economic development. Adam Smith noted that it was the industrious poor who "generally bring up the most numerous families, and who principally supply the demand for useful labor," and John Maynard Keynes attributed the Great Depression of the 1930s partly to a catastrophic decline in births. This view prevailed among economists through the 1950s in no small part because of the coincidence of the baby boom and high growth rates in the United States. But a dissenting view articulated by John D. Rockefeller III and the Population Council gained influence toward the end of the decade. In 1958 a presidential review of foreign aid led by Theodore Draper concluded that rapid population growth threatened to cancel the effects of any aid infusions. Rostow argued in Stages that population posed a serious but not insurmountable obstacle to takeoff. Kennedy made population control part of the Agency for International Development's mission, and Lyndon Johnson intensified the emphasis, eventually making aid contingent on action to reduce fertility. In the 1970s both theory and policy swung back from that extreme position as a number of studies connected population increases with expansions in consumption and accumulation of social capital. By the 1980s, economic opinion was mixed, and the Reagan administration had repositioned population control as a moral issue.

The Vietnam War afforded rich opportunities for the application of theory, and association with the pacification effort accelerated the splintering of the Rostovian consensus. Pacification proceeded under a succession of "modernization buzzwords"—"rural construction," "revolutionary development," "civic action," "three-machine revolution," "Operation Takeoff"—and repeated failures sapped the enthusiasm of the modernizers. After Saigon and the modernizing regime of the shah of Iran fell in rapid succession, policymakers ceased to regard development as a counterinsurgency weapon. It had once been believed, according to Henry Kissinger, "that there was a sort of automatic stabilizing factor in economic development. That has turned out to be clearly wrong." But events in the industrialized world had already undermined the modernization paradigm. The rising tempo of urban riots following the Watts uprising in Los Angeles in the summer of 1965 disturbed the idealized image of the United States as the end point in the developmental process. In 1967 ghettos in forty cities erupted. The Eighty-second Airborne had to be diverted from deployment to Vietnam to quell violence in Detroit. As the riots called American economic and political maturity into question, the belt of smog settling over the eastern seaboard and Los Angeles aroused fears that the United States had become dangerously overdeveloped. A growing environmental movement questioned the desirability of economic growth. Meanwhile, the student movement opened an attack on the "action intellectuals" whose theories sustained the Vietnam War.

Rostovian theory also came under intellectual attack from abroad. In 1968 the French sociologist Claude Lévi-Strauss was in Vogue, as well as on the pages of the New Yorker and New York Times, proclaiming that there were no superior and no inferior societies, and that supposedly apathetic primitives "possess a genius for invention or action that leaves the achievements of civilized people far behind." In an NBC television interview, the newscaster Edwin Newman pressed J. George Harrar, president of the Rockefeller Foundation, on whether "the Western nations, the richer nations" should impose their standards on the poorer countries if "we are simply presenting them with a different set of problems." Harrar replied that he could offer no justification for modernization "in terms of what we have done to ourselves" but that he was "afraid" that there was no turning back. This standoff characterizes discussions of modernization in the post-Rostovian age. In the early 1970s, social scientists on the left and the right toppled premises and tautologies at the heart of the theory, leaving an unsupported shelf of prescriptions that policymakers continued to use. The academic study of development migrated outward from the pure social science disciplines to schools and institutes of applied policy studies. Policymaking bodies no longer relied on universities but on in-house experts and
think tanks to supply justifications and strategies for the use of aid.

The trauma of the 1960s split the discourse of modernization into two conversations, one academic, the other oriented toward policy. Occasionally, sounds from one conversation reached the other, but so indistinctly as to distort their meaning. "Civil society" became a fashionable term in both academic and policy circles in the 1990s, but while social scientists described it as a set of rituals for identifying and mobilizing the public, policymakers referred to support for non-governmental organizations (NGOs) and religious and private institutions. More often, the two conversations were simply separate. Within the university, Rostovian theory was replaced by a new structuralism in the form of dependency theory. In the 1960s, Latin American scholars had deepened and widened Prebisch's critique of the "unequal exchange" between North and South. Whereas Prebisch, Myrdal, and other early structuralists saw meliorist solutions within capitalism (redistribution, planning, and import substitution), dependentistas identified the instigators of those solutions, the state and the national bourgeoisie, as the core of the problem. Drawing on the Marxist tradition in Latin American thought, they argued that economic dependency created class alliances between elites at the center and the periphery, reproducing culture, social relations, and systems of exchange under the guise of development. The only way out of dependency was a mass movement of "popular forces" that would rupture connections to multinational corporations and international exchange and organize a socialist future.

Dependency theory reversed the optics of Rostovian theory, viewing development inward from the periphery rather than outward from the core. It adopted, with modifications, the reified concepts used by Marx and development economics, but it focused on the processes of underdevelopment rather than the dynamics of development. It recognized, as Rostovian theory did not, that local conditions are influenced primarily by a nation's subordinate position in the global economic hierarchy. To American scholars it offered the familiar typologies and analytic power of Rostovian theory but with a very different set of values. American consumers of dependency enlisted on the side of the Latin American popular forces. The principal texts, Andre Gunder Frank's *Capitalism and Underdevelopment in Latin America* (1967) and Fernando Cardoso and Enzo Faletto's *Dependencia y Desarrollo en América Latina* (1969), dominated the teaching and study of underdevelopment (especially of Latin America) at American universities in the 1970s and 1980s. Its influence extended to the history of U.S. foreign relations, both in its original form and as world systems theory, which has been described as dependency without the nation.

As an orthodoxy, dependency theory was open to attack, and in the 1980s and early 1990s scholars took it to task for reproducing many of the illusions of development theory. Socialist regimes displayed many of the patterns of cultural reproduction, class relations, and distorted development that dependentistas ascribed to capitalist nations. The hope that isolation and socialism would open a "way out" of dependency (the Myanmar model?) dimmed as scholars recognized the irresistible spread of global networks of culture and influence. The apparent movement of Japan, Taiwan, and South Korea from semiperiphery to core within a capitalist framework forced modifications in dependency theory, while some of the leading theorists (Cardoso became president of Brazil on a neo-liberal platform) abandoned the approach altogether. Finally, new approaches—postcolonial and subaltern studies and postmodernism—moved the study of power relations in Asia, Africa, and Latin America toward issues of culture and knowledge-creation and away from economic development. The newer approaches appealed to a narrower, almost exclusively academic audience. By the 1990s, social scientists had completed their withdrawal from the heights of influence over policy and public opinion they had occupied in the early 1960s.

Within the Agency for International Development, the World Bank, and UN agencies, development doctrine continued to evolve in response to institutional constraints and political currents in the developed world. In 1968, under a new president, former Secretary of Defense Robert S. McNamara, the World Bank "discovered" poverty much as the Johnson administration had four years earlier. Declaring poverty a security threat to the rich nations, McNamara targeted enlarged aid funds at poverty within countries, encouraging programs that ignored issues of national investment and growth. Breaking the customary link between development and the nation that had prevailed since List, he freed the World Bank of concerns about absorptive capacity and state planning and enlarged its mandate. It invested
heavily in the green revolution, already under way in South and Southeast Asia, which promised (convincingly at the time) to eliminate hunger and alleviate rural poverty.

Development agencies were increasingly sensitive to concerns raised by the new environmental movement. Rachel Carson's *Silent Spring* (1962), Paul Ehrlich's *The Population Bomb* (1968), and Donella Meadows's *The Limits to Growth* (1972) grimly predicted that slow poisoning lay along the path of accelerating industrial growth and the chemical-dependent agriculture of the green revolution. E. F. Schumacher, a British economist and author of *Small Is Beautiful* (1973), another bible of the ecology movement, encouraged an "economics of permanence" that recognized that "there cannot be unlimited, generalized growth" on a planet with limited capacity. By questioning the very possibility of progress, environmentalism undercut the rationale and methods of development. In 1983 the United Nations assigned a commission on environment and development under Norwegian Prime Minister Gro Harlem Brundtland to reconcile the objectives of environmental health and economic growth. The Brundtland Report, issued in April 1987, popularized the term "sustainable development" to describe a strategy based on careful husbanding of resources, population control, and reduction of toxic wastes. Sustainable development (ecotourism, microenterprise, rain-fed agriculture) opened space for the collaboration of environmentalists and development experts. With some effort, dissent was once again funneled into the framework.

At the policy level, development doctrine continued to accept an idealized vision of the North Atlantic nations as normative, allowing theory to adapt to the political and economic sea change of the 1970s and 1980s. Reagan administration reforms supplanted the New Deal model, and when the collapse of the Soviet bloc opened a vast new field for development experts, they applied a set of prescriptions almost the reverse of the Rostovian formula. "Structural adjustment" called for the withdrawal of the state from the economy: privatization, the lifting of import and exchange controls, the "importation" of legal codes and standards, and the subjection of all sectors to "market discipline." Jeffrey Sachs of Harvard's Kennedy School of Government urged the Russian government to step aside and allow universal rules of the market to surface. Boris Yeltsin's administration in Russia issued vouchers giving the public a share in worthless state enterprises, while profitable natural resource monopolies were quietly grabbed up by party officials. With a seat in the legislature an "entrepreneur" could amass a fortune in windfalls from privatization and development aid. When the market failed to impose discipline, the Yeltsin administration followed a U.S.-prescribed course of "shock therapy," putting the ruble into free fall against the dollar and wiping out the savings of millions. As evidenced by poverty and suicide rates, Russia's barter economy ("Zaire with permafrost," according to one journalist) was in worse shape ten years after the Soviet breakup than it was under communism.

As ever, development doctrine dispensed advice but not apologies. Sachs admitted that he felt like a surgeon who had cut open a patient to find that nothing was where it was supposed to be, but apparently this was the patient's fault. Development experts accused a lingering "peasant" mentality and Russia's stubborn bureaucracy of undermining a theoretically sound plan. Structural adjustment schemes supported by the Clinton administration opened stock markets in Southeast Asian economies that until the early 1990s were clocking respectable growth figures. Portfolio investments poured in, inflating bubble economies in real estate and construction, then poured out, leaving a sticky residue of debt and unemployment. In a number of nations—Indonesia, Democratic Republic of Congo (Zaire), Sierra Leone, Mexico—the decline of state control, followed by collapse of the market, created criminalized or "narco-economies." In 2001, President George W. Bush added minor modifications to the structural adjustment formula, advocating more grants for education and health initiatives to allow poor nations to increase productivity and pull themselves out of debt. This was thought to represent a small step forward even if the links between education and productivity, and productivity and debt reduction, remained unproven.

Historians are of two minds on the legacy of modernization theory. On the one hand, it has mobilized humanitarianism on a global scale and given the poor an entitlement to progress. On the other, it has licensed self-interested and sometimes brutal forms of intervention while peddling illusions as scientific certainties. Development aid has become a fixture in international relations. Nations and international agencies will continue to use it and to need principles and standards to guide its use and measure its effectiveness. A care-
ful study of past theories and the practices they inspired may enable them to approach these problems with self-awareness and a healthy skepticism.

One of the most persistent and difficult problems that has faced the makers of American foreign policy, particularly in the twentieth century, has been the conflict between the desire to encourage democracy abroad and the need to protect perceived American interests around the world. Since its founding, the United States has been philosophically dedicated to supporting democracies and human rights abroad. This commitment is found in the most important documents and treaties of the nation, including the Declaration of Independence, the Constitution, and the United Nations Universal Declaration of Human Rights, and has been proclaimed by presidents and secretaries of state since George Washington and Thomas Jefferson. In addition, from its inception, the United States has been an expansive nation territorially, economically, and culturally. As a result, the American desire to promote democracy abroad has often conflicted with the support of dictatorships that promised stability, protected American trade and investments, and aligned themselves with Washington against enemies of the United States. American foreign policymakers have often supported right-wing dictatorships in their efforts to protect what they see as the national interest while opposing communist regimes and left-wing dictators. Dictatorships on the left have been seen as opposing both American political ideals and material interests. They have been, therefore, consistently criticized and opposed by the United States.

THE NINETEENTH CENTURY
In order to understand American attitudes toward dictatorships, it is essential to survey the development of the ideology of American foreign policy during the nineteenth century. The desire for land and greater economic opportunity, combined with the commonly held view that the nation and its people were on a special mission, fueled the expansion of the United States. Territorial expansion was rapid, with the country growing from thirteen states on the Atlantic coast in 1789 to control over transcontinental North America by the end of the 1840s. The key was that this conquest was all done in the name of expanding liberty, as part of the mission of the United States to provide a moral example and guidance to the world. Expansion, therefore, was part of American political ideology from the outset. When establishing the Republic and the Constitution, one of the central questions the Founders grappled with was whether a vast territory could be compatible with a virtuous republic. Rome served as the most often-used historical precedent, and its lesson was that a republic could not expand and avoid the corruption and dictatorial power that emerged under Julius Caesar. It was generally believed that republics could only function and survive if they were the size of Greek city-states or Geneva. James Madison addressed this problem in Federalist No. 10 and provided an alternative view that solved the dilemma between expansion and a republic for the Federalists. Madison argued that expansion was a positive good for the nation and the ideology of republican values. With the proper constitution and checks on power, a large republic was not merely possible; it was necessary to maintain freedom. An expanding nation provided insurance against any faction, cabal, or region dominating national politics and seizing power. Institutional checks and balances were, therefore, aided by size. A large republic would guard against tyranny by making it impossible for a coherent majority or sizable minority to form and gain control.

The belief in an Empire of Liberty and vision of national greatness was captured well on the Great Seal of the United States with the inscription annuit coeptis; novus ordo seclorum (God has blessed this undertaking; a new order of the ages).
Throughout the nineteenth century this continued to inspire and guide Americans’ actions and helped fuel the rapid expansion across the continent that John O’Sullivan termed “manifest destiny” in 1845. The notion of manifest destiny rested on the view that Anglo-Saxons had a right to land because they, according to Senator Thomas Hart Benton of Missouri, one of the most articulate exponents of manifest destiny, used it according to the intentions of the creator. By this reasoning, the material gains of the United States were not selfish acts, but benevolent undertakings in line with the principles of the nation. Manifest destiny became the ideological shield used to justify Indian removal and the taking of land from Mexico in the name of liberty and freedom. Nineteenth-century Americans did not see their actions as doing violence to their own moral instincts, religion, or republican and democratic values. With the belief that God willed that the United States control the continent, these actions could be carried forward without creating an ideological crisis.

The full expression of the compatibility of expansion and liberty came in Frederick Jackson Turner’s 1893 “frontier thesis.” Turner, speaking at the Columbian Exposition in Chicago, set out to provide an understanding of American history and development in the first century since the adoption of the Constitution. Central to Turner’s thesis was the idea that westward expansion and the frontier experience were the key influences on American life and the development of American democracy, and it was this that made U.S. history and the American people unique. The United States was seen as an exceptional nation, free from the vices of Europe and its corrupt institutions. He argued, “Up to our own day, American history has been in a large degree the history of the colonization of the Great West. The existence of an area of free land, its continuous recession, and the advance of American settlement westward, explain American development.” The frontier created and recreated an independent people and formed and regenerated American democratic government and values.

Yet, from the outset, challenges would appear in the world that created a paradox around the expansion of liberty and the support of democracy and human rights. The first of these was the French Revolution in 1789. Initially, it was welcomed by most Americans as a repeat of the American Revolution. The French appeared to be following the American example and the overthrow of their monarchy was seen as a harbinger of change from autocratic rule to a republican and a democratic future guided by the same enlightenment values that inspired the Declaration of Independence and the U.S. Constitution. As the events in Paris took a more radical course and the impact of the revolution brought international conflict, however, the Washington administration became divided over whether to support France or not. The ensuing disorder and wars in Europe harmed American trade and raised questions about the proper extent of change and democratic rule for other people. The question of supporting and promoting change and democratic values had quickly proven to be a complex and difficult proposition.

The revolutions that swept South America and then Central America in the first decades of the nineteenth century further complicated the question of how to respond to the collapse of colonial empire and the rule of monarchs. As with France, most Americans initially welcomed the fall of Spanish rule to the south, but concerns were quickly raised about the stability of the new nations and the danger of other European powers taking advantage of the upheaval to impose their own rule in the former Spanish empire. The United States responded to these threats with the Monroe Doctrine that declared that Spain could not reimpose its rule on the already independent states of the Western Hemisphere and that the United States would not permit any new colonization or military intervention by any European power. In turn, the United States promised not to meddle in European politics. Thus, the United States asserted its authority to determine the political future and course of events for the rest of the nations of the Americas. These developments prompted Secretary of State John Quincy Adams to issue a warning to his fellow citizens concerning the dangers of foreign intervention and the tension between expansion and democratic rule. Adams argued that the United States should not go abroad in search of monsters to destroy. Rather, the nation was better served in international affairs by upholding its own values and leading by example. It could seek to impose its will on other areas of the world, but in the process it would damage its own institutions and succumb to corruption.

By the middle of the century, a clear policy had emerged in Washington that the United States would recognize any government that could maintain itself in power and meet the minimum obliga-
tions of government. In 1848, Secretary of State James Buchanan, summarizing this policy, stated: “We do not go behind the existing government to involve ourselves in the question of legitimacy. It is sufficient for us to know that a government exists, capable of maintaining itself; and then its recognition on our part inevitably follows.”

Simultaneously, however, Americans developed other positions that would come to shape the nation’s attitudes toward dictatorships in the twentieth century. Central to these were the notions of the racial inferiority of other peoples, the desire for stability and order in the world as necessary for the promotion and protection of American economic interests, and a growing fear of revolution. The concept of race has been an all-pervasive one in American history from the first contact with Native Americans and the importation of Africans as slaves. By the nineteenth century, an essentialist outlook dominated white Americans’ thinking on race. Different people were placed in categories based on what were believed to be their inherent traits as peoples, groups, and nations. Anglo-Saxons were considered the most advanced race, carrying civilization wherever they went.

Groups were ranked in descending order of civilization and ability to govern and maintain stability. Other western Europeans were seen as near equals to Anglo-Saxons. The rest of the peoples of the world were categorized as either inherently dangerous or unfit for self-rule, and usually both. Latin Europeans and Slavs were seen as fundamentally undemocratic as people, and all non-Europeans were seen as inferior and in need of guidance and direction from “their betters.” These views were buttressed by the development of the “scientific” idea of social Darwinism that held that the domination of western Europe and the United States over world affairs as well as their greater wealth were merely the working out of natural selection and the survival of the fittest.

These ideas were consolidated at the beginning of the twentieth century in the Roosevelt Corollary to the Monroe Doctrine. In the wake of the Spanish-American War and the acquisition of the Panama Canal zone, the maintenance of order in the Caribbean and Central America was becoming an ever-growing concern to the United States. President Theodore Roosevelt worried about the negative impact of unrest to the south on American trade and investments, and sought various means to preserve order through the assertion of police power over the other nations in the hemisphere. Roosevelt believed that the increasing interdependence and complexity of international political and economic relations made it incumbent on what he saw as the civilized powers to insist on the proper behavior of other nations. In 1904, Roosevelt provided his rationale for why revolutions were dangerous and justification for American intervention in Latin America in what became the Roosevelt Corollary:

If a nation shows that it knows how to act with reasonable efficiency and decency in social and political matters, if it keeps order and pays its obligations, it need fear no interference from the United States. Chronic wrongdoing, or an impotence which results in a general loosening of the ties of civilized society, may in America, as elsewhere, ultimately require intervention by some civilized nation, and in the Western Hemisphere the adherence of the United States to the Monroe Doctrine may force the United States, however reluctantly, in flagrant cases of such wrongdoing or impotency, to the exercise of an international policy power.

Soon after, U.S. troops were dispatched to Cuba, Nicaragua, Haiti, the Dominican Republic, and Honduras to maintain order.

THE GREAT WAR AND THE BOLSHEVIK REVOLUTION

Prior to World War I, therefore, the problems of unrest and disorder were seen as the manifestations of politically immature people, irresponsible individuals, or bandits. The postwar threats of nationalism and communism, unlike these previous disruptions, served to threaten the whole international system that the western nations operated within and forced American leaders to develop new approaches to these questions. In response to the broad revolutionary challenges of the 1910s, particularly the Bolshevik Revolution in Russia, a persistent concern with order and stability emerged among American officials. The revolutions in Mexico, China, and Russia could easily spread given the economic and political dislocation that had occurred during the previous decade. President Woodrow Wilson initially responded to these challenges with a policy that sought to promote self-determination and political democracy internationally as the best means to secure American interests and prevent the further spread of revolution. In 1917, he led the nation into World War I to destroy autocratic rule and militarism in Europe. Wilson hoped that by promoting liberal,
democratic forces and states in Europe through his Fourteen Points he could solve the dual problem of war and revolution. The president placed his faith in the League of Nations as the mechanism that would allow peaceful, nonrevolutionary change to occur in Europe and guarantee collective security to prevent another war and concomitant revolution. The Bolshevik Revolution, however, shifted the president’s attention from his battle with autocratic rule to the concern with revolution and containing communism.

President Wilson saw Bolshevism as a mistake that had to be resisted and corrected. He believed that the revolution in Russia was worse than anything represented by the kaiser, and that the Bolsheviks were a “group of men more cruel than the czar himself.” A communist regime meant, according to Wilson, “government by terror, government by force, not government by vote.” Furthermore, it ruled by the “poison of disorder, the poison of revolt, the poison of chaos.” It was, the president believed, the “negation of everything that is American” and “had to be opposed.” Secretary of State Bainbridge Colby reiterated Wilson’s points when he set out the official United States policy of not recognizing the communist government in Moscow in August 1920. Colby wrote that U.S. policy was based on the premise that the “present rulers of Russia do not rule by the will or the consent of any considerable portion of the Russian people.”

The Bolsheviks had forcefully seized power and were using the “machinery of government . . . with savage oppression to maintain themselves in power.” Moreover, the “existing regime in Russia is based upon the negation of every principle of honor and good faith, and every usage and convention underlying the whole structure of international law.” It was, therefore, “not possible for the government of the United States to recognize the present rulers of Russia.”

The policy of nonrecognition was based on the claim that a regime was illegitimate due to how it came to power and because it was a dictatorship that ruled by force against the will and interest of the people. Such nations were, therefore, a threat to American values and interests in the world. This policy would become a standard American diplomatic weapon for demonstrating its opposition to left-wing dictatorships and was used, most notably against China in 1949 after Mao Zedong’s successful establishment of the People’s Republic of China, Fidel Castro’s regime in Cuba in 1961, and Vietnam in 1975 after the defeat of South Vietnam, to deny legitimacy, trade, and international aid to these governments and force political change.

The upheavals of World War I also led to a reevaluation of American views on right-wing dictatorships after the war. Republican policymakers rejected Wilson’s criticism of autocracy and sought to back any individual or group they thought could ensure order and stability while opposing communism and protecting U.S. trade, investments, and interests. Beginning in the 1920s, American policymakers developed and institutionalized the logic, rationale, and ideological justifications for U.S. support of right-wing dictatorships that has influenced American policy ever since.

American officials first articulated their emerging rationale for supporting right-wing dictatorships in response to the post–World War I events in Italy. The United States came to support the fascist regime of Benito Mussolini based on a view that there was a Bolshevik threat in Italy and that the Italian people were not prepared for democratic rule. This unpreparedness and inability at self-government, American policymakers believed, created the instability that bred Bolshevism. These beliefs served to legitimize U.S. support of Mussolini in the name of defending liberalism. America’s paternalistic racism combined with anticommunism to lead American officials to welcome the coming to power of fascism in Italy. The fascists, they believed, would bring the stability that would prevent Bolshevism and that was a precondition for economic recovery and increased trade.

This logic and rationale was quickly extended to other right-wing dictatorships, often after the overthrow of democratic governments, that were perceived to meet all of the qualifications for U.S. support: promise of political stability, anti-Bolshevism, and increased trade with the United States. The quest for order in a framework acceptable to Washington led the United States to support Anastasio Somoza Garcia in Nicaragua, General Maximiliano Hernández Martínez in El Salvador, Fulgencio Batista in Cuba, and Francisco Franco in Spain, and the Fourth of August regime in Greece during the interwar years. Similar to the situation in Italy, the specter of communism and the argument that the people of these nations were not yet ready for democracy underlay the United States support for these dictators. Moreover, in Latin America this policy had another benefit to U.S. officials. It allowed the United States to find a new means to establish
order in the region without direct military intervention. American forces had intervened no fewer than twelve times in different nations in the Caribbean basin. These actions, however, failed to provide long-term stability. Rather, as Henry L. Stimson, secretary of state from 1929 to 1933, noted, disorder continued to grow. Yet, if the United States tried to take the lead in the area, Latin Americans complained of American domination and imperialism. Right-wing dictators provided the desired solution by providing both imposed order while ending the cry against American imperialism.

U.S. support for right-wing dictatorships after World War I, therefore, represented a new development and departure from both the policy of promoting self-determination and political democracy internationally, and earlier tolerance of military and authoritarian regimes, particularly in Latin America. American leaders grew preoccupied by international order in the wake of the disruption of World War I, the rise of radical nationalism combined with a decline of Western power, a questioning of traditional authority in nations, and greater demands for self-determination. This emphasis on order came to permeate policymaking in Washington, and the United States found strong-arm rule, the maintenance of stability, anticommunism, and protection of investments sufficient reasons to support nondemocratic rulers on the right. The often-quoted apocryphal statement by Franklin D. Roosevelt concerning Somoza of Nicaragua, “he may be a son-of-a-bitch, but he is our son-of-a-bitch,” captures the American attitudes and policy toward right-wing dictatorships. While left-wing dictatorships would be opposed, those on the right found support in Washington. This “lesser-of-two-evils” approach to foreign policy, influenced by racism and at times irrational fears of communism, created blindness to the shortcomings of right-wing dictators, and led the United States to support and align itself with many of the most brutal regimes in the world.

WORLD WAR II AND THE COLD WAR
This view, however, did not remain static. Pendulum swings in the policy appeared after times of crisis and failure. Most notably, the rise of Adolf Hitler and World War II provided a fundamental challenge to the idea that supporting right-wing dictators enhanced American interests and brought the debate over support of authoritarian governments to the fore within the Franklin D. Roosevelt and Harry S. Truman administrations. Roosevelt confronted the problem of Nazi Germany at first by efforts to appease Hitler, a strategy he abandoned when it became clear that Germany was intent upon war. The wartime opposition to fascism and the triumph of the Allies made the promotion of democracy and change paramount concerns, and the opposition to authoritarian governments, such as Juan Perón’s in Argentina and Francisco Franco’s in Spain, became U.S. policy.

The Allied victory in World War II appeared to mark more than the defeat of Germany, Japan, and Italy. It was to be, for many, the beginning of a new epoch. Central to that vision was the defeat of fascism and the triumph of democratic ideals and values over dictatorship and authoritarian rule. The world’s nations had not only joined together in an antifascist coalition on the battlefield; they also produced documents such as the Atlantic Charter and the Charter of the United Nations that extolled human rights, self-determination, and freedom. At home, Roosevelt spoke the lofty language of the Four Freedoms, criticized tyranny and colonialism, and talked of the expansion of American institutions and values to other parts of the world. For Americans, the postwar period promised the vindication of their nation’s values and institutions. From these ideas emerged the remarkable achievements in postwar West Germany, Japan, and Italy of establishing democratic governments and the rebuilding of the economies of western Europe and Japan.

In other areas of the world, events looked equally promising as independence movements were on the march in Asia and Africa, and dictatorships were under attack and apparently destined to be a thing of the past. The fledgling United Nations refused to admit Spain, and most nations agreed with its request that they withdraw their ambassadors from Madrid in protest of Franco’s rule, while Argentina’s strongman Juan Perón found himself under attack for his refusal to break relations with Germany until the spring of 1945. Outside of the Soviet Union and the areas controlled by the Red Army, it seemed that democracy was the force of the future. Even postwar disputes with the Soviet Union and the emerging Cold War seemed to demand, in the name of consistency with American criticisms of the governments being established in Eastern Europe, that the United States oppose dictator-
ships and support the establishment of free governments. In 1946 the Truman administration adopted an official policy of opposition to all right-wing dictatorships.

Yet the question was not so clear-cut as American efforts at appeasement of Nazi Germany indicated. Franklin Roosevelt had still distinguished between a regime such as Hitler's that threatened peace and those, such as Somoza's, that apparently did not. Roosevelt and others often adopted a pragmatic rationale for defending dictatorships they favored, and moral judgments were only invoked when the government opposed a regime rather than provide a consistent principle on which to base decisions. Ultimately, the logic and policy developed during the interwar years would be carried into the post–World War II period. The success of establishing democratic governments in Germany and Japan notwithstanding, with the emerging Cold War with the Soviet Union, the policy pendulum swung back to the right. By 1947 the United States came again to prefer “stable” right-wing regimes in the Third World over indigenous radicalism and what it saw as dangerously unstable democratic governments. The pronouncement of the Truman Doctrine and the adoption of containment as the global policy of the United States brought about the change. Truman announced in March 1947 that the United States now faced a global contest between two competing and incompatible ways of life: democracy and totalitarian communism. Democracy represented government “based upon the will of the majority” expressed through “free institutions, representative government, free elections, guarantees of individual liberty, freedom of speech and religion, and freedom from political oppression.” Communism meant the “will of a minority forcibly imposed upon the majority. It relies on terror and oppression, a controlled press and radio, fixed elections, and the suppression of personal freedoms.” It was now a bipolar world. It did not matter that many of the governments the United States came to support more resembled Truman's description of communism than democracy. If it was now a contest between only two ways of life, governments had to fit into one side of the divide or the other. Right-wing regimes became part of the free world no matter what the composition of their governments.

Truman had introduced important new variables into the basic assumptions of American foreign policy that were picked up by others. A distinction was now drawn between authoritarian dictators on the right and totalitarian dictators on the left. Autocratic regimes were seen as traditional and natural dictatorships for their societies while totalitarian regimes were classified as autocratic rule plus state control over the economy. The wartime view of fascism as the enemy had yielded to the danger of Soviet expansion. In this new understanding of the world, there was little room for moral arguments against right-wing dictators. They would be wedged into the free world, no matter what their record of abuses, as nations capable of being set on the course to democracy. No such hope was held out for communist nations. Authoritarian regimes now provided more than stability and the protection of American interests. They were a part of the “free world” and its struggle against communism.

In an analysis that became central to the Cold War justifications for supporting right-wing dictators, the Department of State argued that it was important to determine if a dictatorial regime was of the traditional Latin-American type, or if it was a communist or other police-state type. This distinction was crucial. The former were acceptable, but the latter had to be opposed. Further, it was necessary to distinguish between dictatorial governments who attempted to extend their influence beyond their own borders and those whose actions were not a threat to international peace and security. Communist states fell into the first category while authoritarian regimes did not. It was only totalitarian regimes that had to be opposed. Dictators such as Somoza in Nicaragua were mere authoritarians and deserved support. The Truman administration concluded that wherever dictatorships were overturned, the resulting governments were weak and unstable, making those nations susceptible to communist subversion. This idea was continued into the Dwight D. Eisenhower administration, which believed that when a dictator was replaced, the communists gained. The United States, therefore, had to “back strong men” and dictators. The conclusion was clear. Right-wing dictatorships were historically part of the Third World, unavoidable, and deserving of American support. So-called totalitarian regimes, however, still had to be opposed in the name of freedom. The Truman and Eisenhower administrations, therefore, chose to work with authoritarian rulers or the local military, in nations such as Greece, Spain, Iran, and Guatemala rather than nationalist leaders or democratic forces that appeared vulnerable to communist takeovers.
In addition, American policymakers found new positive reasons to support right-wing dictators. Although the policy of supporting autocratic regimes violated the stated ideals of postwar American policy, officials believed it would serve the national interest of the United States and promote development in other nations. Based upon a paternalistic racism that continued to categorize non–western European peoples as inferior, vulnerable to radical ideas and solutions, and, therefore, in need of a firm government to maintain order, authoritarian regimes were viewed as the only way Third World nations could undergo economic improvements that would allow the development of more “mature” populations without succumbing to communism or radical nationalism. While this attitude undermined the avowed rectitude of American leaders, democracy was not seen as a viable option for newly independent nations or many countries in Latin America. Strong dictators, therefore, were believed to be necessary antidotes for the ills of political and social disorder and conduits for modernization. Hence, policymakers believed that support for authoritarian regimes protected liberalism internationally by preventing unstable areas from falling prey to Bolshevism while allowing time for nations to develop a middle class and democratic political institutions. Expediency overcame a commitment to the ideology of democracy because the policy appeared to provide immediate benefits. The United States gained friendly—if brutal and corrupt—allies who provided stability, support for U.S. policies, and a favorable atmosphere for American business.

Moreover, authoritarian regimes now provided more than stability and the protection of American interests. Through nation building they would be the instruments to the creation of strong and free societies. These views were supported by social scientists in the postwar years. Proponents of nation building and the moving of Third World nations through the proper “stages of economic growth” argued that stability and strong rule were a necessary stage in the development and maturation of these societies. The guiding premise of the Eisenhower administration was that “political and economic authoritarianism prevails throughout the underdeveloped world in general and represents the predominant environment in which the U.S. must associate its interests with those of the emergent and developing societies.” In 1959 the Department of State concluded that right-wing regimes would be the conduits to modernization and provide a necessary stage in the development of Third World nations. Reflecting the influence and jargon of modernization theory, the Department of State noted that “our experience with the more highly developed Latin American states indicates that authoritarianism is required to lead backward societies through their socioeconomic revolutions.” Moreover, if the “breakthrough occurs under noncommunist authoritarianism, trends toward democratic values emerge with the development of a literate middle class.” Right-wing dictators would “remain the norm . . . for a long period. The trend toward military authoritarianism will accelerate as developmental problems become more acute and the facades of democracy left by the colonial powers prove inadequate to immediate tasks.”

“It is of course essential in the Cold War,” the State Department report continued, “to seek to promote stability in the under-developed countries . . . where instability may invite communism. A new, authoritarian regime, though less ‘democratic’ than its predecessor, may possess much more stability and may well lay the ground for ultimate return to a more firmly based ‘democracy.’” The department found these to be “compelling reasons for maintaining relations” with authoritarian regimes in power. “In the bipolar world of the Cold War, our refusal to deal with a military or authoritarian regime” could lead to the establishment of regimes friendly with the Soviet Union. It was the task of the United States to discover “techniques whereby Western values can be grafted on modernizing indigenous developmental systems.”

In the wake of the 1959 Cuban revolution and Fidel Castro’s coming to power, the John F. Kennedy administration reevaluated U.S. policy toward Latin America and support for such regimes as Batista’s. It decided to distance itself from authoritarian regimes and promote reform. Kennedy and his advisers worried that right-wing dictators were proving to be ineffective and even dangerous bulwarks against communism. They upset political stability as much as they protected it by frustrating desires for change and democracy, and they nurtured support for left-wing and communist opposition to their rule. The 1961 Alliance for Progress was the centerpiece of this vision, and the overthrow of Rafael Trujillo in the Dominican Republic a signal of change. This shift was not, however, primarily motivated by an ideological commitment to support constitutional governments at all times. Rather, it was seen as a
better way to combat communism, and the administration's actions never matched the bold rhetoric of the policy. The problem was how to break the dependence on right-wing dictators for order and promote change without unleashing revolutionary movements. Kennedy provided an excellent example of his concern about this dilemma in 1961 when discussing the Dominican Republic. “There are three possibilities,” he said, “in descending order of preference: a decent democratic regime, a continuation of the Trujillo regime, or a Castro regime. We ought to aim at the first, but we really can't renounce the second until we are sure that we can avoid the third.”

Kennedy's policy quickly came into conflict with other American interests and the growing conflict in Vietnam, and his administration backed away from its policy of opposition to right-wing rulers in 1962. In the face of the continuing challenges of revolutionary nationalism and the choice between order and social change, the Kennedy and Lyndon B. Johnson administrations opted to again support military dictators over democratic governments they feared were slipping toward communism. The swing of the political pendulum back to supporting right-wing dictators took on the now-familiar ring of the need for stability in nations that were too politically immature to defend themselves against communism. With the overthrow of Ngo Dinh Diem in South Vietnam in November 1963, the crisis in Vietnam came to dominate the making of American foreign policy. Unrest and potentially unreliable governments were seen as dangerous invitations to Soviet advances.

The repositioning of the political pendulum on the right was completed in the first months of the Johnson administration. Following the assassination of Kennedy, Johnson backed away from the idealistic rhetoric of the Alliance for Progress. Facing continual unrest in Latin America and a rapidly deteriorating military and political situation in Vietnam, Johnson sought to impose order. The Johnson administration supported the military overthrow of the João Goulart government in Brazil in 1964 as security and stability again took precedence over supporting social change and democratic rule. In 1965, when authoritarian rulers failed to provide the stability and bulwarks against communism that Washington demanded, Johnson decided that the United States had to impose order through military intervention in the Dominican Republic and Vietnam. The Johnson administration's determination to establish stability and order acceptable to Washington, which had provided the basis for working with repressive dictators, forced the president to pursue the policy to its logical conclusion of a U.S. intervention to salvage the discredited regimes.

**THE IMPACT OF THE VIETNAM WAR**

After 1965, American policy toward right-wing dictators became a contested issue. The Vietnam War served to undercut much of the logic and rationale used to justify American support of authoritarian regimes. Critics charged that in addition to the questionable morality of supporting right-wing dictators, the policy, while providing short-term benefits, usually led to larger problems for the United States in the long run, mainly long-term instability. Many supporters of the policy realized this danger, yet saw no other way to protect more pressing U.S. interests. Dictatorships created political polarization, blocked any effective means for reforms, destroyed the center, and created a backlash of anti-American sentiment that opened the door to radical nationalist movements that brought to power the exact type of governments the United States most opposed and originally sought to prevent. From Cuba to Iran to Nicaragua, and most tragically in Vietnam, the limits of this policy were discovered.

Support of authoritarian regimes was not completely abandoned by any means, as Richard Nixon's policy in Chile of supporting General Augusto Pinochet's overthrow of the government of Salvador Allende and the continued good relations with leaders such as the shah of Iran demonstrate. But the political climate had changed and policymakers were now forced to defend their position in public and take into account sustained criticisms of American support of dictatorships. For many, the Vietnam War and the postwar revelations of American covert actions in the Third World provided convincing evidence that the old policy of support for dictators was flawed and, more importantly, damaging to American interests and doomed to fail. Critics called for the United States to reorient its moral compass and to find methods other than covert activity and support of brutal dictators to advance American interests in the world. Although no complete swing of the policy pendulum took place, new views were heard and different approaches would be implemented, most notably President James Earl Carter's emphasis on human rights.
The establishment of the Senate Select Committee on Intelligence (Church Committee) provided a central focus for investigations into American covert actions and support of right-wing dictators. The committee chair, Senator Frank Church of Idaho, summarized the position of many critics when he argued during the bicentennial year of 1976 that it was time to return to the objective of the nation's founders and place the United States at the helm of moral leadership in the world. Yet, as his committee revealed, that notion had fallen by the wayside, replaced by the support of brutal dictators, Central Intelligence Agency–orchestrated coups in democratic nations, and assassination plots against foreign leaders. For all of its efforts, the nation found itself involved in a divisive, immoral war in Vietnam and allied to countries that mocked the professed ideals of the United States. Church concluded that American foreign policy had to conform once more to the country's historic ideals and the fundamental belief in freedom and popular government.

President Carter echoed Church's views in his inaugural address when he called upon the American people to “take on those moral duties which, when assumed, seem inevitably to be in our own best interests” and to let the “recent mistakes bring a resurgent commitment to the basic principles of our nation.” Carter adopted a new policy of human rights. He declared that the United States should have “a foreign policy that is democratic, that is based on fundamental values, and that uses power and influence . . . for humane purposes.” The president was convinced that democracy was the wave of the future and the continued support of repressive dictatorships was not only against American ideals but also against the nation’s self-interest. “Democracy’s great successes—in India, Portugal, Spain, Greece—show that our confidence in this system is not misplaced.” Moreover, Carter asserted that the nation was “now free of that inordinate fear of communism which once led us to embrace any dictator who joined us in that fear.”

Carter succinctly summarized the criticisms of supporting right-wing dictators. “For too many years,” the president announced, “we’ve been willing to adopt the flawed and erroneous principles and tactics of our adversaries, sometimes abandoning our own values for theirs. We’ve fought fire with fire, never thinking that fire is better quenched with water. This approach,” he noted, “failed, with Vietnam the best example of its intellectual and moral poverty.” Carter, therefore, called for a policy based on a commitment to “human rights as a fundamental tenet of our foreign policy.” The nation’s policy must be guided by “a belief in human freedom.” The old policy was, according to Carter, based on an inaccurate reading of history and the development of democracy. Strength and stability were not the prerequisites of freedom: “The great democracies are not free because we are strong and prosperous.” Rather, Carter concluded, “we are strong and influential and prosperous because we are free.”

Carter was aware of the limits of moral suasion, and did not believe that change would or should come overnight. Moreover, he realized that he would have to continue to support certain allies despite their record on human rights. As Carter noted, he was “determined to combine support for our more authoritarian allies and friends with the effective promotion of human rights with their countries.” He hoped for reform to prevent revolution. “By inducing them to change their repressive policies,” the president believed, “we would be enhancing freedom and democracy, and helping to remove the reasons for revolution that often erupt among those who suffer from persecution.”

Advocates of the old policy of supporting right-wing dictators blamed Carter, rather than the widespread popular discontent in their two nations, for the overthrow of two dictators in 1979 who were among America’s staunchest allies, Somoza in Nicaragua and the shah of Iran. The most vocal critic was the future Ronald Reagan administration ambassador to the United Nations, Jeane Kirkpatrick. She captured attention in 1979 and again in 1981 with her blistering critiques of Carter’s human-rights policy and public defense of supporting authoritarian regimes. Kirkpatrick contended that the United States need not apologize for its support of “moderate autocrats.” Such a policy was in the national interest and not incompatible with the defense of freedom. Using Nicaragua and Iran as her examples, Kirkpatrick argued that autocratic governments were to be expected in these nations and the rule of Somoza and the shah of Iran was not as negative as their opponents claimed. In discussing the Somoza dynasty, Kirkpatrick claimed that that government “was moderately competent in encouraging economic development, moderately oppressive, and moderately corrupt.” In addition, it was a bulwark against communism and a loyal ally of the United States. Little more
could be expected, she believed, given the development of Nicaragua.

Central to Kirkpatrick’s argument was the concept of the fundamental difference between right-wing and communist dictatorships, what she called authoritarian and totalitarian regimes. The crucial distinction, according to Kirkpatrick, was that “traditional autocrats leave in place existing allocations of wealth, power, status, and other resources,” and “they do not disturb the habitual patterns of family and personal relations. Because the miseries of traditional life are familiar, they are bearable to ordinary people who . . . acquire the skills and attitudes necessary for survival in the miserable roles they are destined to fill.” The almost exact opposite was true, she claimed, for life under communist rule. Left-wing regimes established totalitarian states that create the type of “social inequities, brutality, and poverty” that traditional autocrats merely “tolerate.”

The key to Kirkpatrick’s argument lay in her claim that because right-wing dictators left traditional societies in place, “given time, propitious economic, social, and political circumstances, talented leaders, and a strong indigenous demand for representative government,” their nations could evolve from autocratic states into democracies. Totalitarian communist states, she flatly asserted, could not. Indeed, by their very nature, communist nations shut off any of these avenues toward development and, therefore, democratic change. Hence, right-wing dictatorships were an inevitable and necessary stage of government for Third World nations. Support by Washington was not only in the national interest but was helping to provide the necessary conditions for modernization and the development of democracy.

When Ronald Reagan became president in 1981, he adopted Kirkpatrick’s ideas as the basis for American policy and returned to supporting right-wing dictators while continuing American opposition to communism and heightening the Cold War. There was, of course, little that was new in Kirkpatrick’s analysis or Reagan’s policy. She had only publicly stated the rationale and arguments that were initially formed in the 1920s and further developed after World War II. It was rare, however, to have such a bold statement of the ideas and assumptions behind American policy toward dictatorships—on the right and the left—that were usually only discussed in such terms in policy memorandums and private meetings. It laid bare the contradiction between the U.S. claims that opposition to the Soviet Union and communist regimes was based on their denial of political rights to their citizens, while Washington supported governments that were equally as guilty of human-rights abuses and the denial of basic civil liberties to their populations. Moreover, the collapse of communism in Eastern Europe in 1989, the reunification of Germany in 1990, and the breakup of the Soviet Union in 1991 demonstrated the fallacy of these arguments as democracy took hold in many nations formerly considered totalitarian and incapable of political change.

The end of the Cold War challenged many of the ideas previously used to justify American support of right-wing dictators and opposition to left-wing regimes. Anticommunism no longer provided a unifying theme for American policy, and no other single policy replaced it. Still, the conflict between the American efforts to promote democracy in other nations and the need to protect other interests remains. While the 1990s provided examples of Washington’s support for the democratic process from the Balkans to Southeast Asia, the United States has also continued to support many dictators in the name of stability and economic development. Moreover, as the only superpower, the United States has found itself drawn into conflicts around the world. Some of these interventions have led it to back local efforts at democracy and self-determination, while others have seen it support the status quo. Without a full commitment to make the promotion of democracy and human rights as the top priority over other interests and claims, the only thing certain is that the dilemma of what attitudes to take toward dictators will remain.

“These men are not being supported as we were supported in World War I.” So the Vietnam War appeared in contrast to the crusade of 1917–1918 to a speaker addressing a reunion of the First Infantry Division in 1969 and reported by the military journalist Ward Just. American military men who fought in Vietnam widely believed that wartime dissent of unprecedented intensity uniquely denied them the support of their compatriots at home. Wartime dissent might never have become a lengthy subject had not the Vietnam War raised the issue to unaccustomed prominence and created a wider debate, ranging well beyond disgruntled military men, over the extent to which the threat of dissent against subsequent use of force might cripple American foreign policy. General Maxwell D. Taylor, former chairman of the Joint Chiefs of Staff and ambassador to South Vietnam, wrote in *Swords and Plowshares* (1972): “As I see the lesson, it is that our leaders of the future are faced with a dilemma which raises questions as to the continued feasibility of a limited war option for future presidents faced with a compelling need to use military force in support of a national interest.”

Yet the intensity of dissent during the Vietnam War was not so unprecedented as many critics of homefront attitudes thought. An exceptionally perspicacious military man of an earlier generation, General George C. Marshall, the army chief of staff during World War II, said that the strategic planning for that supposedly popular war had to seek success in short order, because “a democracy cannot fight a Seven Years’ War.” More than those who saw uniqueness in the dissent that marked the Vietnam War, Marshall probably approached the heart of the issue of dissent in any democratic, and particularly American, war: because democratic public opinion is impatient, popular support of a war depends on the war not dragging on indefinitely. If not simply a short war, to minimize dissent a war should be distinguished by continuous visible progress toward achieving popularly understood and approved goals.

In a 1973 study of dissent during the Korean and Vietnam wars, as reflected in public opinion polls, John E. Mueller similarly concluded in more precise fashion that dissent against war tends to increase with the duration of the war, or more specifically, that it can be expressed by the logarithm of the duration of the war and the casualties of the war. Thus, Mueller found that despite the apparent evidence afforded by the uncommon noisiness of dissent against the Vietnam War, the Korean War received less public support than the Vietnam War—until the latter conflict surpassed it both in duration and in its toll of American casualties.

To be sure, Mueller did not have available to him public opinion polls concerning earlier prolonged wars, and both the Korean and the Vietnam wars differed from many earlier American wars in that they failed to produce results generally recognizable as victory for the American armed forces and the defeat of the enemy. The historian may suspect that if polls such as those cited by Mueller had been taken during the American Civil War, they would show that the war was more popular in the North in November 1864, at the time of Abraham Lincoln’s second election to the presidency, than earlier in the same year, in May 1864, when Lieutenant General Ulysses S. Grant was just beginning his sluging campaign in the Wilderness and at Spotsylvania—despite the accumulation of weary months and horrifying casualties in the interval. The intervening months brought morale-building military victories, and especially the triumphs of Mobile Bay, Atlanta, and Cedar Creek not long before the presidential election. Korea and Vietnam never afforded any such satisfying battlefield successes. The historian therefore would suggest that the effects of time and casualties on the popularity of a war might be
at least partially offset by military victories, and especially by military progress toward some readily comprehended goal—for example, the destruction of the enemy armed forces pursued by Grant and his lieutenants in 1864.

Still, while in the end dissent in the North during the American Civil War was largely drowned out by a tide of military victories, until nearly the end the prosecution of the Civil War was nevertheless plagued by more internal opposition than was the later waging of World War II. It was easier to rally public support for retaliation against the Japanese after the attack on Pearl Harbor and for suppression of Adolf Hitler than to bind domestic political dissidents to the Union with the bayonet. The roots of opposition to a war can be found in the duration of the war, its casualties, and its measure of military success. But one cannot ignore the commonsense view that the war's political aims and circumstances have much to do with its popularity. Of course, the generation and expression of dissent even in wars of politically controversial origin are handicapped, because wars tend to appear as national crises so dramatically overpowering that they inherently require the whole nation to rally around the national standard.

Nevertheless, Mueller's analyses of recent wars and national emergencies tend to indicate—and the longer historical view would seem to confirm—that such a rally-round-the-flag phenomenon is fleeting. Even in the midst of wars, “politics as usual” soon tends to resume. The resumption of habitual political battles can then readily fuel dissent, especially because in the development of American partisan politics it has required a considerable accumulation of experience, and a considerable sophistication for partisan rivals of wartime administrations and congresses to learn to disentangle opposition to the incumbent political party from opposition to the war, and the process of disentanglement has never been complete. And as common sense would have it, the more politically controversial the origins of the war, the greater is likely to be the intensity of wartime dissent, especially if the political controversy involves conscientious opposition to the morality of the war, as in the Mexican and Vietnam wars.

Moreover, once initial patriotic enthusiasm subsides, the dissent fueled by partisan rivalries and the circumstances of the origins of a war can draw upon a still more fundamental source of restiveness, the traditional American hostility toward the armed forces and a traditional ambivalence, at the least, toward the very institution of war.

Once these persistent sources of dissent against war interact in wartime with the hardships, inconveniences, and simple nuisances inevitably attendant upon any war, and with the more or less severe political controversies of any war, the rise and expression of dissent become so likely, and in most wars have become troublesome enough, that wartime administrations have been perennially tempted to suppress dissent by the use of law and armed force, diluting the constitutional guarantees of free expression of dissent on the plea that the national crisis demands it. Supporters of wars have also been tempted to use informal extralegal means to eliminate dissent. Thus the record of such temptation and of consequent actions against dissent forms part of the history of dissent in American wars, although on the whole the ability of administrations and populace to resist these temptations is fairly heartening to believers in the American constitutional system.

THE REVOLUTIONARY WAR

Despite the quotation from General Marshall, the United States did manage to fight and survive a “Seven Years’ War” at the very outset of national existence, the revolutionary war. It is possible that the revolutionary war was exceptional because it was so directly and unequivocally a war for national survival, with independence itself at stake. Modern nationalism is such a strong force that its survival may transcend ordinary rules concerning the depth of democratic support for war. It is at least as likely, however, that the safe emergence of the United States from the Revolution was largely a matter of fortunate historical accident.

Among British and Loyalist leaders there had developed a widespread impression by 1780, which lasted until October 1781, that for them the War of the American Revolution was almost won. In the southern colonies, 1780 witnessed the virtual completion of the reconquest of Georgia and South Carolina, and the following year Lieutenant General Charles Cornwallis pursued the remnant of the revolutionary forces in the area all the way northward across North Carolina and planted the royal standard in that province. The remaining resistance south of Virginia, although highly and perplexingly troublesome, was mainly of the irregular sort that later generations would
call guerrilla warfare. Farther north, at British headquarters in New York, General Henry Clinton received consistently optimistic reports from his agents throughout the Middle Colonies. Typical was the conclusion of the prominent New Yorker William Smith that “the Rebels were a minority who governed by the army and that this [the revolutionary army] reduced, the Loyalists would overturn the usurpation.” If it was the sole remaining prop supporting rebellion, the rebel army itself appeared well on the way to collapse. There had been a mutiny in the Massachusetts line as early as the beginning of 1780; in the Connecticut line in May 1780; in the large and critical Pennsylvania line at the beginning of 1781; and in the New Jersey line in response to the Pennsylvania mutiny. During this period General George Washington, the commander of the Continental army, repeatedly warned Congress that his army was on the verge of dissolution—from loss of supplies, pay, popular support, and internal morale. If Washington felt obliged to put on a show of pessimism in order to try to wring maximum assistance from a frugal Congress, accounts from other sources inside his army agreed with those of Clinton’s informers that his exaggerations were small and that his army might collapse under the slightest British pressure, or simply expire. “Why need I run into the detail,” Washington wrote John Laurens on 9 April 1781, “when it may be declared in a word that we are at the end of our tether, and that now or never our deliverance must come.”

Deliverance, of course, came. Clinton did not muster the energy or the self-confidence to pursue his opportunities with even the slightest vigor; he was thinking instead of how to woo back to British allegiance the faltering revolutionaries without in the process antagonizing Loyalists who were crying for condign punishment of the rebels as a reward for their own loyalty—that is, the very flagging of the Revolution paradoxically contributed to Clinton’s perplexities and thus to his irresolution. Meanwhile, Lord Cornwallis, the other principal British military commander in America and Clinton’s nominal subordinate in the South, lapsed into the opposite kind of bad generalship—recklessness. Cornwallis presented the revolutionary army with the opportunity to join forces with the French navy in a manner that entrapped him at Yorktown in October 1781. Although Cornwallis’s blunders were egregious, Washington and his French allies were able to capitalize upon them on account of a most remarkable run of good fortune in weather and timing, to say nothing of what was to prove the only major French naval success against a British fleet in the whole second Hundred Years’ War. The surrender of Cornwallis has no suggestion of inevitability about it but appears rather as historical accident. The United Kingdom in 1781 was no democracy, but the British government was far enough from a despotism and representative enough that it was having its own troubles in sustaining the war. The setback at Yorktown proved sufficient to push Britain into the hands of the peacemakers. Until Yorktown the American revolutionary cause had been in a much more perilous condition than the British cause, and except for the supreme good fortune of Yorktown it was the American cause that had been more likely to founder.

Dissent in the revolutionary war is otherwise difficult to measure on any scale similar to those applicable to later wars, when there was an established American government from which to dissent and more or less established channels of dissent. During the Revolution the prosecutors of the war on the side of the United States were themselves the dissenters from the accustomed American order of politics. The war was more confusedly an American civil war than the later war of 1861–1865, in which the antagonists were more clearly marked off from each other by geographical lines. Just as the revolutionary war was both a war for independence from Great Britain and a revolution seeking social change at home, so both thrusts of the war provoked their own sets of dissenters, with some who otherwise supported independence, for example, dropping out when the struggle set a course toward social revolution. In Pennsylvania, where the revolutionary movement most drastically changed the previous political order with the radically democratic Constitution of 1776, the sense of the revolutionaries that they must use the force of their new system of laws to compel the laggard to fall into their procession became most desperate, and it precipitated the most troublesome controversy in any province over test oaths of loyalty to the new regime. But everywhere, the revolutionary governments felt obliged to curb dissent with legal penalties of confiscation of property and political ostracism. Furthermore, the patterns of dissent were not easily predictable; loyalty oaths excited most controversy in Pennsylvania, where the Revolution became most radical, but dissent against the Revolution took its most ambitious military
form—and apart from the incursions of the British army required the nearest approximation of full-blown military campaigns to repress it—in the Carolinas, where the movement toward independence changed little in the previous social and political order. The sources of dissent and its manifestations were at least as varied as the motives that separately guided each colony into statehood.

THE QUISEI-WAR AND THE WAR OF 1812

After the American Revolution, dissent in the next war presents a special case; the war did not last long enough, or amount to enough as a military operation accompanied by casualties, for the effects of duration to have much play, but in its origins the war was perhaps the most politically controversial in the history of the country. It was the Quasi-War with France of 1797–1800. With the American political system still in process of formation, and partisan political opposition still widely regarded as illegitimate, it was hardly more a war against France, however, than a war conducted by the Federalists, who controlled the executive branch and Congress, against the Jeffersonian Republican opposition. French depredations against American maritime commerce and the XYZ Affair precipitated naval conflict with the French. Yet the causes of the war never ran deep enough to generate even a brief initial enthusiasm—despite the XYZ Affair—in more than a few localities. Moreover, the Federalists used the war to push through Congress authorizations of substantial increases in the army, although President John Adams remarked that as for an enemy army for this force to fight, “At present there is no more prospect of seeing a French army here than there is in Heaven.” Stephen G. Kurtz’s conclusion is that the new army, whose officers were carefully screened to assure their Federalist partisanship, was to be the tangible instrument for suppressing Jeffersonianism—a political army to cow the opposition. Against this threat to the antimilitary tradition and against the Quasi-War that nourished the threat, dissent became so sharp that Kurtz also concludes that fear and resentment of the political army ranked with the notorious Alien and Sedition Acts as a cause of disaffection from the Federalists and thus of the Republican “revolution” in the election of 1800.

Historians can perceive a deeper stream of causation leading to the War of 1812 than to the Quasi-War. In 1812 there was a fuller, more widespread patriotic spirit generated by the conviction that longstanding British refusal to grant the United States the rights of independent nationhood at sea represented a threat to the very independence of the Republic. Nevertheless, to the Federalists, now reduced to the role of opposition, the War of 1812 appeared as much a partisan war conceived for the political benefit of the rival party and for the ruination of themselves as the Quasi-War had seemed to the Republicans. By 1812 the Federalist Party had become a sectional party; except for enclaves of strength in the Carolinas, Philadelphia, and New York City, it was a New England party, and its interests and those of New England had come to seem indistinguishable. For commercial New England, the War of 1812 was the hideous culmination of a perverse Republican policy of countering British and French depredations against maritime commerce by terminating American overseas commerce altogether. For New England, no cause of the old revolution had loomed larger than the Boston Port Act; now the Republican strangulation, not just of Boston’s but of all New England’s commerce, naturally suggested a Boston Port Act much magnified. Thus, if the Boston Port Act had offered just cause for withdrawing from the British Empire despite all the benefits and ties of loyalty that the empire represented, then some New England Federalists saw Republican restrictions upon commerce as cause for seceding from the American Union. Republican trade restrictions and the ensuing war seemed all the more perverse to the Federalists because unlike the Republicans, the Federalists saw Great Britain as the defender of all people’s rights against a revolutionary France whose excesses had descended into Napoleonic tyranny, while the Republicans responded to both French and British maritime depredations with an increasingly anti-British policy leading at last to a war whose only beneficiary was likely to be Napoleon.

The vote of the New England members of the House of Representatives, except for frontier Vermont, on the war resolution of 4 June 1812, was nineteen against war, nine for, and three not voting—surely a clear alignment against the war, although not nearly so one-sided as some accounts might suggest. Connecticut and Massachusetts soon rejected federal calls for their militia, and Rhode Island and New Hampshire supplied only a handful of militiamen for federal service in 1812. Federalist Governor Caleb Strong of Massachusetts proclaimed a fast day to mourn
a war “against the nation from which we are descended,” and New England Federalist leaders generally made no secret of their displeasure with the war. Nevertheless, New England's passive dissent threatened to turn into active resistance to the Republican administration only when the badly conceived war proved to be badly fought as well. Then twenty-six New England Federalists met in late 1814 at the Hartford Convention, “to protest,” in the words of James M. Banner, Jr., “against the inept Republican management of the war with Great Britain and the whole system of Republican administration since Jefferson's election . . . to force the federal government to provide defensive help.”

Early in the conflict, New England profited from it. Hoping to encourage New England's disaffection, Great Britain at first did not apply its naval blockade of the United States to New England. In the spring of 1814, however, with Napoleon defeated and Great Britain free to devote major military attentions to the American war, the British decided that making New England bear some of the brunt of the conflict would be a more productive encouragement to dissent. On 31 May 1814 the blockade was extended to the whole United States coast. Worse, British invasion of New England followed. In July an expedition from Halifax, Nova Scotia, took Eastport in the District of Maine; by early September, Lieutenant General John Sherbrooke had entered the Penobscot, taken possession of the whole Maine coast east of that river, and claimed the coast as far as New Brunswick. Towns around Cape Cod were raided, and under British guns Nantucket declared its neutrality. What brought the Hartford Convention movement to a head, according to established scholarship, was the inability of the government in Washington to provide respectable defense against these British attacks. The Federalist state governments and the Republican federal government still quarreled over who was to control the militia, the New England states insisting that in the crisis they must retain command of their militia for their own defense but that the federal government should pay the costs of defense. When early in 1815 Congress authorized compensation of state forces by the federal government, it met what Banner calls the Federalists’ “central demand”; Harrison Gray Otis, perhaps the most influential Massachusetts Federalist, thought that passage of such an act earlier would have forestalled the Hartford Convention altogether.

This issue of defense was certainly more central to the Hartford Convention than the plots of secession that have sometimes been charged against the convention. The convention was engineered by the moderate leadership of the New England Federalist Party, of whom Otis was one example and George Cabot, the president of the convention, another, in order to press for effective action for defense and against Republican mismanagement. At the same time New England Federalists kept the political initiative in their section in their own hands—those of pragmatic politicians—and out of the hands of moralists, often led by the clergy, who increasingly couched their opposition to the Republicans in absolutist moral terms and were in fact likely to move toward extreme action, even including disruption of the Union. A convention of party leaders was an affair the pragmatists could control, and they did, confining the Hartford Convention to resolutions on behalf of federal support for state self-defense and proposals for constitutional amendments to pare the power of the Republican dynasty in Washington. This outcome fulfilled George Cabot's prediction that he could tell exactly what the convention would produce, namely, “a great pamphlet.”

A delegation including Otis carried the Hartford resolutions to Washington, leaving Boston just after they learned of Andrew Jackson's victory at the Battle of New Orleans and arriving in the capital just in time for the celebrations of the Treaty of Ghent that ended the war in February 1815. Holding the convention and passing its resolutions were probably necessary to divert the New England extremists and maintain, for the time being, a viable Federalist Party in New England. But enough secessionist overtones were imputed to the Hartford Convention that Federalism was forever damned elsewhere for disloyalty in time of war.

THE MEXICAN WAR

The conventional wisdom surrounding what happened at the Hartford Convention consequently came to be that failure to support a war effort is likely to mean the death of a political party. Thus, in 1846–1848, when the Whig Party found itself opposed to the Mexican War, the party pragmatists argued that although they might challenge the policy of going to war, they must not fail to vote for funds and supplies to support the army that was fighting it. A rival faction of Conscience
Whigs nevertheless took the logical and principled position that if the war was wrong, supporting the fighting of it was also wrong, and that therefore opposition must be thoroughgoing at whatever risk to party fortunes. The resulting divisions within the Whig Party very nearly produced the fatal effect that the pragmatists hoped to avoid.

During the Mexican War the sources of Whig dissent were partially the same as those of Federalist dissent during the War of 1812. In both instances, New England was the stronghold of dissent, although opposition spread more widely from 1846 to 1848. In both instances, the grievances of New England against the administration in Washington included the administration’s policies of westward territorial expansion, which implied a permanent diminution of New England’s political power. In the Mexican War, of course, westward territorial expansion was immediately at issue. In both instances, fear of the diminution of New England’s power sprang not only from direct political interests but from distaste for the whole southern and western economic and cultural system that the dissidents saw represented in the administration in Washington and in the administration’s war. During the Mexican War such distaste for southern and western values was reinforced by the rise to prominence of the slavery issue, which had been merely a cloud on the horizon—although already perceptible—during the War of 1812. In August 1846 the Wilmot Proviso tied the slavery issue inextricably to the issues of the Mexican War by proposing to forbid slavery in any territory to be acquired from Mexico. In both instances, opposition to the war could draw upon and be reinforced by the self-conscious Christian tradition of New England against the administration’s war. In the Mexican War this distaste for southern and western values was reinforced by the rise to prominence of the slavery issue, which had been merely a cloud on the horizon—although already perceptible—during the War of 1812. In August 1846 the Wilmot Proviso tied the slavery issue inextricably to the issues of the Mexican War by proposing to forbid slavery in any territory to be acquired from Mexico. In both instances, opposition to the war could draw upon and be reinforced by the self-conscious Christian tradition of New England tradition. New England dissent from the War of 1812 had in fact led to the founding of peace societies, which later helped mobilize opposition to the Mexican War.

In the 1840s the Christian antiwar tradition was readily mobilized against a conflict even more iniquitous than the War of 1812, in that the Mexican War could well be regarded—and is still regarded by some historians—as an act of aggression by the strong United States against weak Mexico. The mobilization of this Christian antiwar tradition in its New England centers, at a time when New England happened also to be experiencing its first great literary renaissance, gave an unprecedented literary aspect to dissent against the Mexican War, as illustrated by James Russell Lowell’s The Bigelow Papers (1848) and Henry David Thoreau’s essay “Civil Disobedience” (1849).

For all that, organized dissent against the Mexican War never attained a climax as notable, albeit ambiguous, as the Hartford Convention. The military campaigns of the war proved to be short and unvaryingly successful, which in turn proved an insurmountable handicap to effective dissent. Military success in fact diverted the pragmatic, political Whigs from the issue of whether to vote supplies to the more expedient issue of how to capitalize on the military fame of the victorious generals, Zachary Taylor and Winfield Scott, who chanced also to be Whigs.

Nevertheless, opposition to the Mexican War tended to grow more intense the longer the war lasted. When the conflict began in May 1846, only two members of the Senate and fourteen members of the House of Representatives voted against the bill, declaring that war existed “by the act of the Republic of Mexico.” Congress authorized the president to call volunteers and appropriated $10 million for the conduct of the war. By the time the Thirtieth Congress assembled for its first session in December 1847, however, to be greeted by President James K. Polk’s message that no peace had yet been obtained and there was no immediate prospect of one, Congress appeared much less ready to vote for men and money, and certainly the Whigs were more determined to pin upon Polk and the Democrats responsibility for a war begun, as they interpreted it, not by Mexico but by American aggression. Furthermore, the Whigs had captured at least nominal control of the House, although their own divisions made their election of Robert C. Winthrop of Massachusetts as Speaker a very near thing, because the most dedicated Conscience Whigs refused to support Winthrop as too willing to sustain the war. The House then defeated a resolution declaring the war just and necessary. Opposition to slavery inevitably still influenced much of the opposition to the war, but even a southern Whig, Alexander H. Stephens of Georgia, could say, “The principle of waging war against a neighboring people to compel them to sell their country is not only dishonorable, but disgraceful and infamous.” Playing upon the fact that hostilities had begun when Mexican troops attacked Taylor’s forces after they had crossed south of the Nueces River, which Mexico claimed as the southern boundary of Texas, Representative Abraham Lincoln of Illinois introduced his “spot” resolutions calling on the president to say candidly whether the spot where the war began was Mexican or American soil.
Some powerful Democrats, too, had grown outspokenly critical—the elderly Albert Gallatin, who called it a war of subjugation; Thomas Hart Benton; even John C. Calhoun, who feared the war was becoming one for the conquest of central Mexico, which would bring into the Union a racially inferior people incapable of free government. Fortunately for the president, in the midst of congressional debate there arrived the Treaty of Guadalupe Hidalgo (1848), negotiated in Mexico by Nicholas P. Trist, which ended the war with the annexation of Texas confirmed and California and New Mexico added to the United States, in exchange for a payment of $15 million and the assumption by the United States of American claims against Mexico. Although Polk had earlier repudiated Trist as his negotiator, and although some Democrats thought Trist's terms too generous toward Mexico, Polk submitted the treaty for ratification lest the increasingly noisy dissent prove able to paralyze him and make a good treaty henceforth impossible. Under public pressure to end the war as swiftly as could be done, the Senate ratified the treaty.

The opposition Whigs became the immediate political beneficiaries of discontent with the war. Some Conscience Whigs split off from the party to join with various northern Democratic factions disgruntled over the pro-Southern tendencies of all Polk's policies and to form the Free-Soil Party for the election of 1848; but this third party hurt the Democrats more than the Whigs. Choosing Zachary Taylor as their presidential nominee, the Whigs carried the White House. The expedient course of the party pragmatists in supporting war measures if not the war itself apparently had accomplished far more than merely warding off the fate of the Federalists. But the Whig success of 1848 was deceptive. Wartime strains upon the relations between Conscience Whigs and pragmatists had so weakened the party that it could not survive another bout with the slavery issue. The slavery crisis of 1850 broke open the cracks imposed on the party structure by the war and destroyed the party.

THE CIVIL WAR

The foregoing events obviously threw into question the conventional wisdom derived from the War of 1812 about what opposition to both war measures and war alike would do to an opposition party. Discarding the expedient course of the Whigs in the Mexican War, then, most of the Democratic Party leadership in the role of opposition to the new Republican Party during the Civil War chose to revert to a relatively uncomplicated kind of dissent. In general, its opposition to the Republican administration of Lincoln and to the Republican Congress in their conduct of the war was not disentangled from opposition to the war itself.

Democratic policy might have been different if the great Democratic paladin of the Middle West, Stephen A. Douglas, had not died almost at the outset, on 3 June 1861. Douglas had said that “The shortest way to peace is the most stupendous and unanimous preparation for war.” But it would have been difficult for Douglas to hold his party to such a policy. The style of American politics at mid-nineteenth century was one of rough-and-tumble conflict, with the business of the opposition regarded as straightforward opposition to virtually everything the party in power stood for. In this context the maneuverings of the Whigs during the Mexican War could more readily be perceived as having been too subtle and devious by far. Furthermore, the war at hand was a civil war, and the Democratic Party and politicians of the North had long been the comrades and allies of the leaders of the Confederacy, against which the federal government was now contending. It was too much to expect a prompt, wholehearted embrace of old political enemies in common cause against old friends. This matter was especially crucial; historical studies of the Copperhead dissent that was to develop have attempted to tie it to various economic and social interests—assuming, for example, that poor agriculturalists might have objected to the business alliances of the Republicans. But the one consistent gauge of any district’s tendency toward Copperheadism seems to have been the Southern ties of segments of its population.

Aggravating the latter dissent, and displeasing others who initially supported the war, as hostilities continued Republican policy came to include emancipation of the slaves. Therefore the issues of race and slavery again became intermingled with dissent in war, and the Democrats became the voice for all of white America’s deep fears of racial equality, toward which Republican war policies could be interpreted as tending.

Finally, American parties, although diverse coalitions, were by no means without ideology. The ideology of the Democratic Party was well summed up in its favorite wartime watchword, “The Union as it was, the Constitution as it is.”
This maxim rightly implied that the methods taken by the Lincoln administration to prosecute the war—centralizing methods threatening to transform the old loose federation of states into a consolidated nation—seemed to many Democrats so subversive of a proper Union and the true Constitution that a victory for Lincoln's Union would be scarcely more appetizing than the independence of the Confederacy.

The Democratic position was so close to a plague-on-both-your-houses attitude that it is not surprising that under the tensions of civil war, Republicans were likely to suspect nearly the whole Democratic leadership of Copperheadism. Furthermore, after Douglas's death the core of the Democratic membership in the House, thirty-six Representatives, subscribed to a pact of party unity conceived and drawn by Representative Clement L. Vallandigham of Ohio, who was candidly an obstructionist. After the summer of 1861, the Democratic congressional delegations offered much more nagging of the administration and parliamentary foot-dragging than willingness to sustain the war. Most Democratic leaders would have protested sincerely that they were not disloyal to the Union—the old Union. Much recent scholarship has been at pains to deny that the Democrats were disloyal to the Union. But the insistence of these Peace Democrats that the only Union worth preserving was the old noncentralized Union makes this a distinction of limited practical application.

By the fall elections of 1862, the prolonged war and the disappointingly few victories—none in the crucial eastern theater—were reflected in the Democratic gains in the congressional and state elections. By that time too, the Emancipation Proclamation added abduction to the Union war aims and aggravated discontent with Lincoln's leadership. In the State of New York the Democrats elected Horatio Seymour to the governorship. During his campaign Seymour had called emancipation "a proposal for the butchery of women and children, scenes of lust and rapine, and of arson and murder." As governor he employed a states' rights rhetoric reminiscent of Jefferson Davis, and his scornful opposition to conscription contributed to the New York City draft riots of July 1863. In the Midwest the Republican governors of Indiana and Illinois believed that the newly elected Democratic majorities in their legislatures were in league with an empire of secret societies planning a coup d'état to ensure the victory of the Confederacy. The governors collected evidence that Indiana alone had 125,000 members enrolled in antiwar secret societies and that in Illinois 300 secret lodges met every Tuesday night. The Confederate government believed these and similar reports and sent agents to cooperate with the secret societies. Thus can a fratricidal war generate hysteria, because the threat of the secret societies was a chimera. No substantial danger ever emerged from their alleged plotting. The Confederate agents who made contact with them found the Copperhead malcontents unwilling to take risks or action, and no coup d'état ever had a chance of success because the overwhelming bulk of Northern sentiment—including that of the rank-and-file Democrats who continued to serve in or send their sons and brothers into the Union armies—remained determined to restore the Union by war, war-weariness notwithstanding.

This fact proved fatal to the Democratic Party's immediate antiwar policies and highly injurious to the party for many years to come. By the presidential election of 1864, the Democratic Party formed its ranks for the campaign around the principles that while the Union ought to be restored, Lincoln's centralizing war was the wrong way to restore it, and that in addition to being wrong the war was a practical failure. The Democratic platform of 1864 called for a cessation of hostilities "to the end that at the earliest possible moment peace may be restored on the basis of the Federal Union of the States." The assumption that peace could come first and be followed by restoration of the Union was one that was not supported in any of the attitudes of the Confederate leaders. Furthermore, to adopt the assumption would imply that all the sacrifices accepted thus far to seek reunion through war had been needless. Northern voters were not willing to concede that they had sustained so large an error so long, and at so high a price. In late August, Lincoln himself believed that war- weariness would defeat his bid for reelection, but the best remedy for war-weariness, a succession of military victories, intervened. On 5 November the electorate chose Lincoln for a second term by a margin of 55 percent, a respectable victory by the standards of American politics.

The Confederacy had its own problems of war-weariness and dissent. There were many contributing factors, but above all, Southern support for the war and for the Confederacy crumbled away as the South lost the battles. In contrast,
Northern support for the war solidified itself as the North at last won battle after battle. For partisan politics the consequence of this latter fact was that on 25 February 1865 Harper’s Weekly could without much exaggeration proclaim: “We are at the end of parties.” The Democratic Party had so identified itself with the idea of the war as a failure as well as a wrong that the Union victory left the party appearing impossibly myopic. So much had the Democratic leadership identified itself with opposition to the Civil War that during the war large numbers of War Democrats had felt obliged to join the Republican Party. So much had the Republican Party identified itself with the Union and the war that victory in the war represented such a complete vindication of the party that the memory of the war would go far to assure Republican supremacy in Northern politics for a generation. Heeding the implied warning, in no subsequent war has a major party been willing to risk joining its fortunes with those of dissent.

THE SPANISH-AMERICAN WAR AND THE FILIPINO INSURRECTION

In the small wars between 1865 and 1917, dissent would not have been likely to assume proportions highly troublesome for the administrations waging the wars even without such an object lesson. The wars with the Indians had become too remote from the interests of most voters, especially because they could be fought by a small professional army with a large enrollment of immigrants. Any given uprising and campaign was too brief to allow dissent to accumulate, with intervals of peace allaying such public concern as it developed. An Indian rights movement did generate growing support among eastern philanthropists, intellectuals, and some religious denominations, but never on a scale to seriously slow down the military conquest of the Plains tribes. The constraints both upon the army and upon the government’s Indian policy, causing occasional spasms of congressional or executive peacemaking efforts, were more largely those of fiscal economy than of philanthropic concern.

Similarly, the war with Spain was brief enough and inexpensive enough in casualties that it was over before the customary initial patriotic enthusiasm had dissipated. Criticisms of the war effort came afterward and concerned the conduct of the war more than the war itself. The Filipino insurrection, the name most often applied to the Filipino-American War (1899–1902), which followed from the consequences of the Spanish-American War, was more unpleasant in every sense. It raised up anew the moral outcry against American expansionism at the expense of weaker peoples, which had agitated the opponents of the Mexican War. Suppressing the insurrection was a process prolonged enough (two and one-half years for the main insurrection on Luzon alone) and costly enough in casualties that it gave play to two of the principal wellsprings of dissent in war. Furthermore, the fighting involved guerrilla warfare in a difficult tropical climate, a type of conflict that the European-style American army, attuned to European-style regularized warfare, would not have been likely to assume proportions like the more general anti-imperialist movement of which it was a part, was the Indian rights movement writ somewhat larger. It was a movement centering in the eastern, or at least urban, aristocratic, and upper-middle-class intellectual and literary communities, with only occasional outposts in larger constituencies, such as Samuel Gompers in the labor movement; but it had no mass support. The inclusion of distinguished literary and academic figures gave it a high visibility, disproportionate to its strength. In the later era of public opinion polls, the evidence was to suggest—and more impressionistic evidence suggests it was already true—that except during a large-scale war touching numerous lives, foreign policy tends to be too remote from the concerns of most citizens and voters (again resembling the later Indian wars) for the “foreign policy public” to be very large. The opponents of imperialism and of the war in the Philippines were in this light the representative of a schism within the elite segment of the population concerned with foreign policy that had propelled the nation into the Spanish-American War and overseas expansionism in the first place. The misgivings within that elite were severe enough to bring American territorial expansion overseas to an abrupt halt, with the elite foreign policy public in general soon
reverting to its more traditional opposition to that kind of expansionism. Meanwhile, although the opposition party (still the Democrats) flirted with anti-imperialism, the party pursued at most an ambivalent course and after its Civil War experience did not again embrace outright dissent against the war. Dissent remained anything but a mass movement. Although it seemed prolonged at the time, the suppression of the major part of the Filipino insurrection within three years made the affair brief by contrast with the later Vietnam War, with the forces involved and the American casualties also much smaller.

THE WORLD WARS

The unhappy experience of the Democratic Party during the Civil War was surely not the only cause of the reluctance of major parties to embrace dissent in subsequent wars. The discipline and cohesion that modern industrial societies impose upon their populations, in contrast to less-centralized and more loosely organized agricultural societies, had already helped maintain the united front of the North during the Civil War, and that discipline of industrialism had grown immensely stronger by the time of the great world wars of the twentieth century. In World War I, the unity of the populace of every major power in support of nationalist war and patient endurance of the populace through prolonged war confounded the expectations of numerous prophets who had forecast that modern wars would be so costly that they could last only a few months. By World War II the public discipline of the great powers had become even more impressive. Democratic America certainly was no exception to this pattern; if anything, it was the democracies that displayed the greatest social cohesion. In both world wars, dissent in the United States was confined to minuscule fringe groups, mainly of socialists, radical leftists, and pacifists, and conscription focused far more attention upon the conscientious objector than it had done in the Civil War. This change occurred not only because the government and the public demonstrated increasing sensitivity to the demands of the pacifist conscience, but also because the conscientious objector was much more nearly alone as a dissenter than he had been in 1861–1865.

Before the entrance of the United States into World War I on 6 April 1917, it is true, there had been significant dissent over the course in foreign policy that proved to be leading to war, most conspicuous among the protesters being the Progressive elements of President Woodrow Wilson’s own governing coalition. Although after the war the intractable realities of international politics were to cause among this coalition a speedy disillusionment with support for the war, nevertheless from Wilson’s war message onward throughout the war itself, all but a small fraction of this group were enthralled by the president’s promise that the fight was for a reformation of the whole world, and they joined ranks behind the war effort. Not surprisingly, however, the considerable dissent that had surrounded Wilson’s foreign policy before the war contributed to an expectation that there would be more dissent during the war than actually materialized. This expectation in turn contributed to passage of stringent espionage and sedition acts seeking among other things to suppress any utterances that might discourage recruiting or the united prosecution of the war. These acts were enforced not only by an enlarged body of federal investigative agents but also by the federally sponsored American Protective League of private citizens. Abetted thus by what amounted to vigilantes, attacks upon civil liberties and particularly upon free speech became absurdly disproportionate to a mere trickle of dissent. No cases involving wartime suppression of dissent reached the Supreme Court until after the war. Then Justice Oliver Wendell Holmes’s characterization of Abrams v. United States (1919) as involving merely a silly leaflet by an unknown man came close to what is likely to be the historian’s view of all the targets of the espionage laws; but in Abrams, Holmes spoke for the minority of the court, and he himself had seen “a clear and present danger” in the earlier and not much different Schenck case (1919).

A greater sophistication and tolerance marked the government’s attitude toward dissent in World War II—always excepting the relocation of more than 100,000 Japanese from the Pacific Coast. Tolerance could well be afforded. Although American entry into World War II was also preceded by much debate over the nation’s course in foreign policy, the Japanese attack on Pearl Harbor assured that from the beginning of direct American participation there would be still less dissent than there had been in 1917–1918. Although such a leading Republican spokesman as Senator Robert A. Taft of Ohio suspected Franklin D. Roosevelt of exploiting the war emer-
gency to fix the changes of the New Deal permanently upon American institutions, he and most other Republicans permitted themselves only the most cautious criticism of the conduct of the war, which they carefully distinguished from criticism of the war itself. “Every problem,” said Taft, “must be approached in a different spirit from that existing in time of peace, and Congress cannot assume to run the war”—a far cry from the attitudes even of members of Congress of Lincoln’s own party during the Civil War, let alone the opposition. In World War II as in World War I, a certain amount of trouble did develop between the government and the labor movement, over labor’s threats to strike to ensure itself a due share of war prosperity; but this friction can hardly be said to have involved dissent over the war. In World War II, national unity survived even though the American participation lasted nearly four years and was by American standards costly in casualties, unlike the American participation in World War I. The most evident explanation for this national unity was the nature of the enemy and of the circumstances with which the war began. But the historian seeking the sources of unity should also keep in mind that once the initial defeats were overcome, it would be hard to find a long war marked by so consistent a record of military success as favored America and surely helped sustain American morale in World War II.

**THE KOREAN AND VIETNAM WARS**

One of the meanings of the worldwide restlessness that marked the 1960s may well be that the notable social discipline characteristic of the populations of industrialized countries in the first century of the Industrial Age was breaking down. If so, a fundamental shift in social organization may underlie the contrast between the unity with which the United States fought the two world wars and the reversion to major dissent and internal conflict in the Korean and Vietnam wars. But more immediate explanations for the contrast readily present themselves. The most frequently voiced explanation is that the world wars fitted much better than the more recent wars the traditional American image of the nature of war. From the colonists’ first struggles with the Indians, in which each side fought for the very survival of its culture, this argument goes, Americans came to regard wars as total struggles for absolute victory or defeat. The very aversion to war and the military that was so much a part of American tradition implied that when the nation went to war, it must be under the most extraordinary circumstances, and that so immoral an instrument must be employed only against such moral enormities as demanded absolute destruction. The American Civil War reinforced these preconceptions as the North fought for and achieved complete victory over the Confederacy. The argument concludes that after such a history, Americans could well sustain their unity against the Axis Powers during World War II, but they could not readily accept a limited war such as the Korean War, in which negotiations with the enemy to bargain for objectives far short of his destruction accompanied the very fighting of the war.

Allowing for some oversimplification—not every American war had been fought for the enemy’s destruction, as witness the conflicts of 1846–1848 and 1898—such an explanation captures much of the American attitude toward war and goes far to account for the frustrations of the Korean War. Dissent against the Korean War also was much encouraged by a peculiarly uneasy political atmosphere troubling the United States in 1950 even before the war began. World War II had produced not a satisfactory peace but a Cold War with communism and the Soviet Union, in which the United States government held out the prospect of no more triumphant an outcome than containment. So low an expectation was itself a drastic departure from popular expectations of what America might accomplish in the world. Moreover, from 1945 to 1950 the containment policy did not even produce a satisfactory restriction of communism. China, with all its historic attractions to the American imagination, fell to the communists. Then there broke out the prolonged, costly, and militarily stalemated war in remote Korea, a war which itself could be perceived as springing from the mistakes of Harry S. Truman, whose Democratic administration had allowed China to be “lost” and had then supposedly invited communist attack on South Korea by excluding that country from America’s publicly proclaimed Pacific defense perimeter.

During the Korean War the opposition party, the Republicans, did not revert to the risks of outright partisan opposition, although they came close to that in such statements as Senator Taft’s denunciation of the war as “an unnecessary war . . . begun by President Truman without the slightest authority from Congress or the people.” Here Taft touched also on another source of pub-
lic dissatisfaction in the post-1945 limited wars, the unwillingness of presidents for various reasons to ask Congress to declare war. In such puzzling circumstances of undeclared war for limited but not clearly defined objects, it was not surprising that Republican objections came to focus on the theme that the war should either be fought to win or be terminated. This theme linked the Republicans with General Douglas MacArthur, the Far East commander whom President Truman felt obliged to relieve because of his insubordinate public calls for extension of the war in pursuit of “War's very object . . . victory.”

The upshot of MacArthur's activities was the dramatic Truman-MacArthur crisis; but given the anomalies of the Korean War in terms of the American tradition of war, Korea would have provoked much the same partisan and popular discontent even if there had been nothing like that particular eruption. The concept of limited war was difficult for the sponsoring administration itself to master. The theorizing that was to make limited war a familiar conception at least to foreign policy and strategy intellectuals during the next decade still lay in the future. The Truman administration kept the Korean War limited not out of a sophisticated understanding of the conception but largely because of a misapprehension, namely that the war was a communist feint to divert American attention in preparation for a major Soviet offensive in Europe, and that, accordingly, American military resources must remain as much as possible concentrated in Europe and the United States. After China entered the war and destroyed the possibility of using the war to reunite all of Korea, the Truman administration lost its own enthusiasm for prosecuting the war, such as it had been able to summon up, and the administration became so eager for peace that it spared the enemy most military pressure as soon as it announced a disposition to negotiate. In these circumstances the negotiations dragged on inconclusively until the inauguration of a new government in Washington. With the very sponsors of the war so vague about its nature and objectives, so unskilled in its management, and so lacking in conviction that it was worth fighting, it is little wonder that public discontent with the prolonged bloodletting and the absence of clear military success made the Democrats extremely vulnerable in the elections of 1952. The electorate responded to Republican criticism of every aspect of the conduct of the war, and especially to the Republican candidate General Dwight D. Eisenhower's promise that somehow he would end it. With the help of the East-West thaw that followed the fortuitous death of Soviet Premier Josef Stalin, President Eisenhower did end the war.

Dissent in the Vietnam War seemed to be still deeper and more widespread. Dissent certainly became a more conspicuous feature of the public scene, expressing itself in mass protest marches, demonstrations, and displays of civil disobedience. Public opinion polls indicate, however, that opposition to the Vietnam War grew stronger than opposition to the Korean War only after the Vietnam War had surpassed the Korean War in duration and in American casualties. The conspicuous public displays of dissent reflected not so much a greater opposition to the war in Vietnam than the war in Korea, but rather a shift in liberal opinion. Except for the extreme left wing, liberals had usually supported the Korean War as part of the staunch anticommunism that tended to mark their reaction to Stalinist Russia. By the 1960s, a less intransigent Soviet Union, the disruption of virtually all appearances of a monolithic international communism, and a rethinking of Cold War postulates in a more relaxed international atmosphere than that of the Truman years made liberals much less willing to support another war against a small Asian communist state than they had been in 1950–1953, especially when the Asian regime being supported by the United States was a distasteful blend of dictatorship and chaos. The conspicuousness of dissent against the Vietnam War was largely a product of the defection of many of the liberals from the foreign policy coalition of the establishment, because this group was an especially articulate one, in direct line of descent from the literary and academic dissenters against suppression of the Filipino insurrection. The conspicuousness of dissent against the Vietnam War was also much enhanced by employment of the methods of dramatizing dissent that liberals had learned from association with the civil rights movement of the late 1950s and early 1960s. Measured against the apparent volume and the new tactics of dissent, the tolerance of the government for controversy displayed an advance over World War I, despite conspiracy trials directed against dissenters and the illegal methods of attempting to discredit Daniel Ellsberg, who leaked the so-called Pentagon Papers to the press.

The liberal defection during the Vietnam War from the coalition that had supported the
Dissent in Wars

Truman administration during the Korean War also reinforced the moralistic quality that dissent from the Vietnam War shared with dissent during the Mexican War and the Filipino insurrection. The liberal protest against the Vietnam War was another moral protest against an allegedly aggressive onslaught by the great and powerful United States against a weak and ill-armed adversary that was said to be seeking only the self-determination that America’s own Declaration of Independence championed. Like dissenters during the Mexican War and the Filipino insurrection, liberal protesters against the Vietnam War charged that the war was betraying the highest ideals of the United States itself. Some of the more horrifying military expressions of modern technology, such as defoliation, napalm, indiscriminate use of aerial and artillery bombardment by the American forces in Vietnam, gave special intensity to this moral protest.

Yet public dissent against the Vietnam War was not primarily moralistic. The conspicuous character of left-wing protest demonstrations against the war gave a misleading impression of the degree and the nature of the unpopularity of the war as compared with the Korean War. The left-wing protesters, especially the young among them, through the very tactics that made their protests conspicuous, antagonized moderate and conservative citizens. At any rate, the larger public discontent—including that discontent that most directly contributed to the electoral defeat of the original Democratic sponsors of the war and the triumph of their Republican opponents in 1968, much on the model of 1952—was not a moralistic dissent. It was again an expediential discontent that the issues of the war were puzzling in contrast to the great crusades of the world wars and that the Vietnam War was not being won.

The first two U.S. military undertakings in this period were short and occurred closer to the continental United States. Combined U.S.–Caribbean military forces landed on the island of Grenada in late October 1983 to protect lives and end the political chaos following a violent leftist takeover of the country. The “rescue mission,” as President Ronald Reagan called it, quickly restored order and had mostly withdrawn by the end of the year. In December 1989 the U.S. Army decisively intervened in Panama to oust a dictator, curtail the drug traffic, and restore stability. Because both military actions were brief and successful, dissent was minimal.

Then dramatic political changes in the Soviet Union (including the collapse of the Soviet Union itself in 1991) and its European satellite states brought the end of the Cold War. The anti-communist rationale that had helped to justify U.S. military involvement in Korea, Vietnam, and elsewhere disappeared. Conflict nonetheless persisted in the international system, and the United States, now the lone superpower, found itself confronted in the last decade of the twentieth century with a series of regional, religious, and ethnic controversies abroad. Although seemingly remote from immediate U.S. interests, America’s leaders felt strong responsibility to play a prominent role in these conflicts, including the prospect of military intervention.

Of the several U.S. military interventions in the 1990s, dissent against U.S. involvement in the Gulf War was the strongest. Following the invasion and takeover of neighboring Kuwait by the Iraqi dictator Saddam Hussein and his forces in the summer of 1990, George H. W. Bush’s administration and the United Nations condemned the annexation and imposed economic sanctions on Iraq. When the strategy of economic strangulation failed to dislodge Hussein from Kuwait, the Bush administration mobilized a broad multinational coalition in the United Nations, which authorized military action to expel Iraq from Kuwait if its forces had not withdrawn from that country by mid-January 1991. The well-orchestrated gradual escalation of diplomatic and economic pressure on Hussein allowed time for extensive debate in the United States over the merits of prospective military involvement.

Public divisions on the Gulf War were mainly ideological, with opponents, many of whom were already committed to liberal and anti-war causes, forming coalitions composed mainly of student, religious, labor, African-American,
and human rights groups. On college campuses, for example, students claimed that young people were being asked to risk their lives in a crisis for which there were no vital U.S. interests, and the war could result in the reimposition of the military draft. Referring to the U.S. interest in regaining ready access to the rich Kuwaiti oil fields, a popular slogan, especially among more radical opponents, was "No blood for oil." A smaller, but articulate opposition from the conservative right argued that the Gulf War did not directly involve U.S. interests and, objecting to the international coalition, believed the United States should pursue its national objectives unilaterally. Proponents of U.S. action meanwhile emphasized Hussein's naked aggression in Kuwait and stories of Iraqi atrocities to counter antiwar advocates' moral protest.

Following President Bush's request in early January 1991 for congressional authorization to use U.S. armed forces to force Iraqi withdrawal from Kuwait, Congress openly debated and then approved resolutions endorsing U.S. military action against Iraq. The votes were fairly close, 52–47 in the Senate and 250–183 in the House, with divisions along party, ideological, and regional lines. Even without a decisive mandate for military action, however, the war effort, once begun, received strong popular American support, ranging between 70 and 80 percent in various polls, even after the allies began heavy bombardments of Iraqi military targets, which resulted in many civilian casualties. Opinion polls also indicated that U.S. women on the whole were inclined to have somewhat stronger reservations than men about the need for bombing and a military solution. When the air strikes failed to dislodge Hussein from Kuwaiti territory, a U.S.-led coalition of ground forces launched a military assault, which took only four days to drive the disorganized and demoralized Iraqi forces from Kuwait and obtain Iraq's surrender.

The swiftness of the U.S. military successes along with the often lighter-than-anticipated U.S. casualties sustained American public support for the Gulf War. Subsequent U.S. military operations abroad—in Somalia (1992–1994), Haiti (1994–1995), Bosnia (1995), and Kosovo (1999)—were likewise short-lived and without heavy casualties. The political anarchy and famine in Somalia prompted UN intervention, including thousands of U.S. forces, to bring humanitarian aid, peace-making, peacekeeping, and nation-building to the African state. Poorly conceived and executed, the UN effort failed to restore political order, and ambushes and raids on the occupying contingents by Somali warlords resulted in the deaths of many American troops. U.S. public opinion, previously apathetic, directed its anger at the disastrous UN policies. President William Jefferson Clinton decided to cut the nation's losses, and dissent dissipated with the withdrawal of U.S. and UN forces from Somalia by early 1994.

In Haiti, an army junta's overthrow of a constitutionally elected government headed by Jean Baptiste Aristide in 1991 resulted three years later in a UN Security Council resolution authorizing a U.S.-led multinational force to invade and restore Aristide to power. Drawing on the War Powers Act of 1973, the U.S. Senate passed a nonbinding resolution requiring congressional approval before invading Haiti, but Clinton, like previous recent presidents, denied the right of Congress to restrict the commander in chief. The intervention quickly achieved its short-term political objective of restoring Aristide and political order, although a U.S.–UN peacekeeping presence continued in Haiti until 1997.

After UN forces and the major European nations failed to bring peace and stability to the ongoing political turmoil and fighting in the former Yugoslavia, President Clinton began to assume leadership of a U.S.–European coalition in response to the escalating conflict in Bosnia. Beginning in 1994, NATO planes made sporadic air strikes on the Bosnian Serbs who had violated no-fly zones and attacked “safe-haven” cities and towns for UN forces and Muslim civilians. Further reports of ethnic cleansing by Serbs and their intransigence resulted in more intensive NATO air assaults on Serb positions, and Clinton officials urged Congress to approve the deployment of several thousand U.S. troops to the beleaguered region. Polls suggested an almost even split in American opinion on military intervention in Bosnia. The House of Representatives first narrowly rejected the proposal. Following the Dayton Peace Accords in November 1995, which offered a framework for peacekeeping in Bosnia, Congress approved the deployment of 60,000 U.S. troops to implement the accords, although only by a very narrow margin in the House. Because large proportions of the American public and Congress were ignorant of or confused by the complex ethnic rivalries and conflicts in the Balkans, they wavered during the 1994–1995 crisis. While they seemed opposed to foreign military intervention, they also wanted the president...
to respond to Serbian atrocities. Dissenters did not question the humanitarian needs to relieve the suffering in Bosnia, but argued that the nation's interests were not involved. In the end, the allied forces implementing the Dayton Accords in Bosnia had no U.S. combat casualties, and Clinton ultimately succeeded in announcing that U.S. troops would remain there indefinitely.

The public's deep ambivalence about involvement in the Balkans reemerged following Serbian forces' massacres of ethnic Albanians in Kosovo (1999). Although many Republicans and Democrats in Congress held principled positions in supporting or opposing Clinton's authorization of U.S. and NATO bombing of Yugoslav positions, the partisan bitterness resulting from the recent impeachment and trial of President Clinton made more Democrats inclined to back the president. The Republicans by contrast were more unified in opposition. The failure of an antiwar House resolution as well as another one, by a tie vote, endorsing the air war suggested the hesitation. Meanwhile, the Senate approved the air strikes but rejected consideration of sending ground troops to Kosovo. Finally, after repeated NATO air strikes, Yugoslav President Slobodan Milosevic capitulated and withdrew Serbian forces from Kosovo, and Congress agreed to fund NATO troops to maintain peace and order in the area. Because the air war lasted only seventy-nine days and occurred without a single U.S. casualty, dissent in the war never escalated.

In summary, dissent in war is not a new phenomenon in American history, born during the Vietnam War. All American wars have provoked dissent. Dissent is implicit in historic American attitudes toward war itself and is nourished when war becomes prolonged, costly in casualties, and indecisive. Because the American electorate has always shown only a limited patience for war, those troubled by dissent are mistaken when they interpret it as a new constraint upon the use of military force in American foreign policy. The constraint has been present from the beginning of American history.

Since virtually the earliest days of its existence, the United States has seen fit to announce in grandiose fashion its intentions and purposes to the world at large. The Declaration of Independence, for instance, the grandest statement of all, took aim at a foreign audience more than a domestic one. Subsequent declarations, often imbued with a millennial vision and a sense of exceptionalism, continued to broadcast the nation's principles far and wide. The emergence of the United States as a global power endowed those statements with increasing authority, for Americans as well as for those abroad. In time they came to take on the status of “doctrine,” establishing the precepts of U.S. foreign policy.

For the most part, these doctrines sought to address immediate crises. Each involved diplomatic statements of intent; several of them spelled out specific actions in support of those intentions. For the most part, they sought to ground themselves in the traditions and lore of the American past. In an effort to establish that continuity, presidents have frequently referred to previous statements of policy, offering their own approaches as contemporary applications of enduring principles. Most of these declarations have carried weighty ideological content, venerating “free peoples” and the virtues of liberty. Yet they have been equally grounded in the language of national security, promoting the survival and safety of the American way. As a whole, they offer a thumbnail sketch of the history of American diplomacy.

**THE MONROE DOCTRINE**

In many ways, the “doctrines” of American foreign policy take their cue from the Monroe Doctrine, the seminal statement of national purpose. Articulated in 1823, this doctrine reflects the concerns and aspirations of a young country, bold enough to assert its power on the world stage. In dictating that Europe maintain a “hands-off” policy toward the Americas, it established the United States as a global power, albeit one with limited, hemispheric ambitions. Those ambitions would expand, however, and in future decades the Monroe Doctrine would prove useful for interventionists and isolationists alike. As the most recognizable and perhaps most venerated of diplomatic principles, its hold on the popular imagination has been so strong that it has defined the limits of acceptable policy options, shaping the range of choices open to presidents for the better part of two centuries.

Any appreciation of the Monroe Doctrine must take into account the domestic conditions of a young America and the international dynamics of the European great power system. The United States had only recently withstood the economic and military challenges posed by France and Britain during the Napoleonic wars. The conclusion of hostilities in 1815 seemed to release a host of energies that Americans harnessed and then directed inward. Numerous projects dedicated to fostering a more robust national system—such as the building of roads and canals—expressed the desire of many to subdue the land. It was a project that Americans carried out with missionary zeal, believing it their destiny to inhabit and control vast reaches of space from the Atlantic to the Pacific.

Extending the empire of liberty across the continent demanded that the United States shore up its diplomatic position, for that project of territorial expansion sought to absorb lands still coveted by several European states. One of those states was the empire of Spain, a world power from a previous era suffering the death throes of imperial overstretched. From Argentina to its holdings in North America, Spain's colonies in the New World were declaring their independence, a process that accelerated during the early years of the nineteenth century. Developments in connec-
tion with one of those holdings—West Florida—led Congress to establish a policy of “no transfer,” which forbade the transfer of Spain’s former colonies to any other European power. Interest in wrenching Florida free from Spanish control continued throughout the 1810s; by 1819 the United States was able to capitalize on Spanish weakness and secure title to Florida as well as to regions in the Far West. It was thus well on the way to enlarging the domains under democratic rule.

Support for political liberty was not wholesale, however. While Americans considered a more democratic world to be a more peaceful world—and more conducive to American interests—they questioned the ability of one and all to participate in the democratic experiment. Several members of the Monroe administration, including President James Monroe and Secretary of State John Quincy Adams, regarded Latin Americans as poorly equipped for democratic government. Spanish misrule, Catholic hierarchies, and Old World cultures weighed heavily on those peoples, making U.S. officials leery of supporting revolutions that might ultimately fail—especially if Spain were to mount an effort to retake those lands. Concerns such as these led officials in the Monroe administration to curb their republican passions and withhold recognition. By the early 1820s, however, several of those nations had stabilized, warranting a more formal American commitment to their viability. That pledge would come via President Monroe’s December 1823 address to Congress. Not only would the United States recognize those new nations; it would seek to prevent their recolonization by any European power.

While expectations of conflict with Spain created the general context for the Monroe Doctrine, the president’s declaration stemmed from a more tangible and immediate dispute with Imperial Russia. The czar had long been interested in the Pacific Northwest, coveting the waters off the American coast as a valuable spot for commercial fishing. In 1821, Alexander I declared the waters above 51 degrees north latitude the exclusive province of the Russian American Company and sought to maintain ports as far south as San Francisco.

American officials were not the only ones eager to create a barrier between Europe and the Americas. British statesmen were similarly anxious about the signals coming out of continental Europe, particularly regarding the fate of imperial Spain. The breakdown of Spain’s New World empire was accompanied by political disturbances at home; in the end, however, revolution abroad would not be accompanied by revolution at home as France invaded Spain in 1823, restoring monarchical control to the country. Fears that France, along with Prussia and Austria—the two other members of the Holy Alliance—were interested in regaining for Spain its American colonies unnerved the British. Such a reversal could threaten British holdings in the Atlantic as well as the balance of power in Europe.

These concerns led Britain to approach the United States in the hope of making a joint statement regarding the Western Hemisphere. The intended effect of that declaration would be to ward off Spanish efforts either to recolonize its lost domains or to transfer control of those nations to other European powers. In weighing the British proposal, Monroe sought the help of Thomas Jefferson and James Madison. Friends and political allies, both Jefferson and Madison leaned toward accepting the British proposal, an inclination Monroe shared. Secretary of State Adams, however, disagreed with both their appraisal of the situation and their recommended course of action. First, he pointed out, Spain was ill-prepared to reclaim its colonies, a condition that called into question the very basis of the British proposal. Moreover, even if the European monarchies were prepared to help Spain retake its lost domains, it would be foolish for the United States to throw in its lot with Great Britain. “It would be more candid,” Adams argued, “as well as more dignified, to avow our principles explicitly to Russia and France than to come as a cockpit in the wake of a British man-of-war.” The United States, Adams was saying, should go it alone. It would brook no “interposition” by a European power in the affairs of the Americas, nor would it look kindly on efforts to subjugate newly independent states. For its part, America would refrain from inserting itself into the troubles of Europe, thereby consigning Europe and the United States to their respective and distinct spheres of influence. Those three principles—no interposition, noncolonization, and no interference—would become wedded to the fabric of American foreign policy, attaining the status of dogma for much of the nation’s history.

While those principles have been considered sacrosanct by generations of Americans, government officials have taken great liberties with the Monroe Doctrine, invoking or discarding its precepts at will. The frequency with which politicians, scholars, and citizens have appealed to the doctrine, as well as the malleability it affords, has gen-
erated a fascination with this seminal statement of American policy, turning the study of it into a veritable cottage industry. Interpretations of the Monroe Doctrine have been changing since the middle of the nineteenth century, the time when scholars began to treat it with much gravitas.

One of those areas of debate concerns the very authorship of the doctrine. Historians have pointed to either John Quincy Adams or President James Monroe—with help from Jefferson and Madison—as the man more responsible for the doctrine's final form. Both Monroe and Adams sought to wall off Europe from the affairs of the Americas, and both men—though perhaps Adams more so than Monroe—were disposed to keeping America out of European affairs. Nevertheless, it was Adams who prevailed upon Monroe to make his statement a unilateral one, rejecting the idea that Britain and the United States establish their positions jointly. The most persuasive accounts have accorded Monroe and Adams equal responsibility, with Monroe supplying the document's idealism and Adams its geopolitical realism. Yet it was Adams's insistence that America make that statement alone, without the backing of Great Britain, that elevated the doctrine to its place in American lore. His ability to persuade Monroe on this score—arguably the most important aspect of the president's message—has even led one historian to cite the doctrine as America's declaration of diplomatic independence.

An ancillary debate has grown up around the issue of why the doctrine even appeared in the first place. Scholarship has revealed that fears of a Spanish intervention to reclaim its lost colonies—the context for the principle of nonintervention—were essentially groundless. By the time that Monroe made his statement in December 1823, the Holy Alliance had given up its plans, if any existed in the first place, for helping to reestablish Spanish colonial rule. The seeming irrelevance, then, of the Monroe Doctrine to the actions it sought to prevent has led historians to attribute more personal and political motives to its enunciation. In this account the presidential election of 1824 looms large, as Adams sought to outmaneuver potential rivals, some of whom were associates in Monroe's cabinet. Although an intriguing argument can be made for the relevance of these dynamics to the policy process, the weight of evidence seems to run against the argument that the Monroe Doctrine was more the product of political machinations than the principled stand of disinterested public servants.

Further scholarship has delved into the purpose of the Monroe Doctrine, leaving historians to divide over its relative leanings toward interventionism and isolationism. These debates have often reflected concerns specific to the eras in which they took place. Reference to the doctrine, for instance, first appeared during the annexationist debates of the late 1840s. President James Polk would refer to it explicitly as justification for his policies of continental expansion. In that climate the Monroe Doctrine, with its apparent sanction of American privilege in the Western Hemisphere, captured the upsurge of nationalist feeling as the nation moved westward; indeed, historians have commented on the symbiotic relationship between the Monroe Doctrine and the spirit of "manifest destiny," regarding those ideas as being—in the minds of nineteenth-century Americans—mutually reinforcing, if not identical.

Government officials and diplomatic historians would continually refer to the Monroe Doctrine throughout the nineteenth and twentieth centuries, interpreting its rhetoric as support for their own isolationist or interventionist policy preferences. The doctrine would again assume an activist slant in the 1890s as Secretary of State Richard Olney invoked it with respect to the border dispute between Venezuela and British Guiana. According to Olney, British intervention in the quarrel would violate the time-honored principle of noncolonization; though sharp words were exchanged, tensions between the United States and Britain dissipated, inaugurating a period of much smoother relations.

Subsequent events would give the doctrine an increasingly interventionist spin. Fallout from the War of 1898 left the United States with a preponderance of power in the Caribbean, a power it codified with the Platt Amendment of 1901. Reserving for itself the right to intervene in Cuba's affairs, the administration of President Theodore Roosevelt began to mark out an entire policy toward the region that would expand upon Monroe's original dictum. What concerned Roosevelt was the ability of Latin American nations to pay their debts to European creditors. Fearing that a string of defaults might lead Europe to meddle in hemispheric affairs, Roosevelt chose to intervene in the economic and political lives of those nations, establishing the Roosevelt Corollary to the Monroe Doctrine. Episodes such as these have led historians to marvel at the doctrine's flexibility. As a statement of national interest, the Monroe Doctrine has appeared to
sanction economic imperialism in the Western Hemisphere as well as the missionary impulse to bring good government to the region. Whatever the case, scholars have offered ample evidence for the argument that such interventionism, whether in the service of cynical or noble motives, was absent from the doctrine's original formulation.

It has questionable relevance to American foreign policy in the twenty-first century. The self-imposed injunction against intervening in European affairs—broken on account of World Wars I and II—was altogether abandoned during the Cold War as U.S. troop commitments and armaments cemented the NATO coalition of west European states. American leadership during the air war against Serbian targets during the 1998–1999 Kosovo crisis invalidated whatever was left of that portion of Monroe's injunction. Likewise, U.S. administrations have alternately supported and condemned foreign involvement in hemispheric affairs. While the Reagan administration supported Britain's war against Argentina over sovereignty of the Falkland Islands in 1982, it clearly demanded that the Soviet Union follow a "hands-off" policy in connection with insurrectionary movements in Central America, as had the Nixon administration before it. Such actions suggest that if presidents are to invoke the Monroe Doctrine in the future, they will likely do so selectively, according to their assessment of prevailing geopolitical winds.

THE HOOVER-STIMSON DOCTRINE

While the framers of the Monroe Doctrine and its corollary limited their horizons to the Western Hemisphere, a later statement of national purpose would extend that horizon halfway around the globe. The Hoover-Stimson Doctrine, named for President Herbert Hoover and Secretary of State Henry L. Stimson, actually reiterated earlier pledges regarding American interests in the Far East. In doing so, it sent a mixed message: that while the United States would not recognize territorial changes realized by force of arms, it had no interest in coming to the defense of that principle.

The events precipitating the doctrine's articulation took place in northern China in September 1931, along a section of track on the South Manchurian Railway, which had been administered by Japan since the first decade of the century. An explosion near the railway, subsequently attributed to the Japanese military, was blamed by Japan on Chinese rebels. Japan used the occasion—thereafter known as the Mukden Incident—as a pretext to pacify ever-larger regions of Manchuria. Continued Japanese conquest alarmed the international community, prompting the League of Nations to condemn such aggrandizement. In an effort to underscore its concern, the league sought to enlist on its behalf support from the United States and the administration of President Herbert Hoover. On 7 January 1932, Secretary of State Stimson delivered notes to both Japan and China stating U.S. opposition to the course of events in Manchuria. Stimson's announcement was twofold: first, that the United States would not recognize any treaty that compromised the sovereignty or integrity of China; and second, that it would not recognize any territorial changes achieved through force of arms. It was a statement of pure principle, made even purer by the disinterest and inability of the United States to back up those words with deeds. Given the economic, military, and diplomatic constraints ensuing from the Great Depression, violations of the Hoover-Stimson Doctrine would bring public rebuke by the United States but little else.

Although the Hoover-Stimson Doctrine is often derided as a manifestation of pie-in-the-sky American idealism, its articulation made great sense to a great many at the time. Reflecting widespread revulsion at what the Great War had wrought—the enormous loss of life, manifold disruptions of European societies, and an overwhelming reluctance to repeat the mistakes of the past—the doctrine sought to marshal world opinion in the service of peace. Its appeal to universal standards of conduct reflected the emergence of a new mind-set in world affairs—that there was, in fact, such a thing as an international community and that certain norms governed its behavior. No statement was more emblematic of that consciousness than the Kellogg-Briand Pact of 1928, an agreement signed by thirty-three nations outlawing the use of force as an instrument of national policy.

The doctrine was also rooted in the history of the region. Western interest in China stretched back hundreds of years, but the ability to exercise decisive influence on that country was a more recent phenomenon. Britain's 1842 victory over China in the first of the Opium Wars established a pattern whereby several countries, including the United States, were able to demand most-favored-nation trading status from the Chinese authorities. By the late nineteenth century, the imperial
powers were carving up China into separate spheres of influence. As China lay prostrate, U.S. Secretary of State John M. Hay proposed that those nations adopt an Open Door policy for China, an arrangement that would preserve China's territorial and administrative integrity while maintaining equal trading rights for all. It was Japan, however, that would mount the greatest challenge to the Open Door. Having gained a foothold in Manchuria following the Russo-Japanese War of 1904–1905, Japan applied increasing pressure on China, resulting in its Twenty-One Demands of 1915. American remonstrations to Japan indicated that the United States would not recognize any agreements in violation of the Open Door, a position it reaffirmed in 1917 and then again in 1922. The Mukden Incident of September 1931 represented the clearest challenge to date of that long-stated U.S. position.

The Hoover-Stimson Doctrine also was part of the history of U.S. recognition policy. This policy dated to the early national period when Democratic-Republicans and Federalists, arguing bitterly over a proper response to the French Revolution, questioned whether the United States was obligated to carry out agreements signed with the ancien regime, and vice versa. The issue of diplomatic recognition would reemerge following the War of 1812, as a more assertive United States questioned the wisdom of establishing formal relations with a coterie of weak, newly independent Latin American nations; it was this debate, in fact, that was the backdrop for the Monroe Doctrine. The matter would demand executive attention once again during the administration of President Woodrow Wilson. A series of regime changes in Mexico—some of them bloody—led Wilson to withhold recognition of General Victoriano Huerta, reversing the general principle of conferring legitimacy on whoever could demonstrate de facto territorial control. The Mukden Incident would reopen the issue of whether, and on what grounds, the United States would recognize the sovereignty of a new controlling authority.

Despite America's absence from the League of Nations, U.S. officials hoped that body would act swiftly to resolve the crisis. To prod it into action, the United States sent an observer to attend its deliberations. This led to the formation of a commission of inquiry to investigate the dispute and report back to the league assembly. When in 1932 the commission announced its findings, which blamed Japan for the crisis, the Japanese delegation walked out of the League of Nations. In the interim, a new Japanese government had assumed power and embarked on the further conquest of Manchuria. It was this action, undertaken by Japan in the fall of 1931, that prompted Stimson to issue his policy of non-recognition—a policy suggested, in fact, by Hoover himself.

Although Stimson had hoped his approach would garner European support, formal endorsements were not in the offing. Britain, reversing the role it had played earlier regarding the Monroe Doctrine, let America wave the banner of non-recognition, hoping to benefit from that policy without having to tie itself too closely to the American kite. Ultimately, the League of Nations endorsed Stimson's pledge, although over the next several years a number of its members would recognize Japanese suzerainty over Manchuria.

By most any measure, the Hoover-Stimson Doctrine failed its first test. Only three weeks after the secretary of state delivered his diplomatic notes, Japan attacked the port city of Shanghai, extending its sphere of influence into central China. The United States refused to take action; Stimson wanted to impose sanctions on Japan, but Hoover was reluctant to engage the United States in measures he deemed tantamount to war. Moreover, given the domestic pressures Hoover was facing—including staggering unemployment figures, numerous bank failures, and a massive drop in consumer spending—it was all but impossible to send ill-prepared military forces around the world. The president hoped that China's size and culture would help it absorb the Japanese incursion, and that a dose of moral suasion would help convince the Tokyo leadership to cease and desist. Neither of these developments came to pass.

Insofar as Hoover dictated the nature of America's response during the Manchurian crisis, it seems wrong to castigate Stimson exclusively for policies that came to be associated with his name. Stimson envisioned a series of measures, increasing in severity, which he hoped would compel a Japanese change in behavior; the president, on the other hand, took the more isolationist position. Hoover, in fact, sought to wrestle authorship of the doctrine away from his secretary of state, a curious move given the manifest impotence of the measures it advocated. Yet grasping for evidence of leadership during the 1932 presidential campaign, Hoover wanted Stimson to consign its provenance over to the president. Eventually, Stimson did bestow that honor
upon Hoover. Nevertheless, its principles continue to be associated with Stimson, and any mention of a doctrine continues to bear his name.

The Hoover-Stimson Doctrine would continue to amass a sorry record during the 1930s as the new political orders in Austria, Czechoslovakia, Albania, and Ethiopia—the fruits of German and Italian aggression and intimidation—received widespread international recognition. Fascism’s ascendance, observers would argue, took its cue from Japan’s earlier behavior in the Far East; reluctance to confront Japan emboldened Hitler and Mussolini, creating conditions for the greater horror to come. In this sense, the promulgation of both the Hoover-Stimson Doctrine and the League of Nations judgment might have done more damage to international peace than the withholding of such statements. The failure of both the United States and the international community to back up their words with effective retributive actions thus allowed the Japanese, and perhaps the Germans and Italians, to call the world’s collective bluff, plunging hundreds of millions into global war.

Scholars have regularly disparaged the Hoover-Stimson Doctrine on those grounds, describing it as both toothless and dangerous. Some historians, in fact, have argued that Stimson’s approach was even weaker than that of the League of Nations, for it offered no procedure for mediating the Manchurian dispute. Others have decried its reliance on “legalism”—the reliance on vague notions of universal norms to influence international behavior—at the expense of more “hard-headed” approaches to geopolitics. On the other hand, legal theorists have responded to the doctrine with guarded acclaim, pointing out that its injection of morality into global politics would help to shape an international consensus in the postwar era.

**THE TRUMAN DOCTRINE**

While the Hoover-Stimson Doctrine sought to constrain Japanese militarism, the Truman Doctrine addressed a new and more global threat—that of international communism. The purveyor of that creed, the Soviet Union, had enjoyed a rocky relationship with the United States; since October 1917, Americans had looked upon the Soviets as outcasts and irritants. Then, during World War II, they became allies. With the emergence of the Cold War their status changed again, with Moscow now taking on the attributes of an implacable foe. President Harry S. Truman would help sear that image into the minds of Americans, most spectacularly when, on 12 March 1947, in a message before a joint session of Congress, he laid down a set of principles that would govern U.S.–Soviet relations for decades to come. “At the present moment in world history,” Truman proclaimed, “nearly every nation must choose between alternative ways of life.” Too often that choice was not a free one. It would therefore be the policy of the United States “to support free peoples who are resisting attempted subjugation by armed minorities or by outside pressures.” Although Truman chose not to identify those minorities or groups by name, their identity as communists was hardly in doubt. To help those free peoples—in this case, Greeks and Turks—to withstand communist pressure, Truman would ask Congress to provide them with $400 million in economic and military aid. Yet far more than just Greece and Turkey was at stake, Truman proclaimed. The United States was caught in a global struggle between two opposing ways of life. Consequently, Truman deemed all of “the free peoples of the world” equally worthy of American assistance. By implication, then, the president’s proposal was no mere stop-gap measure. As many in the press and government realized, it aspired to nothing less than the preservation of Western civilization.

Fears of postwar Soviet expansion had ebbed and flowed during 1946. The presence of Red Army troops in northern Iran well past the date established for their departure raised Western concerns about the nature of Moscow’s intentions. Renostimations by U.S. officials, however, led to a Kremlin withdrawal by late spring. Tensions would heat up later that summer as the Soviets pressured Turkey into revising the Montreux Convention—the protocol governing access to the Dardanelles—to allow for a joint administration of the Turkish straits with an eye toward the eventual establishment of Soviet bases in Turkey. Reports of Soviet troops massing along the Turkish border led the Truman administration to conclude that invasion might well be imminent. Turkish and American resistance led Moscow to drop its request, but Soviet behavior continued to worry U.S. officials.

Greece appeared to be the next target of the Soviet pressure campaign. Civil war between communists and monarchists had been raging in that country since the Nazi retreat of 1944, and neither the British, who stepped in as the occupy-
ing power, nor the Americans, who sent millions in aid, were able to quell the strife. Support for the communists came from the Yugoslav leader, Josip Broz Tito, although U.S. officials feared—erroneously, as it turned out—that Moscow was the controlling force.

America's rise to power in the Mediterranean is also the story of Britain's fall from power. Previously, Britain had assumed the role of protector of the states in that area. With its economy in tatters following World War I, however, Britain found it could no longer play that role, and thus feared a Russian surge into the power vacuum it created. On 21 February the British embassy in Washington informed the State Department that Britain would soon be cutting off economic and military assistance to Greece and Turkey.

Committing the nation's resources and prestige to the security and survival of Europe during an era of nominal peace was a radical departure for American policymakers. It certainly stood in stark contrast to Monroe's pledge not to intervene in European affairs. As a result, administration officials thought it necessary to portray the situation in the most dramatic of terms. The president's address to the nation therefore employed rhetoric bordering on the apocalyptic, casting the struggle with Moscow in a highly dualistic light.

The choice facing America, Truman argued, was between two opposing and irreconcilable ways of life: between the virtues of democracy and the horrors of totalitarianism. Although the East-West conflict had become more ideologically polarized during the preceding twelve months, the administration had yet to frame it—at least publicly—in such a dichotomous fashion.

In doing so, the Truman Doctrine wove together several themes running through the national dialogue on the Soviet Union and thrust them out into the public realm with substantial force. One of them involved the image of “Red fascism.” Although parallels between fascism and communism had been popular for years, the Truman Doctrine helped to work that image into the public consciousness, locking in the notion that Soviet Russia posed an equal if not greater threat to world peace than had Nazi Germany. The Truman Doctrine also contributed to the emergence of an equally powerful representation of the enemy: the “Communist monolith.” Belief in the “monolith” presupposed that Greek communists, like all communists, were tools of the Kremlin. This was a viewpoint shared widely—and not without reason—by administration personnel and media figures alike. By minimizing the differences between any and all totalitarians, the Truman Doctrine reinforced that interpretation of communist behavior.

Not everyone in the administration embraced the overly ideological cant of the president's speech. Officials such as policy planning director George Kennan, State Department counselor Charles Bohlen, and Secretary of State George Marshall thought Truman's comments either too dramatic, too overwrought, or too open-ended. Similarly, Walter Lippmann, the nation's leading journalist, likened the doctrine to “a vague global policy” devoid of any limits, and described it as “the tocsin of an ideological crusade.” Indeed, fallout from the speech suggested that the public was—from the administration's point of view—focusing too narrowly on its military and ideological aspects and ignoring its economic dimension. The administration was thus caught in a public relations paradox. On the one hand, it sought to brief the country on what was transpiring in Europe; only by “shocking” the nation, it believed, could the American people grasp the issues at stake. Yet the resultant upsurge in anticommunist sentiment threatened to overwhelm the administration's capacity to manage it.

Hoping to get the word out in a more sober fashion, a speech by Undersecretary of State Dean Acheson reframed the debate around the administration's preferred theme of economic reconstruction. Marshall would return to that theme in early June, laying the groundwork for the recovery plan that bore his name.

In the interim, Congress debated the terms of the Greek and Turkish aid bills. Their passage was by no means assured, for Republican victories in the 1946 election ushered in a Congress that was not in Democratic control for the first time since 1932. Many of those who now sat in the majority had won their seats on pledges of fiscal restraint and tax reduction. Lawmakers thus sought to limit the scope of Truman's policy, a restriction that Acheson refused to accept; future requests for aid, he stated, would receive consideration on a case-by-case basis. Congress raised additional concerns over whether the recipients of foreign aid could be considered democratic. Acknowledging that neither the Turkish government nor the Greek forces were paragons of liberal virtue, administration officials urged Congress to fund both groups nevertheless. Otherwise, they argued, both Turkey and Greece
would lose the ability to govern themselves and lay vulnerable to forces aided and abetted by the Soviet Union. Time was of the essence, Acheson declared; he and his associates urged quick action on the Greek and Turkish aid bills, arguing that the United States, and not the United Nations— with its clumsy machinery—was the proper engine for the aid program. Congress passed the aid measures and on 22 May Truman signed the bills. The Truman Doctrine was now the operative principle of U.S. foreign policy.

If the Monroe Doctrine established the general principles for subsequent declarations of American foreign policy, the Truman Doctrine established the more particular guidelines for the duration of the Cold War. It was the most dramatic statement issued by the administration since the emergence of conflict with the Soviets. It established a precedent of sweeping appeals to aid democratic forces, leaving to subsequent administrations the privilege of deciding precisely what constituted democratic behavior. Perhaps the greatest testament to its impact is the legislation and diplomacy that followed, more or less logically, from the premises it established. Within three years, the administration would usher through Congress bills establishing aid programs and treaties such as the European Recovery Program (the Marshall Plan) and the North Atlantic Treaty Alliance, committing the United States both economically and militarily to the defense of Europe. NSC 68, a 1950 National Security Council report to the president, and the attendant legislation that tripled the defense budget, likewise were expressions of the themes and arguments contained in Truman’s speech. Indeed, for the next several decades, much of the nation’s international behavior—from its involvement in Korea and Vietnam to its support of Afghani and Nicaraguan rebels—grew out of the postulates laid down in the Truman Doctrine.

Historians have long debated the merits and demerits of the Truman Doctrine. Some have described it as an inherently self-serving policy. For these scholars, the Truman Doctrine was the opening gambit in America’s quest for global economic hegemony; the plan, they charge, was to make the world safe for American capitalism. To be sure, U.S. policymakers were acutely aware of economic concerns as they mapped out American strategy in the postwar era. Fears of a “dollar gap” in Europe mounted when American leaders considered the domestic implications of the continent’s misfortune; the inability of Europeans to purchase U.S. goods threatened to slow down the American economic recovery, leading to renewed concern about recession and even depression. The Marshall Plan, as the argument goes, thus primed the American pump, allowing European consumers to maintain levels of spending adequate for U.S. economic vitality.

It is not entirely clear, however, whether American policymakers focused on those issues with such single-minded zeal. Administration officials certainly understood the reciprocal features of an economically vital Europe and United States and were no doubt interested in maintaining growth in the home market. But they also recognized the dynamic between the economic vitality of Europe and the political health of Europe; it was their contention that a vibrant economy, both home and abroad, was the best protection against communist gains. It was most likely this larger picture, involving a wider matrix of forces, that they had in mind as they contemplated their response to the British withdrawal notes of February 1947.

Scholars have also questioned the wisdom of Truman’s rhetoric. Some have argued that his use of Manichean imagery locked the nation into a rigid, inflexible policy toward the Soviet Union. Diplomacy— the art of compromise— was all but impossible when one’s counterparts were regarded as evil. Likewise, historians have argued, the persistence of that Manichean and monolithic framework prevented policymakers from recognizing difference and division within the communist world. An earlier appreciation of fragmentation in the Soviet bloc—and of downright hostility between some of its members—might have prevented America from pursuing some disastrous policy options, such as those involving the war in Vietnam.

These arguments need to be qualified, especially in light of evidence emerging from the former Eastern bloc. While the Truman Doctrine certainly did its part in establishing a powerful vocabulary for the Cold War, it seems as though the language it used reflected some fundamental truths about international communism. Stalinist Europe was very much a closed system, with the Soviet Union controlling much of what went on there. True, Tito’s Yugoslavia was able to assert its independence from the Soviet grip, but that was the exception; the regionwide purge resulting from the Tito split only reinforced the tendency for the other Eastern European nations to do Moscow’s bidding. Chinese Communists were no
more willing than their European counterparts to contravene Soviet wishes. Although tensions often resulted from tactical differences between Moscow and Beijing, on the larger questions the two stood side by side. As a result, American officials had little chance to court the Chinese Communists either before or after the death of Soviet leader Joseph Stalin. Things would change during the late 1950s and the 1960s, but so, too, would U.S. policy; the consensus established by Truman during the late 1940s would come unraveled as the nation plunged further into the jungles of Southeast Asia, leading another generation of policymakers to recast some of the early Cold War premises.

THE EISENHOWER DOCTRINE

By the mid-1950s the Cold War had undergone a transformation. Stalin’s death in March 1953 ushered in a period of transition for the Soviet Union, prompting the Kremlin’s new leadership to stabilize its own power as well as Moscow’s position with regard to the NATO alliance. Yet changes in the international arena would encourage those men, as well as their counterparts in the West, to view the developing world as a new site for East-West competition. President Dwight D. Eisenhower would engage the Soviets in that global battle for hearts and minds, a conflict that threatened to become particularly fierce in a region vital to U.S. national security: the Middle East. Eisenhower’s January 1957 pledge to defend that region from “any country controlled by international communism” recalled his predecessor’s commitment to “support free peoples” resisting foreign aggression. Eisenhower’s willingness to commit American troops to that project went beyond what Truman had offered in March 1947; still, both statements were cut from the same cloth. Working from the premises of the Truman Doctrine while extending its range of policy options, Eisenhower added his name to a growing list of policymakers whose statements had risen to the level of American political doctrine.

Like the Monroe and Truman Doctrines, the Eisenhower Doctrine grew out of a specific set of historical circumstances. Since 1946 the United States had sought to counter Soviet encroachment in the Mediterranean and the Persian Gulf; its program of assistance to Greece and Turkey, as well as its rhetorical defense of Iran, served to keep those nations within the Western orbit. Efforts to strengthen anticommunist forces in the region fell through, however, as Arab support for a Middle Eastern defense organization foundered over U.S. aid to Israel. Failure to erect a security structure for the Middle East in general—and for Western oil interests in particular—loomed large as the tide of anticolonialism grew in that part of the world.

Egyptian leader Gamal Abdel Nasser would rise to power on the force of anticolonialism, and the attraction of Nasser’s equally potent message of pan-Arabism would pose further challenges to Western interests. The Eisenhower administration equated Nasser’s radicalism and anti-imperialism with communism and hoped to contain the spread of those forces, a project of equal interest to Britain. In an effort to foster pro-Western sentiment, Britain tied itself to Iraq, Iran, Turkey, and Pakistan—each a nation bordering the Soviet Union—in a mutual defense organization known as the Baghdad Pact. Tensions in the region continued to ratchet upward as Nasser received arms from Czechoslovakia and, more dramatically, nationalized the Suez Canal in 1956. The ensuing crisis over Suez damaged British and French prestige, embarrassed the United States, and resulted in a propaganda windfall for Egypt and the Soviet Union. Political power in the region thus seemed to be swinging away from the West and toward the communist world.

Eisenhower attempted to reverse that trend in early 1957. Addressing a joint session of Congress on 5 January, the president outlined what came to be known as the Eisenhower Doctrine, a plan of action for combating communism in the Middle East. A resolution designed to implement the doctrine authorized the president to provide economic and military cooperation and assistance to “any nation or group of nations in the general area of the Middle East” fighting to maintain their independence. Money for that initiative, amounting to $200 million, would come from funds previously earmarked for the Military Security Act of 1954. Aside from providing economic aid, the resolution granted the president the option of using armed force “to assist any such nation or group of nations requesting assistance against armed aggression from any country controlled by international communism.” After months of sometimes pointed debate—with lawmakers questioning both the imminence of communist aggression and the wisdom of granting the president a blank check for engaging U.S. forces—Congress passed the resolution, providing the
commander in chief with the tools needed to carry out the nation's foreign policy. The administration would invoke the Eisenhower Doctrine a number of times over the course of the following two years. A political crisis in Jordan, which involved King Hussein's ouster of pro-Soviet members from his cabinet in April 1957, provided the first opportunity for doing so. Claiming that Jordan's independence was vital to the United States, Eisenhower ordered the Sixth Fleet into the eastern Mediterranean. When stability returned to Jordanian politics, Eisenhower attributed that relative tranquility to American resolve. Tensions in the region remained high nevertheless, with Nasserism adding a potent ingredient to the East-West conflict. Lebanon would bear the brunt of that mix when an internal political struggle mushroomed into an international one. President Camille Chamoun initiated that conflict in 1958, when he tried to circumvent the Lebanese constitution and extend his hold on power. Fearing a loss of control, Chamoun appealed to the United States for support under the Eisenhower Doctrine, citing Syrian meddling in Lebanese affairs as a pretext for his request. For six weeks the United States did not oblige him. It was not until 14 July, when a coup in Iraq installed a Nasserite and pro-Soviet regime in Baghdad, that the administration acted. Responding to Chamoun's renewed calls for support, and coming on the heels of British aid to Jordan, the

Doctrines

During the Cold War, America's allies and enemies also resorted to doctrinal statements of policy. Here are two of the more noteworthy declarations.

The Hallstein Doctrine  This doctrine was enunciated by the West German foreign minister Walter Hallstein in the context of the struggle to codify the postwar fate of the two Germanys and the shape of Eastern Europe. The Soviets had proposed that the two sides end their wrangling over Berlin and ratify the boundaries of the two German states. West German Chancellor Konrad Adenauer, who continued to endorse the Bonn government as the true government of Germany, resisted this plan and countered with his own statement of intentions. The Hallstein Doctrine declared that West Germany would have no relations with any country that recognized the existence ("entered into diplomatic relations") with the German Democratic Republic. The Bonn government followed through on its pledge, breaking off relations with Yugoslavia in 1957. Moscow's inability to settle the German question led Soviet premier Nikita Khrushchev, in 1958, to issue an ultimatum to the United States on the fate of Berlin, demanding the full incorporation of that city into East Germany. Failure to achieve that settlement heightened tensions over Berlin and contributed to Khrushchev's placement of missiles in Cuba in 1962. Cuba, in fact, became the second nation to run afoul of the Hallstein Doctrine, leading Bonn to break relations with Havana in 1960.

The Brezhnev Doctrine  During the spring and summer of 1968, reformers in the Czechoslovak Communist Party, led by Alexander Dubcek, sought to create a new brand of socialism with a human face. Those moves, and the Czech leadership's resistance to Moscow's disapproval, occasioned the Soviet invasion of Czechoslovakia in August 1968. Defending his policy of force, Soviet premier Leonid I. Brezhnev maintained that "when internal and external forces that are hostile to socialism seek to reverse the development of any socialist country in the direction of restoring the capitalist system, when a threat to the cause of socialism in that country appears, and a threat to the security of the socialist community as a whole, that is no longer only a problem for the people of that country, but also a common problem, a matter of concern for all socialist countries." President Ronald Reagan would cite the Brezhnev Doctrine in his own doctrinal statement of principles.
United States inserted fifteen thousand troops into Lebanon, the clearest application of the Eisenhower Doctrine to date.

Some have argued that Eisenhower’s Eurocentrism and unfamiliarity with regional concerns blinded him to Middle Eastern realities, making him too willing to interpret the region’s nationalist movements as hostile to U.S. interests. Much of this stemmed from Eisenhower’s equating of Nasserism with communism. The president, in fact, attributed the Lebanese turbulence to the work of communist elements, a development that, he believed, threatened to engulf the entire region. His fear was that a single communist success might precipitate a domino-like chain reaction in which the governments of Lebanon, Jordan, and Saudi Arabia would each fall to the forces of Nasserism. Invoking the Munich analogy as well as the domino metaphor, Eisenhower declared Lebanon to be the victim of “indirect aggression from without,” aggression that spelled trouble for pro-Western forces from Europe to Asia. His decision to send in the marines, therefore, stemmed largely from those broader concerns.

It is far from clear whether the destabilization of Lebanon would have resulted in the domino-like scenario Eisenhower envisioned. Nor is it clear whether anti-Western or pro-Soviet elements in the region would have been as hostile to America as Eisenhower imagined. Scholars have pointed to Iraqi general Karim Kassem as a case in point. Although Kassem would sign a defense treaty with Egypt and take his country out of the Baghdad Pact, Iraq emerged from the crisis as less ensconced in the Soviet camp than first believed. Neither of those measures—neither the arms deal nor the abrogation of the defense treaty—indicated complete subservience to the Kremlin. Moreover, while Kassem did increase his ties with Moscow, he also increased the flow of Iraqi oil to the West, hardly the response of an out-and-out Soviet lackey.

Historians have likewise questioned the wisdom of dispatching the U.S. Sixth Fleet to the eastern Mediterranean. While that show of force was supposed to deter Syria from meddling in Jordanian, Lebanese, and Iraqi politics, the move backfired, according to some historians, encouraging greater Arab unity in the face of Western intervention. Other scholars have claimed that the Eisenhower Doctrine sought to combat a threat that was largely imaginary. Nasser had no great affinity for the Soviet Union, and even less for Marxism. Rather, his anticolonialism was directed largely at Britain and France—not at the United States—leading Eisenhower to squander whatever good will he might have had with the Egyptian leader. Still others have cited Eisenhower’s own actions as testaments to his doctrine’s futility. Six months after the marines landed in Lebanon, they point out, the administration was reevaluating its entire approach to the Middle East, choosing to work with, and not against, Arab nationalism. By 1958 the Eisenhower administration was funneling over $150 million in aid to Egypt, hardly the result one would have expected prior to the doctrine’s enunciation.

THE NIXON DOCTRINE

Eisenhower’s vice president, Richard M. Nixon, would challenge the premises and augment the scope of Cold War presidential doctrines. One of Nixon’s goals, in fact, was to limit the type of intervention that Eisenhower had joined in Lebanon, where the commander in chief responded to an international crisis by “sending in the marines.” He would introduce his new approach on 25 July 1969, the very day that America began its lengthy retreat from the jungles and marshes of Vietnam. Speaking to reporters on the island of Guam, Nixon described the U.S. troop withdrawal in terms that endowed it with a broader, strategic rationale. Retrenchment, according to Nixon, would subordinate the nation’s commitments to its interests, reversing the recent trend of American policy. Nixon’s policy would likewise encourage friends and allies to marshal greater resources in their own defense, even as the United States continued to meet its treaty obligations. Finally, it would grant the United States greater flexibility to respond to new diplomatic realities.

Nixon derived these principles from his appraisal of the postwar international environment, the features of which, he argued, had undergone a recent and dramatic transformation. As Nixon explained, the United States was the only major country to escape the social and economic destruction of World War II. Consequently, in those first years after the war, friends and former enemies depended on the United States for aid in rebuilding their economies and resisting communist penetration. By the late 1960s, however, that first postwar era had given way to a new international configuration. Former recipients of U.S.
economic and military assistance were now capable of contributing more to their own defense; developing nations, at one time easy marks for communist agitators, now required less American help and protection. Of perhaps greater importance were the events taking place within the Eastern bloc. Soviet crackdowns on East Germany, Hungary, and Czechoslovakia, as well as border clashes with China, were easing earlier fears of a monolithic communist movement. Those incidents, according to Nixon, testified to the “emerging polycentrism of the communist world,” an altered landscape that presented the United States with “different challenges and new opportunities.”

The Western alliance had also undergone something of a transformation. France withdrew from NATO’s military command in 1966, challenging U.S. leadership of a united Western front. Britain, America’s foremost partner in Europe, continued its fall from imperial glory, retreating from positions east of Suez in 1968. Economic troubles in both Europe and the United States would further tax the alliance, straining America’s ability to “pay any price” for the survival of liberty. And the war in Vietnam continued to straitjacket America’s flexibility and drain its resources.

Those realities led Nixon to reshape the rhetoric and practice of U.S. foreign policy. Although he accepted the premise that the United States remained “indispensable” to world peace and stability, Nixon also recognized the limits of American power. Other nations, he maintained, “should assume greater responsibilities, for their sake as well as ours,” a clear admission that the United States could not go it alone. America would, therefore, seek to balance the “ends” it desired in its foreign policy with the “means” available for doing so.

Nixon’s Guam statement was the first indication that the president would be adopting a new strategic posture, prompting reporters to label its particulars the Guam Doctrine. Nixon and his national security adviser Henry Kissinger resisted that appellation and sought to change it, believing that a statement of such importance should commemorate its originator rather than its place of origin. Yet the newly coined Nixon Doctrine was vague enough to require repeated and lengthy explanation. The president sought to clarify his intent in an address to the nation on 3 November 1969. First, he noted, the United States would “keep all of its treaty commitments.” Second, it would “provide a shield” should a nuclear power threaten either the freedom of a nation allied with the United States or the existence of a country deemed vital to U.S. security. Finally, and perhaps most significantly, Nixon vowed to maintain the outward flow of economic and military assistance in accordance with U.S. treaty commitments. “But,” he added, “we shall look to the nation directly threatened to assume the primary responsibility of providing the manpower for its defense.”

Southeast Asia would be the setting for the most visible application of the Nixon Doctrine. In an attempt to extricate the United States from the war in Indochina, Nixon sought to “Vietnamize” the conflict by having indigenous troops supplant American forces. It was a program that took four years to complete, with the last U.S. troops leaving Saigon in 1973. That policy, part of a broader effort to reduce American commitments abroad, would also find a home in the Middle East, where Nixon tried to build his new security structure upon the “twin pillars” of Iran and Saudi Arabia. The shah of Iran, Mohammad Reza Pahlavi, would benefit greatly from America’s reliance on proxies, receiving a virtual blank check from Nixon and Kissinger to purchase enormous sums of American military hardware. It was a shopping spree that would boomerang on the shah—and on the United States—before the decade was out.

These manifestations of retrenchment were themselves part of a broader plan to alter relations with the Soviet Union and China. As he laid out in his Guam remarks, Nixon sought to capitalize on the “polycentrism” of the communist world. His visit to China in 1972 opened a new chapter in the Cold War; America would now practice “triangular diplomacy” and engage both the Chinese and the Soviets, creating new opportunities for U.S. foreign policy. One of those was in the field of arms control, where U.S. and Soviet officials sought to rein in a costly and dangerous arms race. Agreements regarding strategic weapons and antiballistic missile systems signaled a new spirit of cooperation between the superpowers, a relaxation of tensions that came to be known as détente. Given the overlap between those developments and his strategic vision, Nixon would ascribe his Soviet initiatives, as well as the commercial, cultural, and diplomatic ventures begun with the People’s Republic of China, to the Nixon Doctrine as well.

Supporters hailed the Nixon Doctrine and the diplomacy of the Nixon-Kissinger team as a new, remarkable, and genuine alternative to the bitter contentions of the first postwar years. The domestic and international circumstances of the
late 1960s and early 1970s, they observed, simply would not allow for massive interventions along the lines of Korea and Vietnam. Instead, the United States would “balance” the distribution of power in the international arena rather than pursue preponderant advantage. Many commentators found this a welcome change, even a sign of political maturity. For the first time in the postwar era, the United States was to a great degree experiencing and acclimatizing itself to the limits of American power.

Critics of the doctrine divided over its novelty, meaning, and effect. Some regarded Nixon’s policies in Southeast Asia—widening the war to Cambodia and dragging out American involvement for another four years—as fully consistent with the tactics of his predecessors. Others have charged that Vietnamization, a policy supposedly born out of a new strategic calculus, was less an inspired idea than an acceptance of, and rationalization for, failure. In fact, Nixon’s use of proxies seemed to inaugurate a new phase of the Cold War; his successors would build upon that policy, supporting “freedom fighters” throughout the developing world. Far from signaling a lessening of tensions or an American retreat from the Cold War, the Nixon Doctrine simply shifted the responsibility for fighting it. Now others would bear America’s burden.

Still other scholars have questioned Nixon’s use of proxy forces to safeguard American interests. Iran provides the most glaring example of that policy gone awry. In opening America’s military coffers to the shah, Nixon led the appetite of a ruler increasingly out of touch with his own people, accelerating tensions in a country deemed vital to the U.S. national interests. While that unrest derived most of its energy from internal factors, initiatives associated with the Nixon Doctrine contributed to such instability, paving the way for the Iranian revolution in 1979.

Detractors have also faulted the Nixon Doctrine for actually expanding the ranks of nuclear-capable nations. According to this critique, pledges to take friends and allies under the American shield left countries to wonder whether, and under what circumstances, they qualified for such protection. Nixon’s failure to identify potential beneficiaries led nations such as Israel, India, Pakistan, and Brazil to join the nuclear club, preferring their own nuclear shields to the ambiguities inherent in an American one.

Finally, scholars have pointed out inconsistencies in the Nixon Doctrine. If its goal was to bring America’s commitments in line with its resources, then pledges to aid countries threatened by communist subversion threatened to widen those commitments immeasurably. Application of the doctrine to the communist world seemed equally muddled. Although Nixon professed a recognition that international communism was polycentric rather than monolithic, he continued to oppose communist forces as though a victory for any of them was a victory for all of them, and especially for Moscow.

In the end, the Nixon Doctrine suffered from an inherent ambiguity. In trying to fashion a broad strategic posture for the United States, it became too diffuse, being associated with everything from détente to Realpolitik, to triangular diplomacy, to arms control, and to the use of proxy forces. In sum, it became the Nixon foreign policy agenda writ large. As such, it lacked a single, unifying principle tying administration initiatives together, even promoting one set of policies at the expense of another.

**THE CARTER DOCTRINE**

The era of détente would prove to be short-lived. Challenges to the Nixon administration emerged from both the right and left of the American political spectrum, questioning the moral basis as well as the geopolitical rationale of engaging the Soviets as equal partners. President James Earl Carter was no more adept at salvaging the spirit of cooperation than was President Gerald Ford before him. Carter’s focus on human rights alarmed Soviet leaders, who were accustomed to Nixon’s disregard for such issues. From Carter’s perspective, a series of events, including conflict in the Horn of Africa and the discovery of Soviet troops in Cuba, led Carter to adopt a more hawkish position toward the USSR. Moscow’s invasion of neighboring Afghanistan would bring him more firmly into the cold warrior camp. The Kremlin’s December 1979 push south of its border jolted the administration, leading Carter to take several measures that, collectively, marked the clearest indication that relations between the United States and the Soviet Union were in a free fall.

The president clarified the new situation one month later in his State of the Union Address of 23 January 1980. Referring specifically to the Soviet invasion, Carter declared that “an attempt by any outside force to gain control of the Persian Gulf region will be regarded as an assault on the vital interests of the United States of America, and
such an assault will be repelled by any means necessary, including military force.” By the following morning, the New York Times had given that policy a name: the Carter Doctrine.

Although the Soviet invasion was the proximate trigger for the Carter Doctrine, momentum for the president’s policy shift had been building over the previous two years. Much of that energy flowed from concern over the fate of Iran. One of the “two pillars” undergirding America’s security structure in the Middle East, Iran had been supporting U.S. interests for close to twenty-five years. Its position was so vital that the administration rarely, if ever, questioned Iran’s ability to play that role; Carter himself labeled Iran “an island of stability” as late as January 1978. Yet in just over a year, the shah would be deposed, Ayatollah Ruhollah Khomeini would return from France and transform the country into an Islamic republic, and fifty Americans would be taken hostage by Iranian students and militants. With the Nixon Doctrine in tatters, U.S. policymakers sought to fashion a new strategy for the region.

Fears of regional instability were only partly responsible for Carter’s movement toward a new strategic posture. According to the president, an amalgam of three distinct forces had combined to prompt his declaration of U.S. policy: “the steady growth and increased projection of Soviet military power beyond its own borders; the overwhelming dependence of the Western democracies on oil supplies from the Middle East; and the press of social and religious and economic and political change in the many nations of the developing world, exemplified by the revolution in Iran.” In all, a host of events had led the administration to conclude that American interests in the Persian Gulf were under grave threat. Only a more forceful statement of purpose could begin the process of redressing the regional and—in the administration’s calculation—global balance of power.

The doctrine also emerged out of a long-running debate within the administration over its policy toward the Soviet Union. Carter’s principal foreign policy aides, Secretary of State Cyrus Vance and national security adviser Zbigniew Brzezinski, differed over the degree to which Washington should confront the Soviets. It was Brzezinski’s contention that Moscow had never stopped probing for weak spots around the globe; for him, instability in both Central America and Africa testified to the Kremlin’s continuing desire for ideological competition, especially in the developing world. Detente, he surmised, had merely allowed the Soviets to continue their expansionist thrust there under the cover of superpower cooperation. In contrast to Vance’s preference for conciliation, Brzezinski had been lobbying for a more aggressive stance toward Moscow since the earliest days of the administration. A series of developments, including the discovery of Soviet soldiers in Cuba and the Soviet invasion of Afghanistan, provided further support for Brzezinski’s arguments. By the time that Carter delivered his State of the Union Address in January 1980, the Brzezinski approach had won out.

A host of measures associated with the Carter Doctrine followed quickly on the heels of its enunciation, signaling a new phase in Carter’s approach to the Soviet Union and to his overall practice of foreign policy. Within a month of his address, Carter sanctioned the creation of a Rapid Deployment Force, a contingent of as many as 200,000 troops, designed to expedite the projection of American military power around the globe, and especially in the Middle East. He would take additional steps to improve America’s combat readiness, preparing the groundwork for a repositioning of the military draft and asking Congress for a sharp increase in defense spending. Other policies would impinge on U.S.–Soviet relations as Carter enacted a partial grain embargo and boycotted the Moscow Olympics. Still further actions, whereby Carter withdrew a second Strategic Arms Limitation Treaty from senatorial consideration and extended the number of Soviet sites targeted by U.S. missiles, recast the nuclear dimension of the two countries’ relationship. On top of those actions, Carter embraced Pakistani ruler Mohammad Zia-ul-Haq, indicating his willingness to subordinate human rights concerns to the struggle against Soviet aggression. By and large, those measures appealed to a Congress eager for action after the previous year’s indignities.

They also struck a chord with the American public. Opinion polls revealed general support for the president’s statement, suggesting that Carter had correctly gauged the popular mood. Responding to criticism that Carter had engaged in pandering and political grandstanding, Brzezinski defended his president, explaining that the administration needed to make such a proclamation if only to steel the public for the demands ahead. Journalists, however, while hardly indulgent of Soviet behavior, interpreted Carter’s speech as a fundamentally political move, designed to reshape the president’s image at the outset of an election year. Scholars, too, have sub-
jected the doctrine to withering critiques. Some have described it as little more than empty posturing, crafted more to improve Carter's political fortune than to alter Soviet behavior. Still others maintain that Carter acted rashly, drawing conclusions about Soviet motives based on very little evidence—motives he himself would qualify throughout the remainder of his presidency. Still others have faulted the Carter Doctrine for its ambiguity, noting that it failed to define, with any sense of precision, the nature of aggression, the characteristics of an outside force, or even the boundaries of the Persian Gulf itself.

Moreover, scholars have argued, the Carter Doctrine and policies associated with it offered little in the way of tangible benefits. None of the measures aimed at the Kremlin—not the grain embargo, nor the Olympic boycott, nor the curtailment of additional trade—forced the Soviets out of Afghanistan. Nor did the president’s unilateralism sit well with his European allies; only British Prime Minister Margaret Thatcher supported Carter’s approach. At the same time, however, European business capitalized on the chillier relationship as several firms concluded lucrative deals at America’s expense.

While the Carter Doctrine secured few if any tangible gains—even its progenitor lost at the ballot box that November—it would continue to shape U.S. policy during the Cold War, largely because subsequent administrations bought into its premises. President Ronald Reagan and his advisers regarded the Soviet Union as an aggressive, expansionist power; if anything, they, and the Bush administration that was to follow, were even more willing to protect U.S. interests in the Persian Gulf from Soviet predations and political instability.

The Carter Doctrine also hastened the buildup of American arms, a process that was already under way by January 1980, and for which some historians give him high marks. It would be the Reagan administration, however, that would capitalize on the perceived need for military expenditures, expanding the size and cost, and revamping the shape, of America’s military forces.

In relation to other Cold War presidential statements, the Carter Doctrine fit squarely within their rhetorical barriers. It maintained Truman and Eisenhower’s focus on the Mediterranean and Middle East, a region that had become increasingly vital to U.S. officials in the aftermath of the October 1973 Yom Kippur War and the ensuing Arab oil boycott. Indeed, it echoed the excited language of both the Truman and Eisenhower Doctrines, offering to assist those nations threatened by totalitarian aggression. And in associating himself with those two statements of national policy, Carter distanced himself from the previous two administrations. His willingness to intercede unilaterally in Middle Eastern affairs testified to the poverty of the Nixon Doctrine’s “twin pillar policy,” the very structure of which was now obsolete. Nevertheless, U.S. support for the Afghan resistance to the Soviet Union suggests that elements of Nixon’s approach remained intact; the United States would continue to assist proxy forces resisting Soviet advances when such a policy proved fruitful, and would seek to impose its own forces when the situation demanded it.

THE REAGAN DOCTRINE

For the most part, the doctrines of American foreign policy have sprung largely from a sense of crisis in the world at large. From the early nineteenth until the late twentieth century, whenever presidents saw fit to articulate certain principles of American foreign policy, they did so in an environment of either apparent danger or impending opportunity. The Reagan Doctrine was no different. Presupposing a world of good and evil, it operated on the assumption that evil, in the form of the USSR, was gaining the upper hand. To Reagan and his advisers, examples of Soviet perfidy, including support for Marxist movements around the globe, were numerous; moreover, Soviet adventurism, from the Horn of Africa in the 1970s to Central America in the 1980s, showed no signs of abating. Reagan was intent on arresting that trend—a trend, he believed, that Carter had done little to reverse. Therefore, he adopted the rhetoric of the early Cold War, advocating policies equally assertive and bold in scope.

Reagan laid out that vision in his State of the Union Address of 6 February 1985. “We must not break faith,” he declared, “with those who are risking their lives—on every continent from Afghanistan to Nicaragua—to defy Soviet-supported aggression and secure rights which have been ours from birth.” The president went on to equate anticommunist forces with American colonists who had fought the revolutionary war, describing those latter-day patriots as “freedom fighters” for democracy. Providing aid to those groups was not only morally just but geopolitically sound. “Support for freedom fighters,” Reagan avowed, “is self-defense.” It would be months
before those declarations would take shape as a fixed statement of policy. In the interim, a further pledge to support “freedom fighters,” made on 22 February by Secretary of State George Shultz to the Commonwealth Club in San Francisco, lent added heft to Reagan’s message. But it was neither Reagan nor his advisers who put the president’s name to the set of policies he was announcing. Rather, it was Charles Krauthammer, a commentator on foreign affairs, who coined the term “Reagan Doctrine” in a Time magazine column of April 1985. Reagan’s practice of waging Cold War through proxy forces had a long doctrinal pedigree, one that dated back to the early years of the Cold War. Presidents from Truman through Carter had all sought to aid governments or movements battling communism, but it was Reagan who, arguably, endowed that policy with its greatest energy. The belief that Moscow was supporting leftist movements in the Third World was one of the doctrines guiding principles. As Reagan commented during the 1980 presidential campaign, “the Soviet Union underlies all the unrest that is going on. If they weren’t engaged in this game of dominoes, there wouldn’t be any hot spots in the world.” Reagan himself chose to play that game early in his administration, authorizing the Central Intelligence Agency in 1981 to begin financing the “contra” forces battling the pro-Soviet Sandinista movement for control of Nicaragua. Funding for such anticommunist units suggests that the Reagan Doctrine appeared in practice long before it became enshrined as such.

Aside from injecting an explicitly moral component into the nation’s conduct of foreign affairs, the Reagan Doctrine augmented the geopolitical rationale of earlier efforts. It was the administration’s position that the Truman Doctrine’s version of containment, which had been designed originally to thwart Stalin’s aims in Europe, was obsolete. Since the 1950s the Kremlin had achieved considerable influence in the Third World, indicating that Moscow’s ambitions were more global than originally imagined. This new reality, according to the administration, called for a revision of those basic postulates first laid down by Policy Planning Staff director George Kennan during the early years of the Cold War. With the Reagan team prepared to challenge the Soviets all over the globe, administration spokespersons began to call their approach “containment plus.”

Reagan officials would add an offensive component to containment that was at least as explicit—and more wide-ranging—than anything that policy had sanctioned during the early Cold War. Secretary of State George Shultz, like Secretary John Foster Dulles before him, spoke of “rolling back” Soviet gains, recapturing nations and peoples for democracy. Yet Shultz pledged to do so in a new environment, where Moscow was a global power committed to the safeguarding of communist regimes. That Soviet conceit, known as the Brezhnev Doctrine—a 1968 statement by Premier Leonid Brezhnev declaring the irreversibility of socialist gains—was anathema to Reagan, “an arrogant pretension,” as he termed it, “that we must face up to.”

The administration’s reluctance to cede virtually any ground to communism revealed another shift in America’s Cold War policy and led Reagan to contravene a principle established in the Nixon-Ford years during the 1970s. That principle, known as the Sonnenfeldt Doctrine—after State Department counselor Helmut Sonnenfeldt—upheld the Nixon-Kissinger strategy of according greater legitimacy to Soviet security concerns. Speaking to a gathering of U.S. ambassadors in December 1975, Sonnenfeldt urged the Soviets and the Eastern Europeans to seek a more “organic” relationship, downplaying the oppressiveness of that relationship while at the same time advocating a “more autonomous existence” for Eastern Europe “within the context of a strong Soviet geopolitical influence.” Displeasure with that position, on both moral and geopolitical grounds, led the Reagan administration to adopt a more aggressive, global policy that challenged the legitimacy of Soviet power.

Although Reagan was unquestionably supportive of the doctrine that bore his name, his role in formulating it seems to have been quite limited. His distance from that project accords with the operating style of a president whose involvement in the day-to-day tasks of policymaking was minimal at best. Clearly, however, Reagan was in tune with the doctrine’s precepts—ideas that sprang from key advisers such as CIA director William Casey, UN ambassador Jeane Kirkpatrick, Defense Secretary Caspar Weinberger, and Attorney General Edwin Meese. Speechwriters and publicists such as Anthony Dolan, Peggy Noonan, and Patrick Buchanan were equally important in shaping the message for public consumption. In the end, however, it was Reagan, through his mastery of public speaking, who sold it to the nation.

Reagan would implement his doctrine in a variety of locales around the world, from Asia to Africa to Central America. In Afghanistan, the
president sought to aid forces working to topple the pro-Soviet government in Kabul. Using means reminiscent of the Nixon Doctrine, Reagan provided the guerrillas with substantial amounts of military assistance in their battle against the invading Soviets. The administration offered similar support to Nicaraguan contras battling communist-dominated Sandinistas who had overthrown longtime dictator Anastasio Somoza Debayle. Likewise, Reagan offered aid to anticommunists in Afghanistan competing with the Soviet-backed government for control of that newly independent country. And in Cambodia the administration propped up a coalition of forces working to unseat a government installed by the Soviet-sponsored Vietnamese after Hanoi's invasion of 1979.

The track record of the Reagan Doctrine is mixed. The administration got what it wanted in Afghanistan: strong resistance to Soviet armed forces and an eventual troop pullout by Mikhail Gorbachev. To the extent that it accelerated popular distrust of the Communist Party and the Soviet government, the war in Afghanistan—and the Reagan administration's contribution to it—helped bring down the Soviet empire and the USSR itself. Yet those immediate gains were offset in later years as Afghan forces turned on their former patrons, targeting U.S. interests around the world.

The Reagan Doctrine also gave a boost to the CIA, an institution that had come under fire during the 1970s as its abuses of power, investigated by Congress, came to light. Under the guidance of William J. Casey, the CIA resuscitated its operations division, carrying out policies largely shielded from public view. That emphasis on clandestine activity, however, would backfire during the second Reagan administration. Fears that "rogue" elements within the government were running U.S. foreign policy were borne out with the unfolding of the Iran-Contra affair, a political scandal that revealed how elements of the National Security Council undermined congressional legislation in an effort to aid the Nicaraguan rebels.

Scholars have questioned the distinctiveness of the Reagan Doctrine. The containment plus designation applied by its supporters suggested that the Reagan Doctrine added the element of "rollback" to the decades-old policy of restricting Soviet encroachment. In doing so, however, the administration exaggerated the novelty of its approach; though George Kennan might have called for engaging the Soviets on a more limited geographic basis in the late 1940s, by the time that Paul Nitze had replaced Kennan as head of the Policy Planning Staff in 1950—and certainly by the time that Truman had made way for Eisenhower—the United States was challenging communist and leftist movements far afield from the Soviet periphery. Similarly, Reagan's use of proxy forces echoed tactics used by every administration from Truman forward; indeed, the speech that launched the Reagan Doctrine included verbatim numerous paragraphs from Truman's 1947 speech. From Greek guerrillas to Guatemalan generals to anti-Castro Cubans to conservative Chileans, indigenous forces with anticommunist pedigrees had long fought America's Cold War battles on many a distant shore.

Others have criticized the administration for applying the Reagan Doctrine selectively. According to these observers, recipients of American aid were often lacking in liberal virtues; the Afghan guerrillas, for instance, hardly merited support on democratic grounds. Use of such proxies led commentators to label the Reagan approach as Realpolitik masquerading as morality, the very criticism Reaganites themselves had leveled at Nixon and Kissinger. It also led critics to charge Reagan with pandering to public opinion, since administration references to "freedom fighters" seemed more reflective of the president's domestic political needs than of the makeup of those forces receiving American assistance.

Aside from the more cosmetic aspects of the Reagan Doctrine, it is far from clear whether it succeeded in rolling back communist gains. Critics have charged that administration policies, such as those pursued in Nicaragua, actually retarded the emergence of stability and the growth of a more pro-American sentiment. Although the Sandinistas did lose at the ballot box in 1990, scholars have described similarly favorable outcomes in locales such as Cambodia and Angola as owing more to changes in the international arena than to Reagan's policies themselves. The breakup of Moscow's Eastern European empire in 1989 and the fall of the Soviet Union in 1991 altered the geopolitical environment, undercutting support for pro-Soviet or Marxist regimes. Settlement of those regional conflicts, in ways largely favorable to Western interests, thus became easier to achieve.

Indeed, it is far from clear whether the allegedly greatest achievement of the Reagan Doctrine—the fall of communism itself—is attributable to Reagan at all. Historians have argued repeatedly that a host of troubles internal to the
Soviet Union—from a stagnant economy to a crisis of political legitimacy to the intractable nationalities question—were far more consequential to the undoing of the Soviet system than any challenge mounted by Reagan. Nevertheless, other scholars point out that Reagan gave the final push to the Soviet house of cards. It was his pursuit of the Strategic Defense Initiative, the argument runs, that bankrupted the Kremlin leadership, prompting a liberalization of the Soviet political economy that, in turn, loosed the forces that brought down the entire system. Likewise, it was Reagan’s rhetoric that emboldened Eastern Europeans to become more assertive, leading to the events of 1989 and the fall of the Berlin Wall. Judgment on these matters still awaits a more thorough historical treatment.

Clearly, though, the last presidential doctrine of the Cold War was every bit as hawkish as the first. It sought to reinject a moral component to America’s foreign policy, hearkening back to the language of the Truman years. In doing so, the Reagan team—rhetorically, at least—abandoned the amoral practice of Nixon-Kissinger Realpolitik, launching an all-out offensive against the “evil empire.” Reagan’s appraisal of the Soviets would undergo a shift, however, leading to a more productive relationship with Moscow, especially after the emergence of Mikhail Gorbachev. Still, the administration remained hawkish in its approach to what it perceived as pro-Soviet forces. Working from a Manichean view of the world, the Reagan administration regarded all leftist regimes as tools of the Kremlin, a position that added greater force to its public rhetoric while possibly reducing the efficacy of its foreign policies.

CONCLUSION

At the most basic level, one can understand the doctrines of American foreign policy as statements of principle, designed to forestall crises or to meet them head on. The Monroe, Truman, Eisenhower, Carter, and Reagan Doctrines all sought to preempt actions deemed hostile to the United States by warning potential aggressors of American intent. They also pledged, save for the Monroe Doctrine, to support allied forces in their campaigns against predatory forces. To some extent, then, most of these doctrines carried deterrent qualities. The Hoover-Stimson Doctrine and the Nixon Doctrine stand out as exceptions: the former because it sought to compel the undoing of past actions as much as to deter future behavior, and the latter because it sought to do so many things, especially on the strategic level, with none of them targeting any specific threat.

In other ways, the story of America’s foreign policy doctrines, at least during the Cold War, is the story of the United States supplanting Britain as a world power. Britain’s inability to prop up pro-Western forces in Greece and Turkey precipitated Truman’s request of $400 million in assistance for those two nations and a global commitment to aid others similarly imperiled. Eisenhower’s pledge to aid Middle Eastern nations threatened by international communism came as a direct response to British, along with French, stumblings during the Suez crisis of 1956. Nixon’s reliance on a “twin pillar” policy, while a recognition of America’s limited resources, was itself brought on by Britain’s withdrawal from territories east of the Suez.

And yet each of those statements exist as quintessentially, if not exclusively, American. Their content reflects the values of a nation imbued with a sense of mission to carry democratic principles around the world. Again, that sense of transcendent purpose shows up most clearly during the Cold War, yet previous statements contain elements of that creed. Nevertheless, the doctrines of American foreign policy are also clearly designed to promote the national interest. Whether they involved the creation of an Atlantic buffer between Europe and the Americas, or the defense of freedom—and free enterprise—in Europe itself, those doctrines have sought to protect American interests, be they material or nonmaterial, so that U.S. citizens could enjoy the blessings of liberty.

Those doctrines, in fact, reveal a close relationship between the missionary ideal of a more democratic world and the security ideal of a resilient America. For the most part, each presumes that the proliferation of democratic government would result in a more peaceful world and a more secure United States. Grounded in the belief that the peoples of the world are more desirous of peace than war, they posit that a government responsive to the will of the people would likewise seek pacific relations. These ideas are embedded in U.S. foreign policy doctrines from Monroe to Reagan. From the protection of democratic regimes in the Western Hemisphere, to the nonrecognition of military conquest in East Asia, to support for “freedom fighters” in the Middle East and around the world, those doctrines operated on the assumption that a more democratic world would be a safer world—and a more secure world for the United States.
At the same time, one might wonder why all presidents, especially from the middle of the twentieth century onward, did not have a doctrine of their own. Surely in an age of increasing American power, Franklin D. Roosevelt might have tapped into a legacy of past presidents and associated himself with a particular statement of purpose. Recent experience with such declarations, however, suggests at least one reason why a Roosevelt Doctrine failed to materialize. While the Monroe Doctrine and the Roosevelt Corollary of Theodore Roosevelt were familiar concepts to Americans, the Stimson Doctrine—the latest in a growing line of policy proclamations—was hardly worthy of emulation. Moreover, previous statements of American purpose were made unilaterally; Franklin Roosevelt's grand declarations—most notably, the Atlantic Charter—were declarations of unilateral intent. Of Roosevelt's many pronouncements, therefore, the statement most likely to have merited doctrinal status might have been his 1937 pledge to "quarantine" aggressor states. Offered in response to Japanese depredations in China, Roosevelt's call for a moral embargo on predatory regimes was so vague, however, and supported with such little force, that a doctrinal statement of principle would likely have gone the way of Stimson's pledge.

The absence of a Kennedy Doctrine is also curious, though perhaps less so than at first thought. President John F. Kennedy devoted much of his energy to the Caribbean. After the Bay of Pigs debacle, however, Kennedy was loathe to commit himself publicly to the removal of the Castro regime, especially given the negative press the effort had received. Certainly it was an outcome Kennedy greatly desired, and he devoted considerable resources to its realization. Yet it might have proved difficult to make so bold a statement on Cuba following his April failure. Indeed, it probably would have been ludicrous for him to have proffered a doctrine designed to rescue him from his earlier defeat. Moreover, having been roughed up by Nikita Khrushchev at the Vienna summit, Kennedy was in no position to be establishing rigid guidelines governing American policy. Aside from those considerations, Kennedy, his associates, and lawmakers in Congress had all spoken of the Monroe Doctrine both before and during the Cuban missile crisis in 1962, so that a Kennedy Corollary to the Monroe Doctrine would have seemed superfluous.

Kennedy's successor, Lyndon B. Johnson, has received scholarly credit for various statements of principle; scattered references to a Johnson Doctrine do exist in the literature. In fact, scholars have identified two such doctrines: one relating to American policy in Southeast Asia, the other relating to U.S. policy in the Caribbean. The first Johnson Doctrine invoked several principles of recent American policy, including the Munich Analogy and the Truman Doctrine. He meant it to apply, however, specifically to Indochina. As he declared on 4 August 1964, the United States would "take all necessary measures in support of freedom and in defense of peace in Southeast Asia." This first Johnson Doctrine, then, was synonymous with the ensuing Tonkin Gulf Resolution; in fact, they were one and the same. Scholars nevertheless usually invoke the resolution rather than the president in their treatments of the episode.

Johnson's second statement, concerning communism in the Caribbean, mirrors the one Eisenhower made regarding the Middle East. Delivered on 2 May 1965, following the insertion of U.S. troops into the Dominican Republic, this first Johnson Doctrine pledged "the American nations" to prevent the establishment "of another communist government in the Western Hemisphere." Its wording indicated the frustration policymakers felt at having to live with one communist regime only ninety miles from the United States. While Johnson's actions in the Dominican Republic receive wide treatment in the literature, few scholars make reference to a "Johnson Doctrine" as such. Perhaps this is because of the "credibility gap" that opened up in the wake of the action. Claims that Dominican leftists were brutalizing the local populace and shooting at the U.S. embassy turned out to be false, prompting Americans to question the veracity of their president. Although the negative press Johnson received might have doomed his efforts to elevate the stature of his policy, equally rough treatment failed to prevent other grand statements, such as the one Stimson made, from rising to the level of doctrine.

In the post–Cold War era, the search for a guiding policy has proved frustrating and elusive, primarily because no international reality, such as that which followed World War II, has congealed. Nor were policymakers able to talk one into existence. President George H. W. Bush's "new world order" failed to materialize, although during the winter of 1990–1991 he was able to array a constellation of powers, the likes of which had never been seen, to resist the Iraqi invasion of Kuwait. Bush's successor, President William
Jefferson Clinton, was no more successful in attaching his name to any grand declaration of policy. While Clinton often spoke out in support of human rights, the tardiness with which the United States and the international community addressed the horrors in Rwanda and the Balkans indicates, perhaps, a problem with making sweeping statements about such issues. Establishing a doctrinal position on the evils of ethnic cleansing, for example, a position that might commit the United States to eradicating those practices, would likely compel a president to make good on that—a position that future presidents would likely resist.

Perhaps another reason for the absence of doctrinal statements lies with the nature of the international environment near the close of the twentieth century. The end of the Cold War brought with it a diminution of public concern over a host of high profile issues, including the possibility of superpower war. Matters of “high politics,” then, such as those involving the United States and Russia over the proliferation or reduction of nuclear arms, seemed less important than matters of “low politics,” such as global trade and economics. While the Balkan conflict carried the seeds of a much wider war—indeed, that was part of the administration’s reasoning for entering it in the first place—it never threatened the United States in ways that touched on the nation’s very existence, in contrast to the superpower rivalry of the Cold War.

Still, during the presidency of William Jefferson Clinton, commentators attempted to affix doctrines to his name. None, however, seemed to have any staying power. Critics likened the Clinton Doctrine to a form of “social engineering,” focusing on the president’s attempts at nation building in Somalia or Haiti. Others have used the term when discussing Clinton’s interest in “cooperative security” and his efforts to create an intricate web of economic interdependence. Again, only time will tell if these “doctrines” seep into the public consciousness.

Perhaps the most that can be said about the future of these grand statements of principle is that presidents will likely treat them as they have always treated them—with great amounts of discretion and latitude. Policymakers have routinely opted for liberal interpretations of these doctrines—the Monroe Doctrine being a case in point—invoking, discarding, or fudging their precepts at will. Nothing in the past offers any evidence for believing that future administrations will do otherwise.

In his final message to Congress on 3 December 1912, President William Howard Taft looked back at the foreign policy followed by the United States during his administration and noted: “The diplomacy of the present administration has sought to respond to modern ideas of commercial intercourse. This policy has been characterized as substituting dollars for bullets. It is one that appeals alike to idealistic humanitarian sentiments, to the dictates of sound policy and strategy, and to legitimate commercial aims.”

Taft’s remarks gave formal definition to the term “dollar diplomacy,” a phrase synonymous with the diplomacy his administration pursued between 1909 and 1913. During those years the goal of diplomacy was to make the United States a commercial and financial world power. It was a narrowly constructed view of foreign relations, arising in great part out of the natural alliances between the corporate lawyers who came to peoples Taft’s administration and the bankers and businesses that were their clients. Thus, the Taft administration concentrated on assisting American businessmen in the protection and expansion of investment and trade, especially in Latin America and the Far East.

The idea of protecting American commercial interests around the world was not new and had been part of the diplomacy of the United States since its earliest days. Efforts to trade with British and Spanish colonies in the Western Hemisphere, defense of the rights of neutrals to trade in wartime, and support of the most-favored-nation concept were all predecessors of dollar diplomacy. Yet dollar diplomacy was the subject of much controversy during the Taft administration and in the years that followed.

Much of the contemporary controversy over dollar diplomacy stemmed from the fact that Taft, the handpicked successor of Theodore Roosevelt, had embarked on a policy that differed from the one Roosevelt had followed. Roosevelt was an expansionist and had supported the American move into world affairs. For a variety of reasons, Roosevelt believed expansion necessary for the United States, with benefits for the rest of the world. He viewed foreign affairs in strategic terms, with Europe as the center of world power. He felt an affinity for Britain and based much of his diplomacy on cooperation between Washington and London. To be sure, Roosevelt supported the expansion of American business throughout the world, but he was much more concerned with the balance of power and improving the Anglo-American relationship. As a result, Roosevelt mediated the Russo-Japanese War (1904–1905) and the conflict between France and Germany over Morocco in 1906.

Taft came to office with a different view. Ever the lawyer, he viewed foreign policy in terms of legal institutions. He thus came to support arbitration treaties. He had differences with Roosevelt over Europe, feeling that the United States had little or no interest in events there. Taft kept the United States out of the second Moroccan crisis in 1911, and, while supporting mediation, he was not willing to mediate the Italo-Turkish War (1911) nor the first Balkan War the following year. Taft believed that the most important relations with Europe occurred in developing nations where the United States and Europe shared interests.

Taft’s view of the role of American business in foreign policy also differed from Roosevelt’s. Taft long had been concerned with foreign trade. He recognized that by 1909 the United States was producing more goods than Americans could consume and therefore had to increase exports. It was perhaps symbolic that during the Taft administration, in 1910 to be exact, that the United States began to export more manufactured goods than raw materials, changing the focus of trade from industrial nations in need of raw materials to lesser developed countries that required finished products. In this regard the developing areas of Latin America and East Asia seemed particularly
important. A concentration on economic opportunities in Latin America and East Asia, especially China, would have many benefits. Such a policy would help the American economy by solving the problem of overproduction. It would benefit recipient nations, bringing economic progress, which in turn would mean political stability; and stability would guarantee American strategic interests in underdeveloped areas. It was not surprising that in Taft's first annual message (7 December 1909) he stated: "To-day, more than ever before, American capital is seeking investment in foreign countries, and American products are more and more generally seeking foreign markets."

While Taft had ideas as to the diplomacy the United States should follow, he had no interest in serving as his own secretary of state, further distinguishing his administration from Roosevelt's. The man whom Taft chose to carry out his foreign policy, after refusals by Elihu Root and Henry Cabot Lodge, was Philander C. Knox, a wealthy conservative Pennsylvania lawyer then in the Senate. Knox had been attorney general between 1901 and 1904; and this fact, in the president's view, more than made up for his lack of experience in foreign affairs, since Taft wanted lawyers in his cabinet. Knox had been what is now known as a corporation lawyer, the Carnegie Steel Corporation being one of his clients. He was thus sympathetic to big business.

Knox shared Taft's views concerning the goal of American diplomacy—protection and expansion of economic interests. A State Department memorandum of 6 October 1909 pointed out that all developed countries were seeking trade and noted that trade was essential to American prosperity. There could be no more important task than expanded investment and trade. Diplomacy had to support American financiers and businessmen by finding opportunities abroad. The State Department appeared to anticipate the activities of the Bureau of Foreign and Domestic Commerce in the 1920s, when Herbert Hoover was secretary of commerce, although Hoover strenuously objected to the concept of dollar diplomacy, making it a priority following his election to the presidency to eliminate its effects, particularly in Latin America. But locating commercial opportunities abroad was not enough for Knox and Taft. As the 1909 memorandum indicated, the United States would insist that Americans compete with Europeans in the developing countries by buying bonds, floating loans, building railroads, and establishing banks.

So it was that the State Department during the Taft years turned to dollar diplomacy. The policy gained support throughout the diplomatic corps, a fact that was especially important as Knox concentrated on policy and allowed subordinates to run day-to-day operations. Francis M. Huntington Wilson, first assistant secretary of state, presided over the daily activities of the State Department and carried out a reorganization of the department into geographical bureaus. Huntington Wilson, Willard D. Straight, and Thomas C. Dawson, the latter two the initial heads of the Division of Far Eastern Affairs and the newly created Latin American Division, respectively, all shared the views of Taft and Knox on trade and investment.

When the administration talked about dollar diplomacy in Latin America, it was almost always referring to the Caribbean, which had strategic implications because of the soon-to-be-completed Panama Canal. Concerned over the general instability of the Central American governments, Taft and Knox set a goal of stable governments and prevention of financial collapse. Fiscal intervention would make military intervention unnecessary. As Knox told an audience at the University of Pennsylvania on 15 June 1910: "[T]rue stability is best established not by military, but by economic and social forces. . . . The problem of good government is inextricably interwoven with that of economic prosperity and sound finance; financial stability contributes perhaps more than any other one factor to political stability."

Such statements did not mean that Taft and Knox were unwilling to use military power in the Caribbean. They did use it. They thought that fiscal control would lessen the need for intervention. They believed that the United States and nations of the Caribbean would both benefit. For the United States, an increase in trade, more profitable investments, and a secure Panama Canal would result. For the local inhabitants, the benefits would be peace, prosperity, and improved social conditions.

Taft and Knox believed that the way to control the finances of the Caribbean countries was to take over customhouses, following the example of the Roosevelt administration in the Dominican Republic. According to the Taft-Knox doctrine, it was important to get the Caribbean nations to repay European debts by means of loans from American businessmen or at least from multinational groups in which Americans participated. In Nicaragua, Honduras, Guatemala, and
Haiti, the United States pushed refunding schemes. The State Department believed that these sorts of reforms would end political instability in the Caribbean.

Nicaragua proved the classic case of dollar diplomacy in the Caribbean. While the American economic interest in Nicaragua was small, the country had been an alternate route for the trans-Isthmian canal. The United States was sensitive to activities in Nicaragua. The longtime dictator José Santos Zelaya had never been popular in Washington and was seen as the cause of much instability in Central America, the result of his efforts to dominate the area. When Knox took control of the Department of State, he ordered withdrawal of the charge d'affaires from Nicaragua, began to press private business claims against the Zelaya government, and sought, albeit unsuccessfully, to discourage a Franco-British consortium from making a loan. In cooperation with Mexico, the United States also sent warships to stop Zelaya from fomenting in Central America.

In October 1909 the situation became complex with the outbreak of civil war in Nicaragua. Insurgency centered on the eastern coast in Bluefields, a city dominated by foreign businessmen and planters. These foreigners and conservative politicians in Nicaragua followed the lead of General Juan J. Estrada. Foreign money, some of it American, bankrolled the revolutionaries. While declaring itself neutral, there was little question as to which side the U.S. government supported. Formal neutrality disappeared when Zelaya executed two Americans captured while fighting with the rebels. The United States broke off relations, asserting that the revolutionaries represented “the ideals and the will of a majority of the Nicaraguan people more faithfully than does the Government of President Zelaya.”

Washington made known that Zelaya’s resignation in late 1909 was not enough. Huntington Wilson pushed for expulsion of the liberal party from power, hoping the rebels would take control. U.S. forces landed at Bluefields to make sure fighting did not damage American interests. Successes followed for the insurgents, and by the end of August 1910 they had taken the capital, Managua. The United States expected fiscal reform in Nicaragua, and refused to recognize the new government until it had agreed to American control of the customhouses and to the refunding of the debt owed to British bankers by means of a loan from American financiers. Dawson went to Nicaragua to negotiate the terms of recognition.

This did not end the difficulties, for the American demands were unpopular. The United States went ahead with its financial program, even though the Senate delayed action on the treaty (known as the Knox-Castrillo Convention) worked out between Washington and Managua in June 1911, which called for refunding of Nicaragua’s internal and external debts and administration of the customs by a collector approved by American officials. While the Senate debated, bankers went ahead with the rehabilitation of Nicaraguan finances, making a loan with the national railroad and the national bank as collateral. American citizens also began to collect Nicaraguan customs and to serve on a mixed claims commission, all in anticipation of Senate action. Much to the distress of Taft and Knox, the treaty died in a Senate committee in May 1912, along with a similar treaty with Honduras.

Another revolution broke out in Nicaragua in July 1912, and this also brought American intervention. Approximately 2,700 marines landed to protect U.S. citizens and property and to suppress the revolution, which was over by early October. Although the majority of the marines was soon withdrawn, a legation guard remained as a symbol of intervention until 1925. The Taft administration went out of office in March 1913, convinced that the policy it had followed in Nicaragua was correct. Intervention had proved necessary, the administration admitted, but it was only for a short time and continued fiscal intervention would make further military intervention unlikely.

The Taft-Knox policy toward Nicaragua, and for that matter toward the rest of Central America, was unquestionably offensive to Latin Americans. Even a goodwill visit through the Caribbean by Knox could not overcome suspicions. Knox said the United States did not covet an inch of Latin territory, but such utterances were not accepted south of the Rio Grande.

In the years after 1912, political leaders in both Latin America and the United States attacked Taft’s policy toward Central America. Elihu Root believed that dollar diplomacy rekindled Latin fears and suspicions of the United States that he had worked so hard to overcome while secretary of state from 1905 to 1909. In 1913, President Woodrow Wilson made clear that he would not support special interests trying to gain advantages in Latin America. The Bryan-Chamorro Treaty, finally approved in 1916, contained provisions similar to the second treaty
Knox had worked out with President Adolfo Díaz of Nicaragua in early 1913. Even so, Wilson and Secretary of State William Jennings Bryan were much less interested in protecting U.S. businesses in Latin America than Taft and Knox. Dollar diplomacy as a policy was at an end in Latin America. Criticism of the policy continued. Like President Hoover, President Franklin D. Roosevelt renounced dollar diplomacy. Both presidents attempted to construct what became known as the Good Neighbor Policy in dealing with Latin America, and the concept of the Taft-Knox doctrine was all but dead by the time of the Hoover administration. In the long run, of course, American businessmen did increase trade and investment in Latin America, but it was World War I, not dollar diplomacy, that decreased European economic interests in that part of the world.

If the results of dollar diplomacy were meager in Latin America, where the United States was the dominant power, they were a disaster in China, the target for the Taft-Knox policy in East Asia. Of course, the situation in the Far East was difficult. In the late nineteenth century and the first decade of the twentieth century much change had taken place. With victories over China in 1895 and Russia in 1905, Japan had become the major power in the Far East. Theodore Roosevelt had supported Japan’s new prominence in East Asia. He decided that Japan did not threaten American interests there. He saw the Japanese as a barrier to Russian expansion; a preserver of the balance of power in East Asia; protector of the Open Door; and stabilizer of China, a nation for which he had little respect. Roosevelt had backed Japan in its war with Russia and in 1905 had mediated the peace.

Roosevelt had hoped to arrange a balance of power between Russia and Japan after the war, but the Japanese victory was so decisive and other events in Japanese-American relations so important that he gave up on the Open Door in China, especially in Manchuria, which the Japanese began to close after 1905. Because of the need to protect the Philippines, which Roosevelt believed was the “heel of Achilles” of the United States, and the war scare that resulted from the Japanese immigration crisis, Roosevelt accepted Japanese expansion on the mainland of Asia. He came to feel that the Open Door was not worth war with Japan. The United States should do what it could to preserve interests in China, but should recognize Japan as the dominant power on the Asian mainland. In short, he gave a green light to Japanese expansion. One of the best expressions of this belief appeared in a letter to Knox on 8 February 1909, shortly before Roosevelt left office. He noted that Japanese-American relations were of “great and permanent importance.” While immigration to the United States had to stop, the United States should “show all possible courtesy and consideration.” The Taft administration had to understand that “Japan is vitally interested in China and on the Asiatic mainland.” Since the Pacific coast of the United States was defenseless and “we have no army to hold or reconquer the Philippines and Hawaii,” the country had to avoid war. Roosevelt felt that American interests in China were insignificant in American Far Eastern policy.

Even as his administration came to an end, forces were at work that would change Roosevelt’s policy in East Asia. In 1908 Root had established the State Department’s first geographic unit, the Division of Far Eastern Affairs. Headed by Willard Straight, the division opposed Japanese expansion in China, and this opposition was to dominate the division in the years between 1909 and 1941.

Roosevelt’s East Asian policy thus was reversed. With urging from the State Department and because of a combination of motives—economic expansion, suspicion of Japan, faith in the future of China—the Taft administration decided to challenge Japan in China. During the Taft years, the Open Door Notes, which had frequently changed in meaning after 1900, assumed new importance in the Far Eastern policy of the United States.

In Far Eastern policy, department officials now proved important. Taft and Knox did not need convincing. Both believed China was the country of the future in the Far East and that if the United States desired influence with that emerging nation it had to increase its financial interests there. If the president and secretary of state had any doubts about such policy, they were overcome by State Department advice. Huntington Wilson, who had served in Tokyo, and Straight, who had been consul in Mukden, Manchuria, were both hostile to Japanese ambitions in China. They had tried unsuccessfully in the last days of the Roosevelt administration to enlarge the Open Door to include investment and trade. With Taft and Knox they had more success.

The Taft administration came to see investment in railway development and loans to the Chinese government as the means to increase influence in China. Knox demanded that American financiers be given the opportunity to join the
British, French, and German consortium in lending money to China to finance railroad construction in the Yangtze Valley, the so-called Hukuang Railway loan. When the demand met with European hostility, Taft appealed to the Chinese head of state: “I have an intense personal interest in making the use of American capital in the development of China an instrument for the promotion of the welfare of China, and an increase in her material prosperity without entanglements or creating embarrassments affecting the growth of her independent political power and the preservation of her territorial integrity.” The State Department persuaded a group of investors to assume part of the loan. Knox grudgingly got his way, but only at the price of irritation in Britain, France, and Germany. In the long run, this project was a failure.

From the Hukuang loan the State Department turned to Manchuria. The result was the Knox neutralization policy, which more than any other proposal epitomized dollar diplomacy in China. In the fall of 1909, Knox proposed that American, Japanese, and European bankers lend China enough money to repurchase the Chinese Eastern Railroad, held by Russia, and the South Manchurian Railroad, in the possession of Japan. Manchuria would be neutralized and open to all commercial activities. Washington feared that southern Manchuria was being closed to non-Japanese influences. Knox realized that the Japanese would be difficult, but he thought the proposal would be supported in Europe. Britain, France, and Germany eventually decided to defer to the wishes of Japan and Russia, and in January 1910 the latter two nations rejected the plan. Only the Chinese showed interest, but that soon turned to concern when Russia and Japan agreed in July to cooperate in guaranteeing the status quo in Manchuria. Knox had only succeeded in driving the former enemies into a virtual alliance to prevent American interference in Manchuria. A companion proposal by Straight, who had left the State Department to head the American consortium planning a railroad that ran parallel to portions of the South Manchuria line, met a similar fate.

By the fall of 1910, Knox recognized defeat in his railroad plans for Manchuria. Throughout the rest of his term as secretary of state, he continued to work for increased American involvement in China, but through plans that did not contest the Japanese and Russians in Manchuria. He became involved in plans for a multinational currency reform loan, but the Chinese revolution that began in 1911 put an end to that scheme. The government that overthrew the Manchu then negotiated with a six-power consortium for a reorganization loan. Negotiations dragged on until the Taft administration left office.

Dollar diplomacy in China stimulated international controversy. The Taft-Knox policy succeeded in causing distress, irritation, and even anger in London, Paris, Berlin, St. Petersburg, and Tokyo. Knox’s clumsy attempts to help China only weakened the empire, since Japan and Russia agreed on a policy. The policy aroused controversy in the United States, where bankers were reluctant to participate. Roosevelt opposed the policy, writing to Taft in late 1910 that the Open Door in China could only be maintained by general diplomatic agreement. He noted that “as has been proved by the whole history of Manchuria, alike under Russia and under Japan, the ‘Open Door’ policy, as a matter of fact, completely disappears as soon as a powerful nation determines to disregard it, and is willing to run the risk of war.” Roosevelt was convinced that Japan was one such nation, and that the United States ought not to try to bluff the Japanese on the mainland of Asia, especially since Americans would never agree to fight a war there.

Wilson later withdrew government support from American investors planning the reorganization loan, charging that the loan violated Chinese sovereignty and threatened China with intervention. The American investors backed out of the loan, and the last of the dollar diplomacy schemes came to an end. In the long run, Wilson reversed his position, approving participation in a consortium in 1918. But Japan remained the dominant power in China until World War II, and Roosevelt’s policy seemed valid in retrospect. Taft and Knox failed in their goal—to dislodge Japan from the Asian mainland.

There were other areas to which the Taft administration tried to apply dollar diplomacy, such as in Turkey. Breaking sharply with the traditional American policy toward the Ottoman Empire, which centered on protecting the rights of American citizens, the Taft administration attempted to share in the mining, irrigation, and railroad concessions then being negotiated by the Turkish government. Taft hoped that the United States would obtain a larger share of the commerce of the Near East. He was to be disappointed. The United States found the European powers too entrenched, and dollar diplomacy failed in Turkey. But Central America and China were the most spectacular examples of the doctrine.
The controversy over dollar diplomacy lasted well after 1913. Generally recognized by students of international relations as a failure, dollar diplomacy has engendered controversy concerning its motives and the people responsible for carrying it out. Some writers have argued that the policy was primarily economic, while others have contended that it was dominated by strategy, especially in Latin America. Others have defended the desire of the Taft administration to “do good” in Latin America and Asia, in some cases noting that its failure was probably owing more to diplomatic bumbling than imperialistic urges. The most recent writings of scholars have additionally argued that the logic of imperialism undermined the logic of “dollars for bullets,” which ended up relying on military intervention to protect the interests of businesses and individual investors. In effect, dollar diplomacy created, rather than mitigated against, havoc. The most balanced account of dollar diplomacy, that of the historians Walter and Marie Scholes, has combined these motives and also noted that Taft’s diplomacy anticipated U.S. foreign policy after World War II. Taft and Knox chose private capital as their instrument, whereas President Harry S. Truman used public capital. In both instances, the most important consideration was preservation of vital American interests abroad by helping underdeveloped countries establish viable governments and integrating them into the twentieth century.

Debate as to responsibility for the policy has taken two directions. Historians have argued over the roles of Taft, Knox, the State Department, and American businessmen. Straight has especially been the subject of debate. One account has convincingly argued that Straight’s role in the Far East has been exaggerated. The most reasonable conclusion would seem that there was a common purpose among the advocates of dollar diplomacy.

Another direction of the debate over dollar diplomacy has been whether it was only one aspect of a continuous policy followed in the twentieth century by the United States—to expand American economic opportunities abroad. It is clear that Taft’s predecessor, Theodore Roosevelt, and his successor, Woodrow Wilson, as well as the rest of the American leaders in the twentieth century, supported the expansion of American business, up to and including the Clinton administration’s crafting of the NAFTA agreement and approaching foreign relations with China on economic, rather than human rights, terms, to the dismay of many Americans and their congressional representatives. Indeed, the term “dollar diplomacy” was revived by the media to describe the thrust of U.S. foreign relations during the 1990s. There has, however, been no extensive scholarly investigation into the validity of using the policy of the Taft administration to define the economic foreign policy being carried out by the United States at the beginning of the twenty-first century. No president, other than Taft, has made such a policy the principal goal of diplomacy. As a result, the term “dollar diplomacy” remains synonymous with the diplomacy of 1909 to 1913.
Dollar Diplomacy

Munro, Dana G. Intervention and Dollar Diplomacy in the Caribbean, 1900–1921. Princeton, N.J., 1964. Cites the importance of strategy as the motivation of dollar diplomacy in the Caribbean, and is very comprehensive.

Vietnamese communist leaders founded the Democratic Republic of Vietnam in 1945, but it took them until 1975 to achieve control of the whole country. For most of that thirty-year period, there were people who argued that communist control of Vietnam must be blocked, not just for the sake of Vietnam itself, but to prevent communism from spreading through Vietnam to other countries.

Historically, the spread of communism had usually involved proximity; of all the countries that were communist during the Vietnam War, only the Soviet Union and Cuba had become so without bordering on lands already under communist control. It was easy enough, therefore, to argue that if Vietnam were to become communist, this would increase the threat to neighboring countries. Some people did make the argument in this reasonable and realistic form. Others, however, found it inadequate. The only country bordering on Vietnam that did not already have a communist neighbor was Cambodia, a country of which few Americans had much awareness. To say that if Vietnam fell, Cambodia would be endangered, might not stir drastic action. To inspire a massive effort to save Vietnam, it was necessary to predict that a massive disaster would result if Vietnam were allowed to fall—great danger or even certain doom for a whole string of countries, most of which did not border on Vietnam. This prediction was given the name “domino theory” after President Dwight D. Eisenhower’s classic statement of it at a press conference on 7 April 1954:

Finally, you have broader considerations that might follow what you would call the “falling domino” principle. You have a row of dominoes set up, you knock over the first one, and what will happen to the last one is the certainty that it will go over very quickly. . . . When we come to the possible sequence of events, the loss of Indochina, of Burma, of Thailand, of the [Malay] Peninsula, and Indonesia . . .

Eisenhower’s language was contradictory; first he referred to the “certainty” that the last domino in the string would fall if the first one did, but then he referred to the “possible” sequence of events. Eisenhower seems not in fact to have believed that the fall of Indochina would be certain to trigger the fall of a whole string of other countries; he only thought the danger was very great. Others committed themselves more firmly to a prediction of doom. A few months before Eisenhower’s press conference, Donald R. Heath—the U.S. ambassador to the Associated States of Indochina (Vietnam, Laos, and Cambodia)—had written that if the French abandoned their effort to save Indochina, “Only the blind could doubt the immediate Communist engulfment of Southeast Asia.”

Some versions of the theory envisioned a longer row of dominoes than others. Eisenhower’s classic statement had predicted the fall of everything down to Indonesia, but not of the Philippines or countries beyond. That was about average. Modest versions of the theory reached only as far as the fall of Thailand. The most extreme ones reached very far indeed. Thus, Walt W. Rostow, formerly Lyndon Johnson’s national security adviser, said in 1969, the year the withdrawal of U.S. troops from Vietnam began, “There’s nobody in Asia who doesn’t understand that if we pull out of Vietnam, we’d have to pull out of all of Asia, the place would fall.”

Even in its weaker form, with the fall of the dominoes treated only as a danger, not a certainty, the theory was a strange one. There was no previous country the fall of which to communism had triggered the rapid fall of a whole string of other countries. Why should it have been thought probable, or even possible, that the consequences following from the fall of Vietnam would be so much greater than those that had followed from the fall of China?
ORIGINS OF THE THEORY
To the extent that there was a historical foundation for the theory, it lay in the origins of World War II. Late in 1938 at the Munich Conference, Britain and France had allowed Adolf Hitler to take the Sudetenland from Czechoslovakia. Many people believed in retrospect that Hitler would have been relatively easy to stop at that time, if the democracies had stood firm in defense of Czechoslovakia. There is no way to tell whether this belief was correct, but at least it was not obviously foolish. However, the opportunity to try to stop Hitler before he became too strong was not taken. Within less than two years after Munich, Hitler partitioned what had remained of Czechoslovakia; invaded and partitioned Poland; overran Denmark, Norway, Luxembourg, the Netherlands, Belgium, and France; and started the Battle of Britain.

The end of World War II eliminated Hitler and his government, but Joseph Stalin remained. Stalin was a ruthless and extraordinarily brutal dictator, a mass murderer on a huge scale. He had emerged from World War II controlling not only the Soviet Union but also much of East-Central Europe. Stalin seemed obviously similar to Hitler, and some of the differences between the two—that Stalin ruled a larger area with a larger population and more industry than had Hitler, and that control of the international communist movement gave Stalin a worldwide influence—made Stalin seem a greater menace than Hitler had been. In 1949 Stalin got the atomic bomb, and the conclusion of the Chinese civil war brought the largest country in the world under communist rule, which many in the United States assumed to mean Stalin's rule.

Even before 1949 some people had begun to worry that any further territorial gains by Stalin or communism—little distinction was made between the two—could trigger a cascade effect, like the rapid sequence of Nazi conquests in the two years after Munich. Dean Acheson described in his memoirs the arguments he had used in February 1947 to persuade U.S. congressional leaders that they must support measures to prevent a Communist victory in Greece:

I knew we were met at Armageddon. . . . Like apples in a barrel infected by one rotten one, the corruption of Greece would infect Iran and all to the east. It would also carry infection to Africa through Asia Minor and Egypt, and to Europe through Italy and France, already threatened by the strongest domestic communist parties in Western Europe.

The geographic logic was rather peculiar. For Greece to have gone communist would not have opened up a single new country to communist contagion, assuming that communism spread by contagion like rot from one apple to another in a barrel, because the only non-communist country bordering on Greece was Turkey, and Turkey already bordered directly on the Soviet Union. The congressional leaders, however, seem to have found Acheson's case persuasive. It was also suggested that if West Berlin (a small and strategically valueless enclave in the middle of Soviet-controlled East Germany) were to be lost, then Western Europe as a whole would crumble and fall under Soviet domination.

THE THEORY EXTENDS TO ASIA
The pattern of thinking soon extended to Asia, where communist parties were engaged in armed struggles in several areas. The Chinese civil war was clearly tending toward a communist victory by the end of 1948. The First Indochina War, in which the Vietminh—a Vietnamese nationalist group under communist leadership—fought the French, was stalemated until 1950, when the balance tipped toward the Vietminh. Guerrilla struggles on a much smaller scale were occurring in Malaya and the Philippines, and there was a brief communist rebellion in Indonesia in 1948.

In November 1948 Madame Chiang Kai-shek, wife of the president of the Republic of China and quite popular in the United States, told the American people that “if China falls, all of Asia goes.” This statement was given considerable publicity in the American press. In December the government of the Republic of China declared in a message to the U.S. Congress that “if China should unfortunately be conquered, the Far East will be sovietized and so would Asia and Europe.” Several prominent Americans said much the same, but the theory that the fall of China would trigger a widespread disaster did not take hold at the top levels in Washington.

It was French government officials who originated the idea that the loss to communism of Indochina, or even a part of Indochina, would lead to the loss of a huge area. In January 1949 French president Vincent Auriol commented upon a proposal that France attempt to negotiate peace with
Ho Chi Minh. He rejected this idea, arguing that to negotiate with Ho, an “agent of Moscow,” would lead to the loss not only of Indochina but of the rest of Southeast Asia. Southeast Asia under Soviet control would constitute a barrier between the United States and Europe; the result would be to “hand over Europe to Russia.” The later spread of the theory in the United States, however, was more a matter of independent invention than French influence, although the French did make an effort to spread it.

One might have thought that when the fall of China, the world’s most populous country, to communism in 1949 failed to trigger the rapid loss of a string of other countries, Americans would have come to doubt that the loss of smaller and less important countries could trigger the disaster. Instead, the idea that the fall of Indochina, or just Tonkin in the northeastern corner of Indochina, could trigger a cascade of other losses, took hold within the U.S. government only after China had fallen without causing such a result.

In the last years of the Truman administration, the National Security Council staff tried to maintain some restraint about statements concerning the dire consequences of Indochina’s fall. The State Department went a little further, and the Joint Chiefs of Staff were the most extreme, saying for example in April 1950: “The fall of Indochina would undoubtedly lead to the fall of the other mainland states of Southeast Asia. Their fall would . . . bring about almost immediately a dangerous condition with respect to the internal security of the Philippines, Malaya, and Indonesia, and would contribute to their probable eventual fall to the Communists.”

THE EISENHOWER ADMINISTRATION

When Dwight Eisenhower became president at the beginning of 1953, he appointed John Foster Dulles as secretary of state. Dulles pushed a very radical version of the domino theory, more extreme than had ever before been advocated by anyone so high in the U.S. government. At a meeting of the National Security Council on 31 March 1953, Dulles listed the vital strong points around the periphery of the communist bloc—Japan, Indochina, India, Pakistan, Iran, and NATO—and then, according to the record, “warned that the loss of any one of such positions would produce a chain reaction which would cost us the remainder.”

In August 1953 President Eisenhower defined the threat in terms almost as extravagant: “If Indochina goes, several things happen right away. The Malayan peninsula, the last little bit of the end hanging on down there, would be scarcely defensible . . . all India would be outflanked. Burma would certainly, in its weakened condition, be no defense.” Eisenhower acknowledged that it would be possible to stop this chain of events by major intervention even after Indochina fell, but he said that halting the process at any later point would be more expensive than stopping it in Indochina.

In early 1954, as it began to appear that a French defeat in Indochina might be imminent, Admiral Arthur Radford, chairman of the Joint Chiefs of Staff, was urging that the United States commit combat forces to Indochina, and he used the domino theory as a major argument. He said that if the communists gained control of the Red River delta, in northern Vietnam, they would win Indochina as a whole, and if they won Indochina they would then win the rest of Southeast Asia. The eventual fall of Japan would be probable. Sometimes he simply said each stage would trigger the next. At times he acknowledged that strong U.S. intervention might be able to prevent the fall of Indochina from causing the fall of the rest of Southeast Asia, but like Eisenhower the previous year, he said that intervention on a much larger scale would then be needed.

The press tended to endorse the domino theory, though not in its most extreme forms. Press versions of the theory typically suggested the fall at most of Southeast Asia, sometimes just the mainland of Southeast Asia, and indicated that this was likely to happen if Indochina fell, rather than saying it would definitely happen.

When the National Security Council met on 6 April 1954 to consider among other things whether the United States should intervene militarily in Indochina, President Eisenhower “expressed his hostility to the notion that because we might lose Indochina we would necessarily have to lose all the rest of Southeast Asia.” But when Secretary of the Treasury George Humphrey asked whether the United States should really be committing itself to oppose communism everywhere in the world, Eisenhower came close to endorsing the view that a few minutes earlier he had rejected. The record of the meeting first summarizes Eisenhower as having said: “Indochina was the first in a row of dominoes. If it fell its neighbors would shortly thereafter fall with it,
and where did the process end? If he was correct, said the President, it would end with the United States directly behind the 8-ball.” The record then goes on to quote Eisenhower as having said that “in certain areas at least we cannot afford to let Moscow gain another bit of territory. Dien Bien Phu itself may be just such a critical point.” The very next day, Eisenhower made in a press conference the famous statement of the domino theory that has already been quoted. The oddity of the logic comes into clearer focus if one considers Burma. Eisenhower mentioned Burma specifically; Radford included it implicitly when he said that if the Red River delta fell to communism then the rest of Southeast Asia would also fall. China had become communist in 1949. Burma shared a long border with China, essentially undefended. A very large area along this border had been in dispute between China and Burma even before the communists came to power in China. Anticommmunist forces were mounting armed raids into China from Burmese territory, which would have provided the Chinese with ample excuse for taking action against Burma if they wished to do so. Roads capable of carrying military supplies from China into Burma (the Burma Road and Ledo Road of World War II fame) existed, although they were probably in poor repair. Despite all of these factors, the Burmese government did not seem about to be overthrown by either Chinese or Burmese communists. Yet communist rule in Indochina, which had a land area about 8 percent of China’s and a population 5 percent as large, barely bordering on Burma at all and having no military roads leading into Burma, was expected to cause the fall of that nation. While some of Eisenhower’s remarks show at least a little caution, the part of them in which the domino metaphor occurs suggests not only that Burma would fall if Indochina fell, but that it would fall quickly. According to Radford, the fall of just the Red River delta (not bordering on Burma, with a population less than half that of Burma and less than 2 percent as large as that of China) would make the fall of Burma inevitable, when the fall of China had not made the fall of Burma inevitable. None of the proponents of the domino theory ever attempted to explain this oddity, to describe some way in which the international context had changed to make Southeast Asia more vulnerable to a chain reaction than it had been in 1949 when China fell.

The mechanism of the predicted disaster was not traced to concrete issues of strength. The domino theorists said that the fall of Southeast Asia as a whole would give the communists resources and population that would add dangerously to their strength, but they did not try to argue that the reason the fall of Tonkin, Vietnam, or Indochina would lead to the fall of the rest of Southeast Asia was that the population or resources of Tonkin, Vietnam, or Indochina would add decisively to communist strength.

The theory appears, instead, to have been based primarily on issues of symbolism and perception. If the United States allowed Tonkin, Vietnam, or Indochina to fall to communism, this would indicate to the world that the United States did not have the will to oppose communism. The communists would be encouraged to launch assaults on other countries, and the noncommunist countries, no longer trusting the United States to defend them, would be demoralized and would not resist the assaults. In effect, proponents of the theory appear to have been presuming that the United States could not adopt a policy of defending some areas but not others, because neither the enemies nor the friends of the United States would be capable of understanding such a policy.

Statements of the theory were often vague about the identity of the communists whose victory was feared, and never acknowledged that the takeover of a small country by domestic communists might have different implications than conquest by some larger communist country. When discussing the struggle in Vietnam in the early 1950s, American officials sometimes suggested that the country was in danger of being taken over by the Chinese, sometimes by the Soviets (note Eisenhower’s comment, quoted above, that “Moscow” might be about to take Dien Bien Phu). Sometimes the likelihood of a takeover by Vietnamese communists was acknowledged, but in carefully restricted language; they were “Vietminh,” or occasionally “Reds,” but never “Vietnamese communists.” The word “Vietnamese” had in fact dropped completely out of the vocabulary with which the U.S. government discussed the Vietminh in the late 1940s; calling Ho Chi Minh or his men “Vietnamese” would have granted them too much legitimacy. Very often it was simply “communists” of unspecified nationality who were said to be trying to take over Vietnam. The theory was similarly vague about which communists would take over the other countries of Southeast Asia should Vietnam fall. Occasionally it was predicted to be the Soviets, more often
On the other hand, it is not likely that Eisenhower was deliberately and consciously lying when he propounded the domino theory. Five factors are all probably relevant to Eisenhower's statements, and those of most other proponents of the domino theory, including even Radford. First, what they really meant by their statements was that communism was expanding, and that this was very dangerous and should be stopped. Second, they genuinely believed this to be true. Third, they had not bothered to think much about whether the words they had used to express that belief were true if taken literally. For that matter, they tended to think about communist expansion in very vague terms; to them communism was something that "expanded," and they did not always ask themselves exactly how it expanded when they were thinking about this problem. Fourth, belief in the danger of communist expansionism was universal in the circles in which they moved, and maintaining that belief was considered morally obligatory. This stance deterred them from questioning the literal truth of any particular words chosen to describe the danger. Fifth, they were convinced that the communists had the same ambitions for conquest as Hitler. This implied that the communists were likely to embark on a massive campaign of overt international aggression—with Chinese armies pouring south through Laos and Thailand into the Malay Peninsula—as soon as they felt strong enough.

The legacy of the 1938 Munich Conference hung heavily over Americans of Eisenhower's generation. The lesson of Munich, as it was understood in the United States in the 1950s, was that aggression will go on until it is stopped, and that stopping it becomes more difficult the longer one waits to do so. The combined armies of the communist powers were by the 1950s larger than the Nazis had ever had, far larger than would have been necessary to initiate the feared wave of aggression had the communist leaders really been a unified group, with ambitions and daring that approximated Hitler's. American policymakers, seeing that the disaster had not yet happened, did not ask whether they really faced a Hitlerian menace. Instead they worried that even the smallest addition to the total of communist strength would finally trigger the deluge.

When France lost the battle of Dien Bien Phu and it became apparent that the first domino in the row was actually likely to fall, President Eisenhower did not descend into the despair that some of his previous statements would leave one
to expect. When asked about this at a press conference on 12 May 1954, he simply explained that he was working to ensure that the fall of the first domino would not knock down the rest of the row. Secretary of State Dulles had said the day before that the domino theory had been based on the assumption that the endangered countries would be facing the threat singly; he said that if they were bound together in an alliance, the theory need not apply.

The habit of American policymakers of saying, at any given time, that the country currently under threat was the final barrier, after the loss of which the forces of communist aggression would be so strong that there would be no stopping them at any acceptable price, is easier to understand if one bears in mind the alternatives. They could not say that the communists were not bent on world conquest; their peers would have called them dupes of the communists and their careers would have been destroyed. For the same reason, they could not say that the communists were weak enough so that even the addition of another country would not strengthen their expansionist drive to a dangerous extent. It was marginally acceptable to say that the communists were already so strong that they could be stopped only by a big expensive war, but this was an uncomfortable position to take, since the United States did not want a big expensive war. The only really acceptable thing to say was that the communists were still weak enough to be stopped cheaply if they were stopped immediately, but only if they were stopped immediately.

American policymakers faced a fundamental problem when they tried to win public support for programs designed to oppose communism in distant parts of the globe. Vietnam was a country of moderate importance. President Eisenhower wanted to make a moderate effort to save it from communism, not involving a degree of cost or risk grossly out of proportion to its real significance. If he had described the situation to the public in these terms, however, he would have been attacked from two directions: first, a large portion of the public, which did not even know where Vietnam was, would not have approved any risk or any expenditure had they been told that it was not a matter of high importance, and second, with the “Who Lost China?” debate still going on, it would have been extremely dangerous for any American political figure to have described the defense of Vietnam or any other country as a matter of less than the highest importance. Had Eisenhower said that the relatively modest efforts he was making were all Vietnam was really worth, he would have been accused of abetting communist aggression.

Eisenhower endorsed the domino theory rhetorically, and so strongly that he gave the theory its name, but he did not commit more resources to Indochina than the real importance of the area could justify. This worked for him in 1954, but he was storing up trouble in the long run. The domino theory slid out of view for several years, but it was waiting to reassert itself whenever some country in Asia seemed in danger of falling to communism. One of Eisenhower’s last actions as president, on 19 January 1961, was to tell John F. Kennedy and the top foreign policy officials of the incoming Kennedy administration that if Laos were to fall to communism, it would be “just a question of time” before South Vietnam, Cambodia, Thailand, and Burma did the same.

### The 1960s: High Tide of the Domino Theory

The period from the early to the mid-1960s represented the high point of American belief in the theory. The proportion of top officials who endorsed it was higher than it had been in 1953 and 1954 under Eisenhower. Some of the 1960s officials—most conspicuously Secretary of Defense Robert McNamara—decided years later that the theory had been mistaken, but they confirmed that they really had believed it in the 1960s; their assertions of it had not been mere rhetoric.

Some authors have commented on the rise in the 1960s of the “psychological domino theory,” a belief that the danger of allowing South Vietnam or Laos to go communist lay in what this would do to American “credibility.” One country after another would decide that they could not depend on American assistance, and that it therefore was not worth trying to resist communism. They might submit without any massive invasion by foreign communist armed forces. At the same time, communist countries, no longer fearing the United States, would become more aggressive. Such ideas became more common in the 1960s, but this did not represent a total change in thinking. The phrase “psychological domino theory” is associated with that decade, but there had been an important psychological component to the domino theory ever since the late 1940s.
In 1961 the Departments of State and Defense sent President Kennedy a joint memorandum, the product of prolonged deliberation at the highest level. William Bundy had written the first draft; U. Alexis Johnson and Robert McNamara, among others, had revised it. It stated: “The loss of South Viet-Nam would make pointless any further discussion about the importance of Southeast Asia to the free world; we would have to face the near certainty that the remainder of Southeast Asia and Indonesia would move to a complete accommodation with Communism, if not formal incorporation within the Communist bloc.” The theory had sometimes been put in terms this strong or stronger under Eisenhower, but that usually happened when an individual was speaking without a prepared text. Strong statements of the theory had not appeared in formal documents coming from a wide group.

Policymakers were still vague about the identity of the communists to whom Southeast Asia would fall and about the mechanism of the fall. The most common scenario, when a scenario of some sort was presented, was that the nations of Southeast Asia would submit to unspecified Chinese pressures. Shortly before his death in 1963, when Kennedy was asked about the domino theory in a televised interview, he replied, “I believe it. I believe it... China is so large, looms so high just beyond the frontiers, that if South Viet-Nam went, it would not only give them an improved geographic position for a guerrilla assault on Malaya, but would also give the impression that the wave of the future in southeast Asia was China and the Communists. So I believe it.”

The domino theorists’ frequent vagueness about the national identity of the communists whose conquests they feared reflects a generally low evaluation of the strength of nationalism in Asia. They do not seem to have felt it mattered whether an Asian country was taken over by native communists or conquered by some larger communist power. They knew that the Chinese Revolution had not brought the Soviet army to the borders of Southeast Asia, and indeed that the Soviet military forces that Chiang Kai-shek had permitted at Port Arthur in the late 1940s had been withdrawn in the 1950s. They were aware that when North Vietnam came under communist rule in 1954, the Chinese army had not moved down to the seventeenth parallel, the border between North and South Vietnam. But they did not treat these facts as relevant to the question of whether the fall of South Vietnam to communism

---

**FUTURE PRESIDENTS SPEAK**

“The battle against Communism must be joined in Southeast Asia with strength and determination to achieve success there—or the United States, inevitably, must surrender the Pacific and take up our defenses on our own shores. Asian communism is compromised and contained by the maintenance of free nations on the subcontinent. Without this inhibitory influence, the island outposts—Philippines, Japan, Taiwan—have no security and the vast Pacific becomes a Red Sea. . . .

“Vietnam and Thailand are the immediate—and most important—trouble spots, critical to the U.S. . . . We must decide whether to help these countries to the best of our ability or throw in the towel in the area and pull back our defenses to San Francisco and a ‘Fortress America’ concept.”

— Then-vice president Lyndon Johnson to President John F. Kennedy, 1961

“If South Vietnam falls, through U.S. withdrawal, political settlement, or neutralization (which is surrender on the installment plan), there is no doubt that Cambodia (already on the brink) will go; that Laos, practically gone now because of our gullibility, will go; that Thailand (which wants to be on our side but has held her independence by being on the winning side) will go; . . . and that Indonesia will go. . . .

“In three or four years, then, we would have the necessity of saving the Philippines. Could we avoid a major war to save the Philippines? . . .

“If southeast Asia goes Communist, Japan will eventually be pulled irresistibly into the Red orbit.

“If the United States gives up on Vietnam, Asia will give up on the United States and the Pacific will become a Red Sea.”

— Richard M. Nixon, 1965
would lead other Southeast Asian nations to fall under Chinese or Soviet domination.

The domino theorists also did not feel that the leaders of the non-communist nations of Southeast Asia could be trusted to care very much about preserving their independence. Even those nations that did not harbor strong domestic communist parties might easily be stampeded into accepting, without a fight, Chinese or Soviet domination. An exception, however, was made for South Vietnam. The domino theory was basically a call for the United States to pick South Vietnam as the place to take a stand against communism. Its proponents often exaggerated the strength of anticommunist nationalism in South Vietnam, trying to make it seem more attractive than it was, and more attractive than possible alternatives such as Thailand, as a place to make a stand.

As vice president, Lyndon B. Johnson in 1961 endorsed the domino theory without hesitation; he told President Kennedy that the United States must either hold the line in Vietnam and Thailand or pull its defenses back to San Francisco. In 1964 as president, however, he did ask questions. Johnson was trying to shift the priorities of the national budget away from military spending and toward his Great Society programs. He was, therefore, horrified by the prospect of making the major commitment of U.S. forces that seemed the only way to save South Vietnam from falling to communism. When he asked whether the domino theory was valid, the question was probably not purely rhetorical. Some mid-level officials, notably the intelligence analysts at the CIA’s Board of National Estimates, said that the theory was not valid. But all the top national security officials—Secretary of State Dean Rusk, Secretary of Defense McNamara, Director of Central Intelligence John McCone, and the Joint Chiefs of Staff—ringingly affirmed the theory.

The Joint Chiefs were the firmest. When Assistant Secretary of State for Far Eastern Affairs William Bundy, one of the second-level officials who doubted the theory, asked the Joint Chiefs whether it might not be possible to establish another defensive line and save the other dominoes, the Joint Chiefs strongly rejected this notion.

“We have no further fall-back position in Southeast Asia. . . . Strengthening other areas of Asia, in the context of our having been pushed out of SVN [South Vietnam], would be a thoroughly non-productive effort militarily, and politically it seems dubious we’d even be offered the opportunity to attempt it.” Thailand would fall “almost automatically”; Burma would probably fall.

Belief in the theory was also widespread outside the administration. Influential members of both houses of Congress made very strong statements about it. Richard Nixon, the future president, said in January 1965 that “if Vietnam is lost, all of Southeast Asia is lost.” If the people of Southeast Asia decided, because of events in Vietnam, that the wave of the future was communism, “they are going to go Communist before the wave engulfs them.” In a February 1965 Harris poll, an overwhelming majority (78 percent to 10 percent) said they believed that if the United States withdrew from South Vietnam, “the Communists would take over all of Southeast Asia.”

The domino theory had always been a call to action. Lyndon Johnson felt in 1965 that he had no choice but to make an actual commitment of large-scale combat forces to Vietnam, and the fact that the domino theory said this commitment was necessary was an important part of his motive. But as the scale of the war expanded during the following years, belief in the theory faded. People endorsed the theory only if they were willing to endorse the commitment of enough resources to save South Vietnam, and as the definition of “enough” expanded to 500,000 men and beyond, the number of people willing to endorse the commitment shrank dramatically. There were still believers in the domino theory in 1968, but far fewer than there had been in the early 1960s. Also, the theory was openly derided by many, unlike several years before.

THE 1970S AND AFTER

Once the theory had become a bone of contention, some defenders of the war began to moderate the theory so as to make it more reasonable; then, opponents of the war would not be able to ridicule it and say that its absurdity symbolized the absurdity of the war. When Richard Nixon defended the domino theory in 1970, he did not say (as he had five years earlier) that other nations would promptly fall to communism if South Vietnam fell; he said only that such an event would be “immensely discouraging” to the non-communist nations of Asia, and “ominously encouraging” to China and the Soviet Union.

The fall of South Vietnam in 1975 did not trigger the fall of the rest of Southeast Asia or of any long string of dominoes. Cambodia had
already fallen before South Vietnam did. The fall of Laos was in a sense triggered by the fall of South Vietnam, but only because the Vietnamese communist leaders in Hanoi, who could have completed the communist victory in Laos long before, had been holding back because they feared a premature victory in Laos might complicate the struggle for South Vietnam. The United States did not have to fight a war on some line farther back to prevent the further spread of communism. Indochina under communist rule did not become a conduit for the application of Chinese pressure against Thailand. Instead, in the 1980s Thailand and China were allied against the communist governments in Indochina.

These events have not ended the arguments about the validity of the domino theory. Opponents of the theory say that it was proven false when South Vietnam fell without triggering the fall of most of Southeast Asia, and without the United States even having had to make any major effort to prevent the fall of the rest of Southeast Asia. Supporters of the theory say that it had been a correct description of the situation of the early 1960s. They say that the American defense of South Vietnam had provided a shield during the years when Thailand, Malaysia, and Indonesia had been vulnerable and China very aggressive. By the time this shield was removed in the 1970s, the Southeast Asian nations were stronger and China much mellowed. The most detailed form of the argument states that it was the firm American stand in Vietnam that gave anticommunist military officers the confidence to defeat the communists in Indonesia in 1965. The evidence for this argument, however, is very thin.

A cascade effect very much like that predicted by the domino theory swept communist regimes out, rather than into, power at the very end of the Cold War. In 1989 it became apparent that the Soviet Union under Mikhail Gorbachev would no longer intervene to preserve communist governments in Eastern Europe. This emboldened anticommunist forces and so discouraged the communist leaders that in one country after another they allowed communist rule to be overturned without a serious fight. Communism collapsed in most of Eastern Europe and in the Soviet Union itself between 1989 and 1991.

ENCyclopedia of AMERICAN FOREIGN POLICY
Merging in numerous ways, economic theory has often been linked to U.S. foreign policy. When the United States began its life as a fledgling exporter of raw materials vitally dependent upon connections to Liverpool merchants, crude economic theories accompanied virtually all deliberations and pronouncements on foreign affairs. As the nation grew in size, population, and wealth, this connection became less apparent and, indeed, far less critical or commonplace. By most estimates, foreign trade rarely exceeded 5 percent of the American gross national product. Moreover, after significant growth and increasing specialization in export markets in the late nineteenth century, levels of international market integration that prevailed in 1914 were equaled again only in the 1990s, albeit with far less market segmentation than in the earlier period. The information gaps of that earlier period have almost completely disappeared.

Only when it emerged as a world power following the two world wars did the United States again endeavor to combine the latest in economic theory with virtually all of its foreign policy concerns. The rise of professional economics had much to do with this resurgence; so did the demands for the cooperation and rebuilding made virtually indispensable by both economic depression and destructive and widespread conflict. Institutionalization of professional economic advice, most of which followed the Great Depression and World War II in the twentieth century, brought economic theory into the limelight, where it joined readily and quite seamlessly with heightened international concerns for peace and prosperity. Here it began by acknowledging as well the growing awareness that domestic prosperity was at least partly hinged to global prosperity.

The adaptable theories of giants such as the British economists Adam Smith and David Ricardo notwithstanding, economic theory previously had been applied only loosely to U.S. foreign policy concerns or, as it was in the early Republic, only in forms of a largely prescientific character, too amorphous and philosophical to construct a lasting bond or significant transgenerational analysis. Here it had often reflected little more than a concern for how one might either tease out the factors behind international commercial advantage or better discern both commercial limits and commercial potential in world markets. Falling loosely under the rubric of “mercantilism,” such concerns seldom reflected anything approaching a scientific method or cognizance of recent or past advances in economic theory, and they seldom attracted those social scientists interested in testing the theoretical challenges of pioneers such as Smith and Ricardo. Smith’s suggestion that political economists must find a theory that comports with maximum wages and modest profits, for example, along with Ricardo’s critique of landlord-based economic exploitation, remained obscured by conventional analyses designed mostly to promote commercial interests.

Despite this tendency toward limited, mostly superficial economic analysis of international affairs, discussions of monetary policy in the early Republic often veered into the analysis of international factors and approached levels of sophistication unmatched by many twentieth-century analysts. In some ways, for example, late nineteenth-century U.S reliance on a gold standard with fixed exchange rates represented a departure from an earlier, more flexible bimetallic monetary policy—to which the nation would ultimately return. The alteration, in 1834, of Alexander Hamilton’s 15:1 silver-to-gold valuation of the dollar—to a 16:1 ratio—largely kept silver dollars out of circulation, limited the worldwide potential of later Nevada silver discoveries, and signaled the advent of a more restrictive, even emasculating, U.S. monetary policy. Ceding control of domestic monetary policy to the vagaries of international gold flows, and the overall level of
international commerce to the total gold supply, policymakers had essentially ignored existing economic theory, however immature, in favor of economic policy handcuffs.

But talk of trade clearly occupied the minds of far more policymakers and economic theorists than did international currency analysis. Smith's theories, principally those found in his groundbreaking synthesis published in 1776, An Inquiry into the Nature and Causes of the Wealth of Nations, focused attention squarely on international trade, proffering an analysis designed to integrate trade policy and consumer welfare. Smithian analysis of how to pay for war (taxation versus borrowing)—designed to make its costs more obvious and disabling—also filtered into a great number of American foreign policy debates and was digested and considered fully by both late eighteenth- and early nineteenth-century American leaders. David Ricardo's early nineteenth-century postulates regarding comparative advantage—the notion that two nations may gain through trade even if one can produce everything more efficiently than the other—had percolated, as well, into policy circles in both Great Britain and the United States. Few of these theories, however, found anything but temporary or comparatively insecure footholds in the policy arena until the mid-twentieth century.

From the American economists who toiled for the Strategic Bombing Survey during World War II to those serving today as consultants on currency stabilization, economic theory has now permeated virtually every conceivable foreign policy analysis and situation. It no longer remains confined principally to questions of international commercial advantage or even international trade. At the same time, its chief occupation has most often been limited to three major areas: trade policy, international monetary policy, and policies for international growth and development (for developed, developing, and undeveloped nations). Since the breakdown of the Bretton Woods system for international currency stabilization in the early 1970s, monetary policy has become much more newsworthy; much more often the subject of policy discussions, high and low; and has increasingly become the preoccupation of many skilled economists and specialized policy advisers. Likewise, growth and development policy also increased in significance in the late twentieth century, albeit mostly as a result of both increasing numbers of American, European, and East Asian multinational corporations and increasing emphasis on development that emerged along with post–World War I and post–World War II rebuilding efforts. As the welfare of these companies came to depend increasingly on rising prosperity abroad, and as altruism merged increasingly with self-interest in prominent rebuilding or relief efforts, more people naturally came to ask how such prosperity should be created or sustained.

Analysis of trade policy, however, continues to engage economic theorists more than any other large foreign policy concern. Indeed, a great number of international monetary policy analyses are, in effect, designed to explain how international money affects international trade.

INTERNATIONAL TRADE

Although Adam Smith (1723–1790) is regarded today as the progenitor of “laissez-faire” economic theory—where self-interest, limited government, and the unbridled profit motive converge to produce the ideal political economy—his economic theory really began on much more limited grounds.

Beginning with the overarching belief that the best political economy produced a regime of high wages and low prices—and modest profits—Smith created what many regard as the first modern economic theory, a theory constructed squarely upon a critique of British international trade in the late eighteenth century. When Smith spoke of restraint in critical terms, for example, he most often referred to import restrictions, not restraint of the individual and his single-minded pursuit of wealth. With much of Smith's general theory lost to the questionable interpretation of his lofty, somewhat more malleable rhetoric, one is left mostly with a trenchant special theory. Like the French Physiocrats who preceded him, Smith constructed his theory upon the notion that government promotion of trade most often came at the expense of groups or individuals who were less powerful but more significant, economically, than the commercial exporters favored by such promotion. For the Physiocrats, these individuals were farmers; for Smith, consumers.

Thus began both a long-running debate on the economic merits of free trade versus protectionism and trade promotion, and on a course of theoretical formulations built partly on the criticism of policies that favored commercial interests over agricultural counterparts. Placing the con-
Although the area around Bretton Woods, New Hampshire, possesses one of the least reliable climates anywhere in the United States, it was chosen as the site of the 1944 international conference for post–World War II international economic planning precisely because it promised a potentially pleasant climate. “For God’s sake do not take us to Washington in July,” wrote the British economist John Maynard Keynes to the American Harry Dexter White in May 1944, “which would surely be a most unfriendly act.” White, who had joined the Treasury department in 1934 and had become Treasury Secretary Henry Morgenthau’s chief planner for postwar international economic policy was Keynes’s chief intermediary with the Roosevelt administration. The “White Plan” for postwar international economic cooperation, leaked by the London Financial News in April 1943, became the principal blueprint which guided postwar planning in general and the Bretton Woods conference in particular. Lord Keynes was the chief British spokesperson, a confidant of White’s, and, as it turned out, chiefly responsible for choosing the site of the conference.

Convened on 1 July 1944, and held at the Mount Washington Hotel at Bretton Woods, this groundbreaking conference opened only a short distance from the peak of the highest summit in the American Northeast. On 12 April 1934, the weather observatory on its summit recorded a sustained wind gust of 231 miles per hour, a record that has yet to be equaled anywhere on the planet. It is a place reckoned by many to be one of the windiest places on earth, and attracts a multitude of visitors today, many drawn by the strange lure and challenge of unpredictable conditions. Snow has fallen on the peak in every month of the year, and temperatures below freezing are not uncommon at any time.

There is little doubt that Keynes, who suffered from heart ailments and who would die of a heart attack in 1946, preferred the chance of a blustery climate in July to the potential for oppressive heat and humidity in the nation’s capital. And though the conference concluded by eschewing Keynes’s plea for both an international reserve currency (that he had given the name “bancor”) and an international overdraft fund, it was the masterful British economist who ensured that the more than seven hundred delegates from forty-four nations would meet to plan the postwar international economic order in the Presidential Range of New Hampshire’s White Mountains.

sumer at the heart of his theory, rather than the producers favored in eighteenth-century British policy, Smith ensured that such consumers would always be represented in subsequent economic theory related to international trade. Favors granted by governments to resident exporters, Smith pointed out, might well benefit those producers only at the expense of resident consumers, leaving almost everyone less well off. Hereafter, these consumers would be removed from trade policy calculations only by ignoring relevant and advancing economic theory. Freer trade—perhaps anticipating the theory of the “second-best” enunciated by James Edward Meade and Richard Lipsey in the 1950s and the “scientific tariff” theories promulgated by Harry G. Johnson in the 1970s, became a means to improve domestic purchasing power for the first time under Smith’s formulation.

Although it ultimately came to be submerged within later economic theories that often ignored its most immediate postulates, Smith’s analysis was highly regarded in the early American republic. Indeed, Thomas Jefferson—attracted, perhaps, to Smith’s reshaping of physiocratic, agrarian-centered critiques of commercial subsidy—regarded it as the paragon of contemporary political economy. Smith’s trade theories would also help establish a general pattern for regional political battles in the early nineteenth century (for example, the 1828 “Tariff of Abominations”). Vice President John C. Calhoun’s challenge to American protectionism, nascent despite its implicit connection to the special interests of southern slaveholders, may well have anticipated both the consumer-based populism in the American South during the late nineteenth and early twentieth centuries and the underconsumptionist economic theories of the mid-twentieth-century followers of John Maynard Keynes. His focus on the costs of effective and proposed U.S. tariffs was constructed squarely, if unwittingly, on the back of Smith’s trade theory.
If Smith pointed economic theory toward the potential general benefits of freer trade—couched within a broader, somewhat more ambivalent philosophical treatise—then David Ricardo (1772–1823) transformed it into a more single-minded pursuit of improved economic analysis. Ricardo’s masterpiece, *The Principles of Political Economy and Taxation*, first published in 1817, contributed greatly to the analysis of wage determination, pricing, and tax policy. But most famously, perhaps, it also gave us the law of comparative advantage. Explaining how a nation may gain by importing a good even if that good can be produced at home more efficiently (by allowing it to devote more resources to the production of goods at which it is most efficient), Ricardo revealed previously unrecognized advantages to a regime of freer trade. He also suggested the kind of rigorous analysis upon which all subsequent theory of international economics would have to rest. Indeed, few economists can yet escape Ricardoian challenges, especially in the ongoing analysis of price determination and the relative importance of wage and profit levels. And though policymakers tend to conform to the characterization of the nineteenth-century British prime minister Benjamin Disraeli—encouraging free trade as an expedient rather than a principle—it is also likely that they can seldom avoid beginning the analysis of any trade policy regime without the admonishments of both Adam Smith and David Ricardo.

**INTERNATIONAL TRADE THEORY: FROM TRAILBLAZERS TO TWENTIETH-CENTURY PROFESSIONALS**

The British philosopher and economist John Stuart Mill (1806–1873) updated (and endorsed) much of Ricardo’s analysis with his 1848 publication, *Principles of Political Economy*. The first to emphasize that allocation of resources and distribution of income are two somewhat distinct roles performed by modern market systems, Mill parted company with earlier classical economists by suggesting that policy could indeed shape the distribution of income. The late nineteenth-century (principally 1871–1877) analyses of William Stanley Jevons (1835–1882) in England, Karl Menger (1840–1921) in Austria, and Leon Walras (1834–1910) in Switzerland saw the emergence of the marginalist school of economic theory. Reorienting economic analysis away from theories of price determination that had relied exclusively upon supply-side factors or the costs of production, the marginalist school significantly updated the analyses of Smith and Ricardo and the classical economic theory built upon their writings. Beginning their theory of prices (and therefore of production and allocation as well) with consumer behavior and consumer choice, the marginalists moved economic theory closer to the consumer-centered philosophy espoused, but never developed systematically or mathematically, by Smith. Walras would do this to great effect, for example, with his creation of demand functions, mathematical functions that for the first time expressed the quantities of a given product or service as they were determined collectively by consumer income, consumer preference or taste, product price, and product price relative to other related goods or services.

Until the assiduous efforts of Alfred Marshall (1842–1924) on behalf of the discipline and profession in England, however, economics was the vocation of few in academe, public policy was constructed with little or no professional economic advice, and international trade theory in particular had progressed only a little past its Smithian and Ricardian foundations. Academic chairs in political economy had been established early in the nineteenth century, but throughout much of that century most were either vacant or held as a secondary occupation. Jevons, Menger, and Walras, in fact, all worked in professions outside of academe before being appointed to chairs in political economy at universities in England, Austria, and Switzerland. Jevons’s government post as an assayer in Sydney, Australia, appears to have convinced him, in fact, that public officials required more—and more consistently offered—professional economic policy advice. Despite their later association with schools of free-market or even anti-government economic analyses, the progenitors of the marginalist revolution gravitated to economic theory out of concern for public policy, much of which centered on international affairs and international trade. Like Jevons, Menger, and Walras, the first professional economists found themselves holding academic chairs in political economy; the fledgling science and public policy were undeniably woven together. Until the twentieth century, however, the designation implied no distinct body of knowledge or craft. In Ireland, for example, it fell initially under the instruction of law, changing soon after into a course of study geared principally to business or industrial management.
Professor of political economy at the University of Cambridge from 1885 to 1908, Marshall began his teaching career in 1868 at St. John's College, Cambridge, as a lecturer in moral sciences. When he retired from teaching in 1908 to devote his final years to writing, he had succeeded in establishing a new honors examination (tripos) in economics and politics (1903) at Cambridge, had bequeathed to economic analysis the critical distinction between the short run and the long run (in what he called “period analysis”), and had established political economy as a distinct subject worthy of widespread study and generous public attention. The London School of Economics opened in 1895, and Oxford University offered its first diploma in economics in 1903, attesting to the rising popularity and increased relevance of economic study. Marshall's direct contribution to international trade theory was limited to his analysis of two-country trade with intersecting “offer curves” and its concomitant analysis of demand elasticity (how the increase of goods offered by one nation might affect the quantity of goods offered by a trading partner). The term “elasticity,” so widely used by economists today to denote the ratio of change between dependent and independent variables, was Marshall's invention. More significantly, his attention to the professional standing of economists, his willingness to engage in policy debate and to observe real economic conditions and changes, and his conscious linking of modern economic analysis to classical foundations paved the way for the most significant twentieth-century breakthroughs in international trade theory.

Marshall's major work devoted to international trade issues, Industry and Trade, published in 1919, may well have lacked theoretical consistency or structure precisely because it considered so closely recent trends and activities in British and world trade networks. Indeed, his attention to the practical reach of modern economics led to the frequent inclusion in all of his writings of cautionary notes on what might or might not be successfully “impounded” in analytic assumptions about dynamic economic processes. These caveats remain significant today. For Marshall, any accurate depiction of dynamic economic processes required more information than was ever possible to obtain, an insight proved increasingly sound by the limitations and shortcomings of the newest and most ambitious computer-generated models.

Marshall also created a theoretical path that tended to consolidate and synthesize previous lines of economic analysis constructed upon a classical and orderly market-clearing conception of the economic world. As economic science matured and academic posts in political economy proliferated around the turn of the twentieth century, a classical consensus emerged, much of it constructed upon Marshall's edifice. With his Theory of International Trade, with Its Application to Commercial Policy, published in 1936, Gottfried Haberler introduced an expansive reformulation of this emerging consensus by fitting it with the dynamic language of general equilibrium analysis. The benefits of free trade could subsequently be viewed in terms of both direct and indirect effects, bringing free trade theory closer to real world phenomena. And though German historical economists and American institutional economists, such as Thorstein Veblen, pointed dramatically to the ways in which economic reality differed widely from the behavior predicted by classical economic theory, they offered no compelling theoretical substitute.

Only the economic dislocations of World War I and the onset of the Great Depression compelled economists to urge greater caution and to force the construction of new theoretical pathways, many of which highlighted and served questions of international trade. That levels of international trade had declined so precipitously during the Great Depression—by two-thirds in nominal dollar terms and by one-third in real, inflation-adjusted terms—made it virtually impossible to consider new economic ideas without an unwavering focus upon international trade.

The principal economists of this interwar period nudged theory onto different planes and punctured much of the prevailing orthodoxy regarding general economic adjustment, unemployment and investment, and the influence of money and interest rates. Free markets were judged increasingly as artifacts of the imagination and as abstractions toward which behavior was often inclined but seldom made manifest without significant gyrations, fits and starts, or failings of even the simplest economic prophecy. Free trade orthodoxy, however, proved to be something else; it depended in part upon a free market framework for much of its explanatory power, yet it also came to be viewed increasingly as a sphere of potentially unrestricted behavior existing atop a large assortment of thoroughly regulated or more artificially cultivated domestic economic affairs. In the face of rising skepticism toward the usefulness of the free market abstraction, and rising trade protection-
ism—the first significant departure from freer trade since the beginning of the nineteenth century—the tenets of the prevailing free trade orthodoxy emerged virtually unchanged.

In 1921 the American economist Frank Knight (1885–1972) published Risk, Uncertainty, and Profit, in which he distinguished between insurable risk that could be mostly ascertained and uninsurable uncertainty that proved impossible to predict. Almost ten years later the Swedish economist Gunnar Myrdal (1898–1987) published Monetary Equilibrium (1930), in which he introduced the terms “ex ante” and “ex post,” underscoring both the distinction and the relation between expectations and outcomes and the unpredictable ways in which savings equaled investment. And in 1936 the British economist John Maynard Keynes, a former student of Alfred Marshall’s, published The General Theory of Employment, Interest, and Money, in which he questioned both the microeconomic and the automatic and instantaneous market-clearing foundations of inherited classical theory.

Yet, despite increasingly numerous challenges of this kind, the implications and tendencies of inherited theory on questions of international trade remained virtually untouched. After extensive involvement with the German reparations question after World War I, as well as the debate surrounding the British return to the gold standard in 1924, Keynes had surely proven his interest in international affairs. Later in his career he looked increasingly to the United States for the most practical and noteworthy application of his increasingly refined economic principles. And Keynes’s General Theory did carry implications for how nations might best effect freer trade and how domestic policy formulation should account for the dislocations and perturbations introduced by an increasingly open and free international trade network. But these implications were in no way an assault upon the general free trade consensus. Indeed, few direct theoretical challenges to free trade emerged in the late twentieth century, despite recurring offensives launched by politicians and various labor movements, and the relatively desperate reaction to economic recession.

From the General Agreement on Tariffs and Trade (GATT), signed in Geneva, Switzerland, on 1 January 1948, through the seven GATT revisions and negotiating rounds beginning in 1955 (and within World Trade Organization negotiations after 1994), free trade resumed its ascent in policy-making circles. Crafted as a means to expanded multilateral trade in the post–World War II era, GATT began with nine signatories (including Cuba) and expanded to include 128 by 1994; in 1995 it was subsumed under the newly formed World Trade Organization. Pausing only for the briefest moments during late twentieth-century recessions that paled in comparison with the calamity of the 1930s, free trade–centered theory found itself with fewer and fewer detractors and policy once again conformed generally to theory.

Implications of The General Theory Despite the perceptible ascendancy of Keynesian economics in the second half of the twentieth century, many of the questions raised by Keynes in The General Theory remain unsettled. His own followers, for example, continue to argue over whether Keynes described an economy that commonly achieved equilibrium—albeit at unacceptably low levels of output from time to time—or one characterized by continuous oscillations around a stable point or plateau. Few would argue, however, that Keynes did not describe an economy that converged on equilibrium—whether it could ever reach that point or not—by means of changes in income and output rather than through rapid and responsive price adjustments. Indeed, as Janos Kornai later explained, such tendencies may well be universal in modern, mass-production economies, whether capitalist or not. In Kornai’s formulation, when confronted with underutilization and excess capacity, Western capitalist economies produced unemployment, whereas the command economies of the East, former and present, produced shortages of consumer goods. Under both schemes, price adjustments played no significant role. This may explain in part why officials in the People’s Republic of China have in recent decades been so eager to learn Keynesian economics. Although Keynes left much of the explanation of sticky prices to his successors, he noticed the obvious way in which interest rates, wages, and commodity prices responded in Great Britain and abroad. And since they moved too slowly, haltingly, or imperceptibly to clear markets effectively enough to secure full employment, this led Keynes to his revolutionary conclusions regarding effective demand and the causes of economic stagnation or recession.

Ironically, regarding trade among nations, Keynes had first overlooked this kind of adjustment. The Swedish economist Bertil Ohlin (1899–1979) did much to establish his reputation
by disputing Keynes's rendering of the post–World War I German reparations problem, which Keynes had couched solely in terms of relative price changes. Although prejudiced somewhat by his belief that geographic endowments ordained Germany to lead the European economy, Keynes also believed that Germany faced a double burden under its requirement to pay reparations as determined under the armistice. First, it had to tax its citizens to pay for reparations, and second, it had to cheapen its export prices relative to its import prices by lowering wages at home (to effect export surpluses needed to transfer marks to foreign reparations creditors). Ohlin noted that the first burden would likely remove all necessity for the second; new German taxes sent abroad would simultaneously lower German demand and increase the demand of Germany's foreign creditors. And this would effect higher levels of German exports and lower levels of German imports without any relative change in the levels of German wages or export goods.

While Keynes eventually termed the debate “muddled” due to his insistence on the genuine possibility that creditor nations might entomb the German payments in hoarding or newly erected import barriers—a possibility largely ignored by Ohlin—the latter's argument had made its mark. Indeed, not long afterward, Keynes moved swiftly through a series of theoretical gyrations—building on and then dispensing with the quantity theory of money; finishing his Treatise on Money (1930) by reemphasizing in part his reparations policy argument and, at the same time, orienting himself more toward a general theory built upon a closed, static economy that underscored Ohlin's emphasis upon output or demand changes. Here, currency transfer and associated international trade problems diminished in importance and could be solved with less restricted currencies or special taxes on income from foreign lending. Free trade theory could march on not because it guaranteed the most efficient placement of all resources or global full employment, but because it only helped, and could largely be ignored if one could both loosen the “furtive Freudian cloak” of the gold standard-based, fixed exchange rate regime and focus instead on the stabilization of demand at home. Within a few years of the publication of the Treatise, Keynes encouraged President Franklin D. Roosevelt to make the currency and exchange policy of the United States “entirely subservient” to the aim of raising output and employment.

Heckscher-Ohlin, Factor-Price Equalization, and Real Free Trade Patterns If the abstract economic advantage of free trade had been well established by the late 1930s, the way in which free trade actually worked required additional explanation. Building upon “The Influence of Trade on the Distribution of Income,” an article written in 1919 by his teacher, Eli Heckscher (1879–1952), Bertil Ohlin undertook analyses that would consolidate more completely the pre-eminence of the free trade persuasion in the process. Heckscher, under whom Ohlin had studied from 1917 to 1919 at the Stockholm School of Economics and Business Administration, and whom Ohlin succeeded in 1930, envisioned his article as a minor updating of classical Ricardian theory, which had, like Ricardo's Law of Comparative Advantage, done nothing to address the reasons for the existence of such advantage. Using both Heckscher’s paper and his own graduate research, Ohlin staked out a theoretical position that began to explain the existence of comparative advantage, suggested the stringent real world requirements for the exploitation of free trade principles, and in part revived location theory, a substantial part of Adam Smith's cosmology that had been lost to most economists outside of the German historical school. Walter Isard's subsequent work in the economics of location and in regional economic studies, reflected principally in his 1956 publication Location and Space Economy, followed in part this theoretical pathway reopened chiefly by Bertil Ohlin.

As illustrated in Ohlin's Interregional and International Trade (1933)—for which he won the 1977 Nobel Prize—the Heckscher-Ohlin theorem explained how a nation will tend to have a relative advantage producing goods that require resources it holds in relative abundance (and an advantage importing those goods that require relatively scarce resources). If a nation possesses a relatively greater abundance of labor than its trading partners, for example, it will most frequently export products derived most intensively from labor, rather than capital, inputs.

In 1922, Ohlin had submitted a paper to Francis Edgeworth (1845–1926), Drummond professor of political economy at Oxford and Keynes's coeditor of the Economic Journal, in which he introduced the mathematical outlines of what would become the Heckscher-Ohlin theorem. Though Keynes responded to Edgeworth's request for comment with a curt "This amounts to
nothing and should be refused,” it was one of Keynes’s foremost American disciples, Paul Samuelson, who further refined the Heckscher-Ohlin theorem. It soon became a staple of virtually all general economics texts, including Samuelson’s own best-selling work, first published in 1948.

Samuelson’s *Economic Journal* article, “International Trade and the Equalization of Factor Prices,” also published in 1948, underscored and refined Ohlin’s theoretical work. In this article, Samuelson exploited Heckscher-Ohlin to provide a polished mathematical explanation for how free trade might well serve as a substitute for the free mobility of capital and labor. He extended the theorem to reveal how the change in price of an internationally traded commodity affects a similar change in the income of the factor (labor or capital) used most intensively in producing it. From this followed what he termed the factor-price equalization theorem: as free trade narrows differences in commodity prices between nations, it must also, under the same conditions, narrow differences in income accruing to the factors of production. Thus, free trade naturally lessens the differences and resulting imbalances introduced by immobile or relatively immobile workers, factories, or natural resources.

By dropping one modifying assumption of Ohlin’s theory after another (zero transportation costs and import duties, flexible exchange rates, immobile capital, etc.), Samuelson revealed both the positive force and efficiency of a hypothetical free trade regime and the stringent conditions necessary to carry out such a regime. Indeed, as the empirical work of Wassily Leontief revealed, Heckscher-Ohlin did not always fit the real world. Building on his groundbreaking work in input-output studies, Leontief noted in his “Domestic Production and Foreign Trade: The American Capital Position Re-Examined” (1954) that American exports tend to be labor intensive while American imports are mostly capital intensive, results in direct opposition to those suggested by the Heckscher-Ohlin theorem. Likewise, when put to the test, the purchasing power parity theory—developed principally by another of Ohlin’s Swedish professors, Gustav Cassel (1866–1945)—appears to have equal difficulty fitting real world conditions. Relating free trade flows to international currency matters, purchasing power parity suggests that the purchasing powers of currencies in equilibrium would be equivalent at that rate of exchange. The exchange rate between any two national currencies should, in other words, adjust to reflect differences in price levels in the two nations.

The chief factors that account for the breakdown of purchasing power parity—currency speculation in foreign exchange markets, an abundance of goods and services that are not traded internationally, the extensive trading of financial assets, and the difficulty with which both general domestic and comparable international price levels are determined—also account in part for the potential invalidity of the Heckscher-Ohlin theorem. That Leontief found an apparent contradiction in the U.S. example may only suggest that its economy is both more varied and complex than that of most other nations, and that its behavior consistent with the Heckscher-Ohlin pattern may simply be more readily found within its regional, as opposed to international, trading networks.

Such theoretical insights proved to make Samuelson a virtually indispensable economic policy adviser. Indeed, as chairman of the task force advising president-elect Kennedy in 1960–1961 on economic policy (and Kennedy’s first choice for chairman of the Council of Economic Advisers), Samuelson may well claim paternity of Kennedy’s efforts on behalf of free trade. The Trade Expansion Act (TEA) of 1962, the first significant American legislative sponsorship of free trade since the 1934 Reciprocal Trade Agreements Act, bore the stamp of Samuelson’s theoretical work and policy advice. Well aware of the elusive conditions under which an ideal free trade regime might be enacted, Samuelson provided a sound theoretical footing for the pragmatic approach reflected in the TEA, one of President Kennedy’s few major legislative victories. Giving rise to the so-called Kennedy Round of GATT negotiations, which reduced import duties on industrial goods worldwide by approximately 35 percent (and by a remarkable 64 percent for American-produced goods), the TEA also included new restrictions on textile imports. A historic milestone on the road to greater trade liberalization, the TEA nonetheless reflected a pragmatic appraisal of real-world economic conditions and policy limitations. Trade liberalization for manufactured goods was likely impossible without the textile industry protections.

**Lingering Theoretical Challenges** Appointed to teach international economics at the London School of Economics in 1947, James Edward Meade (1907–1995) launched a book project to
help him better grasp the ideas he hoped to convey to his new students. The resulting *Theory of International Economic Policy*, published in two volumes (*The Balance of Payments* in 1951; *Trade and Welfare* in 1955), attempted to integrate domestic and international policy, pre-Keynesian price effects with Keynesian income effects, and abstract free trade patterns with real world tendencies that often included or necessitated trade control. Recognizing and underscoring the notion that legitimate government assistance (international market research, for example) is often difficult to distinguish from subsidized trade protection, Meade discovered the “theory of second best.” In Meade’s formulation, abstract free trade models may well produce less than optimum outcomes, given real world conditions or tendencies. His theory of the second best revealed how a free trade regime might countenance alternative policies that diverged from absolute free trade principles, protecting the authentic gains from freer trade in the process. Subsequent to Meade’s discovery, few criticisms of free trade outcomes found anything but a loose theoretical foothold, especially so if the free trade regime itself became the object of criticism. After Meade, few of these criticisms represented broad theoretical challenges to the growing free trade orthodoxy but were, instead, reminders that imperfect conditions and irrational economic behavior had to be accommodated—or isolated and marginalized—within the prevailing regime.

The chief ongoing quarrel with increased trade liberalization appears to be a criticism of theorists and policymakers who conflate international free trade with domestic free markets, or international trade with international capital flows. With the recent advent of policy initiatives such as Trade Related Investment Measures (TRIMs), it has become easier to make such a conflation. Promulgated by the World Trade Organization, TRIMs are measures that force nations to compensate foreign investors for rules imposed after their initial investment (such as minimum wage increases). But free trade need not imply a policy of strict noninterference on the part of national governments (or even international organizations); some, like Charles Kindleberger, have suggested that government-sponsored domestic prosperity may even be a prerequisite for the enlargement of free trade networks abroad. If such enlargement requires that one prosperous nation serve as a lender or buyer of last resort, and be willing to sacrifice parts of some internationally exposed markets in the process, then this may well be the case.

As free trade theory and policy burnished their standing among policymakers worldwide in the last quarter of the twentieth century, economic circumstances continued to raise nagging questions. The distributational effects of trade often appeared to undermine general prosperity; protectionist regimes often appeared beneficial if introduced skillfully enough to avoid retaliation; free trade appeared to undermine environmental protection in developing nations. The Prebisch-Singer theory arose directly in response to rising distributational problems, particularly those that surfaced in the southern hemisphere. Named for Raul Prebisch (1901–1986), professor of economics at the University of Buenos Aires and the first director-general of the UN Conference on Trade and Development, and Hans W. Singer, German-born UN economist who had trained under both Joseph Schumpeter and Keynes, the Prebisch-Singer theory suggested that international free trade reinforced harmful economic development practices in the developing and least developed countries. Because colonialism had produced unsustainable economic structures in these nations based on the encouragement of exports—most of which were inexpensive raw materials—Prebisch and Singer argued that trade protection and import substitution strategies were necessary if these developing nations were to strike out onto a sustainable path of growth and prosperity.

An agreement to set up a common raw materials price support fund of $750 million, after deliberations at the fourth UN Conference on Trade and Development, came as a direct result of Prebisch-Singer. Prebisch later suggested, however, that he was motivated primarily by the promise of industrialization, well suited to policies of import substitution but not, perhaps, to the labor surpluses so evident in the developing economies. Noticing later that increased wealth and increased demand for imports in developed nations might well improve the terms of trade for developing countries, Singer also modified his theoretical conclusions and policy recommendations. The slow maturation of the Latin American economies in the early post–World War II period, combined with rising American and European prosperity in the 1950s and 1960s (especially the latter decade), perhaps masked the ways in which protectionism and import substitution may have easily become self-defeating strategies. These developing nations matured and came to depend
increasingly upon external markets and capital only a few years before the stagflation, oil price hikes, and higher interest rates of the 1970s obliterated gains on both sides.

The apparent success of East Asian protectionist regimes in the late twentieth century and the onslaught of developing world environmental crises also cast doubt upon the superiority and applicability of free trade theory. But here, as well, theorists have largely acknowledged that protectionist regimes can flourish only when foreign sources of prosperity offer forbearance and accommodation in place of retaliation or increasing autarky. Absent undemocratic political systems and regressive fiscal and monetary policies, most theorists have also inferred that global free trade need not prevent environmental stewardship, just as it need not prevent lessened inequality within or between nations. Most have concluded that it is economic growth itself and the associated capital intensity that bring pressure on the natural environment. Free trade has essentially been implicated, then, in environmental crises as little more than the handmaiden of economic growth. If free trade is not distinguished from the absolute free market, however, such theoretical conclusions often remain opaque and virtually incomprehensible. And since the theoretical gains from freer trade tend to be as regressive as the theoretical gains from economic growth in general, the conflation of free trade with laissez-faire only serves to make trade theory even more ambiguous. Linking trade theory to development and growth theory, Gunnar Myrdal and others urged deliberate policy initiatives, without which lessened inequality and growth would prove unattainable. Failing to make that distinction, they argued, would place “second best” policy and the progressive, compensatory measures it often required beyond reach and would render free trade incapable of fulfilling its modest theoretical promise.

INTERNATIONAL MONETARY POLICY

International monetary policy attracted few economic theorists before the twentieth century. Only when historic mercantilist concern for the accumulation of specie, and the rapid adjustment of interest rates under the gold standard, gave way to greater concern for mass unemployment did it begin to garner much theoretical attention. Before that, few who suffered at the hands of recurring gold outflows and restrictive domestic monetary policy were in any position of influence to either arrest such trends or call for new policies and theory with which to assail or question the prevailing regime. Exchange rates and gold reserves were defended at almost any cost, interest rates moved precipitously to reverse potentially large capital outflows, and investment planning could proceed under the assumption of minimal or virtually nonexistent exchange rate risk. However secure it rendered investment planning, this approach often proved that it would require, above all else, the willingness to sacrifice output in the name of exchange rate stability. As industrialization reconstituted American and European labor markets, this approach also implied recurring episodes of mass unemployment.

Much as it had with international trade theory, the shock of world war and the Great Depression gave great impetus to change. And just as these events compelled economists to rethink the theories that had somehow prevented them from capturing or explaining real world tendencies in international trade, so they forced economists to train their sights anew on questions of international money. The Baring-Argentine financial crisis of 1890 and the U.S. depression of 1890s had also focused much attention on international currency problems, but economic theorists were as yet unequipped to respond directly or forcefully. It was not until the later crises and the even more widespread economic calamity of the 1930s that economic theory began to respond with analyses directed at international monetary policy. It was at this time that the United States, for example—closely following its European counterparts—began to compile international balance of payments accounts, records of its transactions with the rest of the world. It was also at this time that Keynes and others began to urge new ways of conducting international monetary transactions, actively seeking theoretical insights by which changes could be guided and accommodated. “To close the mind to the idea of revolutionary improvements in the control of money and credit,” Keynes warned, “is to sow the seeds of the downfall of individualistic capitalism.”

To Keynes, the early twentieth century had proven the extent to which nations would resort to currency devaluation as a lever to improve their balance of trade, seldom improving in the process either their own terms of trade or the opportunities inherent in a flourishing and expanding trade network. As balance of payments accounting had
Economic Policy and Theory

become more common, many Western nations had come to believe that unilateral currency devaluation would, in the absence of reciprocal action, improve the terms of trade. It would make a nation’s own exports cheaper in terms of foreign currency and would, of course, make imports equally more expensive. It was not uncommon to find, however, the price of imports rising under such an initiative to the point where the aggregate value of imported goods continued to outpace the value of the higher, newly attained level of exports. Abba Lerner, in his 1944 publication The Economics of Control, introduced what eventually came to be called the Marshall-Lerner criterion, a theoretical rule with which one could determine the positive or negative outcome of such a devaluation. Assuming that factors such as supply constraints do not enter into the picture, Lerner showed that if the price elasticity of exports plus the price elasticity of imports is less than 1, then the increased cost of the imports exceeds the value of the growth in exports. Moreover, if a nation began with a large sum of foreign liabilities denominated in foreign currency, devaluation of its own currency might well add terrific sums to its net interest payments. With competitive devaluation added to the mix as a likely outcome, perhaps only after an interval of unilateral manipulation and worsening results, the terms of trade could seldom be rendered any more reliable or propitious. Global trade diminution became an increasingly likely outcome.

With a little prodding from Bertil Ohlin and others, Keynes’s theoretical insight here was to recognize that in modern industrial economies, monetary policy would simply have little effect in restoring balance through price deflation. It would regulate external balance, instead, by causing unemployment, lower incomes, and decreased imports. He then seized upon the notion that exchange rate mechanics mattered far less than international liquidity. Though gold, the pound sterling, and the U.S. dollar had all proved somewhat useful in attempts at securing substantial international reserves with which to conduct increasing levels of trade, even the highly regarded British and American currencies remained vulnerable to the deflationist tendencies Keynes so abhorred.

Bretton Woods and the Tri芬 Dilemma As the end of World War II approached, Keynes and many of his American counterparts began planning for the postwar period. The Bretton Woods conference of 1944 convened with a sharp focus on both the monetary fragility of the interwar period and the theoretical prescriptions of Keynes and his growing legion of American disciples. The conference proved successful in reorienting the world’s economic exchange system away from the constraints of the gold standard. Exchange rates were fixed and pegged, and could be adjusted within limits only during periods of “fundamental disequilibrium.” Because Keynes and the head of the U.S. delegation, Treasury assistant Harry Dexter White, hoped to insulate government domestic policies from the misdeeds of currency speculators, Bretton Woods called for explicit capital controls. It also created the International Monetary Fund (IMF), an organization designed to provide a cushion of international reserves to nations caught in a persistent current account deficit. The IMF would also serve as the final arbiter of fundamental disequilibrium.

In the end, however, Keynes’s preoccupation with international currency reserves gave way to the overriding American concern for exchange rate stability. His proposal for an International Clearing Union, under which international liquidity could be expanded without reliance upon a single currency, never came to pass, mostly due to widespread fears that it would prove to have an inherent inflationary bias. It included provisions for bank “credits,” extended to surplus states, and an artificial bookkeeping currency he called a “bancor,” to maintain exchange rate stability. Overdraft provisions (up to $26 billion initially for member states) were proposed as well, to prevent contractionary domestic policy measures or competitive devaluations undertaken in the defense of embattled currencies. The IMF, however, acknowledging part of Keynes’s theoretical contribution, did arrange for lending quotas (based mostly on the relative value of recent trading levels). In theory, these might have been utilized for both reconstruction and investment, and like the Clearing Union, could become a means to increased international liquidity. Unprecedented inflation in the immediate postwar years, however, altered the real value of IMF quotas to the point that short-term currency stabilization proved to be the only feasible activity. And since the Bretton Woods system came to be anchored upon the U.S. dollar (pegged to gold at $35 per ounce) rather than any type of new reserve asset, international liquidity would also depend in large measure upon worldwide confidence in a currency destined to wind up in a precarious overhang or glut position. Indeed, generous Marshall
Plan assistance, combined with larger than anticipated Cold War military outlays, quickly transformed a dollar shortage expected to last for some time into a dollar glut. By about 1953 the dollar gap or shortage had disappeared.

Although the modest U.S. payments deficits of the mid-1950s represented little more than a sensible response to varying levels of worldwide savings and investment requirements, Yale economist Robert Triffin noted that the dollar's unique position in the fixed exchange rate Bretton Woods system posed a fundamental dilemma. As the anchor of the system and the chief reserve asset, the flow of dollars into foreign accounts would necessarily outpace the flow of other currencies into American hands. Yet, despite the salutary effect such reserves would have on international trade in general, Triffin speculated that confidence in the dollar as a store of value would decrease as its numbers and its role as a reserve asset increased. Dollar accumulations overseas would engender an increasingly risky situation governed by a self-fufilling prophecy. The implication of this dilemma was that international liquidity depended upon either a return to the Keynesian approach and a new independent reserve asset, or an end to fixed exchange rates pegged to the dollar value of gold.

Although the Lyndon Johnson administration tried to move in the direction of the former option, by introducing special drawing rights (informally, "paper gold") into IMF operations, they failed to catch on as a source of genuine, day-to-day international liquidity. Previously, John Kennedy's undersecretary of the Treasury for International Monetary Affairs, Robert Roosa, had arranged for a series of mostly stopgap measures designed to ease the dollar overhang and stanch the attendant gold outflow. Negotiated offsets (purchase of U.S. goods by nations receiving U.S. military aid), swap arrangements (U.S. agreement to exchange U.S.-held foreign currencies for dollars at a future date to protect foreign banks otherwise reluctant to hold large sums of dollars), and the December 1961 "General Arrangements to Borrow" (a large, short-term borrowing arrangement that gave Great Britain and the United States additional IMF resources to avert a speculative currency crisis) were among the measures employed by Roosa and his successor in the Johnson administration, Frederick Deming. Afterward, the only remaining questions concerned the way in which the world would manage the departure from the Bretton Woods system and the nature of the floating exchange rate system certain to take its place.

The end came quite abruptly after a decade of patchwork revisions, holding operations, and stopgap measures. President Nixon's decision of 15 August 1971, to end the guaranteed conversion of U.S. dollars into gold at $35 per ounce, announced after a series of Camp David meetings with top-level economic advisers, effectively ended the Bretton Woods international monetary regime.

**Floats, "Dirty Floats," and the Tobin Tax**

While floating exchange rates theoretically promised greater scope for expansionary domestic policies—part of Keynes's hope for the Bretton Woods blueprint—large, speculative movements in currency value and rapid, unsettling episodes of capital flight remained distinct possibilities. Indeed, financial transactions soon dwarfed those in goods and services in the post-Bretton Woods era; potentially large and rapid movements became all the more likely. But the demand for reserves did diminish along with the adoption of floating exchange rates, and increased capital mobility opened up the potential for other, more varied types of reserves in general. Nations also adapted, instinctively, by accepting floating exchange rates but with currency management intact. Few currencies were ever allowed to float freely; instead central bankers most often practiced a "dirty float"; large swings were to be checked by rapid central bank buying and selling in currency markets. This is why Barry Eichengreen has suggested that the Mexican peso crisis of 1994–1995 was "the last financial crisis of the nineteenth century," resembling in a fundamental way the Baring crisis of 1890. In both cases, central bankers rallied around the system by rallying around a besieged currency (and, coincidentally, a Latin American nation).

With ample room for speculation and capital flight, however, theorists have more recently come to question the stability of the prevailing system. Currencies have likely become more volatile, capital flight has become an increasing malady, and trade has lost ground to multinational production due to the increasing currency market volatility. It is in this context that economists have debated the potential for capital controls and, as James Tobin often described it, the means by which policymakers might potentially throw a little "sand in the gears," reducing volatility in the process. Chief among the theoretical contributions or policy proposals here is the international currency transactions tax, or "Tobin tax." Proposed initially by the Yale economist James Tobin, such a tax would be small (typically proposed at 0.1 percent) and
placed upon all international currency transac-
tions. Theoretical debate on the Tobin tax has thus
far focused upon the potential for offsetting
effects. Would a transactions tax decrease volatil-
ity by increasing the costs to speculators, or would
it increase volatility by reducing the total number
of transactions, producing “thinner,” more vulner-
able markets in the process? Because it would not
distinguish between speculative transactions and
those conducted on behalf of trade, would the
taxations tax reduce levels of trade as it reduced
speculation, or would it increase trade by reducing
currency market volatility? If introduced, could
the tax be applied widely enough (that is, fairly
and equitably) by wedding it to the policies of
developed nations, or would it be difficult to
enforce uniformly, and therefore conducive to
avoidance and resulting misallocation?

Although free trade remains a contentious
political idea, economists have increasingly
devoted their attention to the related problems of
capital flows, currency speculation, and interna-
tional monetary instability. And though many
economists predicted at the time that the end of
fixed exchange rates would give nations the fre-
dom to create fiscal and monetary policies of their
own choosing (unencumbered by exchange rate
parity concerns), few remained as sanguine by the
end of the twentieth century. Introducing foreign
trade and capital movements into a closed eco-
omy model, Robert Mundell described in the
1960s and 1970s how a floating exchange rate
regime would, by connecting government fiscal
stimulus with higher interest rates, capital inflows,
and currency appreciation, automatically render
fiscal stimulus ineffective. The currency apprecia-
tion, he argued, would lower net exports to the
point where any fiscal stimulus that gave rise to
them in the first place would be completely elimi-
nated. Despite its less suitable conformity to large,
as opposed to small, open markets, the apparent
lack of correlation between government deficits
and interest rates, and the numerous real world
examples of currency appreciation tied to compar-
atively low interest rates, Mundell’s pessimistic
appraisal of modern fiscal policy remains the dom-
inant analysis for floating exchange rate regimes.

development and
growth theory

Economic growth theory remains the most diffi-
cult to master of all modern economic theories. It
requires advanced mathematical skills (differen-
tial calculus) and, as a result, also introduces
assumptions and limitations very difficult to
account for or envision. Even if one excludes the
possibility of perpetual disequilibrium—however
close it may come to a precarious balance—the
passage from one equilibrium state to another
typically excludes any notion that underlying
conditions may change with time as external vari-
ables exert change upon them. To do otherwise
would be to require mathematical reasoning so
complex and fragile that it would likely render all
resulting models completely impractical by
exposing them to the hidden, often increasing
feedback effects of the most minute errors.

Although he was a leading biographer of
John Maynard Keynes and a promoter of Keynes-
ian economics, Roy F. Harrod was also among the
first to leave behind Keynes’s theoretical focus on
a static economy. Although Keynes avoided tak-
ing a similar step on his own because he wanted
to focus on existing problems of underutilization
rather than apparent ongoing cycles of growth
and recession, Harrod was more interested in the
latter, effectively inventing growth economics in
the process. His 1939 *Economic Journal*
article, “An Essay in Dynamic Theory,” gave rise to
growth theory by introducing the notion of a
steady-state equilibrium growth path from which
actual growth most often diverged. Harrod also
revealed how such a divergence fed upon itself,
widening the gap between steady-state and actual
economic trajectories.

Recognizing only a few years later (1946)
that investment created additional productive
capacity capable of being exploited only when fur-
ther increments of investment gave rise to new
income, Evsey D. Domar developed a simple
model corroborating Harrod’s theory. Known
thereafter as the Harrod-Domar model of dynamic
equilibrium, this model and accompanying theory
were adopted by the International Bank for Recon-
struction and Development (World Bank) imme-
diately after World War II, setting the stage for
the pending marriage of growth theory and third
world economic development. Although intended
for use in the analysis of advanced, developed
economies like that of the United States, the
World Bank quickly adopted it as a way to deter-
mine the amount of aid required to lift poor
nations onto a more prosperous growth path. Aware
in the 1950s that his model was being
applied without questioning the relationship
between aid and investment—or inequality, con-
sumption, and investment—Domar disavowed its use. As decolonization proceeded apace after World War II, however, it was inevitable that growth theory would come to be employed in this fashion.

Nicholas Kaldor and Joan Robinson, both, like Harrod, among the first in the Keynesian camp, endeavored to highlight the importance of income distribution to economic growth. Mostly due to his 1960 presidential address to the American Economic Association, “Investment in Human Capital,” Theodore W. Schultz publicized the work begun in the 1950s by Jacob Mincer and popularized the notion that education and training were as critical to development as technology and industrialization. Hollis Chenery, Simon Kuznets, and Irma Adelman all questioned the notions that growth depended solely upon industrial development and that growth automatically engendered greater equality, lessened poverty, and promoted a self-sustaining pattern of development. Kuznets’s famous “inverse U relationship”—between national income per capita and inequality, positive in poor nations and negative in advanced national economies—sparked numerous rounds of debate, including Adelman’s study of semideveloped nations that contradicted Kuznets’s assertion.

Until Raul Prebisch, Hans Singer, Dudley Seers, and others criticized the assumption that poor nations were simply primitive versions of their more advanced, wealthier counterparts, however, few of these theoretical developments questioned the theoretical claim that investment in machinery, however effected, automatically engendered growth. Although Prebisch in particular seemed enamored of the possibilities for industrialization of the developing world and import substitution policy, he placed equal, if not overriding, emphasis on the elimination of unemployment, poverty, and inequality as a prerequisite for industry-led growth. Developing world debt crises of the 1970s and 1980s, evident in nations that had adopted the Prebisch-Singer theory and government intervention designed to implement it, spawned an even more vigorous countermovement marked by criticism of government intervention.

The “total factor productivity growth” approach, developed principally out of Robert Solow’s groundbreaking work in capital theory in the 1950s, also questioned the primacy of capital formation in general or investment as a simple means to economic growth. Solow developed, for example, “vintage” models of growth that underscored not just the size of a given nation’s capital structure, but also its age or vintage. The newer the technology, the greater its productive capacity, and—following Albert O. Hirschman on the “unbalanced” character of economic growth—the greater its linkage to key industries—on both the input and output sides. Research and development, scientific advances, and the processes of technology diffusion—all seemingly outside the scope of economic policy—evidently played as significant a role as policy itself. Vigorous debate on this issue ensued, most notably due to the emergence of empirical studies suggesting that government policy and high investment often appeared to spell the difference between nations that grew more or less rapidly. Joseph Schumpeter’s earlier suggestion that oligopoly allowed firms to compete on the basis of technological innovation rather than price hinted at the role conceivably played by policy and burgeoning investment. Much like Kindleberger’s lender of last resort—a nation that could afford to liberalize trade and share the wealth—Schumpeter’s oligopoly capitalist could provide room for full employment and rising shares to labor as well as produce the profit margins with which to assume risky research or investment outlays. Unmitigated free market competition, it seems, would be incapable of the same. Amartya Sen posed theories of development, social choice, and inequality that suggested similar conclusions. Clarifying the conditions under which collective decisions can best reflect individual values and stressing the way in which poverty and inequality restrict economic choice and freedom, Sen forced economists and policymakers to consider general welfare and development in terms beyond reported changes in per capita income or gross national product.

Economic theory has for centuries remained a significant part of foreign affairs related to trade, money, and development. This is especially so for the foreign affairs of the United States, less dependent on international trade than many other nations but connected vitally to all by virtue of its dominant currency and ascendant role in international economic institutions. Since the emergence of stagflation in the 1970s, its history of adapting foreign policy to advances in theory has been marked by both indecision and a willingness to countenance only the most confident and simplistic versions of new economic theory. The debt crises of the 1980s and monetary turmoil of the 1990s did little to alter this course. And though
heterodoxy remained distant and beyond the ken of most policymakers, the foreign affairs of the United States remained wedded integrally to the counsel of economists, both active and defunct.

BIBLIOGRAPHY

Keynes, John Maynard. *The Collected Writings of John Maynard Keynes*. Edited by Donald E. Mogrridge. 30 vols. London and New York, 1971–1989. Although other volumes in this set are also relevant to studies of international economic policy and theory, volumes 5, 7, 25, and 26 are particularly useful.

Ricardo, David. *Works and Correspondence: Principles of Political Economy and Taxation*. Vol. 1. Edited by Piero Sraffa. First volume of a ten-volume collection of Ricardo's writings. Edited over 30 years by an influential Cambridge economist whose fear of teaching was so profound that the editorship of this series and other smaller tasks had to be invented (principally by John Maynard Keynes) to keep him on the Cambridge faculty.

A theory of wide-ranging importance in historical and political thought, elitism as applied to foreign policy seeks to explain how that policy is made—by whom, in whose interest, in what manner, for what purpose, and with what results, including possible benefits for the policymakers themselves. A causal relationship generally is posited, or at least implied, between the composition of the policymaking group and the content and consequences of the policy it makes. Typically, the explanation of policy is to be found in the machinations of persons belonging to or admitted to a small coterie representing a wider privileged class, at the very top levels of society—an elite. A recurrent issue in elite analysis is that of whether the elite consists principally of the decision makers themselves or whether the elite is instead mainly the socially superior part of a community from which decision makers are drawn. The former view, which tends to be that of diplomatic historians and other scholars who focus on particular events, emphasizes the actors who are involved. The latter view, which tends to be that of sociologists and political scientists who compare overall patterns and may be interested in predicting, as well as explaining, public policy, emphasizes the structures that produce policy decisions. Common to most elite analyses is an assumption that there is some connection between actors, or power holders, and the structures, or social and governmental frameworks.

The English word “elite,” adapted from the French élite, derives from the Latin eligere, a verb meaning to pick out, choose, or select. There is thus a meritocratic element in the concept. The exclusiveness of an elite group, especially in a nominally “classless” country such as the United States, with a republican form of government and democratic social institutions, is not based merely on birth or on wealth. It is, in principle, based as well on individual merit and on achievement—the person’s intelligence and skill, courage and energy, and, of particular relevance in foreign policymaking, expertise and experience. Like wine, diplomats and other statesmen are often thought to get better as they grow older, achieving the status of “wise men.” The role of women in the foreign policy elite, as it is sometimes called, has not been equal, though there is a trend toward greater representation of women in international service.

The broad sensibility needed for foreign policymaking in the United States and elsewhere was usually thought to owe something to an individual’s family background. In the late nineteenth century a wealthy family could embark on a grand tour of Europe, and even around the world, that would expand a young person’s horizons and permanently inform his or her outlook. Before (and even after) passage of the 1924 Rogers Act—which combined the U.S. diplomatic service and the less elitist consular service and established a merit-based classification system for officers—the American foreign service was, as the historian Martin Weil entitled his 1978 book, “A Pretty Good Club.” This almost familial milieu was well described in many diplomatic memoirs and biographies, for example that of Ambassador Joseph Clark Grew by Waldo H. Heinrichs, Jr. (1966). Increasingly, however, the knowledge and skills needed for the practice of diplomacy and for international policymaking generally include a firm grasp of economics and an acquaintance with science as well as working proficiency in languages besides English and French. This may entail specialized study and preparation at postgraduate schools of international relations or equivalent professional training.

In the United States, international service was further democratized by the Foreign Service Act of 1946, as well as the reforms proposed by the Commission on the Organization of the Executive Branch of Government (Hoover Commission) in 1949 and by a committee formed under President Henry M. Wriston of Brown University.
in 1954. These reforms were aimed partly at familiarizing the domestically based civil service with the world and partly at preventing the foreign service from losing contact with American life. “Wristonization,” as the effort was informally called, resulted in some integration of qualified members of the domestic civil service into the foreign service, though not at the expense of the latter’s sense of itself as a select profession.

**CLASSICAL AND NEW ELITE THEORY**

Although the idea probably always has been present in some form, elitism emerged as a recognizable and clearly defined part of Western political thought in the late nineteenth and early twentieth centuries. The leading contributors to the theory were Gaetano Mosca, Vilfredo Pareto, and Robert Michels. These writers attacked classical democratic thought and also Aristotle and Karl Marx. Majority rule, they insisted, is impossible. Every society is divided into those who rule and those who are ruled; and the rulers constitute only a small minority of any society. Aristotle’s classification, which divided political systems into three types (rule by one, rule by a few, and rule by the many), does not fit reality either, for no man is capable of ruling by himself, and the many, too, lack the ability to govern. It is the few, under any political system, who exercise effective control.

And Marx, with his emphasis on a class struggle that in the end (following the victory of the working class) leads to social harmony in a classless society, was also wrong. History features a continuing struggle among elites. That struggle will never end, and a classless society cannot be created. Moreover, to the pioneers in the development of elitist theory, Marx placed too much emphasis on economics and not enough on politics, which could be autonomous.

Classical elitist theory did not maintain merely that the active, socially recognizable people in a country made its important decisions—whether from within offices of government, from somewhere behind the scenes, or from completely outside the state apparatus. It emphatically asserted that the common man, however numerous within a society in absolute or relative terms, did not. Analysts of elites, who generally focus on the distribution of power rather than on the allocation of values, or on property and other wealth forms, differ somewhat over the degree of participation in government or, more generally, the political process that is necessary for a member of the elite accurately to be judged a member of what Mosca characterizes as “the ruling class.” A society’s elite is usually thought to be a stable entity, self-sustaining and constant over time. Yet the actual group that is in office can change markedly and very quickly. The concept of an elite therefore may need to be understood as encompassing all those who might govern as well as those who in fact do govern.

However “elite” is precisely understood, elitist theory is clear in the basic point that a minority, rather than the masses, controls things. The general population of a country—the common man—is ineffective. Even in societies with elections and other democratic mechanisms, it is posited, the ruling elite functions in a way that is largely independent of control by a popular majority. However, it made need a justifying doctrine. That the elite ordinarily functions according to a “political formula,” in Mosca’s term, is what makes its rule effective and acceptable to the masses. Thus, in theory, there can be a democratic elitism, however paradoxical that may seem.

A “new elite paradigm,” building on the work of Mosca and other classical theorists, emerged in the 1980s and 1990s among comparative political sociologists. It drew attention to the occurrence, and the important effects, of divisions that may arise within the elite of a society. Its central proposition, as stated by John Higley and Michael Burton (1989), is as follows: “A disunified national elite, which is the most common type, produces a series of unstable regimes that tend to oscillate between authoritarian and democratic forms over varying intervals. A consensually unified national elite, which is historically much rarer, produces a stable regime that may evolve into a modern democracy, as in Sweden, or Britain, or the United States, if economic and other facilitative conditions permit.”

In the United States, normally, internal and external conditions have favored consensual unity within the nation’s elite. Of course, the American Revolution and, later, the Civil War, are the major exceptions to this generalization. During those periods, divisions ran so deep as to produce counter-elites. As the political sociologist Barrington Moore, Jr., and the political historian C. Vann Woodward have shown, the reconciliation between North and South that occurred following post–Civil War Reconstruction was in significant part a result of a complex bargain.
between the elites in formerly opposed geographical sections. After the late nineteenth century, issues of foreign policy have on occasion divided the American elite as well. A by-product of this has been a widening of participation in the national debate over foreign policy. That this amounts to a “democratization” of American foreign policymaking, however, is highly disputable.

FROM IMPERIALISM TO REVISIONISM

American thinking about the relationship of elites to foreign policy began to develop around the year 1900 during the debate over imperialism. Most elite theorists, or commentators applying elite theory, have viewed policy from the Left, although not all have done so. There is also a conservative, or Rightist, elitism, sometimes politically ideological but more often having a traditional religious or cultural perspective on matters of public life. Such conservative elitists have been somewhat less inclined to address issues of foreign policy.

Most American critics having a view of society as headed, if not actually led, by elites have stressed the influence of business groups. These were seen to have had a role in causing the U.S. war with Spain and the subsequent effort to dominate the Philippines. A few denunciators of such overseas ventures, including socialists such as Daniel De Leon and Eugene V. Debs and populist reformers like William Jennings Bryan, openly blamed imperial expansion on the greed of the commercial and moneymaking classes and on trusts and syndicates looking for new fields to exploit. Most opponents of imperialism at the time did not fully develop such a radical view, but an English writer, John A. Hobson, supplied a theoretically coherent version of it in Imperialism (1902). He interpreted the imperialist dynamic as being the result of a capitalist drive for greater profits than were available at home and also for security for investments made in overseas territories. In studying the American reaction to not only U.S. but also British imperial engagements such as that against the Boers in southern Africa, the historian Ernest R. May, in American Imperialism: A Speculative Essay (1991), surmises that Americans, “already disillusioned by the Philippine war and concerned about the growing power of trusts, probably found Hobson’s arguments especially attractive.”

Putting the whole subject in a broad comparative frame from a transnational perspective, the Norwegian political sociologist Johan Galtung, in the essay “A Structural Theory of Imperialism” (1971), interprets imperialism not so much as the result of the drives or motives behind it as the product of a structured, collaborative relationship between elites. He abstractly outlines one elite “center” inside the imperial power and another, smaller center inside the colonial country. He then theorizes that imperialism succeeds when the relationship between the two elites is “harmonious,” or smoothly functioning and mutually profitable, but that it is bound to fail if it is not. Galtung’s theory helps to account for the breakdown of British control over southern Africa. It also helps to explain the failure of the United States to achieve “harmony” with the Philippines, whose native leadership in large part refused to collaborate with American authorities and henceforth were subdued by military force. What is pertinent here is that a significant part of the American “center” also refused to enter into such a collaborative relationship, one of imperialism.

It has been shown that in the United States those who most prominently opposed U.S. territorial expansion in Asia following the Spanish-American War were themselves in many cases members of the American elite, if not mainly from the ruling political class or dominant economic group. Many were of an older type, for whom the early American Republic rather than the current and purportedly liberal British Empire was an appropriate model for the country. In Twelve Against Empire (1968), Robert L. Beisner observes that the leading anti-imperialist figures he studied generally “all shared the same biases and for the most part cherished the same conservative vision of an ideal American society.” They were “elitists,” he emphasized, and as such “they were not so much interested in conserving a system of economic privilege for themselves as in defending a style of life and a social tone against the leveling influences of arriviste businessmen and the democratic masses.” Most of these, being themselves white, Anglo-Saxon, and Protestant (later to be called the WASP type), had long been concerned that increased immigration, from sources other than certain countries in western Europe, might alter the racial and religious character of American society. Taking over the Catholic Philippines would only add to this perceived risk.

Previously, Ernest May notes, the American elite as a whole had been “overwhelmingly anti-
colonialist.” In the late 1890s, however, the nation’s ruling classes began to divide, with some, mostly of a younger generation, identifying with England’s liberal imperialists and becoming enthusiasts for a similar high-minded American imperial expansion. The split between imperialists and anti-imperialists cost the American elite some of its influence and also its control over public opinion. May writes: “In 1898–1899, this not only made for an intra-elite debate about whether the United States should or should not acquire colonies; it legitimated a much wider public debate. Less educated and less cosmopolitan Americans could speak with greater freedom because they could take sides with one set of opinion leaders against another.” Arguably the elite division had a permissive effect, allowing persons who previously had been merely “talkers” to become, if not real authorities, then frequently quoted “advisers.”

In that era there were few American scholars who systematically employed elitist theory, or at least an awareness of the role of leadership groups, in attempting to comprehend the structure of American society. One who did was the pioneering sociologist Edward A. Ross. “Every editor, politician, banker, capitalist, railroad president, employer, clergyman, or judge has a following with whom his opinion has weight. He, in turn, is likely to have his authorities,” Ross observed in Social Psychology (1908). “The anatomy of collective opinion shows it to be organized from centers and subcenters, forming a kind of intellectual feudal system.”

Much more broadly, a Progressive outlook, shared by Charles A. Beard and other historians as well as by leftist and reform-minded politicians, disposed Americans to detect “hidden” influences responsible for the country’s social direction and political decisions—for example, in permitting monopolies to operate. With the beginning of World War I in July 1914, explicit arguments about the class or group domination of American public life gained greater prominence. When the war started, President Woodrow Wilson asked Americans to be “impartial in thought as well as in action.” Congress’s declaration of war in April 1917—at the president’s own request and following repeated protestations of U.S. neutrality—was something that required an explanation.

Critics on the Left, many of them strongly opposed to the war decision on grounds that it was inimical to the interests of the workingman or out of an ideological pacifism, supplied an explanation that stressed the malign influence of an economic elite. The centers of it were seen to be located on the East Coast, in the financial and industrial elites of New York and other Europe-oriented cities. Particular individuals such as J. P. Morgan, the Rockefellers, and the Du Ponts were named. Somewhat more generically defined groups, notably international bankers and the munitions makers—or, simply, “Wall Street” and war-profiteering “merchants of death”—were identified as being responsible for causing the country to join in the European carnage. They were thought to favor the overly ambitious peacemaking efforts led by President Wilson and his friend Colonel Edward M. House, along with his group of experts called the Inquiry, that resulted in the Treaty of Versailles and the League of Nations Covenant, which many feared would be an “entangling alliance.”

This interpretation of history, with its emphasis on economic factors, resembled Marx more than Mosca, Pareto, or Michels. Also unlike those European theorists who accepted the idea of a permanent ruling class, the American accusers of the “interests” did not regard elite domination of society and determination of national policy as inevitable. The “people”—who, in the view of critics, had been, or at least should have been, opposed to intervention in the war because it meant suffering and loss rather than profit for them—could and should be put in control.

A number of writers during the 1920s were participants in a “revisionist” historiography that challenged official explanations of the war and the claim that U.S. intervention was caused by Germany’s assault on America’s maritime rights. Further, these writers augmented what was essentially an economic conspiracy theory by finding other, noneconomic forces at work: British propaganda, pro-British official bias, and Wilsonian idealism. Harry Elmer Barnes, C. Hartley Grattan, and others whose work is assessed by Warren I. Cohen in The American Revisionists: The Lessons of Intervention in World War I (1967) accorded considerable weight to the activities of political leaders, above all President Wilson himself and even certain diplomats, such as his ambassador to the Court of St. James’s, Walter Hines Page, who was known for his Anglophile tendencies.

World War I revisionism became politically relevant during the 1930s as many Americans grew alarmed about the fateful course that American foreign policy might take. The 1929 stock market crash and the ensuing Great Depression...
reinforced doubts about America’s private economic leadership. Barnes, Grattan, and Beard, who turned his attention from domestic history to current foreign policy, stressed the inability of banking and commercial elites to redefine the American “national interest” to suit themselves and their international connections. A Senate investigating committee, headed by North Dakota Republican Gerald P. Nye and consisting mainly of isolationists, publicized this general historical interpretation—the “devil theory” of war, as Manfred Jonas called it in *Isolationism in America, 1935–1941* (1966). The Neutrality Acts of 1935, 1936, and 1937, the major policy expressions of the isolationism of the time, were designed to keep the United States out of future wars by placing restrictions on three dangerous parts of the American elite that had gotten the country into the last war: international bankers, armaments manufacturers, and presidents of the nation.

The other side of anti-elitism is populism, a belief not just in the political rightness of majority rule but also in the people’s inherent goodness and wisdom. In 1937, Representative Louis Ludlow, Democrat of Indiana, proposed an amendment to the U.S. Constitution that would require a popular referendum before Congress could declare war. The premise of Ludlow’s scheme, one of many of the same type made during the interwar period, was that only small groups would seek American intervention in foreign wars. The people, if asked to decide, would guard against this. The Ludlow amendment gained considerable support, which increased after an American gunboat, the USS *Panay*, was sunk by Japanese bombers on the Yangtze River in December 1937. But it never came to a final vote in the House of Representatives.

As elitist theories began almost to make policy, two revisionists grew unhappy with them. Walter Millis argued that the American people, rather than their leaders, had made war possible in 1917–1918. Charles Beard recognized that the people as a whole had become dependent on wartime purchases by the Allied powers. He continued to fear the influence of bankers and politicians, but he also feared that of farmers and other large groups having a stake in foreign trade. Logically but unrealistically, Beard called for a sharp reduction in U.S. dependence on such trade and for a more concentrated economic development of America, a doctrine called “continentalism.” He imagined that this could be done through a more equitable division of wealth and thus a more widely exercised purchasing power. Determined to stay out of war, he would, if necessary, use state power to scrap the capitalist system.

This emphasis on the people, and their economic needs, became background discussion as the events leading to U.S. involvement in war commanded immediate attention. As Nazi Germany overran France and as the United Kingdom and the United States began to coordinate their naval operations, Beard, for one, became convinced that President Franklin D. Roosevelt was masterfully engineering the entry of the United States into another world war by dramatizing incidents in the Atlantic. In *Back Door to War: The Roosevelt Foreign Policy, 1933–1941* (1952) another revisionist, Charles Callan Tansill, saw the biggest “incident” of all, the Japanese attack on Pearl Harbor on 7 December 1941, as the culmination of Roosevelt’s strategy. In Tansill’s view, the president provoked a war in the Pacific that he could not obtain in the Atlantic in order to cloak his domestic political failures and come to the aid of the British Empire.

During the period of America’s involvement in World War II, the influence of economic interpretations of U.S. government policy and action fell off considerably, as military imperatives dominated official thinking and conduct. To be sure, there were those who suspected the motives, short-term and especially long-term, of the corporate “dollar a year” men who went to Washington to manage war production. The accomplishments of American industry during the war, under relatively little state supervision, did restore much of the reputation that American business had lost. Major decisions, however, were made by the president and his closest advisers, notably the secretary of war, Henry L. Stimson, and the senior military leadership, including General George C. Marshall. New government entities such as the Office of Scientific Research and Development, headed by Dr. Vannevar Bush of the Massachusetts Institute of Technology, significantly contributed to the war effort by managing the contracts for the secret production of new weapons including the atomic bomb. Diplomacy during the war was conducted mostly by President Roosevelt himself at leaders’ conferences with his British and Soviet counterparts, Winston Churchill and Joseph Stalin. The State Department under Cordell Hull was somewhat eclipsed, though it did concentrate on postwar planning.
FROM MCCARTHYISM TO THE NEW LEFT

In order to shape a better world order, what could be considered a series of elite groups assisted the Department of State in its planning process. The most central of these, the Inquiry-like War and Peace Studies project of the Council on Foreign Relations in New York, which received support from the Rockefeller Foundation, became part of a civilian advisory committee that reported directly to Assistant Secretary of State Leo Paskovsky in Washington, D.C. Among the subjects addressed by the various study groups under the aegis of the Council on Foreign Relations was the structure for a new international organization to replace the League of Nations, which was generally thought to have failed. This blueprinting effort contributed to what eventually became the Charter of the United Nations.

The influence of the council’s War and Peace Studies project should not be exaggerated. By 1944 the memoranda of the project, which previously had been circulated confidentially to the State Department, were made available to the general membership of the council for private reading. “Such indications that the ideas produced by the studies staff did not need to be kept secret,” comments Robert D. Schulzinger in an irreverent but informed assessment, The Wise Men of Foreign Affairs: The History of the Council of Foreign Relations (1984), “demonstrated both the Council’s success in raising issues of international cooperation and collective security and the drab conventionality of its approach.”

In Washington, what has been called a revolution in foreign policy—the Truman Doctrine, Marshall Plan, and North Atlantic Treaty Organization—took place, with a fair measure of bipartisan congressional support for the Democratic administration under Harry S. Truman. The quick succession of World War II by the Cold War did not permit relaxation. Many wartime military chiefs entered the national leadership structure, including George C. Marshall, who served President Truman as his personal representative to China and subsequently became secretary of state and then secretary of defense. Marshall was emblematic of the new place of the “warlords,” in the lexicon of the radical sociologist C. Wright Mills (The Power Elite, 1956), who argued that the military had moved alongside the big corporations and the machinery of the state itself in America’s “higher circles.” General Marshall did indeed wield enormous organized power in what some scholars, including the historians Daniel Yergin and Melvyn Leffler, have characterized as the American “national security state.”

Perhaps most exemplary of the elite type, as some perceived it, was Secretary of State Dean Acheson, whose aristocratic manner represented “the British accent” in American diplomacy, as the historian John T. McNay suggests in Acheson and Empire (2001). An Episcopal bishop’s son from Connecticut who became a Washington lawyer, Acheson wrestled with “a conflict that would be evident throughout his life: an intellectual attachment to democratic values pitted against a personal elitism that caused him to view with condescension ‘the vulgar mass of humanity,’” as Walter Isaacson and Evan Thomas put it in The Wise Men (1986), describing Acheson and a circle of friends who epitomize the style and outlook that dominated American foreign policy after the war. Sartorially elegant, meticulously mustached, and verbally fastidious, Acheson would later title his memoir Present at the Creation (1969), compounding the impression he perhaps inescapably gave of arrogance. He was elitism’s very embodiment—Groton, Yale, Scroll and Key, Harvard Law School, Covington & Burling, and then the cabinet, to which, however, he did not seem particularly to aspire but, rather, only to deserve.

In part because of his manner, Acheson was a red flag to some politicians, notoriously Joseph R. McCarthy, the junior Republican senator from Wisconsin, who accused Acheson of “coddling” communists in the State Department. McCarthy was among the conservatives who believed that the setbacks the United States experienced internationally in the early years of the Cold War—the “loss of China” to communism in 1949 and the near collapse of South Korea when invaded by North Korea in 1950—were the result of high-level policy mistakes. Imagining “a great conspiracy on a scale so immense as to dwarf any previous venture in the history of man,” the senator found the answer in “the traitorous actions by those who have been treated so well by this nation.”

With his accusing finger pointed at Acheson and even the respected General Marshall, as well as more vulnerable officials, McCarthy carried out an anticommunist campaign that was, in its social-psychological basis as well as in its rhetorical method, anti-elitist. To the extent that it was grounded, it was based on populism, a conviction that “the people,” the majority of the U.S. population that lived outside centers of sophistication,
properly should rule but were losing their ability to do so. McCarthyism reflected what the historian Richard Hofstadter has termed “the paranoid style” in American politics. To be sure, McCarthy’s credibility was in question. To accuse the highest authorities in the land of treason, as he did, required a temerity that could only be justified by the actual truth of the charges. McCarthy’s ultimate inability to produce significant proof finally undermined his crusade, but not before it had cost some of the expert “China hands” in the State Department their jobs and, moreover, cautioned many other members of the educated upper class to think twice about entering government service or any other form of public life. It was more comfortable, and safer, for those who were securely employed to remain in good positions in industry, finance, and academe—the institutional niches of the “silent” generation.

McCarthyism failed partly because it did not offer a substitute elite. It merely threatened the existing one, which, entrenched in institutions, survived. The administration of John F. Kennedy brought into government a younger generation that had come of political age during World War II but had not been responsible for political decisions during the conflict. Kennedy nonetheless drew heavily on older leaders of what was called by the journalist Richard A. Rovere the “American Establishment,” seeking counsel and reassurance during events such as the perilous 1962 Cuban Missile Crisis. As Leonard Silk and Mark Silk authoritatively recount in The American Establishment (1980), this notion of an Establishment—the word derives historically from the establishment of a state church, the Church of England—had been popularized in Britain in the 1950s by the historian A. J. P. Taylor and the journalist Henry Fairlie. The “heart” of the American Establishment was the New York financial and legal community, in the view of the Harvard historian Arthur M. Schlesinger, Jr., who served as a special assistant in the Kennedy White House. The Establishment’s “front organizations” were the Rockefeller, Ford, and Carnegie foundations along with the Council on Foreign Relations, as he noted in his memoir A Thousand Days. Its “organs” were the New York Times and the journal Foreign Affairs.

Curiously, President Kennedy, though himself unmistakably a member of the American upper class (Boston branch, Irish Catholic), did not personally know many bankers, industrialists, leaders of the bar, university presidents and deans, foundation officials, generals, and others who constituted America’s nonpolitical, institutional leadership. Nor was he very familiar with the New York financial and legal community, at the Establishment’s center. It thus was a measure of that elite’s power that a significant number of Establishmentarians entered his cabinet. He filled the position of secretary of state, for example, with Dean Rusk, a former senior State Department official who had been president of the Rockefeller Foundation, on whose board were a number of older Establishment figures including Robert A. Lovett and John J. McCloy, both of whom were assistant secretaries of war during the Roosevelt administration. Perhaps the best example of an Establishment man who entered the new administration was Douglas Dillon, who became secretary of the Treasury. Dillon, son of Clarence Dillon of the New York banking house of Dillon, Read and Company, had served as undersecretary of state in the outgoing Eisenhower administration. An internationalist more than a partisan, he easily made the transition from a Republican to a mainly Democratic cabinet.

The American Establishment, though “predominantly Republican,” acknowledged Schlesinger, “possessed what its admirers saw as a commitment to public service and its critics as an appetite for power which impelled its members to serve Presidents of whatever political faith.” Presidents Roosevelt and Truman both “had drawn freely upon them,” as Schlesinger shrewdly explained, “partly to avail themselves of Establishment competence, partly to win protective coloration for policies which, with liberals in front, would have provoked conservative opposition. It was never clear who was using whom; but, since it was never clear, each side continued to find advantages in the arrangement.”

President Kennedy, as the journalist David Halberstam observed in a similarly knowing but more critical account, The Best and the Brightest (1972), “believed in the Establishment mystique.” At the beginning of the 1960s, there was little criticism from outside the Establishment or disension within it either. “Rarely had there been such a political consensus on foreign affairs,” Halberstam commented. Containment was good, communism was dangerous, and foreign aid bills, required to keep the Third World from going communist, could be politically debated in Congress. “Besides,” Halberstam noted of Kennedy, “he was young, and since his victory over Nixon was slimmer than he had expected, he needed the
backing of this club, the elitists of the national security people. And he felt at ease with them," more so than he did with liberal “Democratic eggheads” with causes to push.

The American foreign policy consensus fractured when the Vietnam War began, as did the Establishment, although the cause-and-effect relationship is uncertain. Never a perfectly solid or solitary monolith, the Establishment began to fall apart, its cracks widening to open spaces for other, new participants to enter. Teaching then at Harvard University, the historian Ernest May remembers, “I thought I saw in progress in the mid-1960s something similar to what had taken place in the late 1890s,” when the American elite had split over imperialism and the Philippine conflict. At the start of the Kennedy administration there had been a near consensus about the need, in the words of Kennedy’s inaugural address, to “pay any price, bear any burden . . . support any friend, oppose any foe.” But the televised hearings conducted by Foreign Relations Committee Chairman Senator J. William Fulbright and teach-ins at Harvard and many other universities throughout the country were evidence of serious division within the American foreign policy elite. However, that this dissension in elite circles was, as May suggests, responsible for “bringing in its train a great expansion of the public prepared to argue opinions” is not a total explanation. An alternative view would assign more autonomy to the American public itself, enabled by television and other media to be more attentive, while coming to doubt the justice and wisdom of the war being conducted in their name. The massive public reaction to the apparently successful North Vietnamese Tet offensive in January 1968, which caused President Lyndon B. Johnson to decide against running for another term and to opt for a partial bombing halt and peace talks, would tend to support this view.

Coinciding with, and to a considerable degree a part of, these events was the emergence of a political New Left and a corresponding revisionist historiography, which challenged the very premises of American foreign policy, then and earlier. Locating the causes of the Cold War and the later Vietnam struggle less in external threats to the United States than in factors within it, including the influence of powerful elites, the new revisionists dominated academic discussion for a time and also shaped the public debate. The seminal work was William Appleman Williams’s *The Tragedy of American Diplomacy* (1972), an idiosyncratically radical critique of U.S. foreign policy and its leadership as being inherently expansionist, using the “open door” principle both as an ideological motivation and as a diplomatic instrument—in the manner of Mosca’s “political formula”—in carrying out American imperialism. Other writers, including those in the Williams-influenced “Wisconsin school,” did monographic work on particular periods. The Vietnam War itself was subjected to detailed New Left analysis, with researchers finding precise evidence of American corporate and other elite manipulation of U.S. policy, implicating, for example, the Firestone Tire and Rubber Company and the Roman Catholic Church. While sometimes lacking historical perspective and interpretive balance, these studies had a powerful effect in discrediting the foreign policy of the United States and also those, members of various elites, involved in making it.

**FROM GEOPOLITICS TO TRILATERALISM**

The ambivalence regarding Vietnam of many in the American Establishment itself as well as in the American electorate was evident in the election in November 1968 of Richard M. Nixon, a Californian Republican semi-outsider and former hard-line cold warrior, to the presidency. Declaring the purpose of “peace with honor,” President Nixon and his national security adviser, Henry Kissinger, a refugee from Nazi Germany who became a celebrated professor of government at Harvard, carried out a strategy of gradual withdrawal of U.S. ground forces (“Vietnamization”) while using air strikes to demonstrate America’s will, even while engaged in peace talks with representatives of Hanoi in Paris. The effort was institutionally and politically very complex, requiring emotional balance as well as brain power.

In order to hold the government and country together, and possibly also to gain personal reassurance as well as policy confirmation, Kissinger in particular cultivated the elite, among whom, however, he carefully picked and chose. “On a personal level I can never forget the graceful—I might almost say gentle—way in which Dean Acheson welcomed me to Washington when I arrived as national security adviser, and the wisdom and patience with which he sought thereafter to bridge the gap between the perceptions of a Harvard professor and the minimum
requirements of reality,” as Kissinger recalled in White House Years (1979). He was particularly gratified when Ambassador David K. E. Bruce, scion of an old Maryland family who had served as U.S. representative in London, Paris, and Bonn, agreed, at the age of seventy-two, to represent the Nixon administration in the difficult peace negotiations with the North Vietnamese in France.

“We were on a long road, certain to be painful,” Kissinger wrote. “But with David Bruce as a companion its burdens would be more bearable. And any effort to which he was willing to commit himself had a strong presumption of being in the national interest.” The importance of the sustainment that Kissinger, an immigrant to America, received from his association with Establishment figures like the aristocratic Bruce, who seemed to represent as well as recognize the U.S. national interest, was surely profound, if difficult to estimate precisely.

With the very different administration of Jimmy Carter, an almost complete outsider from Plains, Georgia, who had been a submarine officer in the U.S. Navy and a pro–civil rights governor of his home state, the Establishment seemed to have lost out. This would be a mistaken impression. In an attempt to formulate a completely new, post-Vietnam foreign policy consensus for the country on a different basis from the essentially power-oriented, “geopolitical” focus of the Nixon and subsequent Gerald Ford presidencies, President Carter emphasized human rights, nuclear disarmament, and “interdependence.”

This last was a concept associated with the Trilateral Commission, a nongovernmental group of North American, European, and Japanese leaders who were focusing not on East-West competition but on North-South cooperation. Intellectually, its approach appealed to Carter. The initiative (and the resources) for the formation of this elite group came from David Rockefeller, chairman of Chase Manhattan Bank and the Council on Foreign Relations, following his return from a Bilderberg Conference in Holland early in 1972. With Zbigniew Brzezinski of Columbia University as executive secretary, the Trilateral Commission enlisted some 145 “commissioners”—bankers, industrialists, labor leaders, lawyers, politicians, academics—from the three Trilateral regions. Among the politician members invited (co-opted, a skeptic might say) to join the U.S. group was James E. Carter, Jr., as his name then was listed. Carter was grateful for the chance. As he wrote in his campaign autobiography, Why Not the Best? (1976), “Membership on this commission has provided me with a splendid learning opportunity, and many of the other members have helped me in my study of foreign affairs.” As Leonard and Mark Silk reported, when Carter became president, some 40 percent of the U.S. members of the Trilateral Commission became members of his administration (the co-optation was mutual).

One of these was the New York corporate lawyer and former high-ranking Defense Department official Cyrus R. Vance. “If, after the inauguration,” President Carter’s closest aide from Georgia, Hamilton Jordan, had injudiciously said in a widely quoted statement, “you find Cy Vance as secretary of state and Zbigniew Brzezinski as head of national security, then I would say we failed.” Indeed, it did seem as if the Carter people had been forced to give in. “There can be no doubt today,” commented Robert A. Manning in
the nonestablishment journal *Penthouse*, "that David Rockefeller and his Trilateral Commission have succeeded in seizing control of America's foreign policy." Such fears should have been partially laid to rest, commented the Silks, when National Security Affairs Adviser Brzezinski and Secretary of State Vance started feathering over arms control and other issues.

These internal differences within the Carter administration notwithstanding, the Trilateral concept, and the international associations that came with it, broadened the purview of American foreign policy, making it more truly global. In place of the shifting "triangular" diplomacy handled, sometimes arbitrarily, by Nixon and Kissinger alone in a way that seemed to place America's relations with Moscow and Beijing on the same, or even higher, plane than its established relations with London, Paris, Bonn, Rome, Ottawa, and Tokyo, there would now be a new emphasis on working with neighboring Canada, the western European powers, and Japan in a more structured and reliable trilateral formation. The policy aim was to coordinate the decisions of the so-called industrial democracies so as not only to stabilize their own economies but also to enable them to grow consistently in order to absorb more of the primary and other products of developing countries. Newer issues such as protection of the global environment and the universal promotion of human rights also were placed on the agenda. That radical critics of Trilateralism, such as Holly Sklar and others (1980), saw it as "elite planning for world management" bothered but did not deter David Rockefeller and his fellow commissioners, outside government or in.

**FROM REAGANISM TO CLINTONISM AND BACK TO BUSHISM**

The Iranian Revolution in 1979 and particularly the Soviet invasion of Afghanistan at the end of that year brought the U.S. government suddenly back to geostrategic thinking and produced a shift in elites. The holding of U.S. embassy personnel as hostages by young Islamic militants in Tehran seemed to immobilize the Carter administration. Carter's defeat in the election of 1980 by the conservative former Republican governor of California, Ronald Reagan, replaced talk of "interdependence" with assertions of "strength," a readiness to defend U.S. interests around the world—unilaterally, if necessary. The relevant elites for Reagan were not international bankers in New York, Frankfurt, or Tokyo but the very rich businessmen in California who, remaining behind the scenes (as his "kitchen cabinet"), had long financed and in other ways facilitated the actor-politician's career. This West Coast elite expected, and got, a resolute defense of the Free World against Soviet-supported insurgencies and a worrisome Soviet arms buildup. In the important field of economic policy, the ideology of the "magic of the marketplace" replaced technocratic discussion of international "policy coordination."

Within the broader American Establishment, there was considerable repositioning, not just between coasts. Long-established organizations of business leaders like the Conference Board and the Business Roundtable gained in influence. Among the policy-oriented research institutes, those like Brookings, being moderately liberal, were overshadowed somewhat by the newer and highly energized conservative American Enterprise Institute and Heritage Foundation. The Hoover Institution, situated on the campus of Stanford University, also gained in status and influence. While not dominant in the actual policymaking process, within government itself, these conservative think tanks assisted the Reagan administration by providing informed, articulate commentary useful in the national debate over foreign policy, defense strategy, and economic philosophy. President Reagan, the "great communicator," was able through his skillful use of the media to express much of his message to the American public directly. It was simplified but well crafted for mass effect.

The "CNN factor"—twenty-four-hour-a-day worldwide cable TV—emerged as an actual historical force during the subsequent presidency of George H. W. Bush. When the Iraqi army invaded Kuwait, when anarchy broke out in Somalia, and when internecine violence began in Yugoslavia, CNN was there, and its reports commanded American and worldwide attention. There was speculation, exaggerated but perhaps having an element of truth, that media moguls such as CNN's owner, Ted Turner, were capable of setting the agenda of American foreign policy, presumably to improve their outlets' ratings and increase their profits. Although assimilable to the general idea of corporate capitalism, the notion of a distinct "media elite" emerged to compete with old theories about the influence of traditional establishments in America.
The rise in importance of the media—particularly “new news” sources including talk radio, cable TV, and the fledgling Internet—did create a new competitiveness among would-be opinion leaders within the government or outside it. Even the dignified Council on Foreign Relations was prompted to engage in public “outreach,” in the form of traveling panels and radio programs. It also gave its journal, *Foreign Affairs*, a more polished look. The council had been startled when, as he began his run for the presidency, George Bush resigned his council membership. He also ceased participating in the Trilateral Commission. Having formerly been U.S. permanent representative to the United Nations, chief of the U.S. Liaison Office (ambassador) in Beijing, and director of the Central Intelligence Agency, these were natural affiliations for him to have. But it was no longer clear that such connections were needed by political aspirants, or even advantageous for them.

The emergence of Bill Clinton, from Hope, Arkansas, was further evidence of uncertainty and flux among American elites. He himself was a mixture of backgrounds and influences. A man of modest beginnings but prodigious energy and ability, he graduated from Georgetown University in Washington, interned there in the office of Senator William Fulbright, won a Rhodes Scholarship to Oxford, and completed his education at Yale Law School. He then returned to Arkansas and rose smoothly to its governorship. Except for longtime “Friends of Bill” (many of them fellow lawyers by training), new acquaintances made in Hollywood and in salons in Georgetown, and comradely relations with his fellow governors, he was relatively independent of powerful interest groups and even the national Democratic Party.

His administration, in its composition, was intended to “look like America” and, owing to the large number in it of women, African-Americans, and Hispanics, it did somewhat. The impression it gave of diversity was reduced, however, by the reality that many of its inner figures had received their educations at the same few institutions, principally Harvard, Yale, and Stanford. Like President Clinton himself, nearly all were government-focused. As Thomas R. Dye observed in *Who’s Running America? The Clinton Years* (1995), “Almost all top Clinton officials are lawyers, lobbyists, politicians, and bureaucrats; very few have any background in business, banking, the media, or the military.”

The Clinton administration at the outset emphasized the essential connectedness—the “inextricable intertwining,” in a phrase used by Secretary of State Warren Christopher—of foreign affairs and domestic affairs. The main practical effect of this doctrine, which seemed to reject the idea that foreign policy required specialized geopolitical understanding, was aggressive trade promotion. This effort was led by Secretary of Commerce Ron Brown, who went abroad with retinues of American business leaders, and by President Clinton himself, who pressed for the negotiation of multilateral trade accords including the North American Free Trade Agreement (NAFTA), the Asia Pacific Economic Cooperation (APEC) arrangement, the World Trade Organization (WTO), and, prospectively, a Free Trade Area of the Americas (FTAA). The increasing stake of the United States in large overseas markets and investment outlets powerfully conditioned the Clinton administration’s policy. In dealing with the People’s Republic of China, for instance, President Clinton ultimately “de-linked” the issue of human rights and that of the extension of most-favored-nation trading rights, which were made permanent. This surely reflected the ever-enlarging American economic interest specifically in China but, more generally, a globalizing world economy. Many elite interests were subsumed in this Open Door–like expansionism.

The administration of Texas governor George W. Bush, the first son of a former president to become president himself since John Quincy Adams followed John Adams and a reminder of the curious “dynastic” factor in America’s open and democratic politics, was even more conspicuously committed to the defense of America’s business interests. A businessman himself, President Bush had only limited personal experience in foreign affairs except with bordering Mexico. In Texas it was said that his worldview was formed by the Midland Petroleum Club, though the example of his father’s rich international involvement must have somewhat informed it too. A kind of political throwback, he surrounded himself with (or was surrounded by) many of his father’s former advisers. The person he selected as vice president, Richard Cheney, formerly a White House chief of staff and also secretary of defense, was chairman of the Halliburton Corporation, a Houston-based oil-equipment firm. Cheney was a proponent of an energy policy that emphasized increasing supply rather than energy conservation or environmental protection, and no doubt influenced the president’s quickly made decision to withdraw from the Kyoto Protocol on global warming. President Bush’s remark,
“We will not do anything that harms our economy because first things first are the people in America,” somewhat masked his solicitude for corporate interests. So, too, did his blunt denunciation of the 1972 Anti-Ballistic Missile Treaty, though negotiated by a Republican administration, as “a relic of the past.” He surely was reinforced in his suspicion of the restrictive ABM Treaty by the man he appointed as secretary of defense, Donald Rumsfeld, another corporate CEO who had been White House chief of staff and secretary of defense. Most pertinently, as chairman of a bipartisan commission that in 1998 had produced the Rumsfeld Report, the new secretary was a strong advocate of building a national missile defense (NMD) system, if necessary with the United States doing so alone.

Environmentalist associations and arms control groups at home and abroad weighed in heavily against what seemed a hard-right political turn, which the uncertain outcome of the November 2000 U.S. presidential election did not seem to warrant. The popular majority, which the Democratic candidate Al Gore had won, clearly had not chosen such a radical departure. The president seemed to be a captive of his Texas cowboy persona, perhaps of defensive feelings about having been established in office by the U.S. Supreme Court and of the interested elites in the Bush camp.

Viewed from many perspectives, especially from outside the country, the younger Bush was initially perceived as the most divisive president of the United States since Ronald Reagan. Foreign opinion, including the influence of European and other elites, had an impact on U.S. decision making. Not merely President Bush’s trip to Europe in June 2001 to meet his counterparts in NATO and the European Union but also the media-reported popular reactions abroad to the stark positions he had taken brought about immediate adjustments in at least the presentation of his policies.

This responsiveness was something new. In Galtung’s transnational scheme of analysis, the “center” in America was being harmonized with, and to some extent by, “centers” of influence within Europe. The intra-institutional processes of the NATO alliance and also of the increasingly structured U.S.–European Union relationship described by Éric Philippart and Pascaline Winand as an “Ever Closer Partnership” (2001), as well as the interpersonal chemistry of relations at the leadership level, made the new president, and administration, much more sensitive to foreign, particularly European, opinion. This was evident not just with regard to foreign and security policy matters, including global warming and military defense, but also cultural and moral matters, such as the death penalty.

For elite theory, as applied to international relations, this pattern of development is instructive. The intellectual and social division over policy issues may increasingly become cross-national, with elites in one country joining with elites in other countries to influence the publics, as well as the governments, within. The American “foreign policy elite” has always been internationally minded to a degree, though actual contact with its counterparts elsewhere has been limited. In an age of nearly instant global communication, with travel and networking made easier than ever before, it is likely to become more even globalist in outlook. In the process of globalization, the elite itself may be globalized.

THE FUTURE OF AMERICAN FOREIGN POLICY: ELITISM VERSUS PLURALISM

The idea that a cosmopolitan elite has controlled, even actually dominated, American foreign policy and diplomacy is a difficult thesis to evaluate. The subject is an elusive one. Part of the reason is the uncertain relation of elites to institutions, of actors to structures. There is a continuing debate among sociologists, political scientists, and other commentators on American social patterns between those who see power as founded on and inhering in institutions, including, but not limited to, the formal institutions of government, and whose leadership almost by definition constitutes the elite, and those who see power as requiring actual participation in decision making, which can be somewhat extra-institutional. Institutions and their representatives may not in fact be actively involved in important historical events. Outside forces, including a variety of organized groups and even unassociated individuals, may at times participate in them very effectively. The former, institution-oriented view, stressing positional power and latent influence, sometimes is called the “elitist” school. The latter, more group-oriented view, requiring actual involvement and impact to prove the reality of power, is commonly known as the “pluralist” school.

C. Wright Mills believed that “great power”—such as foreign policy entails—must be institutionalized and, more specifically, that America's
leaders are institutional elites because they are the ones who possess formal authority in the country. Among scholars who later emphasized this was Thomas Dye, whose book *Whose Running America: Institutional Leadership in the United States* (1976) and its sequel volumes attested to this view in detail, “naming names.” Somewhat similar, though concentrating on persons occupying powerful institutional positions who come to government and other command positions from what is regarded as the “upper class,” was G. William Domhoff, whose book *Who Rules America?* (1967) and other studies carried on a more radical tradition. Both were basically on the “elitist” side. The opposing view, that mere potential control and formal authority are not enough, and that an examination of actual decisions made in America shows a wider variety of participants, was perhaps most influentially stated by Robert A. Dahl in numerous works, including *Who Governs?* (1961), a study of local politics in New Haven, Connecticut. This, the “pluralist” view, resists the argument that there is a single power structure, describing instead a basic competition for power and control.

Such an approach offers not a hierarchical model of American politics but a polyarchical model, suggesting that different groups of individuals exercise power in different sectors of society, that they acquire power in different ways, and that the interplay among them has an indeterminate outcome. It should be noted that neither the so-called elitists nor the so-called pluralists see the mass of the population as capable of leadership. This basic point is shared with Mosca, who posits a permanently ruling minority of variable composition. Elitism theorists see groups as being socially and in other ways interlocked, operating in monopolistic or at least oligopolistic fashion. Pluralism theorists see intergroup dynamics, much less constrained by social and other structures, as the essence of American policymaking. According to the pluralists, the public, though incapable of directing itself, can maintain its freedom and thereby preserve American democracy by choosing among rival elites that compete for its favor.

A question that has not adequately been addressed in most of the pertinent sociological and political scientific literature is whether the making of foreign policy is essentially different from the making of domestic policy. There is some evidence, to be sure, of a difference between elite opinion and mass opinion with regard to foreign policy, especially now that the Cold War international consensus has somewhat broken down. Eugene R. Wittkopf and Michael A. Maggjotto have found (1983) that elite views among Americans tend to be more “accommodationist” as well as “internationalist,” and American mass, or public, opinion tends to be more “hard-line” and “isolationist.” Nonetheless, it still may be supposed that “politics stops at the water’s edge,” and that such internal differences, involving opinion only, make little difference, on the traditional premise that foreign policy—the actual management of it—is an elite preserve.

In general, it still is true in the United States that foreign affairs is an elite sphere, with those in office running things. The federal government is recognized constitutionally as the nation’s “one voice” in speaking to the world. Increasingly, however, America’s international relations, which include more than policymaking and formal diplomacy, are coming to involve and affect a much wider array of direct participants, official and unofficial. This may challenge the institutionalized elite character of U.S. foreign policy and its conduct. It may be that the only way the American foreign policy elite, or Establishment, can retain its historical and accustomed control will be to continue to outcompete the growing list of participants by concerting more closely with elite counterparts in other centers, through interallied consultation and meetings such as those of the Group of Eight. The more that transnational “civil society” penetrates the global plane of power and influence, however, the more the making of foreign policy in the United States is likely to become pluralistic, and anti-elitist.

For most of America’s history, the word “embargo” was used to refer specifically to a prohibition on the departure of ships or exports from a nation’s own ports, whereas the words “boycott” and “nonimportation” were used to describe prohibitions of imports or ship entries, and “nonintercourse” was used to describe a total prohibition of trade with a nation. But the word “embargo” also was used generically to refer to all stoppages of trade.

Since World War II, the growth of modern economic institutions and relations has afforded governments, especially rich and powerful ones like that of the United States, an arsenal of commercial weapons extending far beyond an outright stoppage of trade, including denial of aid and loans, commodity dumping, import and export limitations, revocation of most-favored-nation (MFN) trade status, and freezing assets. As those means increased, the word “embargo” seemed less applicable to the wide range of economic coercive measures that the United States, the United Nations, and other entities were using to accomplish noneconomic goals. The preferred term now is “sanctions.” In eighteenth-century Europe, an embargo was generally a prelude to a formal declaration of war. A civil embargo prohibited a nation’s own ships from leaving port; a hostile embargo affected all ships in the port, foreign or domestic. Neutral ships caught in the embargo might even be forced into the service of the belligerent nation. The right to do this was called the power of angary. By imposing an embargo before declaring war, a nation could keep friendly ships from falling into the hands of the enemy and hold enemy ships hostage for future contingencies.

European powers rarely resorted to an embargo as a weapon in itself rather than as a prelude to war, although there were two exceptions to this in the sixteenth century: a French grain embargo against Spain and a threatened Turkish wheat embargo against Venice. In most cases, European nations had little incentive to consider a broader use of embargoes because geographical proximity made conventional military attacks easy and effective. Besides, the seventeenth and eighteenth centuries constituted the age of mercantilism, in which people believed that national power depended upon exports exceeding imports. Thus, most diplomats expected an embargo of long duration to hurt the embarguing nation more than its enemy. An extreme example of this philosophy was Great Britain’s famous blockade of Napoleonic France, which was not designed to starve France but to compel it to accept British imports or receive no trade at all.

THE REVOLUTIONARY WAR ERA

The United States was the first modern nation to make significant use of the embargo as a substitute for, rather than a prelude to, war. Being three thousand miles from the centers of European power, the United States was not in imminent danger of invasion if it resorted to economic warfare, and for most of its early history, the United States had a small army and only a moderate-sized navy. America also had been a colony whose major physical ties to the mother country had been those of trade. Since the American colonies were of value to England primarily as economic entities that provided between a third and a sixth of the entire trade of the empire, it stood to reason that the colonists would think first of commercial measures if they were seeking to coerce the mother country. They were convinced especially that the West Indies were dependent upon imports of American food and lumber for survival. They reasoned, then, that an embargo would be a formidable weapon against any nation with colonies in those islands.

But Americans were reluctant to resort to a complete embargo. They had economic interests...
and mercantilist ideas of their own that militated against such a measure. In the decade preceding the American Revolution, the colonists wielded economic weapons against many of Britain's unpopular measures, but in each case the chosen weapon was a boycott rather than an embargo. In fact, when George Mason proposed that Virginia embargo certain exports to protest the Townshend Acts of 1767, his fellow members of the Virginia legislature specifically rejected the idea, adopting nonimportation and nonconsumption resolutions instead. Similarly, the Continental Congress, meeting in 1774 to respond to the Coercive Acts, quickly adopted nonimportation. But the Virginia delegation insisted that any embargo be delayed until September 1775, by which time the Virginia planters could sell off their tobacco crop. Congress agreed. Then, when actual warfare broke out in April, the members moved immediately to forbid all exports without congressional permission. The embargo was soon lifted when Congress found that it was hurting America more than Britain. After a lengthy debate, America's ports were thrown open to all nations except Britain, and Congress was soon begging the French for naval help to get American ships out of their home ports.

Despite this failure, most members of Congress were still convinced that the United States could wield economic weapons effectively. They remembered that the British had repealed the Stamp Act and Townshend Acts at least partly in response to boycotts, and they were convinced that, during and after the war, foreign nations would pay a high price to divert American trade from Britain to themselves. When Congress appointed Benjamin Franklin as minister to France, it instructed him and his colleagues to offer only American trade as bait for France to enter the war as an ally of the United States. Although quickly enough disabused of the hope that France would accept so little for so much, Americans continued to believe that once the war was over, European powers would scramble over one another to offer concessions for access to American markets and goods. But when peace was restored, Europeans returned to their mercantilist systems and closed the United States out of most colonial markets. So, once again Americans contemplated commercial retaliation.

Because the Articles of Confederation left trade regulation in the hands of the individual states, it was found impossible to coordinate any retaliatory policy. The Constitutional Convention at Philadelphia met in part to correct the situation. But southerners were fearful that the commercial Northeast, using its greater population for voting advantage in Congress, would wield the weapon of commerce too freely. The South demanded that any navigation law should require a two-thirds vote of each house for passage. Ultimately, the convention reached a compromise. The Constitution would permit the federal government to levy taxes on imports; taxes on exports would be constitutionally prohibited. Exports could be embargoed, but they could not be taxed.

Despite this evidence of southern opposition to export taxes, several southern leaders still believed devoutly that economic sanctions could be America's primary diplomatic weapon. The leaders in this movement were Secretary of State Thomas Jefferson and James Madison. When the first Congress met after ratification of the Constitution in 1789, Madison used his position as a leader of the House of Representatives to begin a campaign for a broad use of commercial weapons that would last for more than twenty years. Angry at Britain for closing American ships out of the British West Indies and for refusing to sign a trade treaty with the United States, Madison told Congress that America could force Britain into a more amenable posture by threatening to divert American trade from Britain to France. He did not propose anything so drastic as an embargo at this point; he merely called for higher duties on imports from unfriendly nations than from friendly nations. The shipping interests and their congressional representatives had been strong supporters of commercial retaliation against Britain during the hard times of the Confederation period, but now, in a time of rising prosperity, they changed their minds. Led by Secretary of the Treasury Alexander Hamilton, they defeated Madison's proposals in session after session. Hamilton and his supporters thought British trade too valuable to the United States to risk using it as a diplomatic weapon, and they feared that British retaliation would hurt America far more than America could hurt Britain.

When war broke out between Great Britain and revolutionary France in 1793, Madison and Jefferson saw a new chance for the use of economic sanctions, and introduced discriminatory duties against England in the House. Hamilton and his followers in Congress rallied against the proposals, with Fisher Ames of Massachusetts complaining that "Madison & Co. now avow . . . that we will make war, not for our commerce, but with it; not to make our commerce better, but to
make it nothing, in order to reach the tender sides of our enemy, which are not to be wounded in any other way.” Ames and his fellow Federalists argued for military preparedness and negotiation rather than commercial retaliation. They succeeded until early 1794 in putting off Madison’s proposals, but when the British suddenly swooped down on American ships trading in the French West Indies and captured more than 250 of them, Madison and the Republicans introduced even more stringent measures, such as sequestering British debts and stopping all trade with England.

Compelled by the public’s outrage to do something, the Federalists agreed on a short-term general embargo as the least harmful alternative. By embargoing all ships, foreign and domestic, in American harbors, the measure would ostensibly affect all nations alike, thus avoiding a direct challenge to Great Britain. It also could be defended as a traditional precautionary step in case of war, and the Federalists could deny that it had anything to do with the Republican campaign for commercial coercion. Thus, with mixed motives, Congress passed a joint resolution in March 1794, laying a hostile embargo for thirty days. This was later extended for another month, and President Washington was empowered to resume the embargo if the public safety required it.

The Federalists then resumed their crusade to strengthen the army and navy and thwart the rest of the Republican program for commercial retaliation against Britain. They sidetracked the bill for sequestering British debts, and Vice President John Adams cast the tie-breaking vote in the Senate against a total prohibition of British trade, imports as well as exports, which had passed the House. Meanwhile, the Federalists persuaded Washington to send John Jay to England as a special envoy to negotiate with the British and head off the war crisis. When Jay returned with a treaty promising not to interfere in any way with Anglo-American trade in exchange for a minimum of British concessions, the Republicans cried that using America’s commercial weapons would have been far more effective than exchanging them for so little. After a bitter battle, the Federalists got the treaty ratified by the narrowest of margins in 1796. On the heels of that victory, they then elected John Adams to the presidency over his Republican rival, Thomas Jefferson.

Adams, however, found the French as bitter about Jay’s Treaty as the Republicans. The French counted on Americans as carriers of their commerce because the British had swept the seas clear of most French ships. The Americans, by compromising with the British rather than fighting for America’s neutral rights, hurt French trade as badly as their own. The French responded by capturing American ships, claiming the right to do to the Americans whatever the Americans allowed the British to do to them. The Federalists and Adams were less reluctant to oppose the French revolutionaries than they had been to resist the British, but they used the same techniques they had used in the Jay’s Treaty crisis: military preparations and negotiation. Their only concession to Republican theories of commercial retaliation was an embargo on French trade passed in July 1798, after negotiations had broken down over the XYZ affair. Even this was clearly a precautionary war measure rather than a substitute for a military response. Ultimately, Adams made peace with France, splitting the Federalist Party and enabling Jefferson to defeat him for the presidency in 1800. The embargo would soon receive its supreme test as a substitute for war.

THE EARLY REPUBLIC

The Treaty of Amiens (1802) brought a temporary peace to Europe, which allowed President Jefferson to concentrate on domestic programs and to purchase the Louisiana Territory. Then, the Napoleonic Wars resumed, and Jefferson found himself in the same predicament his predecessors had faced. Once again the belligerents interfered with American trade and captured American ships. In the early years of the wars, British offenses were more numerous and blatant than those of the French, often taking place within sight of the American coast and involving the impressment of American seamen and the raiding of U.S. commerce. Jefferson began his program of retaliation with the Nonimportation Act of 1806, barring certain British imports. It was more a gesture to demonstrate American determination on the eve of negotiations than an all-out attempt to coerce Britain, and the Republican negotiators, James Monroe and William Pinckney, did no better than their Federalist predecessor, John Jay. Jefferson and his secretary of state, Madison, rejected the treaty their negotiators sent back from Britain because it failed to prohibit impressment. The envos were instructed to renegotiate the treaty, eliminating the excessive appeasement of Britain. Such a task, Monroe and Pinckney realized, was hopeless.
Meanwhile, another event drove Jefferson and Madison toward stronger measures. On 22 June 1807, a British vessel, the HMS Leopard, fired on an unsuspecting U.S. naval ship, the USS Chesapeake. The British attackers then mustered the crew of the Chesapeake and removed four men who were alleged to be British deserters. This violation of American sovereignty brought a loud outcry even from many Federalists, and Jefferson could easily have had a declaration of war. He delayed six months, until he received news of a British order in council barring all nations from trading with any part of Europe except the Baltic area. At the same time, he learned that France had begun capturing American ships in enforcing Napoleon’s Berlin Decree. Jefferson then called upon Congress not for war but for an embargo. He and his followers in Congress defended the move on two separate grounds. On the one hand, it would be a proper precautionary move in case of war; on the other, it might in itself coerce Great Britain. Thus, he appealed to two very different groups. Those who wanted war should have been put on their guard by the fact that the administration secured a rejection of the original plan to embargo foreign as well as domestic ships, and specifically refused to place a time limit on the measure. But the two disparate groups were united for the time being by the ambiguity of the measure. The Senate passed the Embargo Act in a single day in December by a vote of 22 to 6; a few days later the House did the same by a two-to-one margin.

As the months wore on, America’s ardor for war cooled. Jefferson was soon left with no alternatives but to continue the embargo as the sole coercive weapon or to abandon the measure entirely, in a humiliating retreat. He decided to continue the embargo. But, as he introduced supplementary measures designed to close loopholes in the law, the Federalists leaped to the attack. Between the embargo and the supplementary laws there was no connection, declared Barent Gardenier, representative from New York. One was a prelude to war, preventing ships from going out and being captured; the other, a measure of coercion in itself. Gardenier and his fellow Federalists insisted that only French influence could inspire so foolish and wicked a measure as a permanent embargo. Jefferson was strong enough in Congress to override these objections and force through stringent enforcement acts, including elaborate bonding procedures, precautionary seizures, and general search warrants. But the unpopularity of the embargo, especially in New England, led to widespread defiance, smuggling, and criticism. As a result, the Federalists’ electoral vote in 1808 was triple that of 1804, and their share of the House of Representatives was doubled.

The embargo was no more successful abroad than it was popular at home. France, of course, was unaffected by the embargo, since its trade had already been substantially cut off by the British blockade. British trade was affected. The embargo substantially reduced American exports to Britain, and the Nonimportation Act of 1806, which unlike the embargo was directed explicitly at Great Britain, reduced British exports to the United States. This affected Britain’s foreign exchange, and gold began leaving the country. The price of gold rose from 8 shillings per ounce in 1807 to 110 shillings per ounce in 1813, embarrassing the Treasury and precipitating discontent over wages and prices. In most other areas, the Embargo Act and the Nonimportation Act did not wound Britain severely. The stoppage of America’s cotton exports was actually welcomed by many British merchants, who had warehouses so full they had been worried about a glut. It did harm many workers in the textile industry, setting off a riot of weavers in Yorkshire; but they were not people with much political leverage.

Meanwhile, the revolutions in Spain and the Spanish colonies in Latin America opened new markets and sources of supply for Britain, which helped compensate for the loss of trade with the United States. The Nonimportation Act of 1806 was no more effective than the embargo, since it exempted cheap textiles and manufactured goods, those things the United States needed most from Britain but also the goods Britain most needed to export. The sight of British ships arriving in American ports with these goods galled the American merchants, whose own ships were rotting at the wharves. They were not much consoled that the embargo forced British vessels to leave in ballast. In the West Indies, too, the embargo failed. It hurt the French West Indies more than the British because the British had ships to supply their islands, while the French did not.

As the failure of the embargo abroad became apparent and disaffection at home continued to rise, the Republicans had to retreat. During Jefferson’s lame duck period, he abandoned his direction of Congress, which promptly replaced the Nonimportation Act and the Embargo Act with the Nonintercourse Act of 1809. This act reopened trade with all nations.
except Britain, France, and their dependencies. But the purposeful vagueness as to just which nations would be considered British or French dependencies, and the lack of a navy to enforce these regulations outside U.S. territorial waters, made the new law an invitation to smuggling. It, too, was soon abandoned and was replaced by Macon’s Bill Number Two (1810), throwing trade open to all nations with the promise that the United States would cut off trade with the enemy of any nation that would respect America’s neutral rights. When Napoleon promised to respect those rights, Madison, Jefferson’s successor, cut off trade with Britain, despite the fact that Napoleon never actually lived up to his promises. When economic weapons again failed to coerce Britain, Madison recommended, and Congress declared war. Actually, Britain had finally abandoned some of its orders in council before the American declaration. But news of the repeal failed to reach the United States before Congress voted. When the news did arrive, Madison refused to consider peace unless impressment also was eliminated. So the war went on.

Ironically, two months before the United States declared war, Congress had laid yet another embargo on Great Britain. It was specifically a measure to prepare for war, and it expired shortly after the war began. But Madison was not satisfied. He pushed another embargo through Congress in 1813. This had little effect on the southern states because the British were already blockading them; but in New England, which the British left unblockaded as a mark of favor to the section most opposed to the war, the embargo hit hard, increasing discontent and leading to threats of secession. Madison and his followers refused to admit the uselessness of the measure until the defeat of Napoleon in 1814 opened the markets of Europe to the British and destroyed what little leverage the embargo had.

In the euphoria of what Americans considered a victorious and glorious defense against Britain in the War of 1812, the American people nearly forgot the humiliations they had suffered in the commercial warfare period and the early fighting. Republican partisans cast the blame for the failure of the embargo on the Federalists and the New Englanders who had defied the law, saying that only such subversion prevented the measure from coercing Britain. But this rhetoric did not erase America’s bitter memories of its attempts at economic sanctions, and it would be many years before the United States tried them again.

THE CIVIL WAR

For decades after the War of 1812, peace in Europe gave the United States a chance to expend its diplomatic energies on westward expansion, where it did not need economic weapons. Population pressure and diplomatic maneuvering were often adequate, and where they failed, outright military action was possible because these areas were physically contiguous. Not until the Civil War was the weapon of economic sanctions once again taken up, this time by the Confederacy. The South was convinced that “cotton was king” and essential to both British and French industry. After the North instituted a blockade of the entire Confederacy, the South decided to enhance that blockade by embargoing exports of cotton. The Confederacy urged southerners not to plant cotton until the war was over, and they burned more than two and a half million bales. Unfortunately for the South, the bumper crop shipped in 1860 had already given Great Britain an oversupply of cotton, and cotton factors actually welcomed the shortage as a chance to reduce their supplies. Shortages did begin to occur by 1862. Four hundred thousand workers lost their jobs. Many of these workers advocated British intervention on behalf of the South to restore the cotton supplies; but their political impotence, the increasing supplies of cotton from Egypt, and the growing realization that the South would lose the war doomed their efforts. As the war went on, even southerners found the embargo too painful, and they cooperated in running more than a million and a half bales of cotton through the northern blockade. Once again an economic sanction had proved to be a disastrous failure.

THE EARLY TWENTIETH CENTURY THROUGH THE INTERWAR YEARS

From the Civil War until after the United States emerged from World War II as the most powerful economy in the world, America used economic sanctions more sparingly. Gone was the confidence that economic sanctions could substantially affect a powerful enemy. In this period, sanctions were used more as a gesture than as a weapon. They might be used to indicate moral disapproval or to keep the United States out of foreign wars. They might be used as a warning of firmer measures to come, or as a futile substitute for war when armed force was impolitic. But
Americans no longer regarded economic sanctions as an extraordinarily potent weapon in their foreign policy armory.

In 1898, Congress passed a joint resolution granting the president authority to bar the export of coal or war matériel from American seaports during the Spanish-American War. This embargo was merely an adjunct to war, not an important weapon in itself. President Theodore Roosevelt stretched the authority of this law in 1905 to keep weapons from falling into the hands of revolutionaries in the Dominican Republic, where the United States had taken control of the customs. In 1912, when the government of Francisco I. Madero protested American shipments of arms to Mexican rebels, Congress gave President William Howard Taft more specific authority to handle the situation than it had delegated to Roosevelt. It amended the 1898 resolution to provide that when there existed in any Western Hemisphere country conditions of domestic violence promoted by U.S. arms, the president should proclaim that fact. This would make exports of arms or munitions illegal except as the president provided. In effect, this gave the president the right to provide arms to whichever side he favored. Taft used this authority to embargo all arms to Mexico, but when a revolt broke out against the reviled Victoriano Huerta, President Woodrow Wilson lifted the embargo so that arms could be shipped to Huerta's opponents. When the United States recognized the government of Venustiano Carranza, it restored the embargo but made American arms available to Carranza's forces near the U.S. border. Then Pancho Villa began raiding in the area, so Wilson sent General John J. Pershing across the border after him and removed the exemption to the embargo. Thus, the United States had begun a regular use of arms embargoes as a means of controlling or manipulating domestic revolutionary situations in the Western Hemisphere, as well as using them to prevent aid to nations with which it was at war.

During this same period, U.S. businesses began serious overseas operations and another kind of embargo made its appearance—the capital embargo. Throughout most of American history, capital embargoes applied only to loans involving the public sale of foreign bonds and were quite informal. The government had only to recommend against a loan, and foreign bonds would not find purchasers because prospective buyers knew that the government would not enforce payment if the borrowing country should default. Thus, Taft's secretary of state, Philander C. Knox, discouraged a loan to China during the revolution of 1911, and Wilson discouraged a consortium seeking to reorganize a loan to China in 1913. Wilson also advised against loans to the belligerents during World War I but reversed that policy in 1916. In March 1922 the State Department made its informal policy official by announcing the hope that American corporations contemplating loans would check with the department first.

Just prior to World War I, Wilson dusted off the idea of a broader use of economic sanctions as a means of forcing the British to reduce their interference with American shipping to the European continent. In September 1916, he persuaded Congress to pass a law permitting him to ban imports and deny clearance for any departing vessels. After his reelection in November of that year, he hinted to the British that he might use that authority to embargo arms or deny clearance to vessels refusing to carry goods for firms blacklisted by the British. Since the British blockade had already cut off trade to Germany, any embargo would hurt only the Allies, thus paralleling the situation in Jefferson's day. Wilson never actually exercised his authority because he was more concerned with German submarine warfare than with the British blockade or blacklist. He did not want to find himself in the position of Jefferson and Madison, locked in a dispute with both belligerents at the same time or allied with the wrong nation because it capitulated more quickly to U.S. sanctions.

With the entry of the United States into the war, Congress embargoed all supplies to the Central Powers by passing the Trading with the Enemy Act of 1917. This embargo was wielded against the neutral powers of Europe, driving them into agreements to limit trade with the Central Powers in exchange for vitally needed goods from the United States. These agreements, along with blacklisting and limits on coal supplied to ships seeking refueling at U.S. ports and bases directed against firms within neutral countries suspected of trading with the enemy, tightened the economic noose that the Allied blockade and American embargo placed around the Central Powers and contributed substantially to the Allied victory in World War I.

After the war there arose in the United States a general revulsion against American involvement in world politics, and the policy of using economic sanctions as an alternative to political or military entanglements came to play an important part in
the debate over the shaping of a new foreign policy for the United States. As a kind of prelude, Congress made two minor gestures in 1922. It expanded the arms embargo of 1912, which had previously applied only to Western Hemisphere countries, and permitted the president to embargo arms to countries where the United States exercised extraterritorial jurisdiction whenever there existed conditions of civil violence. This law was directed primarily at China. Also in 1922, the State Department recommended against credits to Soviet Russia because that nation refused to pay its war debts. But neither this capital embargo nor the refusal to recognize the Bolshevik regime hindered American trade with the Soviets.

Consideration of a broader use of the arms embargo began later in the 1920s. Some influential Americans wanted the president to have authority to embargo arms and munitions to any aggressor nation. They saw this measure as a chance for the United States to cooperate with the League of Nations. They were fearful that America’s traditional policy of neutrality, which insisted on a neutral’s rights to trade with all belligerents, would undermine any system of collective sanctions the league might undertake. Conversely, American

Historians, analysts, and politicians differ passionately about the efficacy and morality of America’s record in using sanctions, as one can readily see from the following quotations:

“A nation that is boycotted is a nation that is in sight of surrender. Apply this economic, peaceful, silent, deadly remedy and there will be no need for force. It is a terrible remedy. It does not cost a life outside the nation boycotted, but it brings a pressure upon the nation which, in my judgment, no modern nation could resist.”

—Woodrow Wilson, quoted in Huffauer, Schott, and Elliott, vol. 1, p. 9.—

“We use sanctions so often—nearly 100 times this century—that they have become America’s grand diplomatic experiment. This experiment, repeated many times, shows [that sanctions do not work and are America’s folly]. . . . A nation boycotted is not in sight of surrender: recall North Korea, Cuba, and Iran. . . . In achieving ‘high’ foreign policy goals, sanctions are not a substitute for force, but they can be a prelude to force—consider Iraq, Haiti, Bosnia. . . . Contrary to [Woodrow] Wilson’s belief, economy sanctions have turned out to be an offer that nearly every target can refuse—not only powerful China, but also powerless Panama.”

“Sanctions can offer a nonmilitary alternative to the terrible options of war or indifference when confronted with aggression or injustice.”

—National Conference of Catholic Bishops, quoted in Haass, p. 2.—

“[Sanctions] do not work. . . . it is important for us to recognize as a nation the enormous value of having American businesses engaged around the world. To recognize that engagement does more to encourage democracy and freedom, to open up societies, to create opportunities for millions of people who up until now have not been able to participate, than just about anything else we can do.”

“It is indisputable that the myriad pressures generated by the many forms of sanctions imposed on South Africa forced the previously immovable and inflexible system of apartheid to recognize the necessity of change.”

“The economic sanctions continued to strangle the people of Iraq, and the country has been pushed to the verge of collapse, placing the life of its civilian population in great peril.”

—Bashir Al-Samarrai, “Economic Sanctions Against Iraq: Do They Contribute to a Just Settlement?” in Cortright and Lopez, p. 135.—
cooperation in those sanctions would strengthen the league and the system of collective security immeasurably. Thus, they argued for a discretionary embargo, which would allow the president to embargo arms to aggressor nations but to supply arms to the victims of that aggression.

The movement for cooperation with the league ran head-on into a growing countermovement inspired by disillusionment with World War I and a belief that American involvement in the war had been manipulated by munitions makers and other so-called merchants of death. This countermovement, too, called for an arms embargo, but its advocates insisted that the embargo be impartial. The purpose should be to keep the United States out of any future wars, not to deter future wars by the threat of collective sanctions against aggressors. This debate created a groundswell of support for some sort of arms embargo. By the mid-1930s, only a few congressional voices, along with the weapons manufacturers themselves, still called for adherence to America's traditional policy of enforcing a neutral's right to trade with belligerents in any commodities whatever.

Although the debate over arms embargoes began in 1928, Congress did not pass the first Neutrality Act until 1935. Henry Stimson, secretary of state in the late 1920s, favored a discretionary embargo to strengthen collective security but received little support from President Herbert Hoover. Without strong administration backing, the measure failed. Hoover was particularly adamant against imposing economic sanctions on Japan for its aggression in Manchuria, sanctions strongly favored by Stimson. Instead, Hoover forced Stimson to retreat to an ineffective policy of refusing to recognize any gains Japan might make, a policy ironically known as the Stimson Doctrine.

Franklin D. Roosevelt came to the presidency pledged to Stimson’s policy of discretionary embargoes. Such an embargo actually passed the House in 1932. But when it encountered opposition in the Senate, Roosevelt consented to an impartial embargo, a complete negation of collective security. When his own advisers, including Secretary of State Cordell Hull, objected to his concession, Roosevelt agreed to drop the whole matter, and the embargo died.

The issue was revived during the next congressional session, however. Bolivia and Paraguay were engaged in the Chaco War, and the administration wanted to cooperate with the League of Nations in an arms embargo against both nations. Roosevelt could have supported a general impartial embargo on all warring nations; one was already before the Senate. But he still hoped for a discretionary embargo, and so he settled for a specific resolution embargoing arms to Bolivia and Paraguay only. This was the first time the United States had adopted an embargo avowedly for the purpose of stopping a war between two countries, and in that way it could be seen as a step toward collective security. In fact, it strengthened the concept of an impartial embargo because it stopped arms to both countries. The widely publicized Nye Committee hearings and the publication of several best-selling books further strengthened the concept of an impartial embargo by promoting the idea that American economic interests, particularly the munitions makers, had been responsible for America’s entry into World War I. Perhaps even more important in the movement for an impartial embargo were the growing crises in Europe and Asia, as Japan, Germany, and Italy engaged the other powers in an arms race and embarked on campaigns of territorial expansion. Many hoped that the United States could escape the coming conflagration by embargoing arms and thus not repeating the supposed error of becoming involved in World War I.

The result of this growing movement was the Neutrality Act of 1935. Rejecting an administration bill allowing discretionary embargoes, Congress instead passed a mandatory impartial embargo on arms to belligerents, closed American ports to belligerent submarines, and prohibited Americans from taking passage on belligerent liners. The administration managed to limit the act to six months’ duration, and then to use it for its own purposes. When Italy attacked Ethiopia, Roosevelt, to show America’s displeasure with Italy, put the Neutrality Act into effect and declared a further “moral embargo” on any trade with the belligerents that was not covered by the Neutrality Act. Although supposedly impartial, the actions hurt only Italy. The United States had no trade with Ethiopia, and Ethiopia had no passenger liners to suffer from a prohibition against American passengers.

Although these actions may have given America some spiritual satisfaction, they had little effect on the course of world events. American businesses defied the moral embargo, and the League of Nations embargo omitted oil from the list of prohibited exports. Since oil was Italy’s most vital need, the conquest of Ethiopia continued apace. This failure notwithstanding, Congress renewed the Neutrality Act in 1936 and added a
provision prohibiting loans to belligerents. The administration and the business community managed to stave off a movement for an impartial general embargo rather than a mere arms embargo, but sentiment for a general embargo gained considerable strength as the year wore on.

When civil war broke out in Spain later in 1936, Congress honored the administration’s request to embargo arms to that country. As Germany and Italy began to provide massive support for Francisco Franco, liberals put considerable pressure on the U.S. government to lift the embargo and supply the Loyalists. But the embargo remained. The advocates of collective security had been defeated again.

In 1937, congressional pressure to expand the arms embargo to a general embargo applying to all belligerents frightened many businessmen, and they sought a way to sidetrack the issue. Presidential adviser Bernard Baruch came up with a suggestion of “cash-and-carry,” arguing that as long as American goods were purchased and transported by belligerents, the capture or sinking of the goods would not affect the United States. In return for other concessions, the administration succeeded in making the cash-and-carry principle discretionary, to be instigated with the rest of the Neutrality Act only at the option of the president. Roosevelt was also willing to accept cash-and-carry because he realized it would favor Britain and France; Great Britain controlled the seas and could ensure that only Allied ships would reach the United States to take advantage of the offer. The Neutrality Act of 1937 passed Congress just one day before the expiration of the act of 1936 and was flown to the presidential yacht in the Gulf of Mexico for Roosevelt’s signature.

The Neutrality Act of 1937 was the high-water mark for advocates of an impartial neutrality; the decline of the movement had already begun. American sentiment was heavily against Franco’s forces, and many regretted the embargo on arms to his opponents. Then, in 1937, Japan renewed its war against China. By rights, Roosevelt was supposed to embargo arms and loans to both nations and, if he chose, to establish the cash-and-carry policy. But both of these actions would favor Japan, since China needed the arms and credits, whereas Japan needed neither. Also, Japan was a sea power capable of taking advantage of the cash-and-carry policy. Roosevelt avoided this dilemma by pointing to the technicality that no official declaration of war had been made. Thus, he refused to invoke the Neutrality Act, enabling private loans and arms to continue to flow to China. Roosevelt followed this action with his famous quarantine speech and then imposed a moral embargo on exports of aircraft to Japan. Although isolationism remained strong and Roosevelt was forced to retreat from his quarantine policy, the American people generally accepted his tacit ignoring of the Neutrality Act. The United States was beginning to use sanctions as weapons against aggressors rather than as a means of avoiding conflicts.

**WORLD WAR II**

In 1938 Roosevelt failed to secure revision of the Neutrality Act. It was not until Germany invaded Poland in 1939, setting off World War II, that Congress revised the act. Even then, Roosevelt had to disguise his actions by claiming that the arms embargo actually endangered the peace of the United States. He also offered to bar American ships from designated war zones. He was thus able to persuade Congress to place arms on the same cash-and-carry basis as other commodities. He then went on to greater aid measures, such as the destroyer deal and lend-lease.

But while Roosevelt turned from sanctions toward measures of positive aid to Europe, in Asia his administration moved toward a more pointed use of embargoes against Japan. Japan relied heavily upon American oil and metals to supply its war effort in China. Any threat to stop those exports would have a significant impact on Japanese plans. The swing of public opinion and the revision of the Neutrality Act in 1939 allowed Roosevelt to take some action on behalf of China. So, in May 1939 the United States notified Japan that it was withdrawing from the 1911 Treaty of Commerce. According to terms of the treaty, in six months the United States would be free to limit or terminate exports to Japan. Roosevelt hoped this would give the Japanese pause, but Japan continued its war in China. The U.S. government hesitated to implement sanctions for fear that they would drive Japan to replace the embargoed items by invading new sources of supply. This would most likely be Southeast Asia, where French, British, and Dutch colonies were supplying those same vital materials to America’s allies in Europe. The six-month period of grace passed, then a year, with no sanctions applied.

In July 1940, a cabinet change in Japan signaled a more aggressive Japanese policy in South-
east Asia. With that, the United States imposed an embargo on aviation gasoline and high-grade scrap iron to Japan. This embargo affected only a fraction of exports to Japan, and the U.S. government went to some lengths to justify the embargo on the grounds of American domestic needs rather than any displeasure with Japan. Still, the embargo signaled the Japanese that the United States would oppose any moves against Southeast Asia.

Instead of backing down, Japan accelerated its search for more secure sources of vital raw materials. It extorted concessions from the Dutch East Indies, coerced Vichy France into allowing Japanese occupation of northern Indochina, and began negotiations for an alliance with Germany and Italy. The United States responded with a complete embargo on scrap iron, but this was followed the very next day by the formal announcement of the Axis pact. The United States continued to expand its embargo, extending it to tools, iron, steel, copper, bronze, and many other critical metals. When the United States intercepted Japanese messages detailing plans for further expansion in Southeast Asia and reports arrived that Japanese transports were moving on southern Indochina, Roosevelt decided on a last-ditch gamble to stop Japanese expansion. He issued an order freezing all Japanese assets in the United States. Only a special license from the U.S. government could release Japanese assets to pay for American exports, including, most critically, oil. When the British and Dutch joined the oil embargo, it cut off the vital Southeast Asian sources of raw materials as well. With only a two-year supply of petroleum, Japan either had to give up the war in China or secure its own sources of supply. Japan first tried diplomacy, but negotiations with the United States failed, and Japan declared war. During World War II, the United States used the 1917 Trading with the Enemy Act to impose a complete embargo on the Axis powers.

**COLD WAR SANCTIONS**

The United States emerged from World War II as the only great power whose economy had escaped the conflict relatively unscathed. Consequently, it was a potential reservoir for rebuilding war-torn nations and was often the sole supplier of critical goods. Such economic power inevitably made economic sanctions an attractive option for the United States in the Cold War, despite the dismal record of embargoes in American history. Economic sanctions were often the only recourse for the United States when fear of nuclear war or other political constraints put limits on the use of military force.

In 1948, the United States began a campaign of economic sanctions against the Soviet Union that would last more than fifty years. In March of that year, the Department of Commerce announced restrictions on exports to the Soviet Union and its European allies. Congress formalized these restrictions in the Export Control Act of 1949. Originally, Congress intended this act as a temporary measure to keep arms and strategic materials out of the hands of potential enemies, but the outbreak of the Korean War in 1950 made the Cold War more rigid and the measure became permanent. In 1951, the United States attempted to strengthen these sanctions with the so-called Battle Act. According to this act, the United States would refuse assistance to any nation that did not embargo strategic goods, including oil, to the Soviet Union and nations subject to its influence. Under pressure from its allies, the United States accepted many exemptions from this act and it was not notably effective.

For many years, the embargo on the Soviet Union was quite severe. The embargo on Eastern European countries was less stringent, in hopes of driving a wedge between the Soviet Union and its allies. Two of the most independent East European nations, Poland and Romania, were given particularly mild treatment. With the growing détente of the 1970s, trade restrictions on the Soviet Union and its allies were increasingly lightened, most notably in the permission granted the Soviets to purchase large amounts of American wheat when Soviet crops failed in 1973. But restrictions were tightened again after the Soviet invasion of Afghanistan in December 1979. In 1983, Ronald Reagan approved the National Security Decision Directive 75, which set the policy of using economic pressure to limit the foreign policy and military options of the Soviets. This stricter regime of sanctions led to considerable conflict with America’s allies on the Coordinating Committee for Multilateral Export Controls (COCOM), especially over the export of oil and gas equipment.

When the Soviet Union collapsed in 1991, a major debate broke out over the contribution that the campaign of economic sanctions had made toward the fall of the Soviet empire. Many former officials in the Reagan administration credited sanctions with a significant role in the disintegration of the Soviet economy and therefore of the
Soviet Union itself. On the other hand, the leading work on the effectiveness of economic sanctions—Hufbauer, Schott, and Elliott, *Economic Sanctions Reconsidered* (vol. 1, p. 137)—concludes that although the United States did succeed in denying some arms and key technologies to the Soviets, the collapse stemmed from internal inefficiencies rather than U.S. economic sanctions.

Ironically, the most effective use of economic sanctions made by the United States during the Cold War in Europe was against its own allies, Great Britain, France, and Israel, during the Suez Crisis of 1956. When those three powers concerted to invade Egypt in response to Egyptian nationalization of the Suez Canal, President Dwight Eisenhower not only warned them to retreat, he began a massive sell-off of British pounds and embargoed U.S. oil shipments to the three nations. For one of the few times in history, sanctions stopped a military invasion in its tracks.

During the Cold War in Asia, the United States imposed embargoes on North Korea, China, and North Vietnam. These were severe embargoes established under the Trading with the Enemy Act. The embargo of China and North Korea began in 1950, during the Korean War. Secretary of State John Foster Dulles insisted that the embargo continue after the war, but America’s allies protested, arguing that such trade should be under the same regulation as trade to Eastern Europe. The United States used the Battle Act to prevent this, but in 1957 gave way to allow its allies to trade with China and North Korea. The United States, however, maintained its own unilateral embargo until 1969, when the administration of Richard M. Nixon lifted restrictions on most trade to China except for strategically important goods. The economic effect of the embargo on China was minimal because China itself chose to restrict imports to what it could pay for with its few exports. China found all the imports it needed in Europe anyway.

The United States reimposed some sanctions on China after the Tiananmen Square massacre of 1989. President George H. W. Bush suspended arms and some commercial contracts but maintained China’s most-favored-nation status. Congress, however, continuously threatened to remove that status in order to apply pressure against China over its record on human rights. Using the Jackson-Vanik Amendment to the Trade Act of 1974, which was originally designed to force the Soviet Union to permit Jewish emigration, Congress required the president to certify annually that China was respecting human rights before he could renew its MFN status. Ultimately, in 1999, President Bill Clinton narrowly succeeded in convincing Congress to grant China permanent MFN status and permit China to join the World Trade Organization. Clinton argued that the best way to influence China was to keep it engaged in the world economy and politics. The likelihood that the United States would resort to economic sanctions to influence China’s human rights policy in the near future diminished as a result of this decision, but the United States continues to hold out the possibility of sanctions against China’s nuclear proliferation policies by restricting Chinese access to advanced technologies.

While the United States relaxed its harsh economic sanctions against China a few years after the Korean War, it maintained those sanctions against North Korea because of human rights violations, a nascent nuclear building program, and a continuing military threat to South Korea. In 1994, North Korea’s concessions on its nuclear program led the United States to lessen the restrictions and offer some aid. A famine in North Korea and the growing détente between North and South Korea have brought some increase in that aid, but U.S. sanctions against North Korea were still quite severe at the turn of the century.

Economic sanctions accompanied America’s war against North Vietnam just as they did previous U.S. conflicts. The Eisenhower administration suspended all export licenses for North Vietnam in 1954, shortly after the Geneva Convention temporarily divided Vietnam in two. President Lyndon Johnson extended those sanctions to a prohibition of all commercial and financial transactions with North Vietnam when the war escalated in 1964. Although the peace agreement signed in 1973 included a provision for renegotiating economic ties, the final conquest of South Vietnam by North Vietnam in 1975 resulted in an extension of the sanctions to all of Vietnam. President Jimmy Carter moved toward easing those restrictions, but he was thwarted first by congressional opposition and then by Vietnam’s occupation of Cambodia. Thus, sanctions remained in place until February 1994, when Bill Clinton ended the nineteen-year trade embargo.

America’s Cold War embargoes and sanctions in the Western Hemisphere were somewhat different from those in either Europe or Asia. Rather than being attempts to punish military adventures or to slow the arms buildups of major powers, the United States used sanctions to desta-
bilibize weaker regimes that were too friendly to the Soviet Union or otherwise threatened stability and U.S. interests in the Western Hemisphere.

The United States levied the most stringent and long-lived of its sanctions against Cuba. In 1962, following the embarrassing defeat at the Bay of Pigs, President John F. Kennedy expanded a set of piecemeal sanctions that had been imposed on Cuba after its 1959 revolution by using congressional authorization to embargo all trade with Cuba. The United States then brought pressure on the Organization of American States and the NATO allies to follow suit, especially by threatening to deny aid to, and penalize companies of, nations continuing to trade with Cuba. The OAS did embargo trade except for food and medical supplies, but there was considerable leakage. More important, the Soviets granted large subsidies to keep the Cuban economy afloat, primarily by trading oil to Cuba for sugar on extremely favorable terms.

The fall of the Soviet Union and the elimination of its subsidies devastated the Cuban economy. Some in the United States thought that the end of the Cold War should lead to a termination of the Cuban embargo as well. But others, especially the Cuban exile lobby in Florida, thought that the end of Soviet subsidies provided a chance to tighten the embargo and finally oust Castro. Presidents George H. W. Bush and Bill Clinton, with an eye on Florida's twenty-five electoral votes, tightened restrictions on U.S. foreign subsidiaries trading with Cuba, on the grounds that Cuba needed to improve human rights on the island. The U.S. Congress went even further. In 1996, it passed legislation sponsored by Senator Jesse Helms and Representative Dan Burton to apply economic sanctions to any U.S. ally that continued to trade with Cuba. President Bill Clinton threatened to veto the legislation until Cuba shot down two civilian planes being flown toward Cuba by anti-Castro Cuban exiles. The furor this created in the midst of the 1996 presidential election brought Clinton to sign the Helms-Burton Act, but bitter protests from America’s allies and Clinton’s own inclinations caused the president to suspend the most onerous provisions of the act indefinitely. America’s allies continued to simmer over this attempt to force their participation in the U.S. embargo of Cuba, especially because the United States was passing similar legislation to coerce an expansion of existing embargoes against Libya and Iran. In the annual votes of the UN General Assembly that urged the United States to abandon its sanctions against Cuba, the United States found itself increasingly alone. Meanwhile, Castro hung on to power and continued to defy the United States.

Sanctions against other Latin American nations during the Cold War were somewhat more effective. When President Rafael Trujillo of the Dominican Republic tried to have President Romulo Betancourt of Venezuela assassinated in 1960, the United States limited the Dominican sugar quota and successfully pressed two-thirds of the OAS members to vote for an embargo on oil, trucks, and spare parts to Trujillo. The sanctions did play a part in the fall of Trujillo’s regime, but the assassination of Trujillo and subsequent threats of military force against his successors played a larger part.

Sanctions also played a minor part in the military coup that ousted Joao Goulart of Brazil in 1964. They destroyed the viability of Salvador Allende’s government in Chile, which made it easier for the Chilean military, with U.S. support, to overthrow Allende in 1973. Sanctions helped to strangle the economy of Nicaragua under the Sandinistas and secure the election of the opposition UNO party favored by the United States in 1990. Finally, the denial of aid and loans to Manuel Noriega’s government in Panama sowed much discontent, paving the way for the U.S. invasion of Panama and the arrest of Noriega in 1989. Thus, economic sanctions against regimes in Latin America during the Cold War had a more obvious effect than they did in Europe or Asia, primarily because those regimes were already weak and unstable, and received little outside help from the Soviet Union. But, even then, sanctions in Latin America most often required covert activities and military action to succeed fully.

Because the United States had fewer vital interests in Africa than in Europe, Asia, or Latin America, there were fewer instances of American economic sanctions. The United States did institute sanctions against Angola and Ethiopia in the 1970s to counter Soviet influence. But in the two major instances of embargoes and sanctions, South Africa and Rhodesia, the United States was a reluctant and partial participant in UN sanctions rather than an initiator of them. This was because the human rights objectives of the sanctions, with which the United States for the most part sympathized, threatened America’s Cold War interests in the strategic materials supplied by South Africa and Rhodesia. In both cases, therefore, the United States supported limited sanctions as a moderate
alternative to the more militant actions demanded by a majority of United Nations members.

From 1951 to 1962, the United States embargoed any arms to South Africa that could be used domestically to support apartheid; it extended that embargo to all arms in 1962. The United States and its allies, Britain and France, voted consistently against attempts by the United Nations to apply further sanctions, however. Jimmy Carter tightened arms sanctions slightly, but Ronald Reagan reversed course with his policy of “constructive engagement.” Reagan specifically undercut a concerted UN move to impose wider sanctions on South Africa in support of the independence of Namibia by tying any action on Namibia to the exodus of Cuban troops from Angola. Congress, however, steadily pressed for tighter sanctions and, in 1986, overrode Reagan’s veto to extend sanctions beyond arms to loans, new investments, and many imports. Combined with the sanctions of the United Nations and the refusal of many private banks to roll over South African loans, these economic pressures contributed significantly to the internal pressures from black anti-apartheid rebels that finally brought the white regime to accept a new constitution installing majority rule in the 1990s.

In Rhodesia, when Ian Smith declared independence from the British Commonwealth in 1965 as a means of maintaining white rule, the United States followed the lead of Great Britain in the United Nations. The United States first joined a 1966 embargo on oil, arms, and spare parts along with a boycott of major Rhodesian products; it then moved on to a complete embargo in 1968.

While responding to these initiatives of the United Nations, the United States voted against proposals that called on Britain to use force against Rhodesia. The United States cast its first veto ever in the Security Council to defeat such a measure in 1970.

In 1979, Smith had succumbed and agreed to majority rule.

SANCTIONS AND HUMAN RIGHTS, TERRORISM, AND NUCLEAR PROLIFERATION

The Carter administration enhanced the use of sanctions for human rights purposes in areas outside Africa as well. Secretary of State Henry Kissinger and the administration of Gerald Ford resisted a 1973 congressional initiative that would have denied aid to nations that violated human rights, but Carter was more favorable to this tactic. With Carter’s support, Congress attached riders to military aid bills denying aid to South Korea, Chile, Uruguay, the Philippines, Brazil, El Salvador, Guatemala, Nicaragua, Paraguay, Ethiopia, Argentina, and Zaire. Carter used his presidential prerogative to expand further the list of nations denied security aid on human rights grounds to include Bolivia, Haiti, and Iran. Reagan reversed course on this and vetoed legislation that tied aid to human rights, but with the end of the Cold War, the United States once again adopted sanctions on human rights grounds, most notably against China, Iraq, and Serbia.

In the 1970s, the United States also began using sanctions specifically against terrorism. Congressional legislation in 1976 and 1977 prohibited aid and exports to nations abetting terrorism. At the behest of Congress, the State Department began issuing lists of nations supporting terrorism. These lists included Libya, Syria, Iraq, Cuba, South Yemen, and Iran.

In the same decade, the United States and many other nations began using sanctions to discourage the proliferation of nuclear weapons. These sanctions sought to stop trade in items related to nuclear weapons with nations that refused to sign the Non-Proliferation Treaty. The nations most affected were Brazil, Argentina, India, Pakistan, and Iraq.

POST–COLD WAR SANCTIONS

With the end of the Cold War, the United States had greater success in persuading other nations to
join it in imposing sanctions against terrorism, nuclear proliferation, and violations of human rights. Rival powers on the UN Security Council no longer automatically vetoed sanctions that affected their respective allies. The two most prominent crises in which broad multilateral sanctions played a major role were the Gulf War of 1991 and the meltdown of the former Yugoslavia. Sanctions in these cases succeeded in devastating the economies of the two rogue nations at the center of the crises, Iraq and Serbia. But in the end it took military force to compel the leaders of those countries to make major changes of policy.

When Iraq invaded Kuwait in 1990, the United States and the UN Security Council sanctioned all Iraqi trade and financial aid. But Saddam Hussein defied the bans and received substantial supplies through sympathetic Palestinians in Jordan. He also made a firm peace with Iran, thus securing his borders. As Saddam showed no signs of relenting on Kuwait, President George Bush began pushing his allies for military action. Many American leaders, including the former chairman of Reagan's joint chiefs of staff, Admiral William Crowe, argued that continuing sanctions might well force Saddam to settle without further bloodshed. Bush's own joint chiefs, led by General Colin Powell, were also reluctant to go to war, but were willing to do so if overwhelming force were used to avoid another Vietnam. Bush agreed, and the resulting Operation Desert Storm routed Saddam's army. But the allied armies stopped before taking Baghdad or capturing Saddam himself. They then signed an agreement with Saddam that restored Kuwait's border and permitted inspections to ensure the dismantling of all Iraqi weapons of mass destruction.

Saddam defied those agreements, and the United States and the United Nations continued their sanctions to try to bring him into line. Nevertheless, Saddam held out for more than a decade while the sanctions regime slowly declined. The United States and its allies exempted some Iraqi oil from the sanctions under strict controls to see that the money was used for humanitarian purposes within Iraq and to compensate Kuwait for war damages. But Saddam managed to divert some of that aid to maintaining his regime. He also smuggled oil, with the cooperation of Iran and others, to keep himself afloat. Meanwhile, Russia, France, and other nations pressed for further loosening or even ending the sanctions, on the grounds that Saddam had sufficiently conformed to his agreements and that the embargoes bore most heavily on innocent civilians.

Multilateral sanctions also played a major part in the Balkan crises of the 1990s. After the death of Tito, Slobodan Milosevic began appealing to Serbian nationalism as a substitute for the collapsing communist ideology that previously had sustained his position. As a result of growing Serb militancy, Slovenia, Croatia, and then Bosnia declared their independence. Milosevic used his control of the Yugoslav army and heavy weapons to invade Bosnia and Croatia in support of the Serb inhabitants of those areas. He then expelled or massacred all non-Serbs in the conquered areas, in a program dubbed "ethnic cleansing." The Croats and Muslims often returned the favor of ethnic cleansing when they had the chance, but the imbalance of power gave them fewer of those opportunities.

The United States under George H. W. Bush left the Europeans to furnish a few thousand UN troops to deliver humanitarian aid to besieged areas while America led the Security Council to impose an economic blockade of Serbia. By 1994, the blockade had worn Milosevic down to the point that he deserted the Bosnian Serbs and joined the embargo against them in hopes of getting the sanctions lifted against Serbia. But the Bosnian Serbs refused to quit. In July 1995, they brushed aside a UN force protecting the sanctuary of Srebrenica, massacred the adult males, and brutalized many others. Finally, the United States and NATO began a major bombing campaign that, combined with pressure from a rejuvenated Croat army, forced Milosevic to the peace table. At Dayton, Ohio, in November 1995, Bill Clinton succeeded in hammering out a peace agreement to be enforced by an enlarged UN contingent to which the United States would contribute one-third of the troops.

Milosevic, however, began a similar ethnic cleansing program in Kosovo in 1998. Despite the reluctance of Russia, the NATO allies restored sanctions against Milosevic. They eased them when he agreed to negotiate with the Kosovar Muslims, but nothing came of the talks, and Milosevic resumed military activities in Kosovo. It was clear to all that mere sanctions would not change Milosevic's policy, so NATO resorted to threats, and finally the use of force. A devastating ten-week bombing campaign ultimately brought Milosevic to retreat from Kosovo in favor of a UN peacekeeping force that included U.S. troops.
THE EFFECTIVENESS OF U.S. SANCTIONS IN HISTORICAL CONTEXT

The United States also imposed economic sanctions in cases far less serious than Iraq and Serbia after the Cold War. It was imposing sanctions against forty different nations as of 1999. Certainly, the United States was using sanctions more often than any other nation. In fact, many critics believed that its use of sanctions had gotten out of hand. Economic Sanctions Reconsidered, a major compilation of case studies by Gary Clyde Hufbauer, Jeffrey J. Schott, and Kimberly Ann Elliott concerning economic sanctions as exercised throughout the world in the twentieth century, concludes that sanctions worked only about one-third of the time, usually when they were exercised decisively rather than gradually, had multilateral rather than mere unilateral support, and were directed at rather weak and unstable regimes (vol. 1, p. 93). Truly altering a nation's fundamental political or military policy most often required military force. The history of sanctions in American history as narrated here seems to bear out that analysis.

On the other hand, sanctions have served purposes beyond the most ambitious one of changing another nation's fundamental policy decisions. Sanctions have signaled to adversaries, allies, and America's domestic constituencies the seriousness of an issue. They have prepared domestic constituencies for the possibility of armed conflict by making clear that all peaceful options were being tried before resorting to war. They have weakened the economies of adversaries in ways that interfered with their preparations for conflict. And they have served as an object lesson for future adversaries. Fidel Castro and Saddam Hussein demonstrated that determined regimes can survive powerful sanctions for an extended period of time, but the ravages on their economy certainly ensure that no nation will risk such sanctions lightly in the future.

Nevertheless, sanctions also have produced nationalist reactions in target nations that stiffened rather than weakened resistance to America's foreign policy goals. Moreover, even friendly nations often refuse to go along with U.S. sanctions, and the economic effect is simply to transfer commerce from the United States to other countries. In the end, then, sanctions are a tempting means for the U.S. government to try to coerce cooperation with its policies by means short of war and to signal its determination at home and abroad, but in the absence of the threat or use of military force, embargoes and sanctions do not often succeed in changing a nation's fundamental policies, and they impose costs on the initiator as well as the object of such measures.

Environmental diplomacy can be broken into two general categories: conventions regulating the use of natural resources, and conventions regulating pollution. In each case, the central problem is that political boundaries rarely reflect biological boundaries, so that as national economies consume resources and produce pollution, they spread environmental problems far beyond their national boundaries. The sheer size of the U.S. economy has given it both the power to degrade the environment around the world and the influence to push diplomatic efforts to protect the environment. For most of its history, the United States has been one of the leading nations in the field of environmental diplomacy, but at the end of the twentieth century the United States found itself more often on the outside, as global discussions produced treaties that were increasingly unacceptable to the U.S. government. This loss of leadership has coincided with a shift away from bilateral treaties, first to small multilateral treaties and then to conventions that are open to every nation. That shift has been a logical reaction to an increasing international awareness that some of the biggest threats to human society come from global environmental problems, but it has meant that the United States has been less able to shape the course of events to its liking.

Environmental diplomacy has almost always been a secondary, or even tertiary, goal of U.S. foreign policy. Simultaneously, though, it is often the product of intense domestic political pressure, as nongovernmental organizations (NGOs) have done a masterful job of putting their members’ concerns on the diplomatic agenda. As such, it usually reflects the primary diplomatic and domestic goals of the time. Hence, in the twentieth century, such trends and policies as progressivism, the Good Neighbor Policy, containment, détente, and environmentalism, as well as the state of the national and world economy, all played crucial roles in shaping specific treaties. In addition, the increase in scientific knowledge as well as public awareness of and faith in that science were crucial elements in shaping the course of environmental diplomacy during the twentieth century. The United States has almost always been a strong proponent of using science as an impartial tool in international environmental protection, particularly in moving away from static treaties to dynamic bodies that can address changing problems. Finally, one must acknowledge that just as there are formal and informal forms of diplomacy, so too are there formal and informal kinds of environmental diplomacy. While the focus here is largely on conventions and treaties, it should be remembered that the sheer appetite of the United States for imported goods created an unintended international environmental impact that might actually be greater than that generated by formal environmental diplomacy.

THE UNITED STATES–CANADA BILATERAL RELATIONSHIP

Although the term “environmental diplomacy” is a creation of the late twentieth century, the United States has in fact been negotiating access to natural resources since its independence from Great Britain. One could certainly interpret westward expansionism as environmental diplomacy, as the United States strove to acquire the most valuable resource of all, relatively untapped land and the various forms of mineral and living wealth that came with it. More obviously, repeated deals with Great Britain between 1783 and 1910 were a sustained effort to secure access to the grand fisheries off Newfoundland, including those for cod and several other species. These two efforts were, in a way, complementary, as fishing was dear to the New England states and landed expansion was perhaps more appealing in the South and West. In
any case, the efforts of the United States and its northern neighbor to work out fisheries deals were the start of a long and generally fruitful history of bilateral cooperation on both resource use and pollution control.

John Adams and his son, John Quincy Adams, personified the New England obsession with access to the Grand Banks. At the urging of the elder Adams, the Treaty of Paris of 1783, which ended the revolutionary war, ensured that U.S. fishermen would have the liberty to fish within three miles of British territory in North America, as well as the right to continue to catch fish on the high seas. Throughout the nineteenth century, the two nations continued to struggle over these fisheries, with special difficulty interpreting the meaning of the 1783 treaty.

Not accidentally, the next attempt to regularize fishing relations came during the younger Adams’s term as secretary of state (1817–1825). The Treaty of Ghent (1815), which ended the War of 1812, had not reopened Newfoundland’s inshore fisheries to the United States, but many New England fishermen pressed their luck by returning to their old haunts, and as a consequence often found their vessels confiscated. Tension forced the two nations to negotiate a new convention in 1818, which explicitly spelled out which areas were open to U.S. fishermen and which were closed, as well as shore points that could be used for drying and curing fish. Great Britain agreed that these limited areas would be open to the United States forever.

It turned out that “forever” was also open to interpretation, so the Grand Banks dispute did not go away. In the 1850s, the British threatened again to close the inshore fisheries; in the ensuing Marcy-Elgin Agreement of 1854 they traded access to all of Newfoundland’s waters for a reciprocity deal between the United States and British North American colonies. After the Civil War, the United States repudiated Marcy-Elgin, and negotiations opened once again. The Treaty of Washington (1871) not only resolved the Alabama Claims but also settled questions of duties on fish products and access to Newfoundland’s shoreline. Congress eventually abrogated this treaty in 1885, opening the way for yet another agreement, this one emerging from the Joint High Commission meetings in 1888. Because of congressional intransigence, this agreement was never formalized, but the two sides agreed to abide by it for many years, until in 1905 Newfoundland imposed its own set of restrictions on American fishermen.

Finally, in 1907, Great Britain and the United States agreed in principle to arbitration. In 1909 they sent the matter to the Permanent Court of Arbitration at The Hague, as each side presented lengthy arguments to justify either expanded or restricted U.S. access. After months of deliberation, the court issued a complex ruling that resolved the outstanding disagreements and left London with the right to make reasonable regulations. Apparently, “reasonable” has not become the subject of any serious dispute since then.

This fisheries dispute consumed a remarkable amount of time for the young United States, reflecting the importance of both the North Atlantic Triangle (Great Britain, the United States, and Canada) and the raw materials involved. The terms of discussion were quite traditional, as negotiators never considered conservation of the cod and other valuable species, nor did they really address the problem of shifting technology. In a sense, the diplomats could not create a permanent solution because the environment, the technology, the fishing patterns, and the markets that shaped human fishing were all interconnected and all changing constantly. In short, they were trying to create static solutions to dynamic problems. This has been a recurrent shortcoming of environmental diplomacy.

Such problems were not insoluble though, as the North Pacific Fur Seal Convention revealed. The North Pacific fur seal first drew the attention of Europeans when Russian explorers encountered it in the Bering Sea in the late 1700s. The seals breed on rookery islands, with the vast majority using the Pribilof Islands of Alaska, although they spend about three-quarters of their lives on the high seas. They became the subject of intensive hunting early in the 1800s, when sea otter populations crashed, and it turned out that the thick coats that kept them warm in the ocean were quite appealing to people.

Russian management of the seals, limited though it was, sufficed as long as the seals were remote from centers of human habitation and Russia could claim both the breeding islands and the seas around them. When Russia sold Alaska to the United States in 1867, at the same time that British Columbia was rapidly gaining population, hunting of fur seals became a diplomatic issue. The U.S. government leased the Pribilofs and their inshore waters to a private company for twenty years and limited that company to 100,000 skins per year. Both the government and the stockholders profited immensely until the
early 1880s. By then, sailors out of Victoria, as well as a few from U.S. ports, had begun to kill large numbers of seals on the high seas. The response of the U.S. government was to accuse Canadian sealers of piracy and seize their ships, arguing that it owned not only the seals but also the eastern Bering Sea. Such an argument did not get very far in London, where the British generally showed restraint despite their strong support for freedom of the seas. Neither side wanted to back down, nor could either justify military action.

The first move toward compromise, in 1891, was crucial for two reasons. First, the two nations agreed to arbitrate their dispute if necessary; second, they appointed a four-member scientific committee to study the issue during a visit to the Bering Sea. The scientists, like the diplomats, failed to find any common ground beyond the obvious conclusion that fur seal numbers were declining. Still, their very presence—coupled with an 1892 joint scientific commission to study the fisheries along the U.S.–Canadian border—showed that the United States and the British Empire were beginning to consider that science might offer solutions to disputes over use of resources. Given the deadlock, the two nations were headed for arbitration. In 1893, after weeks of arguing and the production of sixteen volumes full of documents, arbitrators created a buffer zone and a closed season meant to protect the seals from pelagic hunting.

Although at first the ruling settled the U.S.–Canadian disagreement, the solution turned out to be temporary, as again shifting behavior and populations left a static agreement behind. Canadian sealers responded by crossing the ocean and demolishing the small Japanese and Russian herds, after which they then began to leave the industry; in response, the Japanese government lifted limits on its pelagic sealers, who promptly crossed the Pacific and took large numbers of Pribilof seals, as they were not bound by the arbitrators’ ruling. The seal population continued to decline; the herd that once numbered 2.5 million was slipping toward 200,000 early in the twentieth century.

After many starts and stops, in 1911 the United States, Great Britain, Japan, and Russia worked out a deal that allowed some flexibility. The key component was a ban on pelagic sealing, which U.S. scientists had shown unequivocally to be the cause of the decline of the seal herd. In exchange, Canada and Japan received a fixed percentage of the skins harvested from the Pribilofs each year, and they allowed the United States to decide how many, if any, seals were to be taken. In effect, the United States had purchased the other nations’ right to catch seals on the high seas. They had been willing to sell in part purely because of economics, but also because the United States had pressed hard that pelagic sealing was both immoral and scientifically indefensible.

The North Pacific Fur Seal Convention was one of the first great successes in environmental diplomacy. The species rebounded quickly to more than two million individuals; all four sides were reasonably happy with the deal; and all agreed that they were willing to conserve the species. The convention broke down in 1941 on the eve of World War II, but after the war international management resumed and continues today, even though the harvest for the fur trade has ended.

In the use of science as a tool of, and conservation as a goal of, diplomacy, the fur seal negotiations proved to be something of a harbinger for North American diplomacy. In 1906, Secretary of State Elihu Root proposed that the United States and the British Empire resolve three outstanding issues: the Newfoundland fisheries, boundary waters control, and inland fisheries. On the third issue he specifically proposed that the protection and conservation of the fisheries should be a central goal. After much fruitless haggling—a facet of environmental diplomacy just as any other kind of diplomacy—Great Britain and the United States signed a treaty to regulate the fisheries along their common border; this brief treaty stood out for its emphasis on a joint regulatory committee based on a scientific understanding of the fisheries. Years later, Congress killed the treaty by failing to enforce it, but it lived on as a model for later agreements.

Attempts to apply the model to just the sockeye salmon fishery in the Northwest began with frustration but eventually met with success. Scientists and regulators met often, proposed solutions frequently, and watched them collapse consistently. On some occasions the culprits were Americans, other times they were Canadians; sometimes they were fishermen, other times diplomats. In 1929, Ottawa rejected a salmon treaty; in 1930, the U.S. Senate returned the favor. Disagreements arose over two main issues: the division between U.S. and Canadian catches and the waters to be covered. Finally, in 1937, after some minor modifications, the Senate reversed course and approved the 1930 treaty, which established the International Pacific Salmon Fisheries
Commission. This commission involved Canadians and Americans in scientific research as a central tool in managing and allocating the catch of this most valuable fish species. In 1985 it was replaced by the Pacific Salmon Treaty, designed to address problems that had not been imagined in the 1930s, such as renewed political clout among the First Nations and greater foreign fishing on the high seas. Still, the startling protest by Canadian salmon fishers in July 1997, when they blockaded a ferry bound for Alaska and burned an American flag, demonstrated that diplomatic solutions rarely met everyone's requirements.

In the wake of Root's 1906 initiative, in 1909 Canada and the United States signed the Boundary Waters Treaty, which formed the International Joint Commission (IJC), with powers to regulate pollution, rivers, and the like. The treaty created a system of arbitration to find those solutions that eluded the members of the IJC. Water pollution, though, remained a low priority. On a few occasions, the two nations have established measures to reduce pollution in the Great Lakes, with a 1972 water quality agreement standing out as the most important.

Over time, the IJC found itself moving into air pollution issues, including most famously the Trail Smelter case. The Trail Smelter opened for business in 1927 and quickly earned a reputation for ruining agriculture on both sides of the British Columbia–Washington border. The smelter's owners offered to pay for damages, but they could not agree on terms with U.S. farmers, who in turn called in the Department of State. In 1941, after years of haggling, the IJC crafted an agreement to resolve the dispute based on "the polluter pays" principle. For many years, the Trail Smelter case appeared, like the fur seal arbitration case, to be a symbol of the ability of Canada and the United States to resolve their differences amicably. In recent years, however, critics have noted that diplomats and regulators deliberately kept the ruling narrow so that it would not impact other sources of transborder pollution. For example, the historian John Wirth noted that the Trail Smelter case, rather than being a victory, in fact impeded international efforts to control pollution for thirty years.

While the Trail Smelter case focused on a Canadian pollution source, a quick study of wind currents and the U.S.–Canadian boundary would suggest that the vast majority of transborder air pollution runs north, not south. As fate would have it, the industrial heartland of the United States was not only built above a belt of sulfurous coal but under wind currents that run right into the most populated parts of Canada. Nature in turn left eastern Canada especially vulnerable to acid rain—there was very little limestone to act as a natural buffer, especially in lakes and ponds popular with both locals and tourists, and the forests were easily damaged by sustained pollution. By the 1970s, Canadian politicians were complaining loudly about acid rain and calling for the U.S. government to control industrial emissions, especially from the Ohio Valley. The Reagan Administration addressed acid rain with great reluctance, suggesting first that the scientific evidence was unclear, then in 1982 simply declaring that acid rain was not an issue. In 1987, Ronald Reagan and Canadian Prime Minister Brian Mulroney announced a treaty to coordinate joint research into acid rain. Still, no steps to curb acid rain were put in place until after passage of the U.S. Clean Air Act of 1990, which mandated a reduction in sulfur dioxide emissions.

The bilateral Canadian-American relationship has also addressed wildlife protection in North America. Most famously, in 1916 the two countries signed the Migratory Bird Treaty (MBT), which protected most species of birds that lived north of the Rio Grande. The MBT divided birds into three categories: game, insectivorous, and others. Game birds could be hunted during specific seasons; insectivores were permanently protected; and those listed in the third category got protection just because they were popular. Like the fur seal treaty before it, the MBT succeeded because it combined solid science, economics, and appeal to people's fundamental ideas about aesthetics. The rationale for protecting birds was that they were beautiful and useful.

Still, the treaty stirred controversy because its motivation was largely domestic. Conservationists had pushed through Congress a law to protect migratory birds in 1913, but most of them believed that the Supreme Court would declare it to be unconstitutional. With Root's support, they focused on the idea that the treaty clause of the Constitution in Article 6 trumped the Tenth Amendment's notion that residual powers were reserved to the states, and they began to push for treaties with other countries to protect migratory birds. That they settled for the adjective "migratory" suggested that they were still very conscious that the states had the right to protect birds that did not migrate across state lines. As in the fur seal convention, the animals'
movements were central to their presence on the diplomatic agenda. When in 1920 the Supreme Court ruled on the treaty's enabling legislation in Missouri v. Holland, Justice Oliver Wendell Holmes placed wildlife protection squarely in the lap of the federal government, and it has not left there since.

Since 1920, the MBT has served as the basis for bird protection throughout the United States and Canada, since the enabling legislation has been updated frequently, and it has also served as a model for three other bilateral treaties. In 1936 the United States and Mexico signed a Migratory Bird Treaty that had been on the conservationists' wish list since 1913. That treaty did little to change U.S. law, although it did add birds of prey to the protected lists, and its main value was to export U.S. ideas about bird conservation to Mexico. In 1972 the United States signed a similar deal with Japan in order to protect birds in the Pacific. And in 1976 the Soviet Union joined the club with an agreement to protect birds that migrated in the northern Pacific.

A few conclusions can be drawn from the U.S.–Canadian environmental connection. First, one can well ask about the treaties that ought to have been executed but never were. The fisheries of the Great Lakes were the scene of intense competition, but only the failed treaty of 1908 attempted to regulate them in any way. Rather than make a sustained effort to work with fishermen to create a sustainable fisheries regime on the lakes, the two governments dropped the issue and focused on local regulations that were doomed to failure. Simply put, there was no strong lobbying group or government agency committed to freshwater fisheries conservation, and now there is no commercial fishery of consequence on the lakes and many native species have been severely depleted.

Second, many treaties that are completed often are held up by strong economic opposition, sometimes until it is too late. It usually takes some dire emergency to move these treaties forward at the last moment. The fur seal convention could have been completed years earlier, but stubbornness in Ottawa and Washington prevented leaders from making a few minor sacrifices until it was almost too late for the species. The water quality agreements in the Great Lakes came long after the International Joint Commission had declared all of the boundary waters far too polluted to drink—only a catastrophe like the fire on the Cuyahoga River compelled the two sides to take any serious action. No doubt, much of the opposition to cleaning up the lakes came from the industrial concerns that would be forced to change their ways.

Third, by comparison, there have been very few treaties to regulate the environment between Mexico and the United States. In part, this trend reflects the smaller border between the two and perhaps some environmental differences in the borderlands and their species. But it also reflects differences in levels of competition—Canada and the United States were similar enough societies to demand the same goods from the same source—and deep diplomatic suspicion. The Mexican War and U.S. opposition to the Mexican Revolution, not to mention deep religious and cultural differences, left Mexico uncooperative and the United States aloof. The great differences between U.S. relations with Mexico and those with Canada suggest that environmental diplomacy requires a great deal of goodwill and trust. For all of their disagreements and harsh comments, the United States and Canada have fundamentally trusted one another since Canadian Confederation in 1867. The same certainly cannot be said about Mexico and the United States. One need look no further than the sorry state of the rivers shared by Mexico and the United States to see how far these two neighbors have to go to bring their relationship to a standard that Canada and the United States have shared for years. The signing of the North American Free Trade Agreement in 1992 and the subsequent creation of the Commission for Environmental Cooperation may well result in a leveling of the environmental relationship among the three countries, but it is not clear what the level will be.

Fourth, two large countries can solve a number of problems with bilateral diplomacy, but even then there are limits to what they can do. Just because of sheer land mass, the United States and Canada are in a position to create and solve important environmental problems in a way that is probably unique. And yet, for all of their efforts to protect birds, they really cannot save the scores of species of neotropical migrants that winter in Latin America without cooperation from at least a dozen nations. Likewise, a solution to the sealing crisis eluded them until they satisfied Japan. In short, bilateral diplomacy normally tackles relatively easy questions; as a consequence, when an environmental problem involves more countries, the diplomacy becomes significantly more important and more complex.
EARLY MULTILATERAL CONVENTIONS

While there had been a handful of multilateral conservation agreements before 1940, none were so sweeping as that year's Convention on Nature Protection and Wildlife Preservation in the Western Hemisphere (CNP). U.S. scientists and conservationists conceived the CNP in the 1930s as a means to spread what they considered to be obvious ideas about conservation. Each nation, they proposed, ought to set aside national parks, national reserves, natural monuments, and wilderness areas, all of which already had been established in some form in the United States. They also thought that each signatory ought to protect endangered species and migratory birds, which revealed the convention's roots in the early conservation movement. The scientists worried, despite the Good Neighbor Policy, that Latin American governments might well suspect their motives. Therefore, at the 1938 meeting of the Pan-American Union, delegates sympathetic to the idea created a study committee of Latin Americans. They came back in 1940 with a draft treaty full of ideas suggested first by the U.S. scientists. The Pan-American Union's official stamp was sufficient to give the CNP legitimacy.

By 1942 nearly every nation in the Western Hemisphere had signed on, even though few of them were in a position to fulfill its terms. There were relatively few scientists in Latin America, few conservation nongovernmental organizations such as the National Audubon Society, and few parks or reserves already established. In the face of these difficulties, only Costa Rica did much to set aside large tracts of land. Even the United States failed to take the convention very seriously, as it did not move to protect endangered species as a group until 1966. Granted, the outbreak of World War II distracted attention from nature protection, but the war also served as a catalyst to sign the treaty as a show of unity and cooperation.

While the CNP was not the first environmental treaty to draw in dozens of countries, it provides an excellent example of the two fundamental difficulties of multilateral environmental diplomacy. First, it is a challenge to coordinate policies for countries with vastly different levels of economic development. Not surprisingly, the United States and Guatemala had very different attitudes toward conservation of land and wildlife, based on differences in industrialization, population, wealth, and landmass. Some citizens of Latin American states suspected that part of the U.S. agenda was keeping their nations in a state of economic subservience, while the U.S. scientists and conservationists who created the convention believed that they were simply passing on the wisdom that they had learned the hard way; as well as ideas that were inherently good in any society. Later in the century, differences among rich and poor societies along the same lines would hamstring other efforts to protect the environment.

Second, enforcement mechanisms are usually the first thing to be dropped from such a treaty. Most governments in the Western Hemisphere were willing to say that nature protection was a valuable goal. Few were willing to be held to any specific promises. None would accept the possibility of penalties for failing to live up to the CNP. This pattern repeated itself for the next sixty years. The rhetoric of environmental protection has been unusually appealing, but few governments will sacrifice their sovereignty over internal resource decisions or forgo the possibility of economic development for the sake of environmental protection. If forced to choose between signing an environmental protection convention with real teeth or risking public censure for failing to sign such an agreement, most governments will take the risk of criticism. If anything, the United States was just as reluctant as any country to risk its sovereignty, even though it often had the least distance to go to live up to its obligations.

The reluctance of the United States to push for strong enforcement mechanisms—and the implications of that policy—can be seen most clearly in the long efforts to control whaling. By the early twentieth century, the vast majority of whaling was confined to Antarctic waters, with whales being caught and then brought back for processing to shore stations in such remote places as South Georgia Island. There whalers could be tightly controlled by licenses issued by the European colonial governments. Two technological innovations in the 1920s, the stern slipway and condensers for producing freshwater at sea, allowed whalers to process whales at sea on large floating factory vessels. Whaling companies in Norway and Great Britain quickly worked out the logistics for expeditions involving a floating factory and up to a dozen smaller whale catchers, which could stay at sea for months at a time, catching whales, processing them for their oil, and then delivering the oil to any port in the world. In short, because they could operate on the high seas and fly any flag they chose, they were extremely difficult to regulate.
In 1931, after two years of discussion, the League of Nations produced the Geneva Convention for the Regulation of Whaling as a first step toward international control of the industry. The twenty-six signatories, including landlocked Switzerland, agreed that all whaling vessels would be licensed, that calves and nursing females would be protected, and that they would conduct more scientific research. Despite sponsorship by the suspect League of Nations and the limited nature of U.S. whaling operations, the United States participated in the drafting of the convention, signed it, and ratified it in 1935, all because doing so was an easy way to placate domestic conservation interests.

The 1931 convention did nothing to address the real problem, which was massive exploitation of a finite number of whales. Only a huge glut in whale oil, which was used mainly for margarine, curtailed whaling operations in the early 1930s. In fact, the British and Norwegian whaling companies did more than any government to regulate whaling and save whales by their own private agreements to limit production. The problem was that they could not work with other foreign companies, especially those from Germany and Japan, that were pursuing whaling for national reasons as much as private economic gain.

Over the objections of industry, the United Kingdom and Norway called another conference on whaling in 1937 to craft a tougher convention. They set an open season for Antarctic whaling, created rules for efficient use of whale carcasses, and banned the hunting of certain endangered species. The United States, led by Dr. Remington Kellogg, took an active role, even though U.S. companies contributed only 3 percent to the world’s whaling catch. Germany was also an active participant, which was a victory, but Japan refused to abide by the 1937 convention or any of its subsequent protocols. Not only were the signatory nations unable to do anything about Japanese whaling, they faced strong internal pressure from their own whalers who wanted the same freedom from regulation that the Japanese had.

Attempts to rectify the problems of the 1937 convention came to a halt when World War II erupted, and yet the war also played an important role in shuffling the interests of the nations involved in whaling diplomacy. On one hand, Japan and Germany found themselves at the mercy of the victorious Allies. On the other hand, the United States found itself somewhat unwillingly thrust into the position of global leadership. And most whaling ships found themselves on the bottom of the ocean floor. In short, the opportunity was there for a recasting of global whaling operations.

Under Kellogg’s influence, the United States, a nation that neither caught nor consumed baleen whales, decided to seize that opportunity. With the reluctant compliance of Norway and the
United Kingdom, in the fall of 1946 the United States engineered the writing of the International Convention for the Regulation of Whaling. By 1949 enough nations were on board to create the International Whaling Commission (IWC), which, for all of its flaws, is one of the oldest international bodies with a mandate for conservation. The IWC was a step forward in that it established rules for annual meetings to update whaling regulations, it relied explicitly upon the advice of scientists, and it tightened the restrictions on whalers.

That the IWC failed to conserve whales is more a reflection of the limits imposed on it in 1946 than a reflection of the personal failings of its members. Once again, the drafters chose not to have any mechanisms to enforce conservation regulations. Kellogg had strongly advocated trade sanctions against whaling nations that did not join the IWC, but U.S. diplomats decided that trade policy and conservation issues should not be intertwined. The convention created new problems by giving members the right to object to any amendment to the original regulations and thereby exempt themselves from it. In later years, these two facets would be the target of vehement criticism among environmentalists, but the Department of State insisted on them on the reasonable theory that whaling nations would not join any organization that threatened their sovereignty. In other words, a conservation organization could have clout or members, but not both.

What a whaling commission could have was symbolic value and persuasive powers. In fact, it is clear that those two objectives were high on the list of the U.S. scientists and diplomats who drew up plans for the commission and subsequently defended it during its darkest moments. If nations, including the United States, were unwilling to surrender their sovereignty, they were still willing to listen to other nations’ arguments. In fact, scientists counted on their ability to present rational, irrefutable arguments to recalcitrant commission members as the only viable means to build the necessary consensus. Even after it became apparent that persuasion was not going to stop Soviet cheating, Panamanian indifference to inspection, or U.S. efforts to restore Japanese whaling, U.S. and British diplomats supported the IWC as an important symbol that the nations of the world could cooperate in regulating the high seas—there was no need for South American nations to resort to such unsporting institutions as the 200-mile territorial limit in the name of conservation.

The IWC became the scene of some bruising political battles in the 1970s and 1980s, when the United States led a coalition of countries fighting for a moratorium on commercial whaling. By 1972, only three nations had any significant commercial whaling operations: Japan, the Soviet Union, and Norway, and Norway's industry was a mere shadow of its former self. As the surging environmental movement bore the greatest responsibility for pushing the moratorium, it was easy for the United States to support a measure that would hurt only its Cold War opponent and a major economic rival that seemed intent on destroying the U.S. auto industry. After several years of trying to push a moratorium through the IWC, only to see the whaling countries suggest that they would leave the commission rather than accept a moratorium, it became clear that the United States would have to use its own economic power to make any headway. Using the 1971 Pelly Amendment and the 1979 Packwood-Magnuson Amendment, Congress gave the president the authority to place unilateral sanctions on fishing rights of countries that continued to hunt whales in the face of IWC regulations. It is debatable how much impact these sanctions had, but they were at least marginally important in leading to the 1982 decision by the IWC to ban commercial whaling.

While the whaling commission might be the best known example of multilateral environmental diplomacy, it was certainly not the only post-war example of several nations convening to resolve their differences. The 1946 Northwest Atlantic Fisheries agreement was the first of several multinational treaties to regulate pelagic fisheries. Beginning in 1959 there was a series of treaties to regulate and protect the resources of Antarctica, including minerals and marine life. And there have been occasional isolated conventions, such as the 1987 agreement among five northern nations to protect polar bears. In each case, these treaties have brought together a set of countries with a mutual interest in a specific, local resource. Given a reasonably small number of countries with focused interests, the United States has been able to lead consistently.

GLOBAL CONVENTIONS

Beginning in the 1950s, thanks largely to United Nations activism and pressure from countries emerging from decolonization, the nations of the world began to gather in huge conferences to dis-
cuss truly global issues. One of the first of these grand global conferences was the 1958 meeting of the UN Conference on the Law of the Sea (UNCLOS), and over the next forty years it would be followed by several major attempts to unite the scores of nations of the world on key issues of diplomacy. In these discussions, the United States gradually found itself losing influence and often choosing not to lead. As environmentalism gathered steam in the 1970s, it served as a force to criticize the consumerism of the United States and its role in the Cold War, which helped push the U.S. government away from a leadership role. In addition, the United States found that its sheer power, and ties to former colonial powers, made it a target of developing nations more often than their leader.

The law of the sea negotiations started out with a focus on navigation, although marine resources were never far below the surface of the agenda. In fact, while pollution and fisheries disputes were important postwar motivators for the UN to call the conference, the aforementioned claim by Ecuador, Peru, and Chile in 1952 to a 200-mile band of territorial waters was one of the most important driving forces. The 200-mile limit was also one of the most controversial issues, as the conferees failed to reach an agreement on territorial waters at either the 1958 meeting or UNCLOS II in 1960. Only with the third meeting, which began in 1972 and ran off and on for ten years, did delegates accept the idea of the 200-mile zone.

The resource issues, which at first seemed fairly straightforward, became increasingly difficult to solve. In 1958, one of the four conventions signed addressed fishing and conservation in territorial waters. But that same conference, and the second one in 1960, failed to come to terms for fishing beyond territorial seas, in part because they failed to agree on a definition of those seas. Even after 1993, when the Law of the Sea Convention went into effect, fishing nations could not agree on regulating the seas beyond the new 200-mile economic zones. While treaties covering some regions and some species are open for signature, nothing has been completed, despite intense pressure from environmentalists to ban such practices as long-line fishing and drift-netting. The surprising incident of 1995, when Canadian warships fired on Spanish fishing vessels just outside of Canada's 200-mile zone, suggests that some sort of law is needed to cover these contested fisheries. And yet, as of 2001, only twenty-nine nations, including the United States, had ratified the supplementary agreement managing straddling and highly migratory fish stocks.

The most controversial point had nothing to do with swimming marine resources, but rather with those that have been lying on the ocean floor for millennia—mineral nodules. In the 1960s companies exploring the seabed discovered areas covered with rocks full of manganese, nickel, copper, and other valuable and reasonably scarce minerals. At UNCLOS III in 1982, governments split dramatically over how companies should get access to these minerals. Developing nations, often referred to as the Group of 77, argued that the minerals were the common property of mankind; therefore, an international agency should control the nodule fields, and companies that wished to exploit them would have to transfer technology to poorer countries and pay hefty fees. The United States and other developed nations countered that resources on the high seas had always been free for the taking by anyone with the capital and fortitude to take the necessary risks.

At UNCLOS III, the conferees adopted language closer to the Group of 77 nations' desires, and the Reagan administration refused to sign the convention solely because of the deep seabed articles. After a further twelve years of negotiations, the United States finally found a Deep Seabed agreement to its liking, in part because zealots on both sides were coming to the conclusion that mining there might never be economically feasible. Not only did the United States ratify the convention in 1994, but by then 159 states had at least signed, meaning that just about every national government in the world offered some form of support for the Law of the Sea Convention. When one considers that the UN has forty-two landlocked members, the signature count is especially impressive.

By the 1970s the huge meetings to discuss some global issue had become common, and in fact it is now hard to imagine a year without some grand conference sponsored by the UN. The factors that made such conferences more feasible, such as improvements in air travel, applied of course to environmental conferences, which were themselves furthered by both the strong wave of environmentalism sweeping around the world and the growing sense that some resources were simply the common heritage of humanity and therefore within the purview of all nations, not just a privileged few. Not only did new conven-
tions and conferences come together, but membership rose dramatically in some old organizations, such as the IWC, which grew from fewer than twenty members to more than fifty in a few years. Not surprisingly, then, the 1970s witnessed a slew of conferences to deal with global issues, such as trade in endangered species, wetlands protection, and the general condition of the human environment.

None drew more attention than the 1972 United Nations Conference on the Human Environment (UNCHE) in Stockholm, Sweden. The UN had sponsored large meetings on resource conservation and protection in 1949 and 1968, but they had been limited in their scope. In 1969 the UN accepted Sweden's proposal to host a global conference on the human environment, broadly defined. When delegates from 114 countries and 300 nongovernmental organizations (NGOs) met in 1972, they ensured that the environment would have a prominent place on the diplomatic agenda for decades to come.

As one might expect, UNCHE had both its share of conflicts and cooperation. The first conflict came from the decision of the organizers to invite West Germany but not East Germany, which triggered a boycott from the Soviet bloc. Of course, that conflict contributed to the easing of negotiations by removing most Cold War tensions at the conference. Likewise, developing nations split from their industrialized compatriots in assessing the nature of the threat—was it pollution and the diminution of natural resources, or did economic imbalance lead to the other problems? Again, this disagreement led to some conciliation, as the Western nations agreed in principle that equitable distribution of wealth would lead to a healthier human environment, and both sides agreed that development agencies had to do a better job of considering the environmental impact of their decisions.

In the end, the Stockholm meeting had three practical consequences. First, NGOs gained their status as leaders in environmental diplomacy. Second, the delegates created the UN Environment Programme (UNEP) to serve as a global agency for environmental protection. Third, they produced 109 recommendations for action at local, national, and international levels.

With Stockholm as the impetus, in 1973 the United States took one of its last bold leadership steps by sponsoring the Convention on International Trade in Endangered Species (CITES). In many ways, it was one final example of exporting conservation strategies, as the U.S. Congress had recently passed a tough new endangered species act that served as an ideological template. The goal of CITES was to halt the commercial exploitation of endangered species, with the hope therefore of pulling them back from the brink of extinction. Nations that joined CITES promised not to allow importation of species declared endangered by any other member of the convention. In addition, CITES had a means for scientists to list species as endangered if the home government failed to do so. Threatened species could be put on a "gray list," which allowed only limited trade. At present, about 5,000 animals and 25,000 plants are listed as protected under the convention. Finally, and most critically, CITES actually included provisions to sanction nations that failed to halt trade in endangered species. The United Arab Emirates, Thailand, and Italy have all been punished by CITES, and El Salvador and Equatorial Guinea joined the convention because of sanctions pressure. In all, 154 states are parties to CITES, with the United States holding the distinction of being the first nation to ratify it in 1974.

Despite that rare display of teeth and tusk, CITES still has the problem of any environmental convention. If it enforces the rules strictly, it runs the risk of losing members, who will then be legally free to trade for all of the endangered species parts that they desire. Those who administer such conventions must decide if they would rather bend over backward in the hope of persuading rogue states to abide by the rules eventually, or punish them and hope that global public opinion and political pressure will deter them from leaving the convention. CITES's own evidence suggests that most of its members do not abide by its rules, nor do they wish to be shown the door, which suggests that it can do more than just turning a blind eye to infractions in the hope that nations will slowly develop a willingness to abide by these rules.

One of the holes in CITES was that it said nothing about habitat preservation, a subject covered in a few other treaties. The 1971 Ramsar Agreement required parties to protect at least one wetland of special significance. The convention does provide signatories with the right to revoke protection in case of national emergency, but only if the government provides sufficient compensation in the form of further protection of other sites. While 125 nations had signed on to Ramsar by 2001, they were only slowly getting around to protecting the wetlands in question. In a manner
reminiscent of the 1940 Convention on Nature Protection, the wealthy nations that could afford to protect wetlands had already done a great deal of work, whether the United States with its vast system of National Wildlife Refuges or Great Britain with its impressive chain of preserves owned by the Royal Society for the Protection of Birds. Even so, it took the United States until 1987 to ratify the convention, and it has designated fewer hectares as Ramsar sites than some smaller, poorer countries, such as Tanzania.

In contrast to Ramsar's narrow focus on wetlands, in 1972 the United Nations Educational, Scientific, and Cultural Organization (UNESCO) sponsored an agreement to preserve sites of special cultural and natural value, the Convention Concerning the Protection of World Cultural and Natural Heritage. The notion of a treaty to protect sites of cultural value dates back to at least the 1950s, but it was a U.S. idea in 1965 to combine cultural and natural sites into a single convention, and the United States was the first nation to ratify the convention in 1973. By 2001, 164 nations had become parties, making it one of the most inclusive pieces of environmental diplomacy. Member states have access to a small pool of money, about $3.5 million annually, to help them plan for listing and protecting sites, but they join mainly for reasons of public opinion and prestige, and 122 nations had listed nearly 700 sites at the beginning of the twenty-first century. The United States is one of the few countries that listed more natural sites than cultural, with eleven of its eighteen being national parks.

In an attempt to follow up on CITES, Ramsar, and the World Heritage conventions, in 1979 the UN opened for signature the Convention on Migratory Species. The negotiators began with a premise that U.S. conservationists had acted upon at the turn of the twentieth century, that migratory animals inherently needed international cooperation for their protection. Parties agree to protect habitat for endangered and threatened species, pass laws to protect them from hunting, and study them to learn more about means of protecting them. Seventy-four nations ratified the agreement, mostly from Europe and Africa. The United States, like Russia and China, did not sign, but U.S. wildlife officials cooperate with policies from the Convention on Migratory Species. This cooperation suggests a recurrent problem, that the U.S. government is especially reluctant to accede to a convention that might override its own laws.

As if exhausted from the spate of treaties in the early 1970s, the world did not create another major piece of environmental diplomacy until the middle of the 1980s, when it tackled the problem of ozone-depleting chemicals. Ozone, a collection of three oxygen atoms, serves as a shield in the upper atmosphere against ultraviolet radiation from the sun. As such, it makes life on earth possible. In the 1970s, scientists theorized that ozone would break apart when it came into contact with chlorofluorocarbons (CFCs), a family of chemicals widely used in Styrofoam, refrigerants, and aerosol cans. CFCs had been invented in the 1930s, and they seemed like the ideal chemical—inert, nontoxic, cheap, and useful in a variety of ways. But by the 1980s, a move was afoot to ban them based on theoretical concerns.

In a move that surprised many people, the usually antiregulatory Reagan administration vigorously supported efforts to ban CFCs. In part, this position depended on the strong position of U.S. industry to benefit from a ban on CFCs, and perhaps in part it grew from the president's own brush with skin cancer. The first step came in 1985, when delegates from twenty nations met in Vienna and signed the Convention for the Protection of the Ozone Layer, which did no more than commit the signatories to unspecified actions to protect the ozone layer. In addition, they agreed that the UN Environment Programme would monitor the ozone layer and conduct research on it. In short, the signatories could agree on nothing more specific than the theory that the ozone layer was probably in trouble. They did, however, agree to a U.S. proposal to meet two years later to create a binding set of rules.

The discussions evolved from multilateral to global in 1987, as delegates from sixty states convened in Montreal. Evidence that humans were somehow eroding the ozone layer was still sparse, as the famed ozone hole over the Antarctic had just recently become known, and its causes were absolutely uncertain. Still, there can be no doubt that the ozone hole had caught the attention of the U.S. public, although the delegates themselves seemed largely unmoved by it—they were driven still by the scientific theories. Over objections from industry in Japan, western Europe, and, to a lesser extent, the United States, the delegates formally named CFCs as the culprits. Through the Montreal Protocol on Substances that Deplete the Ozone Layer, they agreed to cut production of these chemicals in half by 1999.

In retrospect the Montreal Protocol was at once one of the most amazing pieces of environmental diplomacy and obviously flawed. Working
largely on complex scientific theory rather than compelling data, diplomats from around the world agreed that a seemingly benign chemical had disastrous potential and therefore had to be curbed dramatically. At the same time, critics pointed out that developing nations, such as India, China, and Brazil, needed CFCs to raise their standards of living, but the convention said nothing about transferring technology to them. Finally, many Europeans condemned the convention as too strict, while many U.S. environmentalists and industrialists worried that it would be unenforceable.

To address this range of concerns, delegates from eighty-one countries met in Helsinki in 1989. With further research showing that the ozone problem was not just theory, they agreed to ban all CFC production by 2000. In addition, they drew up schemes to facilitate technology transfer, and they tightened up the rules. The next year in London they finalized all of the details of these agreements, and in 1992, President George H. W. Bush announced that the United States would eliminate CFC production by 1995.

The U.S. position on the ozone layer makes especially puzzling its general lack of leadership in the 1990s. On the twentieth anniversary of the Stockholm meeting, the nations of the world met at the Earth Summit in Rio de Janeiro. Known formally as the UN Conference on Environment and Development, the Earth Summit was supposed to provide leaders a chance to assess and build upon the accomplishments of the 1972 meeting. One of the accomplishments of the meeting was the production of a massive document, known as Agenda 21, as a follow-up to the 1972 recommendations for action. In addition to the thousands of activists who attended on their own, 170 nations sent delegations, many led by their head of state, but President Bush publicly vacillated about attending. Rather than taking an opportunity for leadership, Bush was concerned that he might find himself boxed into an uncomfortable position. In the end, he paid a brief visit, but he was unable either to rally other nations to his positions or even tame the dissent within the U.S. delegation.

On two important issues the United States found itself out of step with the majority of the world’s governments. First, and perhaps most controversially, the conference agreed to the Convention on Biological Diversity (CBD). The UN Environment Programme had been working on this convention for four years, goaded by alarming reports of the extinction of hosts of species, many of which had never been scientifically catalogued. The final convention required signatory nations to take appropriate steps to preserve their own biodiversity, and it established a fund for helping poorer countries do just that. Bush noted that the United States already did more than any other country on both points. The real point of disagreement came with the convention’s provisions on biotechnology and intellectual property. In a debate reminiscent of the discussions about minerals on the deep seabed, U.S. officials argued that American companies had far more to lose than gain because the protections for their patents were insufficient. Despite great pressure at home, abroad, and within the U.S. delegation, Bush refused to sign the CBD. A year later, after consulting with both business and environmental leaders on an interpretive statement, President William Jefferson Clinton signed the convention just days before it was closed to signatures. While 186 governments signed the CBD, the United States is one of only seven—including such pariahs as Afghanistan and Yugoslavia—who have not ratified it.

The other major agreement to come out of the Earth Summit was the Framework Convention on Climate Change. As concern about the ozone layer was heating up, scientists began to fear that the Earth itself was heating up because of human economic activity. In particular, they were coming to the conclusion that industrial emission of so-called greenhouse gasses, such as carbon dioxide, was resulting in a slow but steady warming of the earth’s temperature. By 1989 the UN had endorsed the idea of a convention to curb global warming, and the Rio meeting provided an opportunity to sign an agreement that had been finalized the month before. As usual, there was a split between the developing world and industrialized nations over who should pay for the technological advances necessary to address global warming. In addition, the United States split from its industrialized partners by opposing any hard targets for emissions levels. Without U.S. willingness to commit to anything specific, the convention was necessarily vague. Signatory nations agreed that humans were causing climate change, that more research was necessary, and that they would meet five years later to set specific targets.

In 1997 they convened again at Kyoto, Japan, to update the climate change accord. Each nation received targets for reduced emissions of greenhouse gasses, with the U.S. target set at a 7 percent reduction on 1990 levels by 2012. The
Kyoto Protocol takes effect when at least fifty-five nations, which in aggregate produce 55 percent of the world's greenhouse gas emissions, ratify it, but as of 2001 only thirty-seven nations had in fact completed the ratification process. While the United States is one of eighty-four states to have signed the protocol, the Clinton administration did nothing to move it forward in the Senate. Once again the split between the developing and industrialized worlds presented an insurmountable obstacle. Under Kyoto, nations such as China and India have to make no firm commitments to reduce greenhouse gas emissions. Leaders of those nations argue that they deserve the opportunity to pursue economic growth as the West did before. But many opponents of the protocol in the United States say that they will not accept any agreement that does not commit every nation—and especially the two most populous—to some restrictions. In the fall of 2000, diplomats met at The Hague to iron out differences in the protocol, and they came very close to a deal that would have placated concerns of the United States and some of its allies, notably Canada, Australia, and Japan, by offering credits for the carbon absorption action of forests. European environmentalists took the lead in killing this compromise; within months the new U.S. president, George W. Bush, announced that the United States would no longer work within the Kyoto framework, which his aides described as "dead." Efforts to implement the Kyoto Protocol continued to go forward, but it seemed unlikely that greenhouse gas emissions could be curbed without the enthusiastic support of the United States.

The United States has by no means dropped its active role in environmental diplomacy, even when various administrations are not strongly committed to environmentalism, and it still uses its power to cajole other countries into such conventions. The administration of the younger Bush surprised many people in the spring of 2001 by signing on to a convention to ban the use of persistent organic pollutants, such as DDT and PCBs. These chemicals have been outlawed in the United States for many years, but U.S. companies still exported them. Instead of focusing on lost export revenue, the administration noted accurately that the convention was necessary to stop these chemicals from winding up in the wind and water currents that bring them to the United States. Likewise, in twelve embassies around the world, the Department of State has recently established centers to promote regional environmental cooperation, which will in turn further the work of the department's Office of Oceans and International Environmental and Scientific Affairs. And yet the action of the Clinton and George W. Bush administrations toward the Kyoto Protocol makes clear several points: the United States, because of the sheer size of its economy and the vast cultural influence of its society, is still the most powerful force in environmental diplomacy; it is also now the power most likely to break up potentially stringent conventions; and unless the United States and the two future behemoths, China and India, can bridge their differences there will be little progress on environmental diplomacy. No global agreement on the use of resources can move forward if the prime consumers of resources fail to cooperate.

“American exceptionalism” is a term used to describe the belief that the United States is an extraordinary nation with a special role to play in human history; a nation that is not only unique but also superior. Alexis de Tocqueville was the first to use the term “exceptional” to describe the United States and the American people in his classic work *Democracy in America* (1835–1840), but the idea of America as an exceptional entity can be traced back to the earliest colonial times. Jack P. Greene’s analysis of a wealth of contemporary materials has established that by “the beginning of the nineteenth century the idea of America as an exceptional entity had long been an integral component in the identification of America.” Many scholars of the belief in American exceptionalism argue that it forms one of the core elements of American national identity and American nationalism. Deborah Madsen, for example, contends that exceptionalism is “one of the most important concepts underlying modern theories of American cultural identity.” It is a central part of the American belief system or what Benedict Anderson calls its “imagined community.”

The ways in which U.S. foreign policy is made and conducted are influenced by the underlying assumptions that Americans hold about themselves and the rest of the world. Like most nations, the United States has a distinctive pattern of policymaking that is determined by unique aspects of its national culture. Each country’s historical and cultural heritage, its montage of national beliefs and experience—its national identity—has an influence, whether consciously or not, upon the way it practices politics. U.S. foreign policy is driven by a variety of causal factors including strategic, economic, political, and bureaucratic interests; international and domestic pressures; the personalities and agendas of policymakers; and the actions of other nations. However, the belief in exceptionalism, since it is a core element of American national identity, has an important underlying influence on foreign policy activity. This belief is one of the main ideas that, according to Michael Hunt, has “performed for generations of Americans that essential function of giving order to their vision of the world and defining their place in it.” Although such views are not “codified in formal, systemic terms,” Hunt shows that the evidence for their existence and influence can be found in the “private musings” of policymakers and, more importantly, “the public rhetoric by which they have justified their actions and communicated their opinions to one another and to the nation.” The belief in American exceptionalism provides an essential element of the cultural and intellectual framework for the making and conduct of U.S. foreign policy.

Two main strands of exceptionalist thought have influenced U.S. foreign policy. One is that of the United States as an exemplar nation, as reflected in ideas such as the “city upon a hill,” nonentangling alliances, “anti-imperialism,” “isolationism,” and “Fortress America.” The other, often more dominant strand is that of the missionary nation, as represented by the ideas of “manifest destiny,” “imperialism,” “internationalism,” “leader of the free world,” “modernization theory,” and the “new world order.” Both strands have been present throughout the history of U.S. foreign relations.

**WHAT IS EXCEPTIONALISM?**

The focus here is on the belief in American exceptionalism and its influence on U.S. foreign policy rather than directly addressing the question of whether U.S. foreign policy itself can be measured as exceptional. Indeed, Joseph Lepgold and Timothy McKeown have found little empirical evidence for claims that American foreign policy behavior is exceptional. Faults and blemishes riddle American history as much as that of any other
nation. In foreign policy, the United States has a far from untarnished record. The colonization and expansion of the new nation were accompanied by the displacement or destruction of the indigenous population. Times of war have been plentiful, with the United States imposing its will on peoples in countries as distant as the Philippines and Vietnam, ordering the internment of large numbers of its own citizens, and committing atrocities like any other warfaring nation. Yet despite the abundance of evidence indicating that the United States is just as fallible as any other nation, there has remained throughout American history a strong belief that the United States is an exceptional nation, not only unique but also superior among nations. As Daniel Bell (1989) has argued, in the United States “there has always been a strong belief in American exceptionalism. From the start, Americans have believed that destiny has marked their country as different from others—that the United States is, in Lincoln’s marvelous phrase, ‘an almost chosen nation.’”

Lepgold and McKeown observe that American leaders make “unusual internal justifications” for their actions abroad, using “idiosyncratic symbols and metaphors . . . based on national self-image and values.” It is the belief in American exceptionalism that most commonly provides these symbols and metaphors. Throughout American history, exceptionalist belief has framed the discourse of foreign policymaking by providing the underlying assumptions and terms of reference for foreign policy debate and conduct. Scholars disagree, however, over whether exceptionalism amounts to an ideology as such. Michael Hunt argues that the belief in “national greatness” is a central element of the ideology behind U.S. foreign policy. Alternatively, Siobhan McEvoy-Levy contends that exceptionalism amounts to a “para-ideology” because its influence underwrites much of U.S. foreign policy but it does not have the coherence of a traditional ideology. John Dumbrell argues that American democratic liberalism is the ideology underpinning U.S. foreign policy but a belief in American exceptionalism is a central element of that ideology. It was Richard Hofstadter who observed, “It has been our fate as a nation not to have ideologies but to be one.” The idea of “America” as a bastion of democracy, liberty, equality, individualism, and constitutionalism has given meaning and identity to millions of Americans throughout U.S. history (see Huntington, chapter 2). American nationalism, according to Hans Kohn, is not built on the usual elements of nationhood such as shared language, culture, common descent, or historical territory, but on “an idea which singled out the new nation among the nations of the earth.” This idea was a “universal message” that American values and principles would benefit the whole of humankind. John Fousek agrees that this belief in the exceptionalism of the United States is a “core theme of American nationalism” that has been expressed most commonly in the “long-standing tradition of thought about American chosenness, mission, and destiny.” Anders Stephanson has also shown how a “destinarian discourse” accompanied nineteenth-century American expansion and how it continued to shape the way Americans understood their place in the world during the twentieth century. The belief in American exceptionalism has been central to the formation of American national identity, and thus can be seen to have provided a significant part of the cultural and intellectual framework within which foreign policy has been made.

**THE BELIEF IN AMERICAN EXCEPTIONALISM**

Exceptionalism is a fluid and adaptive idea that can be interpreted in different ways. Therefore it is necessary not only to identify its major assumptions but also to consider its two main strands—the exemplary and the missionary—and the outcomes these different views have for foreign policy. Three main elements of exceptionalist belief have remained relatively consistent throughout American history.

First and foremost is the belief that the United States is a special nation with a special role to play in human history. Throughout American history there have been repeated claims that the United States is the promised land and its citizens are the chosen people, divinely ordained to lead the world to betterment. This notion goes back to the very beginnings of colonization. The New World was regarded as a virgin land upon which its new inhabitants could attempt to perfect society through social, political, and religious experiment. Americans have been charged by God with the task of reforming themselves and the world—they are a redeemer nation. The United States is thus guided by the invisible hand of God, and American actions are the result of divine will. At the same time, though, the chosen people are exposed to temptation and corruption, most often
from abroad or from subversives within. Americans are thus being constantly tested and must undergo continual self-inspection. When they do seem to fail or commit wrongdoing, it is because the forces of evil are working against them. But even in such circumstances, Americans maintain their purity because their intentions are good and they will strive on with their national experiment.

The second main element of exceptionalist belief is the New World’s separateness and difference from the Old World of Europe. In Europe, Americans believed, self-interested monarchies exploited the majority of their own people, then sought imperial expansion abroad to increase their treasures, boost their reputations, and increase their power relative to other monarchies. The political systems were invariably corrupt, and pandered to the needs and desires of the traditional elites, leaving little or no means for commoners to improve their lot in life. In contrast, the New World was committed to freedom, morality, and the betterment of humankind.

The third main element of exceptionalism is the belief that the United States, unlike other great nations, is not destined to rise and fall. Americans will escape the “laws of history” which eventually cause the decay and downfall of all great nations and empires. Americans believe their nation is the leader of progress in the world. Practically everything that the United States does as a nation is regarded as pushing forward the boundaries of human achievement, be it in politics, industry, technology, sports, the arts, even warfare. Certainly there are some mistakes made, but they are few; they are learned from, and they are improved upon at the next attempt. No matter how many setbacks they may face along the way, Americans will continue forward resolutely, striving for progress toward forming an ever more perfect union. Americans think of themselves as exceptional, then, not necessarily in what they are but in what they could be. For this reason the sense of exceptionalism can never die, no matter how unexceptional the nation may appear in reality. Exceptionalism persists because of what it promises just as much as, if not more than, what it delivers. It is tied to what it means to be an American: to have faith in the values and principles that caused the nation to be founded and to continue to exist.

Advocates of both the exemplary and the missionary strands of exceptionalist belief tend to share each of these assumptions. Where they differ is in how they believe these assumptions should translate into American actions with regard to the rest of the world. All exceptionalists believe very strongly in the basic benevolence of their actions toward other nations. National motives are not perceived as being driven solely by the desire for material gain but also by a dedication to principles of liberty and freedom for all humankind. A corollary of this belief is that it is the duty of the United States to help the rest of the world follow the example of the chosen people.

Followers of the exemplary strand of American exceptionalism have mostly advocated that the United States remain somewhat aloof from the world’s troubles and lead by example. Americans should strive to perfect their own society as much as possible without interfering in the affairs of others. To intervene abroad, the exemplarists argue, not only would probably harm the other nation but also most likely would undermine the American experiment at home. Far better, then, that the United States should have peaceful trade relations abroad but concentrate on building a model society for others to copy rather than forcing the benefits of American life on others.

Adherents to the missionary strand of American exceptionalism who advocate U.S. expansion or intervention in the affairs of other nations nevertheless believe that, unlike other nations, the United States is incapable of seeking dominion over other peoples in its self-interest. The American government will project its power abroad not to subjugate other nations but to help them become like the United States, to become free and democratic. These Americans seem to believe that inside every foreigner there is the potential, even the desire, to be an American. To be an American, after all, is not a birthright but the willingness to believe in a certain set of political and social principles and values. The missionary strand of American exceptionalism suggests that all the people of the world want to be like Americans, whether they realize it or not. This assumption has led Americans to find it very difficult to understand that other peoples may place different values on things and have different perceptions from Americans of how the world should be. In fact, both forms of exceptionalism hold, rather paradoxically, that the unique American political values and principles are actually universal in their nature. The United States is regarded as the embodiment of universal values based on the rights of all humankind—freedom, equality, and justice for all. It is the exceptional champion of these rights, but they are shared by all humans, whether they are Americans or not.
Certainly not all Americans believe wholeheartedly in all these aspects of American exceptionalism. Many Americans are all too aware that major problems exist within their society, many of which they may never adequately solve. They accept that in an increasingly interdependent world the United States cannot claim dominion in international affairs and that when they do intervene abroad, Americans very often undermine the very principles they claim to be defending. Scholars also disagree over the importance of the belief in American exceptionalism. The majority of the academic works on the history of U.S. foreign relations neglect or discount the influence of exceptionalist beliefs. Nevertheless, a growing body of scholarship does recognize that the belief in American exceptionalism has been a persistent and major underlying influence on U.S. foreign policy. These works recognize that despite the inherent contradictions and frequent circularity of exceptionalist thought, the "recurring rhetoric" of the belief in American exceptionalism reveals it to be what Michael Kammen has called "a cultural reality and potent force." The belief in American exceptionalism should not be dismissed as "mere rhetoric," but acknowledged as an important and influential idea that contributes to the framework of discourse in which "policymakers deal with specific issues and in which the attentive public understands those issues." This is not to say that the belief in exceptionalism is the root cause of all foreign policy. Although the following analysis reveals the prevalence of the belief in foreign policy discourse, it should be remembered that at every turn policy was shaped and driven by more tangible determinants such as the preservation of national security, the demand for overseas markets, or, indeed, the personal ambitions of policymakers. As Anders Stephanson makes clear in his study of manifest destiny, the destinarian discourse he identifies did not "cause" policy as such. It was, however, "of signal importance in the way the United States came to understand itself in the world and still does." The same is true about the broader idea of American exceptionalism—it is not "a mere rationalization" but often appears "in the guise of common sense."

THE ROOTS OF EXCEPTIONALISM

The idea of America as an exceptional entity dates back to colonial times. Its roots can be found in the thought of Puritan settlers who regarded the North American continent as a promised land where a new Canaan could be built as a model for the rest of the world. The earliest expression of this belief that continues to live on in American public memory comes from John Winthrop, a Puritan leader and first governor of the Massachusetts Bay colony. Winthrop delivered a lay sermon aboard the Arbella, during its passage to New England in 1630, in which he declared that his fellow settlers “must Consider that wee shall be as a Citty upon a Hill, the eies of all people are upon us.” Winthrop’s words were circulated in manuscript form and have since become one of the main formative texts of American self-identity and meaning. Inherent in this notion of the city on a hill is the belief that the American colonists, and those who have followed them, were uniquely blessed by God to pursue His work on Earth and to establish a society that would provide this beacon for the betterment of all humankind.

American exceptionalism, however, has not only religious but also secular roots. The American Revolution and the formative years of the new Republic reinforced the idea that the United States was a chosen nation which would be an experiment in human society. In his influential revolutionary pamphlet Common Sense (1776), Thomas Paine argued that it was America’s separateness and difference from the Old World that demanded its independence. Paine saw America as a special land where humankind could “begin the world over again” by establishing a political society built on new, progressive ideas. The framers of the Constitution built on this idea in 1787. Theirs was to be an ambitious political experiment. The United States would be a society based on a republican system of government ensuring the preservation of certain individual rights. Although they were relatively pessimistic about its chances, the framers’ greatest hope was that the constitutional framework they had created would allow the United States to develop over time into the most perfect republican society in the world. The geographic isolation of the American continent from Europe seemed to offer hope that the United States could protect itself from falling prey to the degenerative nature of the Old World. As Thomas Jefferson observed in his First Inaugural Address (March 1801), the United States was “kindly separated by nature and a wide ocean from the exterminating havoc of one quarter of the globe; too high-minded to endure the degradations of others.” Jefferson and others did
not suggest that Americans would be immune from temptation, but they did indicate that, with eternal vigilance, the United States could be prevented from succumbing to the same vices that had destroyed other great nations.

Providential and republican ideology thus combined to firmly entrench the idea of exceptionalism at the center of American national identity. In these early forms it was initially the exemplar strand of exceptionalism that clearly dominated. The United States would provide a model of freedom, liberty, and democracy from which the rest of the world could learn. It would be an example, a beacon of light—a city on a hill. In early U.S. foreign policy, the notion of the United States as a separate, aloof nation was also dominant, but would come to be challenged by a growing missionary spirit as the Republic became stronger and more successful.

THE INFLUENCE OF EXCEPTIONALIST BELIEFS ON FOREIGN AFFAIRS

In the earliest years of the Republic, both George Washington and Thomas Jefferson called upon Americans to actively seek to preserve their nation’s unique position of aloofness from the world’s ills. In his Farewell Address of 1796, Washington warned against “permanent alliances,” while Jefferson, in his First Inaugural Address (March 1801), advised that Americans should avoid “entangling alliances.” Such pronouncements laid the foundations for a foreign policy characterized by high levels of unilateralism and so-called isolationism. Jefferson nevertheless presided over the first major expansion of the United States with the Louisiana Purchase (1803) and contributed to the notion that a republic needed to grow in order to remain healthy with his view of the United States as an “empire for liberty.”

President James Monroe further emphasized the difference between American and European intentions in foreign affairs on 2 December 1823, in what became known as the Monroe Doctrine. Monroe declared the Western Hemisphere closed to European colonization, warned against European interference in the affairs of the Americas, and signaled the intention of the United States to be the region’s dominant power. Although the Monroe Doctrine was based largely on strategic interest, it was couched in terms consistent with the belief in exceptionalism. Monroe stressed that the United States held nothing but goodwill toward the world’s nations and emphasized that the U.S. policy of noninterference in European affairs marked it apart from the imperialistic nations of the Old World. As Monroe’s Secretary of State John Quincy Adams had stated famously on 4 July 1821, the United States “goes not abroad, in search of monsters to destroy.” Adams was expressing another crucial element of the conviction that the United States would avoid repeating the faults of the Old World. The United States is deemed exceptional because it is believed to be incapable of seeking dominion over others in its own self-interest. It would, then, avoid the temptations that had caused all great nations to seek expansion of their power by conquering and subjugating other peoples. If the United States did intervene abroad, it would be for the good of others, in the name of higher principles. As Adams insisted, America’s “glory is not dominion, but liberty.”

This belief in the basic benevolence of all U.S. actions abroad was further emphasized by President James K. Polk in his reassertion of the Monroe Doctrine on 2 December 1845. He emphasized that the United States had taken upon itself the responsibility not only for its own freedom and security but also for that of all the nations in the Western Hemisphere. According to Polk, the United States did not pursue wars of conquest, but it would do whatever necessary to defend the independence of the Americas. It would not tolerate the interference of a self-interested imperial power in its region yet, paradoxically, it considered its own interference in a neighbor’s affairs as being to the benefit of the neighbor. Such a policy was, of course, the declaration of an ambitious state seeking hemispheric dominance. But subsumed within the doctrine was an assumption that American intervention would not amount to self-interested foreign interference. According to the tradition of exceptionalism, the United States is incapable of doing ill to others, and therefore the nature of its interference in the Americas would be inherently more benign than that of any other foreign power. Polk stretched the credibility of such claims with the war against Mexico in 1846. In his public rhetoric, he justified his ambitions for the acquisition of new land and the provocative nature of his actions toward Mexico by couching the conflict in terms that were consistent with his pronouncements on the exceptional nature of U.S. foreign relations, and cast the United States as the innocent party. Indeed, a new phrase had entered the
American vocabulary that helped explain westward expansion as an integral part of American exceptionalism.

**MANIFEST DESTINY**

The war with Mexico and the annexations of Mexican territory that followed were believed by most Americans to be the result of their “manifest destiny.” The term is generally attributed to John L. O’Sullivan, a Democratic newspaper editor from New York. O’Sullivan’s conception of manifest destiny came to national attention through an editorial in the *New York Morning News* on 27 December 1845, which claimed the right of the United States to Oregon territory disputed by the British: “And that claim is by the right of our manifest destiny to overspread and to possess the whole of the continent which Providence has given us for the development of the great experiment of Liberty and federated self-government entrusted to us.”

In his classic book *Manifest Destiny: A Study of Nationalist Expansion in American History* (1935), Albert K. Weinberg defines manifest destiny as being “in essence the doctrine that one nation has a preeminent social worth, a distinctively lofty mission, and consequently, unique rights in the application of moral principles.” He relates how the idea soon became “a firmly established article of the national creed.” The idea of manifest destiny is one of the clearest expressions of the belief in the exceptional nature of the United States. Territorial expansion was justified by Americans because they believed theirs was a special nation chosen by Providence to spread its virtues far and wide. As Weinberg has shown, nineteenth-century Americans laid claim to new land using a variety of justifications subsumed under the idea of manifest destiny. Americans believed they had a natural right to expand, and that territorial propinquity determined that they must spread across adjacent lands in North America. American expansion was also thought to be divinely blessed because it would cause the extension of democracy and freedom. Americans argued further that they should expand because they would use the land in ways more beneficial to and desirable for the progress of humankind than could its often sparsely distributed existing inhabitants.

The Mexican War saw a further element of manifest destiny emerge that became a central aspect of the belief in the exceptional nature of American interaction with other nations. Most Americans found moral vindication for the war in what Weinberg characterizes as “the conception of a religious duty to regenerate the unfortunate people of the enemy country by bringing them into the life-giving shrine of American democracy.” The Mexican War seemed to confirm the belief among Americans that if the United States did involve itself in the affairs of other peoples, it was not in order to subjugate them but to help them realize their right to the same liberties and freedoms for which Americans had fought in the War of Independence. Countless Mexicans and Native Americans may have perceived events rather differently, but that was of little concern to the exceptional vanguards of civilization and progress.

By the mid-nineteenth century, then, with westward expansion justified by manifest destiny, the missionary strand of exceptionalism was becoming the dominant form. At the end of the nineteenth century, with historian Frederick Jackson Turner having declared the frontier closed, Americans undertook an overseas intervention which is generally regarded as the event that signaled the arrival of the United States as a world power. The highly popular Spanish-American War of 1898 was supposedly fought to secure basic rights of freedom for the oppressed peoples in Cuba and other Spanish colonies. Yet the war gave way to a conflict in the Philippines that left blood on American hands and ignited a nationwide debate over whether the United States was living up to its principles as an exceptional nation or whether it would assume an empire in the tradition of the Old World powers.

**THE IMPERIALISM DEBATE AND EXCEPTIONALISM**

The Spanish-American War was described by Secretary of State John Hay as “a splendid little war; begun with the highest motives, carried on with magnificent intelligence and spirit, favored by that Fortune which loves the brave.” When the war began, little thought was given, at least publicly, to the possibility of an American empire. Yet no sooner had American forces begun to win victories over the Spanish than calls for annexations became widespread. The Treaty of Paris, which officially ended the war on 10 December 1898, recognized eventual Cuban independence, but provided for
the cession to the United States of Spain’s other colonies in the Philippines, Puerto Rico, and Guam. What ensued was a protracted and bloody struggle for control of the Philippines that caused many Americans, known as the “anti-imperialists,” to openly question the annexation policy.

The great debate over American overseas expansion saw the two main strands of exceptionalist belief come into direct conflict with one another. Americans on both sides of the imperialism debate utilized arguments based on their beliefs about the exceptional nature of the United States. They did so even when they recognized what they regarded as legitimate economic, strategic, political, racial, or constitutional reasons for or against the annexation of overseas territories.

The commercial and strategic advantages of annexation provided the rationale for most
expansionists. Yet many expansionists also expressed their conviction that annexation was a morally acceptable policy because it was the duty of the United States, as God's emissary, to extend freedom and democracy whenever possible. It was their divine destiny that called the Americans to free Cuba, the Philippines, Puerto Rico, and Guam from the grip of Old World imperialism. They believed it was the special duty of the United States to help those people overcome oppression and guide them toward the light of the principles of liberty and freedom. The expansionists frequently argued that America was not simply imposing its own brand of Old World imperialism. Rather, they argued, it was adopting these childlike nations so they could be nurtured to maturity and statehood. In time, once they were ready, these nations could choose for themselves whether to be independent or join the Union. The imperialists, drawing upon the tradition of manifest destiny, were strong believers in and advocates of the missionary strand of American exceptionalism.

The anti-imperialists, on the other hand, had a different view of the special American role in the world that reflected the exemplar strand of exceptionalism. They were more concerned that, having ousted the Spanish, the United States should leave the liberated states to determine their own destinies, in keeping with the American dedication to the idea that governments derive their power from the consent of the governed. The anti-imperialists emphasized the aspects of exceptionalism that regard the United States as being above the meddling immorality of Old World imperialists. They argued that the United States is special because it does not involve itself in the affairs of others, particularly not a nation on the far side of the Pacific Ocean that could hardly be considered within the U.S. geographic sphere of influence. As Charles Eliot Norton made clear, he and his fellow anti-imperialists believed that the transformation of the United States into an imperial power “sounded the close of the America exceptionally blessed among the nations.” The anti-imperialists aimed to preserve the exceptionalist nature of the U.S. by preventing Americans from seeking dominion over other peoples in the way that other world powers did. As well as moral arguments, they also gave political, economic, constitutional, diplomatic, racial, and historical reasons for their opposition to annexations. But although their individual opposition varied, the essence of their protest was that they feared the United States was acting in a manner inconsistent with the principles laid down by the Founders. Thus both imperialists and anti-imperialists believed they were arguing for conduct consistent with the idea that the United States was an exceptional nation with a special role to play in human history. They both agreed that the U.S. was different from—indeed, better than—other nations; where they disagreed was on the precise nature of that exceptionalism.

**THE BEGINNING OF THE TWENTIETH CENTURY**

The anti-imperialists failed to raise widespread public opposition to the McKinley administration’s annexation policy. They could not convince the American public that the policy was contrary to American principles, and consequently the Philippine insurrection was defeated, and Puerto Rico, Guam, and the Philippines were annexed. Despite their inability to prevent the annexations and the suppression of the Philippine insurrection, the anti-imperialists were a useful check against the annexationist fever and contributed to the return to the more usual American sentiment of anticolonialism. While the anti-imperialist movement quickly faded after the failed presidential candidacy of William Jennings Bryan in 1900, so did the desire for American imperialism. While European powers were partitioning China, the United States called for an open door trade policy and the protection of China's territorial and political independence.

That the American desire for overseas possessions had subsided appeared to be confirmed on 6 December 1904 by one of expansion's greatest advocates. President Theodore Roosevelt reaffirmed the belief that Americans did not seek imperial dominion over other nations. In a speech adding a further corollary to the Monroe Doctrine, he proclaimed: “It is not true that the United States feels any land hunger or entertains any projects as regards the other nations of the Western Hemisphere save such that are for their welfare.” Roosevelt made clear that he believed the United States had nothing but benign intentions with regard to foreign relations. However, he did stress that the United States felt an obligation to help protect the freedom of peoples in the Americas not only, as Monroe had declared, in the face of foreign aggression but also if their citizens faced internal threats to their freedom.
In his speech, Roosevelt effectively pulled together the two main strands of exceptionalist belief. As a rule, he argued, the United States should stay out of the affairs of other nations and concentrate on forging a more perfect union in the spirit of the Founders, thus providing an ever more appropriate example for the rest of the world to follow. However, when extreme circumstances demanded it, the United States, as the chosen nation, had the “manifest duty” to protect the rights that it promoted if their survival was threatened abroad. Roosevelt’s reasoning would help define foreign policy discourse for many years to come, with the tension between these two elements of exceptionalism often at the center of debate.

WOODROW WILSON AND EXCEPTIONALISM

In many ways, Woodrow Wilson personified the belief in American exceptionalism. As Robert E. Osgood argues: “Wilson’s national altruism . . . was an integral part of his temperament and his philosophy of life, inseparable from his personality.” Wilson’s idealism was firmly grounded in the belief that the United States was a nation set apart by its values and principles from the rest of the world. He believed strongly that the “force of America is the force of moral principle” and that the “idea of America is to serve humanity.” Long before he became president, Wilson wrote of his conviction that the United States had a “plain destiny [to] serve [rather than] subdue the world.” Later, as president, he would contend that this destiny to serve was the only possible motivation for American actions in the world. Wilson held that “morality not expediency” must be the guiding principle of all American policy. He applied this principle to the use of American military force. As Frederick Calhoun argues, Wilson “showed no aversion to fighting if the end justified the means.” As Wilson stated, he believed that while other nations used force “for the oppression of mankind and their own aggrandizement,” the United States would use force only “for the elevation of the spirit of the human race.”

Wilson declared that “the United States will never again seek one additional foot of territory by conquest.” Nevertheless, he frequently used military intervention in efforts to help other peoples become, in his opinion, more democratic and orderly. Wilson sent American troops into Mexico twice, to Haiti, the Dominican Republic, and Cuba, as well as maintaining the military “protection” of Nicaragua. He also intervened militarily twice in the Russian civil war. Wilson best expressed his attitude toward such interventions in 1914: “They say the Mexicans are not fitted for self-government and to this I reply that, when properly directed, there is no people not fitted for self-government.” Wilson was a clear advocate of the missionary strand of American exceptionalism.

When Wilson finally made the decision to enter World War I in April 1917, he justified his action in highly idealistic terms that enabled the American people to come to regard the war as a crusade. Most famously, the determination to “make the world safe for democracy” was proclaimed by President Wilson as he asked Congress for a declaration of war against Germany. The United States, in keeping with its traditions, was joining the hostilities according to Wilson with nothing but the most benign intentions and a sense of a higher purpose. Portraying involvement in the conflict as a just cause in terms consistent with the belief in American exceptionalism was a direct and deliberate appeal to the public and a way to help silence opposition. It was also the only way that Wilson could assuage his own doubts about American involvement in the war. The rhetoric that accompanied intervention made it clear that the United States, in keeping with its strongest principles, was taking a stand against autocratic tyranny, much as it had against the British in the American Revolution and against the Spanish over Cuba. Wilson argued that a peaceful and harmonious postwar international order based on the principle of universal freedom and democracy, as enshrined in the U.S. Constitution, could not be established while autocratic imperialism sought dominance in Europe. Although legitimate political, economic, and strategic justifications for intervention existed, American involvement in World War I was thus justified and conducted in terms consistent with the missionary strand of the belief in American exceptionalism.

ISOLATIONISM AND WORLD WAR II

The tradition of nonentanglement with the affairs of Europe and other countries found a new name in the interwar years: isolationism. The U.S. Senate rejected President Wilson’s vision of an international organization, the League of Nations,
committed to maintaining world peace through arbitration of conflict and mutual respect of the independence and territorial integrity of all member states. Isolationists believed the United States should not be under obligation to any other nation. As Jefferson, Washington, and others had observed, the United States was uniquely blessed with geographic isolation from the degeneracy of the Old World. With friendly, unthreatening neighbors at its northern and southern borders and vast oceans to the east and west, the United States had little to fear from foreign attack. Why should it jeopardize this exceptional degree of peace and security by involving itself with the affairs of others? Wilson’s successor, President Warren G. Harding, made clear in his Inaugural Address (March 1921) that “Confident of our ability to work out our own destiny, and jealously guarding our right to do so, we seek no part in directing the destinies of the Old World. We do not mean to be entangled.”

Harding and others did not believe that the United States should have no contact whatsoever with the outside world, but that it should remain aloof from the petty squabbles and adversarial alliances common in Europe while maintaining its traditional interests within its own hemisphere. It would seek to return to the role of having nothing but peaceful relations with others and to present an exemplary nation to which the rest of the world could aspire. The isolationists used language and arguments that were consistent with the exemplar strand of the belief in American exceptionalism.

The two strands of exceptionalism, however, again came into conflict during the interwar period. A major public debate took place between the isolationists and the “internationalists” who believed the United States had a duty to intervene in world affairs. When Britain and France declared war on Germany in September 1939, President Franklin Delano Roosevelt, as expected, declared U.S. neutrality. The isolationist impulse found enough popular approval to cause the Roosevelt administration to seek ways of assisting Britain and France short of intervening directly in the war. But this final popular attachment to isolationism was shattered by the surprise Japanese attack on the U.S. naval base at Pearl Harbor, Hawaii, and other American bases in the Pacific on 7 December 1941. The reality of a devastating military strike on American territory silenced isolationist claims. The threat posed by Germany and Japan was obvious enough to enable the public to base their support for joining the war on political and strategic reasoning, at least after Pearl Harbor. Yet Roosevelt still felt the need to employ exceptionalist rhetoric to justify American intervention. In his fireside chat to the nation following the Japanese attack, he assured the American people that “When we resort to force, as now we must, we are determined that this force shall be directed toward ultimate good as well as against immediate evil. We Americans are not destroyers—we are builders.”

In January 1942, Roosevelt declared that American victory in the war would be a “victory for freedom.” He made clear that a central U.S. war objective was to establish and secure “freedom of speech, freedom of religion, freedom from want, and freedom from fear everywhere in the world.” The “Four Freedoms” rooted the war effort in one of the central ideas of American political culture. The contrast between freedom and fascism was a central metaphor in American public discourse and official rhetoric throughout the war. Even before the United States entered the war, the Atlantic Charter (August 1941) had indicated that Roosevelt believed the United States must assume global responsibilities after Germany and Japan were defeated. To win the war would not be enough. An allied victory must lead to lasting peace and security in the world based upon universal values and principles traditionally espoused by Americans. To lead such a future was an American responsibility and duty that would not only promote U.S. interests but also those of all humankind. Roosevelt acknowledged that American power in itself brought responsibility, but he also invoked the providential idea that it was God’s will. In his final inaugural address (20 January 1945), he claimed that God “has given to our country a faith which has become the hope of all peoples in an anguished world.”

No matter how convincing the strategic or other tangible reasons for U.S. intervention in World War II, Roosevelt, like presidents before him, couched his justifications in terms consistent with the belief in the exceptional nature of the United States. That he did so when American security was so clearly threatened is substantial evidence that exceptionalism frames the discourse of U.S. foreign policymaking.

THE LEADER OF THE FREE WORLD

The allied victory in World War II seemed to confirm beyond doubt for Americans that the United
States was an exceptional nation with a special role to play in human history. Even before the United States entered the war, Henry Luce, the influential publisher of *Life* magazine, wrote an essay (17 February 1941) in which he declared that the twentieth century should be considered “the American Century.” Luce argued that the United States must “accept wholeheartedly our duty and our opportunity as the most powerful and vital nation in the world and in consequence to exert upon the world the full impact of our influence . . . [with] . . . a passionate devotion to great American ideals.” By 1945, Luce’s vision seemed correct. The United States not only stood victorious but also was the strongest nation in the world militarily and economically. But rather than retreat to the role of exemplar, it remained engaged in world affairs in the postwar years to a greater extent than ever before.

The United States pursued a foreign policy of activist internationalism after World War II as it replaced one global enemy with another. Soviet communism and its containment soon became the focus of U.S. foreign policy as more than forty years of Cold War began. Although strategic, economic and political interests were its central determinants, U.S. Cold War foreign policy and the broad public consensus that supported it were underpinned by an ideology of what John Fousek identifies as “American nationalist globalism” that was rooted in the missionary strand of the belief in American exceptionalism. Anders Stephanson agrees that the “operative framework” of Cold War policy was “the story of American exceptionalism, with its missionary implications.”

President Harry S. Truman has been described as “a staunch exponent of American exceptionalism” who frequently referred to the United States as “the greatest nation that the sun ever shone upon.” For Truman, the victory in World War II demonstrated American greatness, but it also placed on the United States the responsibility of ensuring peace and freedom in the postwar world. Successive presidents and other public officials and opinion leaders persistently portrayed the Cold War in stark, Manichean terms as a battle between good and evil. The United States was “the leader of the free world” that must prevail and save humanity from the “evils” of communism. Truman provided the guiding principles for American Cold War policy during an address to a joint session of the Congress on 12 March 1947 which became famous for containing the so-called Truman Doctrine. It was the duty of the United States, he contended, to do whatever was necessary to protect the rights of free, democratic nations around the world. In keeping with its traditions, the president claimed, America did not seek dominion over those nations in exchange for their freedom. Truman assured the Congress that “I believe that we must assist free peoples to work out their own destinies in their own way.” The task facing the United States was a critical one, he declared, if the values and principles that it held so dear were to survive the challenge of communism and truly enable the world to be led out of darkness: “The free peoples of the world look to us for support in maintaining their freedoms. If we falter in our leadership, we may endanger the peace of the world—and we shall surely endanger the welfare of our own Nation.”

Following World War II, President Truman believed that merely to provide an example for the rest of the world to follow would no longer be enough. He was arguing that the United States, as the chosen nation, must take up the gauntlet and defend the rights of free peoples everywhere against what Americans regarded as totalitarian aggression and subversion. The Cold War ethos was, then, firmly grounded in the missionary strand of American exceptionalism. The Truman Doctrine helped define the policy of containment toward the Soviet Union and its allies that was employed by successive U.S. administrations during the cold war. Each of Truman’s successors also utilized the language and ideas of American exceptionalism to reinforce the nature of the battle with communism.

Yet it was not only in presidential public rhetoric that the Cold War was defined and discussed in terms of ideas about American destiny, duty and exceptionalism. For example, George Kennan, the original architect of the containment policy, ended his influential article “The Sources of Soviet Conduct” in the journal *Foreign Affairs* (July 1947) by arguing: “The issue of Soviet-American relations is in essence a test of the overall worth of the United States as a nation among nations. To avoid destruction the United States need only measure up to its own best traditions and prove itself worthy of preservation as a great nation.” He claimed that the “thoughtful observer” would not object to the Cold War but would “rather experience a certain gratitude to a Providence which, by providing the American people with this implacable challenge, has made their entire security as a nation dependent on
their pulling themselves together and accepting the responsibilities of moral and political leadership that history plainly intended them to bear.” Kennan, who was often critical of moralism in foreign policy, had nonetheless used the traditional language of exceptionalism to advocate his strategy for containing Soviet communism.

During the Cold War, as Michael Hunt has observed, the private communications of policymakers and even secret national security documents were frequently “couched in the stark and sweeping terms usually reserved for crusades.” For example, the authors of the secret National Security Council Paper Number 68 (NSC 68), the document that defined the course of U.S. Cold War policy in 1950, made clear that “Our position as the center of power in the free world places a heavy responsibility upon the United States for leadership.” They described the Cold War as “a basic conflict between the idea of freedom under a government of laws, and the idea of slavery under the grim oligarchy of the Kremlin.” It was “imperative” that the forces of “freedom” prevail, so the United States must, therefore, build up its political, economic, and military strength. This document was designed only for the eyes of other policymakers yet it was built around the idea of free world leadership that, as Fousek argues, “became the controlling metaphor in U.S. foreign policy discourse throughout the postwar period.”

Many Cold War policies reflected exceptionalist assumptions about the American role in the world. The Marshall Plan (1947) for the economic reconstruction of postwar Western Europe was designed to revive European economies using not only American money but also practices and principles. The United States, in the tradition of the redeemer nation, was fulfilling its responsibility of leadership through a program that not only provided benefits for itself but also for the peoples of war-torn Europe. Similarly, modernization theory provided the rationale for much U.S. Cold War policy toward the developing world, particularly during the Kennedy administration. Modernization theorists believed that all societies pass through sequential stages of progress from “traditional” to “modern” and that the West, and in particular the United States, was the “common endpoint” to which all peoples must irresistibly move. Significantly, these influential social scientists also argued that the United States could help underdeveloped countries along the way from being stagnant, traditional societies to active, modern ones—a transition which would not only bring advantages to the peoples of those societies but also to the United States. What made this theory so appealing, according to Michael Latham, was that it gave an “objective” justification for U.S. intervention in other nation’s affairs; it provided a useful weapon in the Cold War struggle with the Soviet Union; and it also fit with American values and traditions, in particular the notion that the United States is an exceptional nation with a mission and duty to be the engine of human progress. As Latham observes “modernization reinforced the connections between strategic concerns and assumptions about America’s role as a moral, benevolent world leader.” Modernization theory shaped the formation, influenced the major practices, and informed the public presentations of so-called “nation building” programs such as the Alliance for Progress with Latin America, the Peace Corps, and the Strategic Hamlet Program in Vietnam. Each program was designed to exemplify the altruistic, benevolent impulses of the United States while also being advocated as an objective, scientifically proven method for aiding developing nations. In the early 1960s, Latham contends, the strength and influence of modernization as an ideology ensured the “continuing power of the widespread belief that America was both called to and capable of remaking the rest of the world.”

Not all Americans, however, accepted uncritically the tenets of the Cold War consensus. African Americans in particular focused on the apparent contradiction of the U.S. demanding freedom and democracy throughout the world when such rights were still widely denied to large numbers of its own citizens at home. The civil rights movement used claims of America’s leadership of the free world to argue that racial equality must also be achieved in the United States. Such demands contributed to the many advancements made in race relations during the 1950s and 1960s. On the whole, though, raising objections to the Cold War consensus was difficult, even dangerous, particularly during the earlier years of the Cold War, not least because foreign policy dissent was frequently equated with “fundamental disloyalty to the nation and its values.”

By the late 1960s, however, much of the Cold War consensus had begun to break down and large numbers of Americans were questioning the direction of U.S. foreign policy, particularly toward Vietnam. The intervention in Vietnam had been conceived in terms consistent with the belief that the United States was the leader of the free
world with a duty to contain communism and protect “free peoples” from aggression. But the war's conduct and the resultant defeat of American objectives would raise serious doubts about both the Cold War consensus and the exceptional nature of the United States.

VIETNAM AND THE END OF AMERICAN EXCEPTIONALISM?

In 1975, following the fall of Saigon, the sociologist Daniel Bell declared “The End of American Exceptionalism.” He argued that the “American Century . . . foundered on the shoals of Vietnam.” Bell concluded: “Today, the belief in American exceptionalism has vanished with the end of empire, the weakening of power, the loss of faith in the nation's future.” The chastening experience of Vietnam had made Americans realize that “We are a nation like all other nations.”

Americans invariably refer to the Vietnam War as a tragedy or a national trauma. Vietnam divided opinion in the country as no other event had since the Civil War. It contributed to the breakdown in the Cold War foreign policy consensus. It diverted resources from domestic reform programs and caused high levels of inflation and national debt. It created an atmosphere of distrust and even hostility between the public and the government. The United States had failed to achieve its objectives in Vietnam. For the first time in the nation's history, the United States had lost a war. Americans could not help but feel that all the lives and resources expended in Vietnam had been wasted. The United States was supposed to be an exceptional nation, above the corrupt immorality of the rest of the world. Yet in Vietnam its leaders had conducted a war whose legitimacy was questionable and whose objectives were often unclear and increasingly unattainable. The nation's leaders were accused of employing inhumane forms of warfare and of persistently lying to the American people about how the war was progressing and what was being done to bring about a victory. This sense that the American people could no longer trust their leaders was further compounded by the events and revelations surrounding the Watergate affair. The United States seemed to have shown itself to be just as fallible and unexceptional as any other nation in history. The experience of Vietnam raised serious doubts among Americans about the traditional belief that the United States is an exceptional nation.

Yet there was evidence to suggest that the idea of the United States as an exceptional nation would survive the defeat in Vietnam. As in previous times of domestic disagreement over foreign policy content and direction, advocates on both sides of the Vietnam issue utilized the rhetoric of exceptionalism in their arguments. President Johnson and others used the language of exceptionalism to justify American intervention. Meanwhile, the opposition of many of the war's protesters stemmed from a belief that the United States was conducting itself in ways that were inconsistent with the values and principles upon which the nation was founded. That did not necessarily mean that those opponents rejected such values. On the contrary, many believed they must oppose the war in order for those values to be reaffirmed. Like the anti-imperialists of 1898, those who opposed the Vietnam War often did so in terms that were consistent with the belief in American exceptionalism. Although the belief in exceptionalism was certainly shaken by the events surrounding Vietnam, the continued use of its rhetoric during the war indicated that the belief would survive this latest “trauma” or “time of trial” in American history.

EXCEPTIONALISM AND THE LEGACY OF VIETNAM

The experience of the Vietnam War, the Watergate scandal, and the other “traumas” of the 1960s and early 1970s caused many Americans to doubt or even cease to believe that their nation's actions were consistent with the values and principles upon which their society was supposed to function. Following Vietnam, Americans suffered what was labeled a “crisis of confidence” concerning the future of their nation and its purpose in the world. But the belief in American exceptionalism was not destroyed by the experiences of Vietnam and Watergate. Indeed, each post-Vietnam president consistently attempted to bolster American self-confidence and revive the perceived moral legitimacy of U.S. foreign policy, usually by rhetorically justifying actions in terms consistent with the belief in American exceptionalism.

Jimmy Carter's self-proclaimed objective was to restore the “moral compass” to the making of U.S. foreign policy. He attempted to follow a foreign policy rooted in what he perceived as the values and principles upon which the United States was founded. Carter attempted to conduct
a foreign policy consistent with the belief in American exceptionalism, particularly through his human rights policy. But the record of Carter's administration shows that moral principles, even in the application of the human rights policy, were usually superseded by strategic, economic, and political interests. Despite repeated appeals to exceptionalist rhetoric, Carter failed to revive American self-confidence and, particularly during his last year in office, following the 1979 Soviet invasion of Afghanistan and the seizing of American hostages in Iran, he was widely criticized for contributing to the sense that the United States was in decline.

Carter's successor, Ronald Reagan, was the greatest advocate of the belief in American exceptionalism during the post-Vietnam era. Reagan imbued his public pronouncements with exceptionalist symbolism and imagery, describing the United States as "a land of hope, a light unto nations, a shining city on a hill." He was a true believer in the exceptional nature of his country. He sought to overcome the crisis of confidence in the United States by largely denying that any problems existed. Reagan insisted that the United States was the greatest nation on earth and that so long as Americans maintained that belief, they would be able to overcome any crises they faced. In foreign policy, he took a tough rhetorical stance against the Soviet Union, which in stark exceptionalist terms he condemned as the "evil empire." He also conducted a massive arms buildup, and demonstrated a willingness to employ force, all in an attempt to overcome the perception of weakness that had characterized Carter's presidency.

Reagan succeeded in bolstering American self-confidence, but his claims that the United States had renewed its strength and overcome the limits imposed by Vietnam were largely illusory. Despite standing tall rhetorically, the president was still reluctant to employ the full power of the United States to back up his strong words. For all the posturing of his foreign policy rhetoric, the Reagan administration employed U.S. military force only twice, and then in extremely low-risk, limited operations against Grenada (1983) and Libya (1986). The only other major deployment of armed forces was as part of the ill-fated peacekeeping operation in Lebanon (1982–1984). Otherwise the administration was prepared to use force only by proxy in Nicaragua, El Salvador, and Afghanistan. Ronald Reagan was far from the overtly activist foreign policy president that his image would suggest. He did couch all his foreign policy in terms of the missionary strand of American exceptionalism but, despite his insistence that all his actions were taken in keeping with the values and principles on which the United States was founded, policies such as the covert war in Nicaragua and his exchange of arms for hostages with Iran indicated that the reality of Reagan's foreign policy did not live up to the claims of his exceptionalist rhetoric.

George H. W. Bush admitted to having a problem with what he called the "vision thing," but, like his predecessors, utilized the language of American exceptionalism in his foreign policy. Following the end of the Cold War (1989–1990), Bush advocated a "new world order" based on global cooperation and the rule of law rather than force. The new world order was Bush's answer to the uncertainties of the post-Cold War world. It was a vision of how the world's nations could strive collectively to achieve, and then maintain, international stability. Significantly, though, Bush maintained that world order was possible only with the leadership, guidance, and protection of the United States—it would continue its tradition as a redeemer nation. For all his talk of universalism, Bush's new world order was distinctly an American idea which assumed that traditional American values and principles had universal applicability. Bush's vision also ensured freedom of action for the United States. The United States would not be subservient to the collective will of the United Nations, but would define and follow its own priorities, preferably with—but if necessary, without—the support of the international community. The new world order was in fact a clear expression of exceptionalist thinking.

Bill Clinton, too, couched his foreign policy in terms of American exceptionalism. He repeatedly identified the United States as "the world's only indispensable nation." Clinton made "democratic enlargement" one of the cornerstones of his foreign policy. The United States would actively support and promote the spread of democracy and free market economies throughout the world. This policy, like so many before it, was underpinned by the idea that unique American values, principles and practices had universal applications.

THE VIETNAM SYNDROME AND AMERICAN EXCEPTIONALISM

Throughout the post-Vietnam era, both the main strands of exceptionalist belief have been influen-
tial on the discourse and content of U.S. foreign policy. Indeed, the tension between these two strands has defined many of the debates over the post-Vietnam direction of foreign affairs, particularly with regard to foreign interventions and the use of force. The United States has remained highly engaged in international affairs, but with added pressure that its conduct be exemplary and consistent with its traditional values and principles. Policymakers and public alike have sought to avoid “another Vietnam” by ensuring that foreign policy actions are conducted in keeping with the perceived lessons of that conflict. The defeat of U.S. objectives by a technologically inferior enemy in Vietnam indicated that there were limits to American power. The nature and extent of these limits, however, continues to be a major source of debate, and has come to dominate discussions over foreign policy in each post-Vietnam administration. The term “Vietnam syndrome” became widely used to describe the collective lessons and legacies of the war, particularly in the political-military realm. Although there is no nationwide consensus on the lessons of the Vietnam War, a pattern has developed in policymaking that has remained relatively consistent across post-Vietnam administrations, especially in the threat and use of force. The Vietnam syndrome, in its political-military sense, amounts to a set of criteria that should be met if the United States is to commit troops to combat. These criteria must be satisfied if public support for military intervention is to be sustained. Presidents feel the need to maintain public support for their foreign policy largely because this grants it the moral legitimacy that became so lacking in Vietnam. To avoid another Vietnam, policymakers have therefore followed the central criteria of the Vietnam syndrome: that the United States should not employ force in an international conflict unless just cause can be demonstrated, the objectives are compelling and attainable, and sufficient force is employed to assure a swift victory with a minimum of casualties.

These conditions for the use of force form the content of the Vietnam syndrome and have become increasingly institutionalized with each successive administration. They have been codified in the Weinberger Doctrine, proposed by Reagan’s Secretary of Defense Caspar Weinberger in November 1984, and the Powell Doctrine espoused by Colin Powell, the chair of the Joint Chiefs of Staff in the administration of George H. W. Bush and secretary of state under George W. Bush. Even though, as Powell himself has argued, administration officials do not formally go down a list checking off the specific conditions of the Vietnam syndrome, it is clear from public and archival accounts of the decision-making process that deliberate steps are taken to ensure these conditions are met before use of force is authorized. The planning and conduct of all major uses of force since the Vietnam War have been influenced directly by the Vietnam syndrome. Even the Gulf War, which George H. W. Bush claimed “kicked the Vietnam syndrome once and for all,” demonstrates how strongly the syndrome’s influence persists. The planning and conduct of the Gulf War, with its emphasis on an air war and in particular the decision not to pursue the war to Baghdad once the objective of liberating Kuwait had been achieved, was carefully designed to comply with all of the Vietnam syndrome’s central tenets: use force only as a last resort in the pursuit of what can be demonstrated as a just cause with compelling objectives that can be achieved swiftly using maximum force with minimal casualties. Far from “kicking the Vietnam syndrome,” the Gulf War helped to institutionalize it.

The Vietnam syndrome actually has the effect of reinforcing and perpetuating crucial elements of the belief in American exceptionalism. It is designed specifically to ensure that the United States does not commit itself to another conflict like the Vietnam War. A central purpose of the syndrome is to avoid situations in which the United States could suffer another military defeat. By following policy based on the Vietnam syndrome, U.S. policymakers can be reasonably assured of achieving victory, and thus reinforcing the exceptionalist belief that the United States is a superior nation which always succeeds in its objectives. The Vietnam syndrome also prevents the United States from undertaking military commitments involving long-term occupations of hostile foreign territory. This requirement perpetuates the exceptionalist notion that the United States does not seek the conquest and subjugation of foreign nations. Finally, and most significantly, if it follows the Vietnam syndrome, the United States will use force only in situations where Americans can perceive a just cause. Whenever a just cause is conceived by American policymakers, no matter whether its roots are economic, strategic, political, or otherwise, it will be couched in terms of American exceptionalism. By following what is perceived as a just cause, any administration will perpetuate the belief that the United States pur-
EXCEPTIONALISM

issues only policy that is consistent with its exceptional values and principles. In this sense, the belief in exceptionalism is self-perpetuating and the Vietnam syndrome does nothing to change that situation; in fact, it reinforces it.

The Vietnam syndrome acts as a constraint on American action in world affairs. It places limits on the strength, resolve, and capabilities of a nation which Americans regard as all-powerful and superior to other nations. In this sense the power of the Vietnam syndrome in the making of American foreign policy suggests that the United States is no longer an exceptional nation but is just as limited in its actions as any other country. Yet, paradoxically, the Vietnam syndrome actually acts as a guarantor of the continued acceptance of the belief in American exceptionalism. If the Vietnam syndrome is followed, then the United States can continue to be at least perceived as an exceptional nation because it will always win its wars, it will remain committed to its tradition of not conquering foreign land for territorial expansion, and it will resort to force only in the pursuit of just causes. The nature of the Vietnam syndrome is a clear example, then, of how the belief in American exceptionalism continues to frame the discourse of U.S. foreign policy.

CONCLUSION

Americans are not unique in their belief that theirs is an exceptional nation. Many, if not all, countries have shared such national vanity at some time or another in their histories. The French mission civilisatrice, the British Empire, and the Third Reich, for example, were all accompanied by their own versions of exceptionalism. Americans are clearly not alone in holding exceptionalist beliefs. Neither are they unique in pursuing foreign policies that are informed by those cultural beliefs. In all countries policymaking is based to a certain extent on assumptions formed from unique elements of national culture.

The fact that other nations have their own forms of exceptionalism, however, does not diminish the effects that the belief in American exceptionalism has on the making of U.S. policy. As the United States remains arguably the most powerful nation in the world, it is important to recognize the consequences that the belief in American exceptionalism has on U.S. foreign policy. Political, economic, and strategic interests are the major determinants of U.S. foreign policy. But no matter what the root reasons for a foreign policy decision are, that policy is usually couched in terms consistent with American exceptionalism. Use of this rhetoric assures substantial public support for policy and has proved very effective throughout U.S. history.

This fact begs the question of whether the use of exceptionalist rhetoric is simply a manipulative tool designed to win public approval for policy. Do American policymakers formulate their desired policy, then cloak it in terms they believe will assure the greatest possible public and congressional support? Certainly officials within most U.S. administrations have acknowledged that couching policy in terms of exceptionalism would have positive effects on public opinion, but to suggest this is the only reason for such language being employed would be to ignore other evidence. Nowhere in the public or archive record, including declassified accounts of National Security Council meetings, is it even implied that once a particular course has been chosen, it will then be packaged in exceptionalist terms. In fact, exceptionalist language is not used only in public explanations of policy; it is also used by policymakers themselves in policymaking sessions behind closed doors. Presidents and their foreign policy advisers frequently use arguments couched in exceptionalist language during private meetings and in personal memoranda. They do so even when perfectly good practical arguments for policy options exist, and they often couch even strategic, economic, or political justifications in exceptionalist terms. It appears to be automatic for American public officials to conceive their policies in terms that represent some notion of the exceptional nature of the United States. They do so not simply because it will be politically advantageous but also because those terms form a natural part of the language they use to understand the world around them. American exceptionalism exists deep within the American belief system, and many of its assumptions are shared by the public and officials alike. It therefore provides the framework for much of the discussion of foreign policy, its presentation by officials, and its realization.

Throughout U.S. history the tension between the exemplary and missionary strands of American exceptionalism have been among the defining characteristics of foreign policy. They have survived challenges to their continued acceptance, such as the imperialist debate of the 1890s and the defeat in Vietnam. They form a core element of American national identity, and
will continue to provide the cultural and intellectual framework for the making of U.S. foreign policy. Foreign observers in particular often regard with contempt or confusion the use of exceptionalist rhetoric by U.S. policymakers. But if we are to truly understand the ways in which U.S. foreign policy is conducted, it is essential that we take seriously the intellectual and cultural framework in which it is made.

A vital function of American diplomacy is the protection of persons, property, and trade interests of U.S. citizens, both native-born and naturalized, in foreign countries. Such protection is commonly referred to as “extraterritoriality.” However, extraterritoriality was also applied within the United States in regions claimed by or ceded to sovereign Indian nations. For example, beginning in the 1830s in Indian Territory (Oklahoma), Indians charged with offenses on white land and whites charged with offenses on Indian land within the territory were compelled to stand trial in white courts in Missouri. Extraterritoriality embodies a regime of protections, immunities, and exemptions, claimed on behalf of citizens of one nation living abroad, from the legal system and territorial jurisdiction of the state in which they are resident. Such immunities may be limited, that is, they are restricted to a specific territory or region. Or they may be unlimited or non-specific, that is, global in their application. Guaranteeing such protection, especially in Islamic and Asian countries, resulted in the eventual development of a system of extraterritoriality which the United States established through negotiation or unilateral imposition in fifteen nations: Algeria (Algiers), Borneo, China, Egypt, Iran (Persia), Japan, Korea, Libya (Tripoli), Madagascar, Morocco, Samoa, Tanzania (Zanzibar/Muscat), Thailand (Siam), Tunisia (Tunis), and Turkey (Ottoman Porte).

In establishing such a regime of diplomatic relationships, the United States drew upon established theoretical principles and historical antecedents. The principle and practice of extraterritoriality is fundamentally a state’s de jure claim of sovereignty and a de facto expression of its diplomacy and foreign policy. Most authorities would accept the broad view that sovereignty is a system of order and relationships among states that is based on a “mutual recognition of one another’s right to exercise exclusive political authority within its territorial limits.” Whereas sovereignty involves a state’s claim of jurisdiction over citizens within its borders, extraterritoriality extends those claims beyond them.

ORIGINS OF EXTRATERRITORIALITY

While the practice and claims of extraterritoriality originated in antiquity, most notably in Egypt, Greece, and Rome, it was during the Middle Ages that its modern principles were established. As early as the twelfth century, Italian cities such as Genoa, Venice, and Pisa secured protection for their merchants in Egypt, Constantinople, and the Barbary States of North Africa. In northern Europe, the Hanseatic League obtained jurisdictional rights for its merchants within its trading region. During the next three centuries, Turkey granted so-called capitulary rights to Great Britain, the Netherlands, Italy, Denmark, Germany, Russia, Spain, Portugal, and the United States.

The problem of guaranteeing such protection, especially in the Islamic and Asian countries, was responsible for the eventual development of a system of extraterritoriality. Although differences in cultures, religions, and legal systems between Western Christian countries and those of Africa, the Near East, and Asia motivated Western countries to secure legal and economic exemptions for their nationals, the roots of extraterritoriality can be traced to ancient times. During antiquity, legal rights and obligations in Egypt, Greece, and Rome were deemed an integral part of membership in the community and could never be extended to aliens—the “strangers within the gates.” However, merchants and traders traveling to distant lands were often permitted to reside and to establish trade factories, to manage their own affairs, to build temples, and to live according to their own customs, ceremonies, and rites.
By the end of the eighteenth century, a significant change had occurred in the concept of extraterritoriality. Before the Treaties of Westphalia (1648), which ended the Thirty Years’ War and established the basis for the modern European system of nation-states, the notion of territorial sovereignty had not taken definite and concrete form. Sovereignty was generally viewed as personal rather than territorial, and it was related to the theory of the personalization of laws: that a foreigner carried his own law wherever he went. It was the ruler's duty to protect those who swore personal allegiance to him. Such allegiance was usually rendered by military service, and, in the case of Asian nations, by the payment of tribute as well. Following the Treaties of Westphalia, however, the concept of territorial sovereignty collided with the notions of personal sovereignty and the personality of laws, especially when the national right of territorial jurisdiction became a basic tenet of Western international law.

The recognition of territorial sovereignty in the West had a profound impact on the Ottoman Empire and in the Orient, where the principle that law was personal rather than territorial persisted for a long period of time. It affected, in particular, the relationships between Christian Europe and the Islamic and Asian countries, which were viewed as outside the pale of “civilization.” Since these states were considered beyond the sphere of international law, it was held that European subjects and citizens had to be protected from the barbarities of “uncivilized” peoples, at least until the latter conformed to the standards of law and justice that Europeans considered just and equitable. Europeans chafed at the idea of being subservient to the laws of “inferior” civilizations. Such subservience, they felt, did violence to their dignity, pride, and concepts of justice. On their part, Muslims and Chinese held foreigners in disdain because they believed in the superiority of their own virtues and civilization.

From the earliest times, foreign ambassadors, government officials, and diplomatic representatives were granted a special status and exemption from local jurisdiction. This privilege later became known as the right of “extraterritoriality.” Diplomatic immunities were acknowledged in Western countries and in most non-Western states as well. Extraterritoriality was distinguished from extraterritoriality in that it applied not simply to foreign diplomats and government officials, but to foreign nationals residing abroad. The special rights and immunities involved were specifically defined in treaties, and were not reciprocal. Although initially the bestowal of extraterritorial rights did not connote any loss of territorial sovereignty, but instead symbolized the beneficence of the grantor state, such was not the case following the Treaties of Westphalia. The imposition of extraterritoriality clearly came to represent the superiority of Western Christian countries over inferior, backward, and “uncivilized” peoples. In this sense, modern extraterritoriality served not only as a protective shield but also as an instrument to further penetration and imperialistic expansion.

MOROCCO

Before the Declaration of Independence, colonial Americans who engaged in trade in the Mediterranean and with the Barbary States were dependent upon the British for protection from Barbary piracy. France had led the way in securing definite rights or protection not only for foreigners but also for natives in the employ of foreigners. The first treaty granting these privileges was concluded between Morocco and France in May 1767; other nations soon gained similar rights through a most-favored-nation clause. When the United States declared its independence in 1776, England withdrew its admiralty passes. To prevent the plundering of American ships, a committee of the Continental Congress immediately urged the negotiation of a treaty with France to obtain a royal pledge to protect and defend American vessels as effectively as England had previously done. Although Louis XVI promised in the Treaty of Amity and Commerce between the United States and France, signed on 6 February 1778, to interpose with the Barbary States “for the benefit, convenience, and safety” of his American ally, this agreement proved to be of little value.

After the American Revolution, the U.S. Congress took the initiative to establish direct contacts to secure the protection of American ships and seamen in the Mediterranean area. In May 1784, Thomas Jefferson, John Adams, and Benjamin Franklin were commissioned to negotiate treaties with the Barbary States. When an American ship, the Betsey, was seized by Moroccan pirates and taken to the port of Tangier, the commissioners authorized Thomas Barclay, the U.S. consul general at Paris, to go to Morocco and act as their agent to conclude a treaty with Morocco. Barclay’s mission was successful. In
1786 he signed an agreement with Sultan Sidi Mohammed, which was ratified by Congress on 18 July 1787. This treaty, which established the basis for American extraterritorial rights in Morocco, was modified and renewed in 1836 and again in 1886, and remained in effect until 1956. The United States soon negotiated treaties with the dey of Algiers in 1795, with the sultan of Tripoli in 1796, and with the dey of Tunis in 1797; it did not relinquish these treaty rights until 1912, when Libya became a colony of Italy. But neither the treaty with Morocco nor those concluded with the Barbary States provided protection to American commerce. Tripoli declared war on the United States in 1801, and hostilities ensued with the Barbary pirates until 1816, when new treaties were imposed upon Algiers, Tripoli, and Tunisia. Following the War of 1812, the United States was no longer harassed by piracy in the Mediterranean.

In the Islamic countries, the protectorate system created serious difficulty. Under bilateral treaties, European consuls obtained both almost complete jurisdiction over the persons and properties of their own nationals, and the right to offer this protection to anyone they employed. These persons were not subject to local law and were exempt from all personal or direct taxation or forced levies. The system lent itself to abuses, since many local citizens gladly paid large sums of money to secure these exemptions.

Foreign consuls found the selling of protection an excellent way to augment their incomes. As early as 1859, the Moroccan government demanded more careful regulation of the protectorate system. Complaints were also voiced against the unwarranted interference by consuls in the local courts. Efforts to remedy the situation were made in 1877, when the sultan sought to limit and control the extent of foreign protectorate claims, and to obtain the return to Moroccan jurisdiction of Moroccan subjects who, after naturalization in a foreign country, had returned to live in Morocco. But the discussions with the diplomatic corps brought no agreement, and the United States, while expressing its willingness to remedy the abuses, insisted that naturalized citizens were equal to native-born citizens, and therefore not subject to Moroccan jurisdiction if they returned to that country.

At the Conference of Madrid in 1880, protectorates were the main item on the agenda. Britain favored conceding to Moroccan demands, whereas France urged that no abridgment be made on the right of protection. The conference adopted the French point of view, and the Convention of Madrid not only validated the protectorate system but also, by clarifying, defining, and legalizing the situation, strengthened it by converting the former bilateral treaties and simple consular agreements into an international convention. After the Madrid Convention an orgy of protection selling began, and the protection problem became linked to political penetration.

During the latter decades of the nineteenth century, imperial rivalries steadily exerted a profound impact on extraterritoriality. As European powers pressed to partition Africa and carve out their colonial empires, the danger of the dismemberment of Morocco became increasingly ominous. In 1871 the sultan of Morocco, fearful that his country might be partitioned by European countries, offered to place his entire nation under an American protectorate. Although refusing to accept the offer, the State Department proffered its friendly offices to prevent such an act. To forestall dismemberment or the establishment of hegemony in a region by any one power, and at the same time ensure the maintenance of treaty rights and extraterritoriality, the United States espoused the creation of international settlements, such as that in Shanghai, which had been set up in the 1850s, and the Open Door policy.

Political and economic competition among the European powers intensified efforts to maintain and broaden extraterritorial rights. In Morocco particularly, a decisive shift occurred from concern with persons and property to an interest in economic exploitation and trade. The Moroccan crisis that almost triggered conflict between France and Germany, and was a prelude to World War I, was occasioned by Germany's desire to prevent French economic control of that country. The intervention of President Theodore Roosevelt in this dispute led to the Algeciras Conference in 1906. While the Act of Algeciras effected a compromise that guaranteed equality of economic opportunity and the Open Door, France and Spain secured privileged positions with the Moroccan police force.

The interests of France, Spain, and Britain converged on Tangier, which overlooks the Strait of Gibraltar. England and Germany strongly favored internationalization of Tangier, but France resisted this proposal, insisting on French and Spanish preponderance. Following the Act of Algeciras, France swiftly took steps to establish a protectorate over Morocco. Germany attempted
to counter this move by dispatching a gunboat, the Panther, to Agadir to “protect German interests.” This action, in 1911, precipitated a second Moroccan crisis. But again a compromise was reached. In a Franco-German accord, concluded in November 1911, Germany conceded France a free hand in Morocco in exchange for a sizable slice of the French Congo. After firmly establishing its position in Morocco, and working out arrangements with Germany and Spain, France agreed to cooperate in the creation of an international regime for Tangier, modeled on the International Settlement of Shanghai. A statute was finally approved by most of the Algeciras powers by November 1914.

The American extraterritorial treaties with Morocco were very similar to those with other Islamic states. However, abrogation of American extraterritorial jurisdiction in Morocco was a complicated matter. France established a protectorate in Morocco in 1912, designating special zones for Spain and an “international zone” in Tangier. After the protectorate was established, France began pressing the United States to renounce its extraterritorial rights.

Following the establishment of the French protectorate in Morocco, many countries surrendered their capitulatory rights. With the signing of the Tangier Statute in 1923, the protectorate system was eliminated. England was the last of the signatory powers to formally renounce its right of protection and all capitulatory rights, in a 1937 accord with France. But the United States refused to accept the Tangier Statute or the modification in 1928 that officially established the basis for the internationalization of the city. Since Americans had few political or economic interests in Tangier, Washington decided it would be more advantageous to remain outside the international settlement, thus retaining both its diplomatic status and its extraterritorial rights.

Some vestiges of extraterritoriality persisted after World War II. For example, American extraterritorial rights were not ended in Morocco until 1956, when Moroccan independence was attained; the final economic integration of Tangier was secured only in October 1960. When the United States finally gave up its extraterritorial jurisdiction in Morocco, one issue was its desire to support Arab nationalism without antagonizing France. Moreover, it was sensitive to the danger that the Soviet Union could exploit Moroccan irritation with American extraterritorial claims. Finally, the United States wanted to preserve its military bases in the region and increase the number of American troops.

**TURKEY**

Meanwhile, prompted by developing interests and problems of missionaries and trade in the Ottoman Empire, the U.S. government initiated direct contacts with Turkey. Efforts to arrange a treaty of amity and commerce were initiated in 1799, but a Turkish-American agreement that extended capitulation privileges to the United States was not concluded until 1830. Article IV of that treaty stipulated that “citizens of America, quietly pursuing their commerce, and not being charged or convicted of any crime or offense shall not be molested; and even when they have committed some offense, they shall not be arrested and put in prison, by the local authorities, but they shall be tried by their minister or consul, and punished according to their offense.”

Although the treaty recognized that American plaintiffs and defendants in civil cases would be subject to Turkish law, this was not enforced. Indeed, while the United States relinquished some narrow judicial authority to Turkey with respect to land and real estate transactions in 1874, it continued to claim broad extraterritorial rights, in large measure because it considered the Turkish legal system to be unjust. As the State Department put it, “The intercourse of the Christian world with the Mohammedan world is not founded upon the principle of the law of nations,” because “International Law, as professed by the civilized ideas subsisting between them [is] based upon a common origin, and an almost identical religious faith.” With the outbreak of World War I, Turkey was the first country to take advantage of the conflict by declaring its intention to rid itself of the capitulatory regime. In September 1914 the Turks, asserting that the capitulatory rights were “in complete opposition to the juridical rules of the century and to the principle of national sovereignty,” proclaimed that Turkey’s relations with all states would be based on the “general principles of international law” after Turkey abrogated the capitulatory agreements, effective 1 October 1914. The United States promptly denied Turkey’s right to abolish the capitulations unilaterally, claiming that such action could be taken only by agreement among all the nations concerned. Nevertheless, Turkey made it clear that it considered the capitulations dead.
Turkey experienced dramatic social, political, and legal changes in the early twentieth century. Kemal Ataturk's nationalist revival and secularization of Turkey helped transform the legal system by granting non-Muslims more equal legal status with Muslims. With these reforms, extraterritoriality did not seem necessary to protect the legal rights of Americans in Turkey. Therefore, the United States was willing to renounce extraterritoriality. Ambassador Joseph Grew informed Turkish foreign minister Tevfik Aras in 1931.

CHINA

Although the Ottoman Empire was the first to enact a capitulatory system that established the basis for extraterritorial privileges, it was in China that the extraterritoriality system was developed most extensively. The origin of extraterritoriality in China has been traced to the T'ang dynasty (618–907). As early as the ninth century, the Chinese allowed Arabs to reside and trade along the coast of Chekiang province and to govern themselves under their own headman. When the Portuguese arrived in Macao in 1557, the emperor permitted them to live according to their own customs and laws. In the first treaty with Russia in 1689, China agreed that each nation would be responsible for its own subjects.

However, though China treated all barbarians equally, permitting them to enjoy the blessings of Chinese civilization and granting to all the privilege of trade, barbarians were required to accept China's conditions of trade. The Chinese exempted foreigners from their law in part because they believed that foreigners lacked the capacity to understand the complex rules of Chinese society; in part because such exemption freed the Chinese from the difficulty of trying to govern aliens who had strange customs, language, and traditions; and in part because the Chinese felt the barbarians should be given a chance to observe their civilized way of life and, by so doing, eventually become assimilated. The Chinese always insisted upon complete control over foreign residence, and Westerners ultimately secured the acknowledgment and extension of extraterritorial rights only by the threat or use of force.

In China, the tribute system established the basis of relationships with barbarians. Foreigners who wanted to trade with China were compelled to abide by the rules and regulations set forth by the emperor. Until the first Anglo-Chinese (Opium) War (1839–1842), Western merchants accepted China's institutional framework and adapted to Chinese requirements of trade. This meant adhering to the Canton system, which confined all foreign trade to the Canton area—the “factory” section of the city and at Whampoa and Macao—and its supervision by the Co-Hong, a Chinese merchants' guild. The Canton system in effect preserved a tribute-and-trade nexus that coincided with the traditional Chinese way of dealing with barbarians.

The Opium War shattered this institutional arrangement. It was replaced by the Western "treaty system," built on treaties signed by China with England, the United States, France, and Russia. The British-dictated Treaty of Nanking (1842) led to the collapse of the Co-Hong system; the opening to trade of the ports of Canton, Amoy, Foochow, Ningpo, and Shanghai; and the altering of relations with China. The treaty system pivoted on two significant stipulations: a most-favored-nation clause, which automatically extended concessions granted by China to one nation to other treaty powers, and the right of extraterritorial jurisdiction.

Before the Opium War, the British and other Europeans had willingly acknowledged, for the most part, China's jurisdiction in both civil and criminal matters. But a gap steadily widened between the British and Chinese on the interpretation and procedures of the law, on matters of responsibility, on evidence, and on punishment. On occasion, the British resisted compliance, particularly by refusing to surrender their nationals who were accused in homicide cases. Westerners were also alarmed by the Chinese practice of torturing prisoners and by the corruption of Chinese magistrates and judicial authorities. Americans, however, readily submitted to China's laws and jurisdiction to avoid interference with trade.

The position of the United States changed drastically after the signing of the Treaty of Nanking, and the supplementary Bogue Convention (1843), which gave British consuls limited jurisdiction to deal with crimes committed by British nationals. Although England first took the initiative in asserting jurisdiction over British subjects in China nearly a decade before the Chinese formally agreed to the principle of extraterritoriality, no direct steps were taken to establish a court of justice, with criminal and admiralty jurisdiction, at Canton. Because this measure was opposed by the Chinese and lacked approval of Parliament and the public, England hesitated to
take any action. As a result, the imposition of an extraterritoriality system in China was effected mainly by the United States.

Caleb Cushing, who was appointed the first official American envoy to China in 1843, was responsible for obtaining China's full recognition of the principle of extraterritoriality. Cushing argued that jurisprudence of Western Christendom alone guaranteed equitable treatment of foreigners. "This fact," he boldly claimed, was "the result of evidence of the superior civilization and respect for individual rights consequent thereon, which prevail in Christendom." Cushing insisted that the United States demand extraterritorial rights in China for American citizens, not as a concession on China's part, but as a principle of established international law.

Cushing's major achievement was the negotiation of the Treaty of Wanghia, signed on 3 July 1844, which granted the United States the right not only to determine punishment of American offenders but also to exercise absolute extraterritorial jurisdiction in both civil and criminal cases. Article XXI of the treaty stipulated: "Subjects of China who may be guilty of any criminal acts towards citizens of the United States, shall be arrested and punished by the Chinese authorities according to the laws of China: and citizens of the United States, who may commit any crime in China, shall be subject to be tried and punished only by the Consul, or other public functionary of the United States, thereto authorized according to the laws of the United States." From the mid-nineteenth century to World War II, American diplomacy in China was occupied with problems relating to the administration of judicial affairs, shipping regulations, piracy, and claims. Other matters that explicitly concerned extraterritorial rights dealt with the buying and leasing of land; crimes against American persons and property; ensuring the guarantee of fair trials, whether in Chinese courts or consular courts; the safety of travel inland; and the rights to trade, to worship freely, and to propagate the faith. At the same time, extraterritoriality became a cloak for the development of successful foreign commercial enterprises and a means to secure control over much of China's foreign trade. It also offered a protective shield to Christian missionary activities, buttressed by the twelfth century, the protection of Americans and other foreign nationals was provided not only by gunboats but also by the presence of foreign troops.

Between 1842 and 1942 the principal symbol and exercise of foreign power in China were the treaty ports, small territorial enclaves or enclosures where foreign governments established extraterritorial jurisdictions throughout much of coastal and eastern China. In them were located foreign consulates, local offices of foreign businesses and commercial concerns, concessions, and settlements. Here also were separate courts, police with foreign officers and staff, and often small military and security forces.

Treaty ports, usually on the coast or along navigable waterways, were open to foreign commerce and contained a Chinese maritime customs office administered by foreigners. In many instances these ports had a de jure foreign district. Direct commercial activities, residence, and property rights were restricted to designated treaty ports and other specified cities open to foreign trade.

Settlements and concessions were municipalities separate from the surrounding Chinese cities. Both foreigners and Chinese were allowed to lease or own property and to live in the settlement area. Foreign nationals dominated the municipal councils of these settlements until the late 1920s. Settlements were generally considered Chinese soil governed by foreigners. Concessions were de jure colonies of the nation leasing the property. Most were organized with a municipal council that had ultimate administrative and political authority over the concession. The law of a concession, which was leased foreign soil, could exclude Chinese and nationals of other countries excluded from entry, residence, and property ownership.

Setting up the machinery and administrative apparatus of the extraterritoriality system produced many problems. For example, down to 1906, few American consuls in China had adequate knowledge or competence to handle legal disputes. Many consuls were attached to American mercantile firms; their meager consular fees and dependence on commercial houses seriously affected judicial administration. Bias for one's own nationals could not be eliminated. Moreover, the complexity of laws and procedures, and the difficulties of appeal, as well as of securing witnesses or producing evidence for trials of foreigners who had committed offenses in the interior, made the handling of cases onerous. The creation of a mixed court at Shanghai in 1864 sought to remedy these judicial problems; a Chinese magistrate presided and a foreign consular "assessor" sat with him as a
co-judge. Although the removal of consular appointments from politics and the establishment of the U.S. court at Shanghai in 1906 helped to improve the situation, the abuses of extraterritoriality persisted.

In the 1840s, the Chinese were not aware of the implications of extraterritoriality or of other concessions granted to foreigners. Nor were they disturbed by consular jurisdiction, since it did not directly affect China's political structure. But as foreign control over the Chinese economy steadily increased, these expectations rapidly disappeared. First applied to about 350 foreigners in five treaty ports, the extraterritoriality system by the beginning of the twentieth century was extended to about ninety treaty ports and some twenty-five ports of call for steamships, and embraced approximately a third of a million foreign residents.

For more than a half-century after the Opium War, China was racked by insurrections, economic dislocations, and the spread of European and Japanese imperialism. Compelled to accept the West's goods and ideas, China by the turn of the twentieth century reached the depths of humiliation with its defeat in the first Sino-Japanese War, the crushing of the Boxer Rebellion, and the signing of the Boxer Protocol in 1901. The latter provided for a huge indemnity and the permanent quartering of foreign troops in the capital as legation guards.

Nationalism and reform movements, however, steadily gained momentum. As they did so, the “unequal treaties” and extraterritoriality in China increasingly became targets of attack. To counter the agitation, the Western powers and Japan signed a series of treaties in 1902 and 1903. The agreements indicated the willingness of these signatory powers in the country. China secured the right to adopt a resolution that provided for the establishment of a fact-finding commission to investigate extraterritoriality in China, the chaotic conditions in the country and a squabble between France and China over Boxer indemnity payments delayed the convening of the Commission on Extraterritoriality until January 1926. After

When China entered World War I on the Allied side in 1917, steps were immediately taken to cancel the extraterritorial privileges of Germany and Austria. At the Paris Peace Conference, the Chinese delegation set forth a program that called for the return of all foreign concessions, settlements, and leased territories; the gradual abolition of extraterritoriality; and complete tariff autonomy. But to their dismay and anger, Woodrow Wilson endorsed Japan's claims to Shantung, which had been obtained in 1914 by the expulsion of the Germans. Delegates at the Paris Conference refused to reconsider the Shantung question or China's arguments on the abolition of extraterritoriality. As a result, the Chinese declined to sign the Treaty of Versailles.

After World War I, extraterritoriality was viewed as a key symbol of foreign domination. At the Washington Conference in 1921–1922, the Chinese delegation again made a strong bid for recognition of its full sovereignty. But the United States, Britain, France, and Japan balked at agreeing to treaty revisions. Although the Nine-Power Treaty (1922) confirmed China's independence and its territorial and administrative integrity, the agreement upheld the existing privileges of the signatory powers in the country. China secured only the promise of a study on the question of extraterritoriality, and real tariff autonomy was postponed indefinitely.

Although the Western powers and Japan resisted the relinquishment of extraterritorial rights in China, stressing that significant treaty revisions had to await China's progress in legislation and adoption of adequate judicial reforms, the extraterritoriality system deteriorated during the interwar years. Meanwhile, the Bolshevik Revolution made itself felt in China, spurring the growth of nationalism and radicalism in the country. Affirming its desire to deal with China on the basis of equality, the Soviet Union renounced extraterritoriality, and in May 1924 a Sino-Soviet agreement officially relinquished Russia's privileges.

Although the Washington Conference adopted a resolution that provided for the establishment of a fact-finding commission to investigate extraterritoriality in China, the chaotic conditions in the country and a squabble between France and China over Boxer indemnity payments delayed the convening of the Commission on Extraterritoriality until January 1926. After
almost a year of investigation and the assembling of a mass of detailed information on China's judicial system and practices of extraterritoriality; the members unanimously concluded that until more effective judicial reforms were carried out, the abolition of extraterritoriality was unwarranted.

In the meantime, the Nationalist revolution coalesced under Chiang Kai-shek's leadership, and by 1928 defeated the northern government. Pledged to end the extraterritoriality system, the Kuomintang (Nationalists) adopted a provisional constitution in October and immediately took steps to establish a new basis of relations with foreign powers. At the end of the year, China reached agreements with Belgium, Denmark, Italy, Portugal, and Spain that provided for tariff autonomy; accepted, in principle, the ending of extraterritoriality; and promised that rights would be relinquished when other states had done so.

In May 1929 the Kuomintang government announced that it intended to promulgate civil, criminal, and commercial laws to replace the extraterritoriality system. Three months later, it issued regulations that ended the provincial and local handling of diplomatic matters and prescribed new procedures for dealing with aliens. But the Nationalists did not unilaterally abrogate extraterritoriality. They expressed the hope, instead, that the system could be abolished by mutual consent by 1 January 1930. Since the United States and Britain insisted upon a gradual relinquishment of extraterritorial rights—and only if China gave evidence of improvements in its judicial system that ensured "effective enforcement of jurisprudence"—the Kuomintang declared its dissatisfaction with this response. On 28 December 1929, the Western powers were informed that beginning 1 January 1930, "all foreign nationals in the territory of China who are now enjoying extraterritorial privileges shall abide by the laws, ordinances, and regulations duly promulgated by the Central and Local Government of China." This mandate was qualified two days later, when China stated its intent was merely to abolish extraterritoriality in principle. With the understanding that 1 January would be regarded simply as the date from which the process of gradual abolition would be said to have commenced, Washington, London, and Tokyo agreed to further negotiations "within a reasonable time."

For almost a year and a half, the United States and Britain attempted to work out an acceptable agreement with China. By June 1931 the points in dispute were resolved, but London, Washington, and Tokyo left final agreement in abeyance, pending an examination of the treaty terms. When the Japanese invaded Manchuria on 8 September 1931, the treaties, not yet ratified, were suspended indefinitely. Efforts to resume negotiations and to arrive at final agreements on the abolition of extraterritorial rights were made in the mid-1930s, but the outbreak of the second Sino-Japanese War in July 1937 once again halted the discussions.

The issue of extraterritoriality was not further considered until World War II. After Japan's bombing of Pearl Harbor in December 1941 and America's entry into the conflict, the State Department decided that it would be advantageous to end extraterritoriality. On 11 January 1943, China simultaneously concluded with the United States at Washington, and with Britain at Chunking, the Treaty for the Relinquishment of Extraterritorial Rights in China and the Regulation of Related Matters. By these treaties, together with exchanges of notes, the United States and England surrendered not only their extraterritorial rights but also their unilateral privileges in China that had previously been acquired by the "unequal treaties." American and British nationals would now be subject to the jurisdiction of the government of the Republic of China, in accordance with the principles of international law and practice. The long-standing grievances relating to extraterritoriality, concessions, settlements, legation quarters, and the right to station foreign warships in Chinese waters and foreign troops on Chinese soil were thus ended.

JAPAN

The United States also strengthened the basis for extraterritorial rights in Japan. This was accomplished by Townsend Harris, a New York businessman and merchant who was appointed the first American consul at Shimoda, Japan, in 1855. Three years later, in July 1858, he concluded a treaty of amity and commerce that greatly extended the privileges secured by Commodore Matthew C. Perry in 1854. Perry's treaty, which opened Japan, contained no extraterritorial provisions, but Harris persuaded the Japanese to grant Americans jurisdiction in both civil and criminal matters.

Although critical of the inefficiency of Japanese judicial administration, the Western powers were negligent—as they had been in China and
elsewhere—in improving the system of extraterritoriality. Gross interference occurred in the enforcement of Japanese laws, especially with regard to quarantine regulations, drawn up in 1873, and the control and regulation of the opium trade. The British minister, Sir Harry Parkes, adamantly insisted that British subjects could be tried and punished only for violation of British laws. He declared that the Japanese government could not enact laws applicable to British nationals. The United States and the Netherlands opposed this position, claiming that there was no danger in recognizing all Japanese laws as long as the power to try and punish foreigners remained in the consular courts. England subsequently modified its policy.

During the 1880s the Japanese government raised the matter of treaty revision. A concerted attempt was made to secure tariff autonomy and the repudiation of extraterritorial privileges. These efforts provoked vigorous opposition, especially from England. Despite this resistance, Japanese leaders took steps to obtain full judicial autonomy by completing the codification of their laws. At the same time, they pressed for an immediate end to consular jurisdiction over matters relating to police administration, partnerships between Japanese and foreigners, and customs affairs. In January 1882 a preparatory conference for treaty revision, attended by the ministers of twelve treaty powers, was convened at Tokyo. Japan proposed the abolition of extraterritorial jurisdiction in five years and the employment of foreign judges in Japanese courts during the transition period. In return, the Western powers were offered an extension of foreign rights to residence and land tenure within treaty ports and the opening of the country to all foreigners. By 1885 a general agreement was reached that the treaties should be revised. On 1 May 1886, the official conference of the treaty powers opened at Tokyo, and after many lengthy sessions a draft jurisdictional convention was approved.

Although the prospects for treaty revision looked bright, they were quashed by the strong popular opposition to Westernization and the proposals advanced by Japan’s leaders. Agitation was especially directed against the system of mixed courts and the promise to submit the constitution of the courts and the codified laws to the Western powers for their approval. Unable to reach a general agreement, the Japanese attempted to abolish extraterritoriality and to obtain tariff autonomy by bilateral treaties. The United States was first approached, and in February 1889 the American minister, Richard D. Hubbard, concluded a treaty with Japan that included the abolition of consular courts in five years. His successor, John Franklin Swift, opposed the treaty’s adoption, and Secretary of State James G. Blaine withheld it from the Senate. Meanwhile, Japan signed new treaties, practically the same as that with America, with Germany and Russia.

In 1890 the British agreed to treaty revision, on condition that Japanese jurisdiction over foreigners would be postponed for five years and that the newly codified Japanese laws would be in actual and satisfactory operation for one year before the expiration of that period. In July 1894 the compromise Anglo-Japanese Treaty of Commerce and Navigation was signed. The agreement specified that foreigners would be treated on an equal footing with Japanese in regard to travel, residence, and trade. Consular jurisdiction and foreign settlements were abolished. The implementation of the treaty was made contingent upon the satisfactory operation of Japan’s newly codified laws, and provision was made for its termination at the end of twelve years.

The United States thus was not the first power to relinquish extraterritorial rights in Japan. Further delays were caused by Washington’s objection to a clause in the Anglo-Japanese treaty that provided for the reciprocal rights of entrance, travel, residence, and property ownership. However, after Japan agreed to include a clause for mutual exemption of laws relating to laborers and labor immigration, a new treaty was signed in November 1894. Early in 1895 the American-Japanese treaty was ratified by both nations. Japan fulfilled all of the conditions that had been specified within the prescribed period of time, and in 1899 extraterritorial jurisdiction in the Japanese Empire was abolished.

The ending of extraterritoriality in Japan coincided with Japan’s victory in the Sino-Japanese War (1894–1895) and its emergence as a major world power. However, the retreat of the Western powers in Japan did not immediately have an impact on other countries.

PANAMA

Extraterritorial jurisdiction continues to exist in the Panama Canal Zone, where, on the basis of the Hay-Bunau-Varilla Treaty of 1903, the United States exercises “all the rights, power and authority within the zone” that it “would possess if it
were the sovereign of the territory . . . to the entire exclusion of the exercise by the [Panama] Republic of any such sovereign rights, power or authority.” Although in 1965 President Lyndon B. Johnson indicated a willingness to negotiate a new treaty, and a Joint Statement of Principles in 1974 affirmed this desire, it was not until 1978 that President James Earl Carter’s administration was able to persuade the Senate to ratify treaties recognizing Panama’s sovereignty and jurisdiction in the Canal Zone by the year 2000.

**TWENTY-FIRST CENTURY EXTRATERRITORIALITY**

For the most part, the extraterritoriality system that prevailed in the nineteenth century, and was maintained, especially in China, down to World War II, is now a relic of the past. However, military status-of-forces agreements negotiated after World War II with Japan, Korea, Taiwan, and the Philippines, among others, embody in a new form extraterritorial jurisdiction affecting American military personnel abroad. However, the abandonment of regional or national extraterritoriality by the United States did not mean the abrogation of all extraterritorial claims. Beginning in 1945, U.S. courts commenced redefining the scope of their sovereign jurisdiction over the activities of American corporations doing business abroad.

In three significant cases the United States broadened the definition of sovereignty and proprietary economic hegemony. Authority for such claims was the Sherman Antitrust Act of 1890. However, in its first substantive ruling involving application of the Sherman Act to overseas commercial disputes, the Supreme Court issued a narrow opinion restricting extraterritorial rights. In American Banana Company v. United Fruit Company (13 U.S. 347), the Court asserted in essence that extraterritoriality was appropriate only on the high seas or in countries where unjust laws prevailed. Subsequently, it declined to assert the jurisdiction of U.S. courts in Costa Rica and stated that the Sherman Act did not apply outside of American sovereign (that is, territorial) jurisdiction. Indeed, in a similar case, Underhill v. Hernandez (168 U.S. 250), the Court ruled that “Every sovereign State is bound to respect the independence of every other sovereign State, and the courts of one country will not sit in judgment on the acts of the government of another done within its own country.”

Since World War II, the Supreme Court has abandoned this narrow interpretation of sovereignty. In a series of rulings—United States v. Aluminum Company of America (148 U.S. 2d 416), Timberlake Lumber Company v. Bank of America Nt&SA (549 F.2d 597), and Mannington Mills, Inc. v. Congoleum Corp. (595 F.2d 1287)—the Court has evolved complex tests for ascertaining what constitutes an “act of state,” and has come to justify claims of extraterritorial jurisdiction to address the growing economic interdependence of the global economy. It would appear that the United States gradually has broadened the nineteenth-century definition of exclusive territorial sovereignty, now clearly transcended by twenty-first-century developments. It has been replaced by new legal conceptions of sovereignty and by the principles of universal rights that are imperative in international relations, especially in developing countries that once were colonies. There appears to be a growing legal sensitivity to the global impacts of activities by states beyond narrowly territorial considerations that will challenge them to creatively define what were once condoned as “extraterritorial rights.”

Finally, it is appropriate to note the application of extraterritoriality in matters of ocean travel, airspace, and international terrorists. Whereas private vessels are subject to local laws, rights of extraterritoriality extend to state-owned vessels in foreign territorial waterways and ports, where they are customarily exempt from local jurisdiction. Likewise, the advent of national “territorial airspace” has given rise to extraterritorial claims, although such claims have found little consensus for an international regime beyond limited bilateral agreements.

In response to terrorist attacks on U.S. embassies and their personnel, in 1999, Congress passed, and President Bill Clinton signed into law, legislation making terrorism abroad a crime punishable as if the attack occurred in the United States (and thus was subject to U.S. laws). In accordance with normal diplomatic practice, the United States retains jurisdiction over its diplomatic officials abroad. It also claims jurisdiction over U.S. military personnel on American military bases abroad. The United States has also criminalized some activities engaged in by Americans abroad. For example, the Foreign Corrupt Practices Act prohibits American companies from paying bribes to foreign officials. However, this legislation is very different from the past practice of extraterritorial jurisdiction over Americans abroad, because it cov-
ers American companies. It is, in a sense, a hybrid of regional and global extraterritoriality.

Many states have enacted “blocking statutes” that prevent their citizens and companies from complying with American extraterritorial laws and court rulings. They include Australia, Canada, Denmark, Finland, France, Italy, Japan, Mexico, New Zealand, Norway, Sweden, Switzerland, and the United Kingdom. The European Union and the Organization of American States have also lodged formal protests against American extraterritorial claims.

Clearly, then, the concept of extraterritoriality historically has been an evolving expression of state sovereignty, which, one suspects, will continue to transform to meet the needs of an ever-changing international system.

The United States government first recognized the usefulness of foreign aid as a tool of diplomacy in World War II. Such a program, policymakers believed, would fulfill three goals: it would furnish humanitarian assistance to needy peoples, it would promote liberal capitalist models of development in other countries, and it would enhance national security. The U.S. commitment to foreign aid since has amounted to well over $1 trillion in current dollars—not counting hundreds of billions more donated through the International Monetary Fund, World Bank, and other multilateral agencies. Always a controversial program, foreign assistance drew its broadest support in the early Cold War era. At that time, the effort to undermine communism permeated all other aid considerations, including the plight of the poor, the expansion of democracy abroad, and U.S. economic goals that might be served by foreign assistance, such as stimulating private investment and opening up markets to American products. All of these objectives, however, generated wide support from members of Congress, ranging from those whose chief focus was U.S. security to those who were most interested in developing the Third World.

In the Vietnam era, however, the consensus of support began to unravel. Like the war itself, foreign aid programs were variously attacked as imperialistic, paternalistic, harmful, wasteful, or just plain useless. (Indeed, these imperialistic attributes of aid had contributed to the United States’s own birth—without the assistance of the empires of France and Spain, the nascent republic would hardly have survived.) Although American foreign aid has changed its emphasis frequently since the Vietnam era in response to such criticisms, the flow has never stopped and has continued to generate calamity from all sides of the political spectrum. Notwithstanding these attacks, foreign aid has undoubtedly racked up some solid achievements. Third World residents have experienced great advances in their standard of living since the 1960s. The eradication of smallpox, the halving of poverty, the doubling of literacy from 35 to 70 percent, and the sharp rise in life expectancy from forty-one to sixty-three years, are evidence of this. Unfortunately, such improvements have not headed off a broadening economic gap between the rich and poor nations. For instance, Africa’s average annual income in adjusted dollars in the 1990s was about the same as it had been in the 1960s, approximately a dollar a day. There, too, the AIDS epidemic has proved as devastating as smallpox. The great ambitions of President John F. Kennedy for foreign aid (see sidebar) were not met in the 1960s “decade of development,” nor have they been realized since.

During the Cold War era, bilateral assistance (on a government-to-government level, including that channeled via nongovernmental organizations) broke down in unadjusted dollars to $139 billion in military and economic assistance to the Middle East and South Asia, $70 billion to East Asia, $48 billion to Europe, $29 billion to Latin America, and $23 billion to Africa. In the 1990s, both the demise of the Soviet Union, whose influence U.S. foreign aid was long designed to check, as well as the spectacular economic growth of such former aid recipients as South Korea, led the United States to adopt new targets. Indeed, as Secretary of State Madeleine Albright declared in 1999, “traditional notions of ‘foreign aid’ have become virtually obsolete.” The 1997 State Department strategic plan outlined the following goals for foreign aid: creating “institutions that support democracy, free enterprise, the rule of law and a strengthened civil society”; providing humanitarian aid; and “protecting the United States from such specific global threats as unchecked population growth, disease, the loss of biodiversity, global warming, and narcotics trafficking.” At the turn of the twenty-first century,
U.S. funds were defending peace in Kosovo, East Timor, and the Middle East, dismantling Soviet nuclear weapons, disarming drug dealers in Central America, democratizing Nigeria, and developing the armies of America’s erstwhile enemies, the former socialist countries. Yet, as Albright herself acknowledged in 2000, the programs continued to support very traditional aims, such as “promoting U.S. exports, spurring overseas development and helping other countries to achieve viable market economies”—in other words, expanding the adoption of liberal capitalist norms of development. While recipient countries have certainly changed, the United States continued to spend about the same amount as it had at the end of the Cold War, utilizing Cold War foreign aid instruments like the Foreign Assistance Act and the Agency for International Development. According to the State Department, in 2000 the United States spent $16.5 billion on foreign operations, ranging from the Peace Corps ($244 million) to the foreign Military Training Program ($4.8 billion).

THE ORIGINS OF FOREIGN AID

Prior to World War II, U.S. government-to-government assistance and loans were extremely rare and limited to emergency situations. The impulse to spend money to spread goodwill and influence abroad was not absent, of course: in the nineteenth century, private individuals supported such causes as Greek independence in the 1820s and victims of the Irish famine in the 1840s; later, major corporations set up international philanthropic arms like the Rockefeller Foundation. During and after World War I, the U.S. government became directly involved in disaster relief, assisting German-occupied Belgium and sending $20 million to Russian famine victims in 1921. Subsequently, enormous U.S. lending helped rebuild Germany and other countries, alongside the efforts of American religious organizations like the American Friends Service Committee and the Young Men’s Christian Association. The U.S. loans stopped, however, in the Great Depression and were never repaid. Campaigning in 1932, Franklin D. Roosevelt promised that the United States would sanction no more such foreign investments.

But military aid continued to flow throughout the interwar years to pro-U.S. regimes in neighboring countries, including Cuba, Mexico, and Nicaragua. During World War II, moreover, the State Department’s Coordinator for Inter-American Affairs, Nelson Rockefeller, set up the Institute of Inter-American Affairs, which furnished food and sanitation assistance as a counterweight to Nazi influence in Latin America. In the late 1930s, President Roosevelt developed a Western Hemisphere Defense Program to further U.S. influence in the region with greater trade and cultural ties, as well as military aid. Like the subsequent $50 billion lend-lease program for Europe and Asia, which included the first major U.S. effort to export arms outside Latin America, these initiatives were all defense measures. They were supplemented by other programs, such as the $6.1 billion that the United States contributed to the Government and Relief in Occupied Areas program from 1943 to 1951, as well as the $2.6 billion it furnished the United Nations Relief and Rehabilitation Administration from 1943 to 1947.

In the immediate aftermath of the war, the United States also sent military surplus items to France, Britain, Nationalist China, and the Philippines, where it maintained bases following independence in 1946. Such assistance remained ad hoc, since Congress as yet resisted an expansion of U.S. military aid. “We should not be sending military missions all over the world to teach people how to fight in American ways,” said the Republican senator Robert Taft of Ohio.

Also during World War II, the Bretton Woods Conference led to the creation of the International Monetary Fund (IMF) and the International Bank for Reconstruction and Development (the World Bank), two key instruments of economic relief and reconstruction that were aimed at ending the kinds of economic nationalism that many felt had led to the Great Depression and the war. The IMF established the dollar as the international currency, facilitated international trade, and made loans to governments to fix trade imbalances; the World Bank ensured that foreign investment in developing areas would be less risky by extending loans for reconstruction and development projects, and promoting investment and international trade. The United States dominated both organizations, in 1945 holding one-third of the votes in each and supplying one-third of the financing of the bank, or $3 billion. At century’s end, the United States still supplied one-fifth of all IMF funds, and these institutions and their policies continued to generate controversy. In September 2000, at World Bank–IMF meetings in Prague, the debts owed by Third World governments sparked riots as thousands of protesters, dissatisfied with the agencies’ debt relief policies.
and the pace of economic globalization, threw Molotov cocktails and rocks at police and at such bastions of global capitalism as a McDonald’s restaurant, cutting short the meetings.

THE COLD WAR FOREIGN AID PROGRAM, 1947–1953

The postwar commitment of the United States to foreign aid stemmed from its vast aid role in World War II but also involved a number of new considerations. Initially, American foreign aid programs in the early Cold War demonstrated the nation’s assumption of the economic and political role previously played by Great Britain, as exemplified by the Truman Doctrine and its support to such former British clients as Greece and Turkey. The United States also used foreign aid to promote free-market standards for development, including the integration of West European economies and the curtailing of economic protectionism, through such instruments as the Marshall Plan. These programs, and especially the Marshall Plan, would greatly benefit the U.S. economy by generating orders at home. Finally, and most importantly, these efforts were designed to prevent the spread of international communism. By early 1946, U.S. policymakers were becoming increasingly convinced that the Soviet Union had embarked upon a path toward world domination. The following year, the State Department official George F. Kennan called for “long-term, patient but firm and vigilant containment of Russian expansive tendencies,” and the United States adopted containment as its doctrine for dealing with the Soviet Union.

It was Soviet pressure in the Mediterranean that led the United States to announce the Truman Doctrine in March 1947, thereby launching its Cold War foreign aid program in earnest. Extending an unprecedented peacetime aid amount of $650 million, the doctrine proclaimed that “it must be the policy of the U.S. to support free peoples who are resisting attempted subjugation by armed minorities or by outside pressures.” It was the first time that the United States had put cold cash as well as warm bodies, in the form of technical advisers, behind the containment policy. In a joint session of Congress, Truman declared that totalitarian regimes “spread and grow in the evil soil of poverty and strife,” and thus, U.S. help—the only help available, he declared—was necessary to stop the spread of communism.

Less than three months later, the United States proposed the Marshall Plan, or European Recovery Program, in response to the postwar economic crisis in western Europe that many U.S. officials felt would only make it easier for communist parties to take hold there. Secretary of State George C. Marshall, outlining the aid plan in an address at Harvard University on 5 June 1947, stated that the United States “should do whatever it is able to do to assist in the return of normal economic health to the world, without which there can be no political stability and no assured peace.” If not for American aid, the Truman administration contended, no parliamentary regime in western Europe would survive and U.S. security would therefore be threatened. The Marshall Plan provided a $12 billion package to sixteen countries in western Europe that not only rebuilt the economies of its recipients but also instituted liberal economic practices such as lower tariffs and instruments to coordinate economic policies.

U.S. officials envisioned that foreign aid, by establishing beneficiaries’ internal political stability, promoting their general economic development, and building military strength, was the best way to counteract Soviet expansion. As the program grew during the Cold War, aid recipients fell into two categories: forward defense countries bordering the communist bloc as well as those located in other strategic areas like South Asia and the Middle East, and the less strategically placed countries. In the forward defense countries, but also in sensitive areas like Latin America, aid was often designed to support existing, pro-American governments, through arms and personnel as well as through economic aid to mitigate internal discontent. It was hoped that aid would prevent these countries from falling into the Soviet orbit, which as a result often put the United States on the side of reactionary domestic forces, as was the case in Vietnam, Iran, and Cuba.

Economic assistance programs faced resistance in a tight-fisted Republican postwar Congress, but Cold War threats helped squelch such recalcitrance. Foreign aid quickly expanded to include the economic stabilization of non-European areas, as well as a new emphasis on military assistance. For example, the United States gave limited aid to such nations as South Korea, the Philippines, and Iran. Its biggest expenditure outside of Europe was the $2.5 billion in military and economic aid to the Nationalists in China, aid that continued even after Chiang Kai-shek's gov-
ernment had proved itself utterly beyond help. Then, at his inauguration in January 1949, Tru-
man put forward a pioneering foreign aid pro-
posal that included (1) support for the United
Nations; (2) U.S. programs for world economic
recovery; (3) support for “freedom-loving coun-
tries against aggression”; and 4) “a bold new pro-
gram for making the benefits of our scientific
advances and industrial progress available for the
improvement and growth of undeveloped areas.”
In the wake of China’s “fall” to communism, and
the Soviet atomic blast, the military threat of
Soviet expansion appeared grave, and Truman’s
third point, to assist “freedom-loving countries,”
was quickly put into effect. In October 1949, two
months after the United States had officially
joined NATO, the Truman administration created
a Military Assistance Program under the auspices
of the Mutual Defense Assistance Act, with a
budget of $1.3 billion. Expenditures continued to
rise, and in its first three years, as Chester Pach
has noted, the program extended $8 billion in
military aid to western Europe, largely with the
aim of enhancing “the psychological attitudes and
morale of our allies.” Despite controversies that
have dogged military assistance ever since—for
instance, that it was an unwieldy program with
“no organized, careful thought about what it was
that we were trying to do,” as Secretary of State
Dean Acheson aptly put it—the program contin-
ued to grow. U.S. officials reckoned that if military
aid were not continued in ever larger amounts,
demoralization would set in, weakening western
Europe’s military position still further.

Point Four, which the inaugural address is
best remembered for, was the basis for the Agency
for International Development (AID), a $35 mil-
lion program that provided technical assistance to
the Third World. The Point Four program,
according to a State Department official, sought
“to strengthen and generalize peace . . . by coun-
teracting the economic conditions that predispose
to social and political instability and to war.”
Europe, now recovering with Marshall Plan aid,
would no longer be the major recipient of Ameri-
can economic assistance. Despite Europe’s con-
inuing importance, as Acheson told Congress in
1950, “economic development of underdeveloped
areas” had become a national concern, since “our
ilitary and economic security is vitally dependent
on the economic security of other peoples.”
The process of decolonization had made these
countries a key battleground in the Cold War,
with both Russia and America vying for influence
over the newly formed nation-states of Asia and
Africa. (Another undeveloped area, Latin Amer-
ica, received less attention in the 1950s.) The UN
and the World Bank also shifted their focus from
reconstruction of war-torn Europe to the prob-
lems of the Third World at this time. The Third
World’s stash of raw materials further heightened
its importance. In 1952 the President’s Materials
Policy Commission recommended that the
United States look to the countries of Africa, the
Middle East, southern and southeastern Asia, and
Latin America for imports of minerals and tied aid
programs to this end in the 1950s.

Truman’s initiatives were incorporated into
the Mutual Security Act (MSA) of 1951, which
succeeded the Marshall Plan and offered a new
program of economic and, especially, military aid
both for Europe and the developing world. In its
first year, for example, the act extended to Europe
a combined military and economic package of
$1.02 billion; in 1952, as the Korean War ground
on, it included $202 million in military support to
Formosa (Taiwan) and Indochina. In the wake of
National Security Council document NSC 68 of
1950, which had called for large-scale military aid
along with an enormous defense buildup, secu-
ry-related assistance would become a hallmark
of the Eisenhower era (1953–1961). Thus, while
military assistance had been a little more than a
third of the $28 billion in aid that the United
States had extended during the Marshall Plan era
(1949–1952), during the succeeding eight years,
it was almost 50 percent of a larger, $43 billion
total. Meanwhile, technical assistance under
Point Four went to such countries as Liberia,
Ethiopia, Eritrea (where the United States had a
large surveillance post), Libya, Egypt, Saudi Ara-
bia, Lebanon, Iraq, Israel, and Iran. Latin America
was largely left out of Point Four until the end of
the 1950s, although certain countries in which
the United States countered perceived communist
threats received significant security assistance.

THE EISENHOWER ADMINISTRATION
AND EXPANSION OF FOREIGN AID

Senator Tom Connally, chairman of the Senate
Foreign Relations Committee, demonstrated the
popular sentiment toward foreign aid when he
declared in 1951, “We can’t go on supporting
countries all over the world with handouts just
because we like them—or any other reason.”
Indeed, many members of Congress in this era
were reluctant to vote public funds for development purposes, because they believed that such funds should not replace private investment. Beginning with the Marshall Plan, aid had been traditionally aimed at stimulating private investment through trade liberalization and by making improvements in the global economic climate. In fact, in his first State of the Union message, President Dwight D. Eisenhower unabashedly proclaimed that the explicit purpose of American foreign policy was the encouragement of a hospitable environment for private American investment capital abroad. He called for trade, not aid. Such hard-headed motives did not preclude a significant expansion of U.S. economic aid in the Eisenhower administration, however, as confirmed by a significant augmentation of U.S. Export-Import Bank loans and an increase in soft loans in 1954. Cold War pressures as well as the lobbying efforts of individual countries helped further this trend, and the Mutual Security Act of 1954, the first single piece of legislation to embrace the entire foreign assistance program, became the instrument for this new policy. The United States also launched the Agricultural Trade Development and Assistance Act in 1954, commonly called the Food for Peace program, which was still thriving a half century later. This program initially authorized $350 million in food surplus shipments, payable in local currency. Known as Public Law 480, it was the product of some heavy lobbying by Senator Hubert Humphrey, a Democrat who hailed from the farm-filled state of Minnesota. Designed to “increase the consumption of United States agricultural commodities in foreign countries, to improve the foreign relations of the United States and for other purposes,” Public Law 480 would authorize $3 billion in sales by 1956 and become an important element in the foreign aid program, while helping to lower U.S. food surpluses. The foodstuffs served as a development subsidy, enabling recipient countries to sell them on the domestic market and then use the proceeds for development projects. Unfortunately, food aid significantly damaged Third World producers, including many Indian farmers, pushing India close to famine in the 1950s and 1960s.

In addition to providing food, foreign aid was also an important weapon of anticommunist intervention during the mid-1950s. After the United States brought down Iran’s nationalist, anti-American prime minister, Mohammad Mossadegh, in 1953, replacing him with Shah Mohammad Reza Pahlavi, it gave that country $85 million in foreign aid, and the shah’s army was soon among the best-equipped in the Middle East. Eisenhower and Secretary of State John Foster Dulles also used foreign aid to gain friendship and allies in Latin America. In 1954, the United States intervened in Guatemala to overturn the regime of Jacobo Arbenz Guzmán and assist in the military coup of Carlos Castillo Armas. Guzmán, according to U.S. Ambassador John Peurifoy, “talked like a communist, he thought like a communist, and he acted like a communist, and if he is not one, he will do until one comes along.” American aid to Guatemala, which had amounted to just $600,000 over the preceding ten years, rose to $130 million in the six years following Castillo Armas’s coup. One of Guatemalan aid’s most vigorous supporters was Vice President Richard Nixon, who touted construction of the country’s Inter-American Highway as promoting everything from trade to security. Guatemala thus became a “testing ground” in the Eisenhower administration’s newly expanded foreign aid program.

At the same time, however, U.S. officials grew increasingly uncomfortable with another Latin American client, Cuban leader Fulgencio Batista, who used American military aid meant for “hemispheric defense” against his own people in the late 1950s. Washington welcomed his departure and, initially, the ascendance of Fidel Castro. Soon, however, American military aid, training, and scuba suits would be furnished to the Cuban foes of the Soviet-leaning Castro, though to little effect. In 1957, the State Department’s International Cooperation Administration set up a Development Loan Fund chiefly to assist India, which faced a serious foreign exchange crisis. This program represented the first significant use of subsidized (or soft) loans, which by the end of the decade would become the most important tool employed in U.S. foreign aid programs, replacing development assistance. By 1961, the World Bank had also set up a soft loan agency, the International Development Association. U.S. and World Bank lending to India helped the government build fertilizer plants, power plants, highways, railroad locomotives, and airplanes. In the process, however, it strengthened India’s national economic planning apparatus, as Shyam Kamath noted in a 1994 article, and “facilitated the growth of the public sector at the expense of the private sector.” Thus, though the United States professed that its aid and technical assistance was aimed at creating a better environment for invest-
ment and a more liberal economy, as the Indian example shows it often assisted instead in the entrenchment of heavy-handed central planning agencies in the Third World.

As the loans to India demonstrated, the less-developed countries continued to be a vital battleground for U.S.-Soviet competition. In January 1957, in response to the deepening of relations between Egyptian leader Gamal Abdul Nasser and Soviet premier Nikita Khrushchev, the Eisenhower Doctrine pledged U.S. support to any nation in the Middle East that wanted help “resisting armed attack from any country controlled by international communism,” and Congress approved a $200 million economic and military aid program for the defense of this region. Then, as 1960 ushered in the “development decade” (see sidebar), Washington finally recognized its largely neglected neighbors at the Conference of the Organization of American States in Bogotá, pledging $300 million for the Inter-American Fund for Social Development. This fund included a bank to furnish improved sanitation, housing, and technical training, in order to enable “the individual citizen of Latin America to live a better life and to provide him the fullest opportunity to improve his status.” At the Punta del Este Conference the following year, the Kennedy administration would launch the Alliance for Progress. This program, funded largely by the United States, had as its goal the modernization of Latin America through reform of its political and economic structures, and the injection of capital and technical assistance.

THE PEAK OF PRESTIGE: FOREIGN AID UNDER KENNEDY

Upon entering office in 1961, President John F. Kennedy very much hoped to burnish the image of American foreign assistance, which had been skewered in such recent books as Eugene Burdick and William J. Lederer's best-selling The Ugly American (1958), a novel about an ignorant, insular set of foreign service officers-at-large in Southeast Asia, hopelessly losing the battle to communism owing to their maladroit application of foreign aid. Kennedy saw the Peace Corps as one way to revamp this impression of America abroad. The notion of volunteers living alongside those they sought to help was a far cry from The Ugly American's out of touch bureaucrats and was particularly appealing in an era that came to repre-

sent the “high-water mark of idealism concerning what overseas aid could achieve,” as Paul Mosley wrote. Kennedy established the agency by executive order less than six weeks after he took office.

While The Ugly American no doubt had a salubrious influence on him, perhaps the president should have paid closer attention to a far more chilling and penetrating critique of American foreign intervention in this era, Graham Greene's The Quiet American (1955). In this novel, an arrogant, clean-cut young American character, Alden Pyle, idealistically destroys innocent lives in order to save the Vietnamese from communism, eerily foreshadowing the U.S. role in that country that Kennedy helped propel in the early 1960s, in part through foreign aid.

In September 1961, Congress enacted the Foreign Assistance Act (FAA), still the governing charter for U.S. foreign aid. Like the MSA earlier, the FAA attempted to systematize all existing foreign aid programs and included a Development Loan Fund, which would assist with large projects, as well as a Development Grant Fund for technical development. In addition, the FAA provided a “supporting assistance” program (later called the Economic Support Fund) to promote economic and political stability and launched a program to protect American business abroad, the antecedent of the Overseas Private Investment Corporation.

Later that fall, the Agency for International Development (USAID) opened for business, coordinating U.S. assistance programs under the aegis of the State Department. As this flurry of activity shows, Kennedy was a great promoter of foreign aid, which he envisioned as part of his goal to “pay any price, bear any burden” to assist the free world. The fundamental task of our foreign aid program in the 1960s, he said idealistically, “is not negatively to fight Communism . . . it is to make a historical demonstration that in the twentieth century, as in the nineteenth . . . economic growth and political democracy can develop hand in hand.” As Michael Hunt notes skeptically, Kennedy and other foreign aid advocates were convinced that “thanks to American wisdom and generosity and to the marvels of social engineering, the peoples of these new nations would accomplish in years what it had taken the advanced countries decades to achieve.”

Despite Kennedy's words, fighting communism remained a priority. By its very dynamic, as he recognized, the modernization process that was necessary for economic growth could also
unleash unpredictable forces, including mass unrest. This was just the sort of milieu that communists might exploit through sponsorship of internal insurrection, “the so-called war of liberation,” as Kennedy put it in a June 1961 speech. An American military response alone would be ineffective in combating such uprisings; aid, too, was necessary, as it would “help prevent the social injustice and economic chaos upon which subversion and revolt feed.” Foreign assistance and American counterinsurgency expertise, it was believed, would steer countries through these difficult transitions without their resorting to revolutionary, communist regimes.

As USAID administrator Fowler Hamilton put it plainly to Congress in budget hearings in 1962, “The communists are active. The total commitments they are putting out now run on the order of $1.2 billion to $1.3 billion a year.” Fortunately, “the free world” was more than holding its own, supplying the Third World with $8 billion in both aid and private investment. “I think that we have the resources and the good sense to prevail,” said Fowler, mindful of his budgetary ambitions.

Yet Representative Marguerite Stitt Church of Illinois raised one of foreign aid’s most vexing questions during Fowler’s testimony. While agreeing with the importance of defending “the cause of human freedom, as exemplified by the ideals of this country,” she also worried that the emphasis still placed on major huge projects “would not reach the lives of the ‘little people’ whom we must touch.” A similar plea was made at the time by the foreign aid analyst John D. Montgomery in The Politics of Foreign Aid, who argued that the United States was too willing to overlook the undesirable aspects of certain recipient regimes, giving the United States the reputation of being “divorced . . . from the social progress” of the people in these countries.

As such observations revealed, even in the heyday of foreign aid the program faced sharp criticism. Representative J. L. Pilcher asserted that despite over $1 billion already spent in Vietnam, leader Ngo Dinh Diem’s lack of popular support
would mean that the country would be “in the hands of the communists” within twenty-four hours of the departure of U.S. troops—not such an inaccurate prediction, as it turned out. “Where is all our economic aid going to help stop communism in that country?” he wondered. It was an unanswerable question, and the spending continued.

Indeed, U.S. representatives in the newly decolonizing countries quickly learned that aid would get them improved access to government officials, and by 1963, there were twenty-nine aid programs operating in Africa. Some members of Congress, however, remained dubious about the expansion of foreign aid, and, for that reason, Kennedy asked a prominent detractor of foreign assistance, General Lucius Clay, to look into the matter—the confident Kennedy certain that even the critic Clay would be convinced of the program’s value once he looked into it. However, Clay’s committee’s findings showed that “these new countries value their independence and do not want to acquire a new master in place of the old one . . . there is a feeling that we are trying to do too much for too many too soon . . . and that no end of foreign aid is either in sight or in mind.” Clay’s verdict as to the indeterminate nature of this program was certainly borne out. And despite Kennedy’s fervent conviction of the effectiveness of foreign aid, programs like the Peace Corps and the Alliance for Progress were hard-pressed to meet the social and economic challenges they confronted in the Third World.

Kennedy’s idealism, too, could not alter the fact that throughout the 1960s, foreign aid programs were conceived with increasingly close attention to U.S. security interests. Foreign assistance remained largely focused on keeping the Third World from turning to communism, and included support to strengthen resistance to internal communist movements as well as to meet the external Soviet threat. Funds for infrastructural improvements and education were a favorite vehicle for these objectives. Secretary of Defense Robert McNamara, demonstrating the close link Washington envisioned between aid and U.S. predominance in the Cold War, declared in 1964 that “the foreign aid program . . . and the military assistance program [have] now become the most critical element[s] of our overall national security effort.” Making the connection even more precise, President Lyndon B. Johnson added that the foreign aid program was “the best weapon we have to ensure that our own men in uniform need not go into combat.”

Actually, foreign aid went right into war alongside the soldiers in Vietnam, as part and parcel of the large U.S. pacification program in the southern half of that country. Vietnam drew the fervent involvement of USAID, which, as Nicholas Eberstadt has pointed out, made that country the donor for nearly half of its development grants by 1966. Much of this went to fund the ill-fated strategic hamlet program and other disastrous measures, which, while feeding the dislocated South Vietnamese, gutted their economic foundations and thus worked exactly against the traditional objectives of foreign aid. But at the same time, the United States also showed its sensitivity to indigenous economic conditions by hosting the Tidewater conference in Easton, Maryland, where representatives of seventeen nations mobilized in 1968 in response to the threat of famine in India. Their work led to the “green revolution,” a movement that brought innovations to agricultural cultivation in the Third World to produce more staple foods and prevent famine.

**FOREIGN AID IN CRISIS: THE VIETNAM EFFECT AND “NEW DIRECTIONS”**

Despite such successes, disillusionment arising from the deepening commitment in Southeast Asia led many Americans across the political spectrum to disparage foreign aid, and for the first time such criticisms were heard at the highest levels of the U.S. government. For much of the post–World War II period, the policymaking establishment held foreign assistance as sacrosanct in American politics and diplomacy and often oversold its virtues to a skeptical public and Congress. Democratic and Republican administrations outbid each other in extending aid programs; liberal and conservative members of Congress joined in bipartisan voting on aid appropriations, even as individual members grumbled; and labor, management, religious, and educational groups all voiced approval of foreign aid. Yet the interventionist consensus articulated in the Truman Doctrine and Point Four, and widely supported for two decades, foundered in Vietnam. Arguments that for twenty years had given the greatest urgency and immediacy to the cause of foreign aid—including the threat of communism, the need for continued access to vital raw materials, the economic benefits to be gained through increased trade, and the political divi-
dends to be reaped in terms of peace and democracy—lost much of their force, at least temporarily. At the deepest point in U.S. involvement in the Third World, many Americans began to question the rationale for any involvement.

Thus, by 1970, Washington had dropped its commitment in Africa to ten countries, and in 1971 and 1972 the Senate refused to fund foreign assistance at all, although a year-end catchall resolution covered the budgets. Antiwar legislators joined members of Congress who opposed government waste in tightening the reins on USAID, as the agency became subject to heightened congressional oversight that gave legislators veto power over even the smallest items. Despite considerable public and congressional debate over the objectives and techniques of foreign aid programs—particularly from conservatives in both parties who objected to what Representative Otto Passman called “the greatest give-away in history”—Congress decided to keep foreign aid in the 1970s, although revising its aims significantly.

Meanwhile, Third World nations were also becoming increasingly critical of the existing system of aid distribution. Rejecting reform proposals of the foreign aid establishment such as those contained in the Rockefeller Report (1969), which urged the United States to widen its use of private investment, skills, and other initiatives, these nonaligned nations proposed a new international economic order, which Jeremy Brecher and Tim Costello note called for “the regulation of global market forces in the interest of the development process” through a program of subsidies and other supports for exports. Critics of the proposal like Nicholas Eberstadt, however, claimed that it was simply an attempt to “disassemble[c] the liberal international economic order . . . augmenting instead the capacity of states and the authority of their leaders to plan their local economies” at Western expense.

In the self-critical angst that characterized the late Vietnam era, the United States was only too willing to shed its old shibboleths about capitalism’s virtues. Under the U.S. Foreign Assistance Act of 1973 and the Mutual Development and Cooperation Act, also passed that year, the liberal capitalist model for Third World progress and its associated large-scale development projects came under withering criticism. The mantra of the 1973 reforms, known as “New Directions,” became the goal of meeting “basic human needs.” USAID focused on programs that assisted in the provision of food, medicine, and housing, especially in rural areas, rather than more grandiose infrastructure projects. The act’s categories of assistance grants and development loans were replaced with “functional categories aimed at specific problems such as agriculture, family planning, and education,” an organizational structure that has largely remained. The new program in some ways resembled the technical assistance efforts of the early 1950s, but in keeping with the move away from liberal capitalist tenets, the U.S. effort emphasized instead top-down government “development planning” as the best tool to foster Third World growth. Unfortunately, this was often “planning without facts”—especially when Texas-style cattle raising proved untenable in sub-Saharan Africa. The World Bank, meanwhile, participated in a $2.4 billion investment in African agriculture in the 1970s, largely for vast state farms and irrigation programs, with dismal results. In a 1994 article, James Bovard attributed these failures to inappropriate technology as well as “soil unsuitability.” By the 1980s, food output in Africa had fallen 20 percent from twenty years earlier. Governments’ zeal for complex technologies in place of simple and workable changes, coupled with widespread political corruption, was largely responsible for the disasters in Africa.

In the 1970s, the United States increasingly turned to the World Bank and similar agencies as a favored instrument for dispensing aid, a process called multilateralization. Ostensibly, multilateral aid diluted the pressure that bilateral aid placed on recipient countries, although these agencies’ funds came with their own chafing leash. During Robert McNamara’s tenure at the bank (1970–1981), its lending rate increased thirteen times, from $883 million to $12 billion. This aid was not always helpful to the people of the Third World. In his article, Bovard quotes a former executive director of the International Monetary Fund, who charged that such “unseemly” lending only ratcheted up Third World politicians’ control over their own people, assisting the repressive collectivization programs of such leaders as Julius Nyerere of Tanzania in the early 1970s and the brutal social engineering of the Vietnamese government later in that decade.
ity in U.S. foreign policy, and this focus led him to cut back on aid to such brutal regimes as that of Ethiopia's Mengistu Haile-Mariam. Military aid, however, continued to the Somali allies of the new Soviet-backed Mengistu; by 1980, 75 percent of total African aid was going to the Horn of Africa, reflecting Cold War priorities. Carter's human rights campaign helped reform oppressive governments in Brazil and Argentina, but elsewhere, such as in El Salvador, South Korea, and China, Carter's message was more inconsistently applied, with security interests outweighing human rights concerns. Most egregious, perhaps, was his approach to Iran, where Carter, despite strong congressional criticism, sold the shah of Iran sophisticated AWACS radar systems. American support for the shah helped lead to the revolution of Ayatollah Khomeini. At the same time, Carter administration officials sought to deflect criticisms that USAID was a U.S. foreign policy "tool," and they removed it from the State Department, placing it under the new International Development Cooperation Agency (IDCA). USAID remained closely connected with the State Department, however, and foreign aid continued to serve America's state interests. (The IDCA was closed down in 1998.) Carter also continued a practice begun in the wake of the 1973 Yom Kippur War of extending heavy aid to the Middle East, especially Israel and Egypt, following the 1978 Camp David peace accords between those two nations. In 2001 Egypt and Israel remained the largest recipients of U.S. foreign aid.

When Ronald Reagan entered office, his rhetoric harkened back to the Eisenhower administration in its emphasis on traditional liberal capitalist models of development that would stimulate private investment, an outlook that over the following decade slowly took hold in the foreign policy establishment, replacing the 1970s New Directions ethos. By the 1990s, this model was manifest in the foreign aid establishment's support for globalization, essentially a process that promotes the opening of national borders and the internationalization of economic and social ties through capitalist models of free trade and investment. However, in the 1980s, USAID administrator M. Peter McPherson could still insist that overpopulation, not underinvestment, corruption, and mismanagement, was the "primary obstacle" to Third World development. Indeed, the United States continued to fund hopelessly crooked regimes in order to keep them from linking up with the Soviet Union, like that of Mobuto Sese Seko in Zaire (now the Democratic Republic of the Congo). As an exasperated USAID official noted later, Washington's $2 billion investment in Zaire "served no purpose."

During the Reagan administration military aid once again became a high priority, with more than 40 percent of U.S. bilateral aid being distributed in the form of loans for military training and equipment between 1981 and 1986. Outside of Israel and Egypt, a good deal of this aid went to Central America's anti-leftist regimes, including the government of El Salvador. Another key shift in foreign aid in the Reagan era was the new importance placed on Africa. Owing in part to the efforts of a growing number of African-American members of Congress, as well as the increasingly influential nongovernmental organizations, Congress created the Development Fund for Africa, which, as Carol Lancaster notes could not be "raided" by other programs. By the early 1990s, the U.S. African effort had more than recovered from the cutbacks of the early 1970s. USAID had programs in forty-three African countries, with thirty field missions.

While the United States certainly changed priorities in its economic aid programs in the wake of Vietnam, Congress was ready to gut military programs in this era. In 1976, President Gerald Ford tried to stem congressional zeal for cutting military assistance, as exemplified in the Foreign Assistance Act of 1974, which called for such aid to be "reduced and terminated as rapidly as feasibly consistent with the security of the United States." Ford compromised by cutting such assistance in the 1977 budget. However, Congress then passed the International Security Assistance and Arms Export Control Act of 1976, which made legislators the final arbiter of arms transfers and deployment of military advisers abroad.

The 1980s, however, also saw a growing debt crisis in the Third World, as many countries defaulted on their foreign obligations. In Africa, debt grew from $55 billion to $160 billion between 1980 and 1990, and servicing the debt proved a crippling task for many governments. The International Monetary Fund and other multilateral agencies, reflecting the growing ethos of "neo-liberalism" in this era, emphasized the importance of markets and market-based reforms to get nations out of debt. Continued aid was made contingent upon policy reforms designed to bring stabilization, such as cutbacks on borrowing and currency devaluation. Gambia, for instance, devalued by 90 percent. In Nigeria, the
World Bank made loans conditional on the ending of subsidies and large-scale irrigation schemes and the furthering of market reforms. In many countries, however, these changes often proved as difficult and culturally dissonant as cattle raising had in the 1970s. As Nguyuru Lipumba noted in a 1988 article, in countries like Tanzania, “streamlining public enterprises and letting them operate as commercial enterprises . . . without central government interference is considered a second-best policy.”

THE POST–COLD WAR WORLD

With the fall of the Soviet Union in 1991, U.S. foreign aid programs faced a deep crisis. Senators like Patrick Leahy proclaimed that American aid had lost its purpose and vision and that its connection to foreign policy goals was tenuous at best. This transitional period has provided an opportunity for business groups, among others, to call for a more traditional use of aid: to provide markets for U.S. exports, a sentiment that also led to the 1992 signing of the North American Free Trade Agreement (NAFTA) between the United States, Canada, and Mexico. The NAFTA negotiations were a direct result of Mexico having moved away from more traditional patterns of Third World development, including import substitution and high tariffs, toward a more open market in the 1980s. Such economic openness was touted by foreign aid officials as the best means to improve the plight of the Third World.

The post–Cold War reassessment of aid also brought sharp budget cuts, and by 1997 USAID had lost twenty-four foreign missions and one-third of its staff from a peak in the early 1990s. While traditional in-country development did not disappear, the new emphasis on globalization helped create an agenda of transnational issues, or problems that affect a community of nations, often in a specific region. In 1993, the Clinton administration established the Task Force to Reform AID and the International Affairs Budget, which offered a number of broad-based initiatives reflecting the new transnational perspective on foreign aid such as preventing the spread of disease, environmental destruction, and drug trafficking, and addressing concerns such as child survival, migration, population growth, and the promotion of democracy. The task force’s Wharton Report became part of the administration’s Peace, Prosperity, and Democracy Act proposal, which called for making foreign assistance more amenable to “emerging international realities”—thus challenging the more narrowly construed national security premises of the venerable Foreign Assistance Act of 1961. This effort did not succeed. Senate Foreign Relations Committee Chairman Jesse Helms decided in 1994 that cuts to foreign aid were more important than an ambitious retooling: “We must stop this stupid business of giving away the taxpayers’ money willy-nilly.” However, some revamping was unavoidable; the world had changed. To assist the former socialist states, in 1994 Congress enacted the Freedom Support Act and the Support for East European Democracies Act. USAID accordingly set up its Center for Democracy and Governance and an Office of Transition Initiatives. Sixteen Eastern European and former Soviet Union countries were targeted for assistance ranging from election financing to media advice. As a result of such initiatives, in 1996 the United States was giving aid to more countries (130) than it did in 1985. Still, traditional priorities did not disappear; while more countries were now getting development aid, it was a small total compared to the security aid that went to the two nations of Israel and Egypt.

The 1990s were also a decade of close reexamination of foreign aid in the international giving arena. The United Nations Development Program issued a study in 1996 that noted that in the 1980s, 100 countries, or 1.6 billion people, had experienced economic decline—despite enormous amounts of global aid. Most of these countries had lower average incomes in 1990 than in 1980, and almost half had smaller incomes than in 1970. The few who seemed to be holding their own were civil servants, whose salaries totaled 20 percent of Zambia’s GNP, for instance.

Foreign aid’s role in forestalling crises looked dubious too. Much U.S. aid, for example, had gone to so-called “collapsed states,” meaning states that have fallen apart due to mismanagement, corruption, civil war, or oppressive leadership, including Somalia, Liberia, Zaire, Rwanda, Sierra Leone, and Sudan. And where states survived, it became difficult to argue that such aid did not have distorting effects on local economies. In 1995, for example, such funds accounted for 46 percent of Lesotho’s government expenditures; 77 percent of Ghana’s, 97 percent of Malawi’s, and an unbelievable 101.4 percent of Madagascar’s. In the 1990s, recognition of this fact and its contribution to corrupt practices led the United States
to cut off bilateral aid to fifty countries. Washington later replaced some of this aid with assistance designated for humanitarian purposes. The AIDS epidemic in Africa, which by 2001 had created 11 million orphans, was a major impetus behind this new agenda.

In 2000, Congress allocated $715 million to child survival programs that promote maternal and child health and provide vaccines, oral rehydration therapy, and education. Nongovernmental organizations (NGOs) like the Global Alliance for Vaccines and Immunization, backed by corporate constituents including the International Federation of Pharmaceutical Manufacturers Associations, have played a leading role in administering these programs. In 1995, in fact, NGOs registered with USAID spent $4.2 billion on overseas programs, and fourteen of them raised more than $100 million in cash and kind, including government food and freight assistance. These ranged from the giant CARE, with a total of $460 million, to Project Hope with $120 million. The NGO projects were often both simple and innovative. Project HOPE, for instance, used USAID funds to work with tea plantations in Malawi to provide health care for women and children.

Another priority was the promotion of democratic politics in the so-called Second World of former socialist countries. In Serbia, U.S. aid supported resistance movements like Otpor, whose activism helped bring about the ouster of the dictator Slobodan Milosevic. Aid administrators were also tying their works to new transnational priorities. The Clinton administration’s Climate Change Initiative, for example, assisted forty-four countries in lowering greenhouse gas emissions. In addition, growing sensitivity to local economies prompted the United States to begin to send farmers along with food supplies in the Food for Peace Program. More than five thousand were sent abroad in the 1990s. Perhaps the largest priority as far as spending was concerned were peacekeeping efforts. These included the well-established programs in the Middle East as well as newer initiatives in the Balkans and in Northern Ireland.

The USAID Development Assistance request from Congress for 2001 illustrated the new global priorities, with $234 million for economic growth, $12 million for human capacity development, $92 million to support democratic participation, $225.7 million for the environment, and $385 million for population programs and protecting human health. The increase in spending on child survival, which rose from $650 million to $724 million between 1998 and 2000, was notable, as was the rise in the International Fund for Ireland (that is, Northern Ireland), which rose from $2.4 billion to $2.7 billion, and the Assistance to Independent States, which rose from $770 million to $836 million. The new emphasis on such programs as child health, which overshadowed development aid, highlighted a continuing debate among the foreign aid establishment as to the relative merits of relief initiatives versus developmental ones.

U.S. economic assistance in the early twenty-first century came through many channels. For example, the Development Assistance program was a mammoth account that included such programs as the Narcotics Control Program of the Department of State, the Development Fund for Africa, Economic Support Funds, Support for East European Democracy, Food for Peace, the InterAmerican Foundation, and the Peace Corps. In addition, many U.S. cabinet agencies, like the Departments of Transportation and Commerce, also provided their own aid and technical assistance programs in such countries as Egypt, Kazakhstan, Russia, South Africa, and Ukraine.

GLOBALIZATION’S IMPACT ON FOREIGN AID

Many of the new priorities reflected a growing recognition of the ongoing process of globalization, which has flourished since the breakdown of rigid trading blocs in the former communist world, as well as the embrace of free trade by Third World nations such as Mexico and South Korea. As noted, it has also brought new attention to transnational issues such as environmental destruction, infectious disease, and terrorism. Globalization has certainly greatly accelerated international communication and trade. It has, for instance, allowed U.S. exports to Central America to double since 1992 to almost $10 billion annually. The process has won a wide following in U.S. foreign aid circles; in 1989 a study conducted by USAID pointed to a seven-point annual growth rate difference between the most and least open economies. In 2000, the World Trade Organization (WTO), an international body that promotes free trade and supports developing countries with technical assistance training, published a paper by Dan Ben-David and L. Alan Winters that argues...
that poor countries engaged in free trade are able to lift their living standards. The authors cite the experience of South Korea, whose economy jumped 700 percent since the 1960s. In a similar study of eighty countries over four decades, the World Bank agreed that economic openness is linked to higher living standards and growth. The rise of globalization has thus been used by foreign aid administrators to make the case for liberal capitalist models of development, and has undermined the 1970s ethic of direct government-to-government economic transfers to the Third World. As a result, while USAID did not abandon its development projects, it began to tailor them more closely to market results. Yet the U.S. support for just such policies, as exemplified in its leading role in the agencies that promote globalization such as the World Bank, International Monetary Fund, and World Trade Organization, has opened it to criticism that it is forcing them onto Third World nations who would prefer a different path to development.

The 1999 World Trade Organization summit in Seattle, Washington, vividly revealed the wide opposition to globalization, drawing a huge force of protesters from both poor countries and wealthy ones. Many of the protesters would agree with the arguments of Jeremy Brecher and Tim Costello, who have asserted that the WTO “work[s] hand-in-hand with the IMF and the World Bank to impose the Corporate Agenda on developing countries.” This corporate agenda, they write, seeks “to reduce all barriers to downward leveling of environmental, labor, and social costs” The American Friends Service Committee went so far as to claim that globalization “has undermined basic rights, cultural and community integrity, the environment, and equity . . . [and] caused economic insecurity.” Critics point out that it has also lessened the importance of nations that once could use their resources or strategic locations as bargaining chips for aid, and has helped to create global disasters like the banking crisis in Asia in 1997–1998. Moreover, while some Third World nations like Mexico and Chile were enjoying rebounding economic success from globalization, many were being left behind.

Despite the critics, the process continued apace; in 1998, U.S. exports to the Third World reached $295 billion, showing the increasing importance of these markets to the global economy. Meanwhile, foreign investment in developing nations rose from $70 billion to $118 billion in just two years, 1996–1998. But some globalization supporters have pointed out that Americans and other Westerners could help still further by fully embracing the process themselves and allowing larger quantities of the most impoverished nations’ goods to land on their shores. In a 1994 article J. Michael Finger pointed to the stark fact that developed countries’ protectionism “reduces developing countries’ national income by roughly twice the amount provided by official development assistance.”

FOREIGN AID’S CRITICS

Attacks on globalization and its supporters in the foreign aid establishment, interestingly, resembled earlier excoriations of the imperialistic taint of foreign aid programs. In a 1987 study, Michael Hunt contended that “development was the younger sibling of containment” and “drew its inspiration from the old American vision of appropriate or legitimate processes of social change and an abiding sense of superiority over the dark-skinned peoples of the Third World.” Writing in 1978, Ian J. Bickerton noted that “foreign aid has enabled former colonial powers, such as the United Kingdom and France, to maintain their historic political, economic, and cultural ties with former colonies . . . it is precisely this network of Atlantic-European domination and imperialism that forms the basis of the current aid programs.” This assessment was echoed by the World Trade Organization protesters in Seattle, who accused the United States and other Western countries of perpetuating a mechanism of worldwide economic imperialism—née globalization. In the view of globalization’s critics, this process is just another way for rich countries like the United States, with only a fraction of the world’s population, area, and natural resources, to manipulate the global money market, to control much of the world’s trade, and to reserve most of the world’s raw materials for its own use.

In many ways, of course, foreign aid does continue the relationship that began under an earlier, imperialist past, particularly for colonial powers like Britain, France, and Belgium. Yet many other countries, such as the Scandinavian nations and Canada, who lack an imperialist history, have also become foreign aid donors, as Olav Stokke noted in a 1996 article. An overemphasis on the imperialism of foreign aid overlooks the importance of their “humane internationalism,” which he termed “an acceptance of the principle
that citizens of industrial nations have moral obligations” to the outside world.

Beyond the crimes of imperialism, foreign aid has also been vilified for aiding and abetting despotic regimes that have done little for their people. Scholars such as Hunt, Thomas G. Paterson, Richard H. Immerman and many others have criticized the United States’s historic penchant for supporting right-wing military dictatorships in Latin America, Southeast Asia, and the Middle East in order to inhibit the forces of “international communism.” Analysts like Nicholas Eberstadt, Doug Bandow, Peter Boone and others agree that aid keeps oppressive political elites in control, but they have focused their critiques more broadly on the overall ineffectiveness of this aid in meeting its stated aims. In several African countries, governments have been so corrupt and countries so wracked by civil war that foreign aid has served only to line the pockets of dictators. While such funds have certainly helped mitigate illiteracy and disease in much of the world, their record of lifting countries out of poverty is more mixed. Many countries have been aid recipients for as many as three decades, including Chile, Egypt, India, Sudan, Turkey, and the former Yugoslavia.

Besides being often ineffective, in some cases aid has been actually damaging. Relief worker Michael Maren, a veteran of the massive Operation Restore Hope campaign in Somalia during the early 1990s, recalled that “the relief program was probably killing as many people as it was saving, and the net result was that Somali soldiers were supplementing their income by selling food,” even as rebel forces were using it to further their war on Ethiopia. In another ironic example, the U.S.-supported World Bank gave $16 million to Sudan to fight hunger while Sudan’s government was starving its own people. Foreign aid, then, has been attacked by critics for imperially exploiting the Third World for Western interests, distorting economies, hurting local farmers and peasants, and consolidating the grip of local elites at the expense of the average Third World resident.

Nicholas Eberstadt argues that a chief reason for the inefficacy of U.S. aid is because it has not supported policies that are congruent with American values, including “the defense of liberty” and “the promotion of justice.” Instead, the United States has too often relied on a “materialistic” policy limited to financial aid to oppressive regimes, overlooking the plight of those who continue to live under them. Yet Carol Lancaster, a former deputy administrator of USAID who readily admits the failure of aid in many African countries, contended in a 2000 article that foreign aid nevertheless has been “an extremely useful tool of U.S. diplomacy.” She points to progress in lowering the rate of poverty worldwide, from 28 percent in the late 1980s to 24 percent a decade later, and to the trend of rising living standards in Europe, Asia, the Middle East, and Latin America. By the end of the twentieth century, these trends had yet to affect much of Africa. Further, she argues that a new policy of foreign aid, one that emphasizes humanitarian relief, democracy, human rights, and development—the latter to be limited to the poorest countries—is precisely the mechanism to further an American “diplomacy of values.” Such aid will bring “soft power” to the United States, enhancing “the credibility and trust that the U.S. can command in the world.”

This continued emphasis on values recalls the spirit of the 1985 Live Aid concert, orchestrated by rock star Bob Geldof in response to a devastating famine in Ethiopia. This and subsequent events helped create among their numerous participants a “constituency of compassion”—and a conviction that famine was a concern that the world community should respond to. At the time, however, critics dismissed this as so much sentimentalism and called for “development experts” to tackle the problem instead.

In the post–Cold War world both America’s money and its position as the world’s only superpower have made its global economic influence more significant than ever, especially in remaining areas of tension such as the Middle East and the former Yugoslavia. Peacemaking in such areas has emerged as perhaps the leading foreign policy problem facing the United States, and foreign aid remains the vehicle for most of the money that goes to these areas. In the Balkans, for instance, a promise of $500 million in U.S. aid helped end the war in Bosnia. The Israeli-Arab conflict has proved more intractable, though this seems unlikely to stem the flow of U.S. aid. Of the $3.5 billion in Foreign Military Financing (FMF) grants proposed in the 2001 budget to buy defense products and services, Israel was to receive just under $2 billion and Egypt $1.3 billion. In addition to this military aid, the State Department’s Economic Support Fund also listed a $2.3 billion allocation for Israel and Egypt, with $840 million for the former and $695 million for the latter. Despite such hefty grants, Israel requested several billions more for advanced weapons systems not covered by the requested amounts.
Some critics have questioned how consistent these expenditures are with American values or with U.S. interests. As the Center for Defense Information’s Rachel Stohl writes, “Selling weapons to these countries can perpetuate autocratic rule. . . . United States programs should not contribute to the prolonging of these ‘un-American’ practices.” Leon Hadar of the CATO Institute, moreover, argues that the United States should drop its heavy commitment to Middle East peacekeeping, making room for regional powers such as Egypt, Jordan, and Saudi Arabia to get involved instead.

In addition to providing aid to Israel and Egypt, the FMF funds have been used for detonating mines, fighting narcotics traffic, helping to dismantle nuclear weapons in Russia, and integrating Hungary, Poland, and the Czech Republic within NATO. FMF aid, indeed, was part of a sizable U.S. foreign military assistance program that amounted to $17.4 billion in 2000, including both State and Defense Department programs. The International Military Education and Training Program (IMET), for instance, provided military training in the United States for personnel from thirty countries. While the Pentagon asserted that the $50 million program inculcated its students with American values and human rights principles, one of its member institutions, the School of the Americas in Fort Benning, Georgia, came under attack beginning in the 1980s for its connection with military adventurism in Latin America. Nineteen of the twenty-six members of the El Salvadoran military implicated in the murder of six Jesuit priests in that country in 1989 were alumni of Fort Benning. Adverse attention led the school to change its name in late 1999 to the Center for Inter-American Security Cooperation.

Far larger than IMET is the Pentagon’s Foreign Military Sales Program, which racked up $12.1 billion in government-subsidized sales abroad in 2000 on such items as the M1A2 tank and the F-16 aircraft. A similar but much smaller effort is the Excess Defense Articles program, which exports military surplus through sales or grants to such countries as Israel, Egypt, Turkey, Poland, and Greece. Under the Foreign Assistance Act, the U.S. president also has “drawdown authority” to use defense monies for foreign emergencies as he sees fit. In 2000, President Bill Clinton put $80 million toward such causes as peacekeeping in Sierra Leone and a program to promote democracy in Iraq.

CONCLUSION

While U.S. economic and military aid continued to grow modestly at the turn of the century, it comprised a far smaller percentage of total global assistance than was the case in the early Cold War. In the late 1940s, during the height of the Marshall Plan, the United States provided 60 percent of the globe’s foreign aid; by 1993, its portion had dropped to 16 percent. But the United States has not been alone in decreasing its foreign contributions. In the 1990s, international development assistance declined by one-third in real terms, dropping from $61 billion to $52 billion between 1992 and 1998. Development assistance fell to an average of 0.24 percent of GDP in advanced countries by 1998. The most generous country was Norway, which gave away nearly 1 percent of its GNP; the United States, by contrast, donated only 0.1 percent, the smallest of all members of the Development Assistance Committee of the Organization for Economic Cooperation and Development. However, the United States did furnish the second-highest dollar figure in 1998, $8.8 billion; Japan topped the list with $10.6 billion.

Owing to such expenditures, by the mid-1990s Third World governments owed almost $2 trillion to Western loan agencies and governments. The African debt alone surpassed $230 billion. Beginning in 1996, the IMF and World Bank launched the Heavily Indebted Poor Countries Initiative (HIPC), an attempt to provide significant debt relief (up to 80 percent) based on a program of economic restructuring in the debtor nations. However, when few countries proved able to sustain the restructuring requirements, the funding institutions announced HIPC II in 1998, a bolder initiative that targeted $100 billion in debt reduction. By April 2001, $20 billion in debt had been cancelled for twenty-two countries, eighteen of which were in Africa. Over time the reductions were to bring associated total relief of $34 billion to these countries. When combined with other existing debt relief programs, reductions would amount to $55 billion, about two-thirds reduction. The millennial year also saw the launching of the international Jubilee 2000 coalition to lobby for further debt relief, using the biblical terminology of a jubilee year, based on ancient Israel’s practice of forgiving debts on a fifty-year cycle. To the great enthusiasm of a crowd gathered for a Jubilee 2000 meeting in December of that year, British Chancellor Gordon Brown announced that Britain would cancel or
“hold in trust” the debt payments of forty-one countries.

Debt-relief efforts were certainly expected to provide a break for poor nations. However, the fact remained that in 2000 the average person in the richest twenty countries earned thirty-seven times more annually than the typical resident of the poorest twenty nations, double the gap since 1960. Foreign aid, which USAID claims has been responsible for a great deal of the progress in lessening poverty, disease, and illiteracy, indeed may have stopped that gulf from being even wider. The reasons for a continuing gap defy easy explanation, and in general are tied both to rising growth rates in the First World, including a great expansion in private capital, as well as the continuing political, social, and economic problems of the developing world.

With the end of the Cold War’s communist threat and a widening perception that foreign aid monies have been ineffective, wasted, or turned to corrupt purposes, America’s foreign aid program underwent increasingly close scrutiny. As noted, humanitarian relief and child rescue emerged as the most notable new priorities in the 1990s, supplanting the development paradigm and its oft-discredited large-scale projects. Moreover, a new ideological purpose arose to replace the old Cold War consensus. Upon entering office in January 2001, President George W. Bush cut off U.S. funding to all foreign NGOs with family planning programs that provide abortion or abortion counseling, restoring a policy that his father, George H. W. Bush, and Ronald Reagan also employed, dating back to 1984. At the same time, the longtime critic of foreign aid Jesse Helms called for channeling foreign aid funding directly to religious charities and NGOs, separate from the efforts of USAID’s “cold, heartless bureaucrats,” as he put it.

American economic and military aid programs, for all their shifting priorities, contested results, and popular distaste, have long outlived the span that their early adherents predicted, and at the turn of the twenty-first century it appeared likely that foreign aid would continue. One may hope that in the next half century, either owing to aid, investment, political reform, or some other set of factors, the developing world will have come much closer to reaching the results predicted by John F. Kennedy for the 1960s “decade of development.”

Freedom of the seas is one of the original and most important principles in the history of American foreign policy. American statesmen have, in essence, defined it as the right of all peoples to travel unmolested in international waters in both war and peace. Historically, it has been one of the chief means by which the United States has influenced international affairs; the vigorous assertion of the principle of freedom of the seas has been a major cause of four armed conflicts: the Quasi-War with France in 1798, the Barbary Wars, the War of 1812, and World War I.

ORIGINS OF THE CONCEPT OF FREEDOM OF THE SEAS

The concept of freedom of the seas predates the American nation, arising in the European world amid the heightened rivalries of the European state system in the fifteenth and sixteenth centuries. It was on the principle of freedom of the seas that King Francis I of France disputed the exclusive right in certain seas that the pope had granted to Spain and Portugal in the fifteenth century. Later, Queen Elizabeth I of England proclaimed: “The use of the sea and air is common to all; neither can any title to the ocean belong to any people or private man.” Perhaps the most notable assertion of the principle of freedom of the seas was the book Mare Liberum (1609) by Dutch jurist Hugo Grotius. Grotius defined the seas as being, like the air, limitless and therefore common to all people. Despite Grotius’s efforts, European mercantilist powers in the seventeenth and eighteenth centuries generally sought to control as much of the world’s oceans as they could.

From the beginning of the American nation, U.S. political leaders championed the view that the seas ought to be free in war as well as in peace. As John Adams said in 1783:

The United States of America have propagated far and wide in Europe the ideas of the liberty of navigation and commerce. The powers of Europe, however, cannot agree as yet, in adopting them to their full extent. . . . For my own part, I think nature wiser than all the courts and estates of the world, and, therefore, I wish all her seas and rivers upon the whole globe free.

Benjamin Franklin was of the same mind. In 1782 he said, “In general, I would only observe that commerce, consisting in a mutual exchange of the necessaries of life, the more free and unrestrained it is the more it flourishes and the happier are all the nations concerned in it.” The American assertion of the principle of freedom of the seas thus became closely connected to the principle of freedom of commerce. Applied in wartime, these principles translated into the right of citizens of neutral states to carry on their normal trading pursuits without interference by the belligerents, unless that trade was in a narrowly defined list of war goods destined for a belligerent. Throughout its history, with two exceptions—the Civil War and World War I—the United States has been the principal proponent and defender of that view.

The American position on freedom of the seas was first expressed on 18 July 1776, when John Adams presented to the Continental Congress the report of a committee of which he was chairman and whose other members were Benjamin Franklin, John Dickinson, Benjamin Harrison, and Robert Morris. The committee had been appointed some five weeks earlier and had been charged with preparing a “plan of treaties to be entered into with foreign states and kingdoms.” Its report proposed a model set of articles concerning neutral commerce in wartime to be included in treaties of amity and commerce with other powers. On 17 September of the same year, Congress adopted the committee’s proposals, which thereupon became the first official American statement on the freedom of the seas.
The proposal contained four articles: first, should one of the signatories be at war and the other neutral, the citizens of the neutral could trade with the enemies of the belligerent in all items except contraband of war, the latter being limited to arms, munitions of war, and horses (food and naval stores were specifically excluded); second, citizens of the neutral could trade with the enemies of the belligerent in noncontraband not only from enemy ports to neutral ports but also between ports of an enemy; third, enemy noncontraband found in neutral ships was not liable to confiscation by the belligerent (“free ships make free goods”); and fourth, neutral goods, whether contraband or noncontraband, found in enemy vessels were liable to confiscation.

These principles, known collectively as the Treaty Plan of 1776, and clearly favorable to neutrals, were not invented by Adams and his colleagues. For more than a century they had been a part of the international maritime scene and had been practiced by neutrals and belligerents during the great dynastic wars of the seventeenth and eighteenth centuries, albeit with occasional modifications. They had also been incorporated in several treaties between European powers, most notably France and Great Britain in 1655, 1686, and 1713.

It is not surprising that Adams’s committee proposed, and the Congress accepted, the maritime principles of 1776. For one thing, they were a natural and logical concomitant of the Declaration of Independence. It seemed only reasonable that the “unalienable right to life, liberty, and the pursuit of happiness” should extend to the high seas. More important, the principles were consistent with the visions that the Founders had for their country more often belligerent than neutral—and big-navy belligerent, at that—rejected the American overtures. The treaty said nothing about the rights of neutrals.

American diplomats succeeded in incorporating the cherished maritime articles into the first bilateral treaty signed by the new republic. In 1778 the Franco-American Treaty of Amity and Commerce contained almost without change the language and the substance of the Treaty Plan. But that was only the beginning of the nearly universal acceptance of the American position. Three more agreements—with the Netherlands in 1782, with Sweden in 1783, and with Prussia in 1785—also included the maritime articles of 1776.

Meanwhile, in 1780 the Russian empress, Catherine the Great, had announced that her country’s neutral commerce in the war then raging between England and its former colonies would be governed by four principles. Three of them—free ships make free goods, freedom of neutrals to trade between ports of a belligerent, and contraband limited to arms and munitions—came directly from the Treaty Plan of 1776. The fourth—that a port be considered legally blockaded only if there were a sufficient number of vessels at its mouth to make entry dangerous—had not been dealt with by Adams’s committee in 1776. It was, however, included in a new treaty plan adopted by the United States in 1784. At Russia’s invitation, seven other nations adhered to Catherine’s principles. Thus, of the great powers only Great Britain refused to be bound by the liberal maritime principles. Hard though they tried, the American commissioners negotiating the peace that ended the war between mother country and colonies could not get the principles incorporated into the final treaty. English statesmen, envisioning their country more often belligerent than neutral—and big-navy belligerent, at that—rejected the American overtures. The treaty said nothing about the rights of neutrals.

AFFIRMING FREEDOM OF THE SEAS IN THE EARLY NATIONAL PERIOD

A challenge to the principle of freedom of the seas arose soon after the conclusion of the revolutionary war. In 1784 American commercial shipping in the Mediterranean, lacking the protection of the British navy, came under attack from the North African kingdoms along what was known as the Barbary Coast. In 1794, Congress, tired of paying tribute to the Barbary pirates and urged on by New England merchants devastated by ship seizures, passed the Naval Act of 1794, reestablishing the U.S. Navy and authorizing the con-
struction of six frigates to defend American interests in the Mediterranean. President Thomas Jefferson, without seeking congressional approval, dispatched several naval campaigns against the North African kingdoms culminating in the conquest of Tripoli in 1805. In 1815 a U.S. naval squadron bombarded Algiers into agreeing to end its attacks on American shipping. Thus was the principle of freedom of the seas successfully asserted by force.

The wars of the French revolutionary and Napoleonic eras posed an even greater challenge to the principle of freedom of the seas. When war erupted between France and Great Britain in 1793, the United States at once declared neutrality and soon became the chief neutral supplier of belligerent needs. France was legally bound by the terms of the Treaty of 1778 to treat American commerce according to the principles of 1776. Britain, having entered into no agreement with the United States on neutral and belligerent rights, was free to halt, by all means possible, trade between France and America. Unwilling to fight the war at so serious a disadvantage, French warships soon violated the provisions of the 1778 treaty and treated American commerce as the British did. When England and the United States signed a convention in 1794 (Jay’s Treaty) that specifically included naval stores on the contraband list and stated that enemy goods were not protected by the neutral flag, France was furious that American diplomats had not forced Britain to accept the principles of 1776. The result was an intensification of French depredations upon American neutral commerce that led in 1798 to an undeclared Franco-American maritime war. Known as the Quasi-War, it lasted until 1800.

France and England made peace in 1802, but war broke out again in the following year. This second phase of the great struggle was marked by intense efforts by each belligerent to prevent neutrals from trading with its enemy. As the chief neutral suppliers and carriers, American citizens suffered severe restrictions on their trade. In 1812 the United States went to war, in part to defend its citizens’ neutral rights.

It was true, of course, that the war was fought only against Britain, but not because France’s conduct was less reprehensible. Congress, in fact, gave serious consideration to declaring war against both nations. In the end, however, a war against two enemies was unthinkable and Britain was chosen over France for the very good reason that its navy, not France’s, dominated the seas and committed the largest number of violations of American neutrality. The point to remember is that the nation risked its lives, its treasure, even its continued existence, in order to defend the rights of its citizens to travel and trade unmolested on the high seas in wartime.

President James Madison, when touching upon maritime reasons for requesting hostilities, referred specifically only to “mock blockades” and to “violations of our coasts” as evidence of Britain’s perfidious conduct. More generally, he spoke of Britain “laying waste our neutral trade” and plundering “our commerce . . . in every sea.” He surely had in mind three British practices, all contrary to the principles of 1776. One was the interdiction of American trade between ports of the enemy, which England justified on the basis of the Rule of the War of 1756. That rule, established during the French and Indian War of 1754–1763, declared that a trade closed in peacetime could not be opened in wartime. In conformity with mercantilist doctrine, France, as well as every other European nation, prohibited foreigners from engaging in the trade between ports. In wartime, however, when the superior British navy made it unsafe for French vessels to carry the traffic, it was thrown open to non-French bottoms. Thus, the rule deprived American merchants of a lucrative trade. When they sought to evade it by touching at a neutral port (most often in the United States) en route between the two enemy ports, the British were not fooled. Their cruisers picked up the American vessels and their prize courts condemned them on the grounds that the ultimate destination was, in fact, an enemy port and that the voyage between the two enemy ports was “a continuous voyage only ostensibly broken at a neutral port.” The two other British practices were the inclusion of naval stores and foodstuffs on the contraband list and the confiscation of enemy goods found in neutral ships.

Now a belligerent, the United States made every effort “to pay the strictest regard to the rights of neutral powers.” Naval commanders were instructed “to give them [neutrals] as little molestation or interruption as will consist with the right of ascertaining their neutral character,” and the orders were carried out. Neutral rights were respected. Insofar as the war was fought in defense of American neutral rights it proved futile, for the treaty ending the war made no mention of the subject.

Between the end of the war with Britain and the opening of the Civil War, the United States
continued to push for the acceptance of the principles of 1776 and the provision on blockade in the Treaty Plan of 1784. To some observers it seemed anomalous that the United States, on the threshold of becoming a significant naval power, should continue to support liberal maritime principles. A clue to the riddle was provided by Secretary of State Henry Clay, who noted in 1828 that the United States did not expect to become involved in maritime wars because its “prosperity is so evidently connected with the preservation of peace.” And, he implied, even if the country should become involved in a war—and as a big-navy belligerent—it would value “the general cause of humanity and civilization [which] will be promoted by the adoption of these maritime principles [above] pecuniary interest.” Thus, between 1824 and 1850 the United States concluded treaties with ten Latin American republics and one with Prussia incorporating the liberal maritime principles. Efforts to commit Great Britain to the principles remained unsuccessful.

The War with Mexico (1846–1848) provided the United States with the occasion to practice what it preached. Its policy toward neutrals was governed by the instruction of the secretary of the navy to commanding officers of U.S. naval forces in the Pacific, issued on 24 December 1846: “The President has desired to subject neutral commerce to the least possible inconvenience or obstruction compatible with the exercise of the belligerent right necessary to the success of our military operations.” One year later, explaining the U.S. position to the newly appointed commander in the Pacific, the secretary wrote: “No present advantage . . . should induce us to depart from that liberal interpretation of the laws of nations which we have always contended for as protecting the interests of neutrals against the violent claims of belligerents.” Indeed, in the matter of blockade, contraband, and enemy goods on neutral ships, the United States adhered strictly to the principles of 1776 and 1784.

Six years after the end of the Mexican conflict, the Crimean War broke out and the United States again found itself a neutral—but with two important differences from the period of 1793 to 1812. This time Great Britain and France were on the same side, fighting Russia, and they made clear their intention to pursue a liberal course toward neutral commerce insofar as neutral goods on enemy ships and enemy goods on neutral ships were concerned. In both instances the goods, except for contraband, were to be free from seizure. Russia adopted the same principles and incorporated them in a convention signed with the United States in July 1854.

Encouraged by the action of the three belligerents, especially by that of Great Britain, and recognizing that for Britain and France the policies on neutral rights covered the duration of the war only, the U.S. government sought to incorporate the rules in a multilateral treaty and make them a principle of international law. Secretary of State William L. Marcy, in instructions sent to the American ministers in Paris, London, and St. Petersburg in 1854, enclosed a draft treaty, noting: “The United States are desirous to unite with other powers in a declaration that . . . [the rules] be observed by each hereafter, as a rule of international law.” In his annual message to Congress in December of the same year, President Franklin Pierce voiced the same hope.

The three belligerents did, in fact, “unite with other powers in a declaration” on maritime law at the peace conference that met in Paris in the winter and spring of 1856. Four principles constituted the Declaration of Paris, signed on 16 April 1856 by representatives of Austria, France, Great Britain, Prussia, Russia, Sardinia, and Turkey: first, privateering is, and remains, abolished; second, the neutral flag covers enemy goods, except for contraband; third, neutral goods, except for contraband, are not liable to capture under the enemy flag; and fourth, blockades, in order to be binding, must be effective.

The Declaration of Paris proved highly gratifying to the United States. The liberal view on neutral rights that it had so vigorously championed for more than half a century had at last been written, if only in part, into international law. Particularly welcome was the end of British opposition. Still, the United States found itself in the curious situation of refusing to become a party to the declaration. The reason lay in the article on privateering. As Secretary of State Marcy pointed out in a lengthy note to the French minister in Washington, the strong-navy powers could afford to renounce privateering because they could effectively prey upon enemy commerce with their public armed vessels; small-navy states, like the United States, lacking an adequate number of warships, had to rely upon private armed vessels to destroy the enemy’s goods. Only if the words “and that the private property of the subjects or citizens of a belligerent on the high seas shall be exempted from seizure by public armed vessels of the other belligerent, except it be contraband”
were added to the first article would the United States sign the declaration.

That principle—the complete immunity of (noncontraband) private property—had been advanced by the United States for many years. It was a logical extension of the liberal position on neutral rights. First suggested by Benjamin Franklin in 1780 and again in 1782 for inclusion in the peace treaty ending the War of Independence, it was included in the Treaty Plan of 1784 and incorporated into the Treaty of Amity and Commerce of 1785 with Prussia.

The signatories of the declaration did not summarily reject the American amendment. They deferred action pending a careful examination of the problem and the opportunity to consult among themselves. By March 1857, when President James Buchanan assumed office, no action had been taken and the new secretary of state, Lewis Cass, told the American ministers to suspend negotiations on the subject until the president had time to study “the questions involved.” The president, preoccupied with problems closer to home, never did get around to the matter; thus, the United States lost the opportunity to incorporate into a multilateral treaty its historic and traditional position. Because the four principles of the declaration were considered indivisible by the signatories, the United States could not adhere to numbers two, three, and four while rejecting the first.

REVERSING COURSE IN THE CIVIL WAR

Viewed from a different perspective, the failure of the United States to become a party to the Declaration of Paris proved advantageous, for in the Civil War, which broke out in 1861, the United States remained free of any international legal commitments regarding neutral rights vis-à-vis the major naval powers of the time. For the first time in its history, the United States was the preponderant belligerent naval power, and that freedom would permit it to pursue any course at sea calculated to increase the chances of victory. As a matter of fact, the United States did expand its belligerent rights during the war and did constrict those rights of neutrals that it had championed since the earliest days of the Republic.

Early in the war, Secretary of State William H. Seward informed the principal neutral powers that American policy toward their commerce would be governed by the second, third, and fourth articles of the Declaration of Paris. And the United States did, during the course of the war, respect the principles of “free ships make free goods” and the freedom from seizure of neutral goods (not contraband) in enemy ships. On blockade, however, the United States strayed far from its traditional position. It is true that Seward insisted that a blockade not maintained by an adequate force need not be respected and that every effort was made to station a sufficient number of vessels at the blockaded ports to prevent entry and exit. It is true, too, that the British government accepted the existence of an effective (and, hence, a legal) blockade and respected it. But it is also true that in an effort to make the blockade more effective, the United States indulged in some highly questionable practices that the British had used when a belligerent in the French revolutionary and Napoleonic wars (1793–1815) and against which the United States had protested vigorously. One, called the long-range blockade, was accomplished by “flying squadrons” of swift warships that patrolled the sea-lanes and intercepted neutral vessels far from a blockaded port, seizing them if there were grounds for believing their destination to be a blockaded port. Another was to place neutral ports (in Britain, the Bahamas, Mexico, and the West Indies) under surveillance and capture vessels as they left the protection of territorial waters, presumably for a port under blockade. In addition, Union warships took as prizes on the high seas neutral vessels coming from and going to neutral ports, on the ground that the ship and its cargo were ultimately destined for a blockaded port. American prize courts upheld the seizures, considering the voyage between the neutral port of origin and the blockaded port as one continuous, albeit broken, voyage. The doctrine was also applied to contraband. It was strange to find the United States applying the doctrine of continuous voyage, which had been so objectionable when practiced by the British in the wars against France.

In the matter of contraband, the United States did not publish an official list; but the secretary of the Treasury, in a circular sent to collectors of customs at several Southern ports where the blockade had been lifted, enumerated articles considered contraband and therefore banned from the ports. Among them were arms, munitions, and war supplies, as was to be expected. But the list also included naval stores and a host of other items, such as ardent spirits, corn, bullion, printing presses, coal, iron, lead, copper, tin, brass, telegraphic instruments, wire, and marine
engines—and those were not to be expected. They flew in the face of the historic American resistance to an expanded contraband list.

Why the United States turned its back on history and tradition, and exchanged the role of champion of the rights of neutrals for that of defender of the rights of belligerents, can be explained only in terms of a sacrifice of principle for expediency. Winning the war was the overriding factor in determining the nation's policy. Nothing else mattered.

EXPANDING THE FREEDOM OF THE SEAS: 1865–1914

From the end of the Civil War to the opening of World War I in 1914, the United States did not concern itself greatly with the freedom of the seas. It was a neutral in three wars during the period (Franco-Prussian, Boer, Russo-Japanese), but none of them presented any serious problems on the seas. The United States was a belligerent once during this period (against Spain), but that conflict was too brief to raise any serious maritime issues. There was, however, one significant development in American policy toward neutral commerce during the Spanish-American War—the division of the contraband list into absolute and conditional contraband. The former included articles primarily and ordinarily used for military purposes and destined for an enemy country; the latter included articles that might be used for purposes of war or peace, according to circumstances, and would be subject to seizure only if actually and specifically consigned to the military or naval forces of an enemy. In the latter category, foodstuffs and coal were the most important items. This division became a permanent feature of American policy when it was incorporated into the United States Naval War Code, adopted in June 1900.

If there was one preoccupation of American diplomacy concerning neutral and belligerent rights and duties, it was the effort to secure international acceptance of the principle of the immunity of private property at sea. The adoption of such a broad principle, long sought by American diplomats, would have applied to all private property, both neutral and belligerent, replacing the more specific provisions covering neutrals, such as “free ships make free goods.” It was the subject of negotiation with the North German Confederation in 1870, and was incorporated into a treaty of amity and commerce with Italy in 1871. In December 1898, President William McKinley asked Congress for authority “to correspond with the governments of the principal maritime powers with a view of incorporating into the permanent law of civilized nations the principle of the exemption of all private property at sea, not contraband of war, from capture or destruction by belligerent powers.” Five years later his successor, Theodore Roosevelt, reiterated the plea. In the instructions prepared for the U.S. delegation to the First Hague Conference in 1899, the chief item was on immunity of private property at sea; the instructions for the delegates to the Second Hague Conference in 1907 included a congressional resolution of 1904 supporting the same principle. All these efforts proved in vain, however. The United States did not succeed in gaining international acceptance of the doctrine.

The United States did, nonetheless, have the satisfaction of seeing many of its other principles adopted at an international congress that met in London during the winter of 1908–1909, convened at the call of Great Britain. The ten maritime powers represented (Germany, England, Austria-Hungary, the United States, Spain, France, Italy, Japan, the Netherlands, Russia) agreed on a code of prize law that would be administered by an international prize court hearing appeals from national prize courts set up by belligerents. In seventy-one articles contained in ten chapters, precise and detailed rules were established governing blockade, contraband, non-neutral service, treatment of prizes, determination of a vessel’s character, convoy, transfers to a neutral flag, and visit and search of vessels. Taken together, the rules that made up the Declaration of London were favorable to neutrals, which may account for the fact that the British House of Lords refused to ratify them (after the House of Commons had given its approval). Thus, they were not binding on any of the other signatories.

WORLD WAR I: A CRITICAL TURNING POINT

The United States sought, at the outbreak of war in August 1914, to have the warring nations accept the Declaration of London as the guide in their treatment of neutrals. Germany was willing, but England was not. As the preponderant navy belligerent, England was not willing to surrender the advantage to be derived from the lack of legal restrictions.
The plight of the neutrals, particularly the United States—the one most heavily involved in the carrying trade—was cruel indeed. As in the titanic struggle between France and England from 1793 to 1815, the only rule followed by the belligerents was expediency. No holds were barred, no measure was neglected that might contribute to the defeat of the enemy. Each contestant used to the utmost the weapon it knew best. German submarines stalked the seas, but mainly the waters surrounding the British Isles, sinking every vessel it could catch—enemy or neutral—carrying supplies to Britain. The British surface navy roamed the oceans enforcing measures designed to halt all traffic to Germany. Those measures were numerous and comprehensive, and reflected the cumulative experience of a nation for which the sea had been a lifeline for three centuries. The contraband list was extended to include the widest variety of articles and the distinction between absolute and conditional categories, which Britain had adopted at the same time as the United States, was gradually blurred until it disappeared altogether.

The blockade of Germany was not effective, in that ships were not stationed at German ports to prevent entry and exit but were, rather, placed in the North Sea and The Downs, a roadstead in the English Channel, from which the traffic to the Continent was more easily controlled. It must be pointed out that the two belligerents were under no legal obligation to treat American commerce according to American wishes. There was no body of international maritime law binding the warring countries (the Declaration of London not being in force and not having been signed by the United States), nor were they bound by any bilateral treaties with the United States concerning the treatment of neutrals. Visit and search were not conducted at the point of interception on the high seas; neutral vessels were taken into British or other Allied ports for a detailed and careful examination of cargo and papers. Neutral mails were opened and inspected for contraband and for clues as to destination of cargo. The principle of “free ships make free goods” gave way to the practice of detaining all goods on neutral vessels of enemy origin or ownership. Neutral firms that dealt with the enemy were put on a blacklist and forbidden to trade with the Allies, while neutral vessels that did not conform to certain conditions laid down by the British were subjected to “bunker control” and denied coal, oil, and other refueling supplies. Finally, the doctrine of continuous voyage, hitherto applied to absolute contraband only, and where the second leg of the broken voyage was by sea, was applied to conditional contraband, and where the second leg was over a contiguous land frontier.

The United States, caught between the two belligerents, protested both the violations of its neutral rights and the destruction of the doctrine of the freedom of the seas. The protests to Germany were sharper, more insistent, and more demanding than those to England, although the policies of both were equally oppressive and damaging. The reason for such discrimination was stated by President Woodrow Wilson when he compared the British to thieves and the Germans to murderers. The former, he said, seized property, a matter that could be adjudicated at the end of the war, while the latter took lives, which were lost forever. There was, of course, another cause for the partiality to the British: Americans were entangled, emotionally and economically, with the British, which made a rupture of relations with them unthinkable. The United States finally went to war against Germany in 1917 to uphold its rights as a neutral and to defend the principle of the freedom of the seas, not only for itself but for other nations as well (the “challenge is to all mankind,” said the president). The move might be viewed as the fulfillment of the task set out by Secretary of State Robert Lansing in a note sent to the British government in October 1915 that described the nation as “championing the integrity of neutrals . . . [which] the United States unhesitatingly assumes.”

The deep concern the United States exhibited for its neutral rights, as well as for the rights of others, between 1914 and 1917 vanished the moment the country joined the Allied cause. Indeed, as a belligerent the United States outdid its allies in trampling upon neutral rights. The justification of a harsh policy toward neutrals lay in the necessity for winning the war and defeating the enemy of mankind’s freedom—on the seas as elsewhere. The neutrals were not impressed by America’s beneficence; they were shocked. As one Danish newspaper noted, “It was as a spokesman of the freedom of the seas and the rights of neutral countries that America came into conflict with Germany, and finally went to war. It would be a strange début for her to start by committing exactly the same kind of outrage which Mr. Wilson pretended to fight against in the interest of the neutrals.” As a matter of fact, the belligerent policy of the United States need
not have been so unexpected. It was heralded in a remark made by Secretary Lansing in 1915. He noted: “It was of the highest importance that we should not become a belligerent with our hands tied too tightly by what we had written. We would presumably wish to adopt some of the policies and practices which the British had adopted, though certainly not all of them, for our object would be the same as theirs . . . to break the power of Germany.”

Almost every practice against which the United States protested as a neutral it pursued as a belligerent—the blacklist, bunker control, sweeping contraband list, postal censorship, and broadest interpretation of the doctrine of continuous voyage—rather as it had done during the Civil War. In fairness, it must be noted, however, that certain British practices were not adopted by belligerent America. The United States did not join Britain in the blockade or in the routing of neutral vessels into ports to facilitate searching them.

As World War I came to an end, the American view of the freedom of the seas underwent a considerable change. It came about as a consequence of Woodrow Wilson’s dream of a new postwar international order. In that order the concept of freedom of the seas would not be used solely to describe the problem of the rights of neutrals to trade in wartime; it would have a much broader meaning. As stated by the president in a message to the Senate on 22 January 1917, it would mean the right of every nation to have free access to “the open paths of the world’s commerce.” And, he went on to say, “The paths of the sea must alike in law and in fact be free. The freedom of the seas is the sine qua non of peace, equality, and co-operation.” One year later, on 8 January 1918, Wilson further elaborated his concept of freedom of the seas in his Fourteen Points. The second of them called for “absolute freedom of navigation upon the seas, outside territorial waters, alike in peace and in war, except as the seas may be closed in whole or in part by international action for the enforcement of international covenants.” It should be noted that by the last qualifying phrase, Wilson indicated that restrictions on freedom of the seas could be effected only by the League of Nations, the new international organization for maintaining the peace, when acting to chastise a peace-breaking nation.

Unfortunately, certain nations were not prepared to accept so broad and bold a definition of freedom of the seas. Britain, particularly, balked at its being incorporated into the peace treaty. The British could not afford to leave so vital an element of their national security in any hands other than their own. “This point we cannot accept under any conditions,” said Prime Minister David Lloyd George. “It means that the power of blockade goes; Germany has been broken almost as much by the blockade as by military methods; if this power is to be handed over to the League of Nations and Great Britain were fighting for her life, no League of Nations could prevent her from defending herself.” France and Italy took much the same view. Said the French premier Georges Clemenceau, “War would not be war if there was freedom of the seas.”

For his part, Wilson would not “consent to take part in the negotiation of a peace which did not include freedom of the seas [and] . . . unless Lloyd George would make some reasonable concessions on his attitude upon the freedom of the seas, all hope of Anglo-Saxon unity would be at an end.” To avoid such a breakdown among the Allies, which would give Germany so great an advantage, the British finally accepted the point as a basis for discussion at the conference, but on the understanding that they “reserve to themselves complete freedom on this subject when they enter the Peace Conference.” The point was never seriously discussed at the conference, and the treaty ending the war made no mention of it. Thus, Wilson’s effort to redefine the principle came to naught.

Between the two world wars the freedom of the seas did not figure prominently in international affairs. After the breakdown of the Geneva Naval Conference in 1927, Senator William E. Borah of Idaho called for a conference of the great powers to codify the rights of neutrals and belligerents on the high seas in wartime, but nothing came of it. It was clear that the United States and Britain would not agree—the former supporting the liberal view of neutral rights and the latter championing a broad interpretation of the rights of belligerents. In 1929 Senator Arthur Capper of Kansas introduced a resolution in the Senate that would have revived in some measure the Wilsonian dream of the United States joining other nations in denying the freedom of the seas to an aggressor. Appreciating the fact that America could not participate in the League of Nations’ enforcement machinery by virtue of nonmembership, he proposed that should the League of Nations declare a nation to be a violator of the peace, the United States would withhold from that country “arms, munitions, implements of war, or other articles for use in war.” Thus, there
would be no danger of the United States clashing with League of Nations states in the protection of its neutral rights. Sentiment in America, however, was not ready for a policy of taking sides in an international struggle. A similar effort in 1933 by the U.S. representative at the Geneva Disarmament Conference failed for the same reason.

FREEDOM OF THE SEAS IN THE AMERICAN CENTURY

The outbreak of World War II in 1939 found the United States, for the first time in its history, a neutral unconcerned with the defense of its rights at sea. It had, by drastic legislation enacted between 1935 and 1939, voluntarily withdrawn from the business of supplying the needs of the belligerents. It had also curtailed the travel of Americans on belligerent passenger vessels and had circumscribed trade with neutrals by keeping American ships out of certain areas, designated as combat zones, adjacent to neutral ports. It had, in short, surrendered its traditional insistence that the rights of neutrals be respected.

Before long, however, the country abandoned the role of passive and withdrawn neutral and became virtually a co-belligerent, supplying the Allied powers with the sinews of war. The restrictive legislation was repealed in November 1941 and a vast flow of American goods in American ships started moving across the Atlantic. Now the term “freedom of the seas” was once more on the lips of American statesmen as German submarines, operating in wolf packs, attacked the Anglo-American maritime lifeline. American ships out of certain areas, designated as combat zones, adjacent to neutral ports. It had, in short, surrendered its traditional insistence that the rights of neutrals be respected.

All freedom—meaning freedom to live and not freedom to conquer and subjugate other peoples—depends on the freedom of the seas—for our own shipping, for the commerce of our sister Republics, for the right of all nations to use the highways of world trade, and for our own safety.

President Franklin D. Roosevelt said in May 1941:

He had already, in September 1940, labeled submarine warfare as defiance of the “historic American policy” for which, “generation after generation, America has battled . . . that no nation has the right to make the broad oceans of the world . . . unsafe for the commerce of others.” And in August 1941, when Roosevelt and Prime Minister Winston Churchill drew up the Atlantic Charter, a blueprint for the postwar world, the seventh of eight principles was the hope that “such a peace should enable all men to traverse the high seas and oceans without hindrance.” Thus, the two leaders reiterated the broad concept of the freedom of the seas first proposed by Woodrow Wilson.

Like the Treaty of Versailles, which ended World War I, the several treaties negotiated after World War II made no mention of the freedom of the seas; and as the Covenant of the League of Nations had ignored the principle, so did the Charter of the United Nations. Thus, the hope of Franklin Roosevelt suffered the same fate as did the dream of Woodrow Wilson. The unrestricted right of all people to enjoy the freedom of the seas is still not guaranteed by international agreement. Indeed, since the end of World War II the United States has on three occasions taken actions that tended to limit the use of the seas by other nations. The first time was in June 1950, at the outbreak of the Korean War. President Harry S. Truman ordered the Seventh Fleet to patrol the Formosa Strait to prevent the Chinese communists from attacking Formosa and to keep the forces of Chiang Kai-shek from mounting an assault on the mainland. The Soviet Union promptly labeled the action a blockade, which the United States as promptly denied. As evidence to support its contention, America pointed to the fact that commercial traffic in the strait was unimpeded and untouched. The interdiction applied only to naval forces.

The second occasion came in October 1962, when President John F. Kennedy, upon learning that the Soviet Union had built missile sites in Cuba and had supplied Cuban premier Fidel Castro with missiles, proclaimed his intention “to interdict . . . delivery of offensive weapons and associated material to Cuba.” He called the policy a “strict quarantine,” yet it had all the markings of a blockade. Vessels were to be stopped, visited, and searched within certain prescribed zones and along certain routes. The Soviets considered it a blockade and protested on the ground that a blockade could be instituted only in wartime. To escape that anomaly, American lawyers called it a “pacific blockade,” which international law permits as a means for one nation to seek redress, short of war, from another. The legal difficulty surrounding the use of that term was that in a pacific blockade only the blockaded nation’s ships could be stopped and seized—not those of a third party. In this instance Soviet ships were the object of search and seizure. Whatever the terminology,
it was clear that the United States had used naval forces to interfere with shipping on the high seas, albeit for the lofty motive of self-defense.

The third example of postwar American practice centered on President Richard M. Nixon’s mining of North Vietnamese ports in May 1972. Again there was confusion as to the legal status of the act. Nixon denied the Soviet allegation that it was a blockade. The New York Times called it a “semi-blockade.” The difficulty was compounded by the fact that the action took place not on the high seas but within the “internal and claimed territorial waters of North Vietnam,” to use the words of the Department of State’s legal officer. And, indeed, there was no interference with freedom of navigation beyond North Vietnam’s territorial waters. Judged by the classic nineteenth-century definition of blockade, the act could not be called a blockade. But by the mid-twentieth century, many of the traditional and historic concepts that made up the doctrine of the freedom of the seas were being altered to suit new conditions of international relations.

One major change concerned the extent of territorial waters. For centuries, the territorial waters of a state were calculated at three miles (a cannon’s range). At a conference held in 1930 at The Hague for the codification of international law of the sea, the three-mile limit was adopted officially and the marginal sea was declared to belong to the state. At the same time, several nations, wishing to exploit, without competition from other nations, extensive fishing beds and mineral resources in the subsoil, made claims to a more extended area—up to two hundred miles. The United States made no such claims, but in 1945 President Truman announced the creation of “conservation zones in those areas of the high seas contiguous to the coasts of the United States” for the development of fishing. Similarly, the continental shelf in the same contiguous areas was to be exploited for its natural resources. No specific limits were put on the contiguous areas, but it was known that the government favored an extension of the territorial waters from three to twelve miles and the creation of an economic zone of two hundred miles.

THE UNITED NATIONS LAW OF THE SEA TREATY

To settle the problem, conferences were held at Geneva in 1958 and 1960 and at Caracas in 1974, but no agreement was reached. At Caracas the United States pushed the twelve- and two-hundred-mile limits, providing freedom of navigation and of scientific research in the economic zone was assured for all nations—“a balance between coastal states’ rights and duties within the economic zone”—but some nations appeared hesitant about diluting their sovereignty in the zone.

Finally, in 1982 a comprehensive United Nations Law of the Sea Treaty agreement was reached that established the twelve-mile limit for territorial waters and the two-hundred-mile “exclusive economic zone” that the United States had pushed for. The historic pact deemed the

**LAW OF THE SEA TREATY: DEFINITIONS**

“Innocent passage” means the right of warships, merchant ships, and fishing vessels to pass without warning the territorial waters of a state in a manner that is not—in the words of the Law of the Sea Treaty (part II, article 19/2)—“prejudicial to the peace, good order, or security of the coastal State.” Beginning in the 1970s the United States vigorously resisted efforts to require warships, nuclear-powered vessels, or vessels carrying environmental hazards to give notification prior to passing through the territorial waters of a sovereign state.

“Right of transit passage” refers to the principle articulated in the Law of the Sea Treaty (part III, article 38) guaranteeing all vessels and aircraft the right to pass through or over straits less than twenty-four miles wide at their narrowest point, that is to say, straits in which the twelve-mile territorial sea claim may have territorialized waters that formerly were international. Such straits include Gibraltar, Hormuz in the Persian Gulf, and Malacca in the South Pacific.

“Archipelagic sea-lanes passage” applies the principle of right of transit passage to archipelagoes, most importantly Indonesia and the Philippines. It guarantees unmolested passage for ships and aircraft through and over archipelagic waters, defined as the area encompassed by the drawing of baselines around the outermost islands of an archipelago. Archipelagic sea-lane passage is guaranteed in part IV of the Law of the Sea Treaty.
world's oceans the “common heritage of mankind” and represented a dramatic shift away from Grotius's notion that the seas were free owing to their boundlessness. Now the seas were understood to be a zone of interdependence in which all nations (including landlocked ones) had a stake. Although the Law of the Sea Treaty substantially affirmed American notions about the freedom of the seas, the administrations of Ronald Reagan and George H. W. Bush refused to sign it because of restrictions it placed on private enterprise regarding deep seabed mining. In July 1994 the Clinton administration, after negotiations leading to the modification of the deep seabed mining provisions, signed the pact; the Senate, however, perceiving that the treaty still hindered the U.S. freedom of action on the high seas, refused to provide the two-thirds majority needed to ratify it. As of 2001 the United States was not a signatory to the treaty, which went into effect on 16 November 1994 after ratification by sixty nations.

DEFENDING FREEDOM OF THE SEAS INTO THE TWENTY-FIRST CENTURY

The expansion of territorial waters and exclusive economic zones by many nations since World War II encouraged some states to restrict in various ways free passage on the high seas, a phenomenon known as “creeping sovereignty.” To resist what American diplomats termed the “excessive maritime claims” of certain states, the United States instituted in 1979 a freedom of navigation policy designed to assert its historic commitment to a broad definition of freedom of the seas. This policy aimed to meet encroachments on the right of passage either by sea or air by a three-pronged strategy of diplomatic protest, operational assertion, and bilateral or multilateral negotiation. The operational assertion part of the policy resulted in several high profile incidents including challenging in 1986 Libya's claim that the Gulf of Sidra was a historic inland sea subject to its complete control and the 1988 bumping of U.S. warships by Soviet naval vessels while exercising the right of “innocent passage” inside the twelve-mile territorial limit in the Black Sea. In 1989 the latter incident resulted in a joint statement signed by Secretary of State James A. Baker and Soviet foreign minister Eduard Shevardnadze affirming the right of American warships to conduct innocent passage through Soviet territorial seas.

For more than two hundred years, from the very beginning of the Republic, the tendency of American policy has been to enlarge rather than to restrict the rights of nations on the seas—that is, except in certain periods when the country was at war and the national interest dictated the extension of American rights at the expense of other nations. The determination and consistency with which the principle of freedom of the seas has been asserted is testimony to its central importance in the history of American foreign policy. It represents the effort to extend American notions of international law and universal human rights to the oceans of the world. It constitutes a massive de facto extension of American sovereignty to the watery borders of all nations. And throughout the nation's history and into the foreseeable future it has been and will be job of the U.S. Navy to enforce the principle of freedom of the seas.

Although historians have been studying gender for several decades, the study of gender in American foreign policy is a relatively new phenomenon. Indeed, the proliferation of scholarship on this topic in the 1990s suggests that gender has become a permanent and theoretically significant category of analysis for the historian of American foreign relations. It is important to note, however, that this approach has generated lively debate among many historians. In journals and on-line forums and at conferences, scholars at the beginning of the twenty-first century continued to argue about the degree to which gender has affected the creation, conduct, and outcomes of international diplomacy.

**WOMEN AND GENDER: DIFFERENT APPROACHES**

Many people understandably but mistakenly equate the study of gender with the study of women when, in fact, these are fairly different enterprises. Historians who study women (many but not all of them women) look at women's activities and contributions in various economic, political, cultural, and spatial contexts. Practitioners of women's history see all women as historical actors: they look at an individual woman or women together in social movements, at notable and elite women or anonymous, “ordinary” women, at women in the kitchen or women in the streets. Since the 1970s (and even earlier), women's historians have argued that historical narratives have largely ignored women's experiences, yielding an incomplete, or even misleading, portrait of the American past. Through critical analysis of traditional primary sources—and by uncovering sources that historians previously did not think worthy of study—women's history seeks to expand and complicate our histories of industrialization, electoral politics, and warfare, to name only a few topics. Historians of women insist that their scholarship should not merely add a new set of female characters to the plot line of American history, but rather that the whole story needs to be tested, reconsidered, and revised.

The study of gender is an outgrowth of women's history, which is why people tend to view the study of gender and women as the same thing. The scholarly interest in gender emerged as practitioners of women's history, informed by scholarship in anthropology, psychology, and literary criticism, began to ask critical questions of their own methodologies. Shifting the focus from women to gender, historians of gender explore how males and females (sex) become men and women (gender). That is, to study gender is to examine how a society assigns social meanings to the different biological characteristics of males and females. Historians who study gender see it as a cultural construct—something that human beings create and that changes over time. The differences between men and women, they argue, are rooted in society, not in nature, and as such can be historicized. Moreover, gender scholars point out, if women's lives have been shaped profoundly by gender prescriptions, then so, too, have men's. Cultural ideals and practices of masculinity and femininity have been created together, often in opposition to one another; therefore, both men and women have gender histories that must be analyzed in tandem. Indeed, gender studies is relational in that research into the history of gender ideals and practices is always linked to investigations about the operation of the economy, the construction of racial ideologies, the development of political institutions, and other phenomena typically studied by historians.

So what does it mean to do women's history in comparison to gender history? Actually, most historians in this field do a little bit of both. Still,
whereas a women's historian would focus on, for example, women's labor force participation during World War II, a gender historian would examine how gender ideologies shaped the organization of labor on the battlefield and the home front, and how the war remapped the meanings of masculinity, femininity, and labor. Put another way, women's historians foreground women as historical actors, while gender historians foreground ideological systems as agents of history. Certainly, those who do women's history engage the question of how gender norms shape women's experiences and struggles, but they tend to focus on women, as such, more than they examine historical ideological shifts in the meanings of masculine and feminine. At the same time, gender historians do not ignore women altogether; rather they interrogate the very meaning of the term “woman,” highlighting historical changes in the construction of masculinity and femininity, manhood and womanhood. Again, many historians do some combination of both, combing the documents for clues about how men and women have both shaped and been shaped by gendered beliefs, practices, and institutions.

The theories and methodologies of gender history have been adapted to many fields, but the integration of gender into the study of American foreign relations has been slow and uneven. Part of the reason for this is that the “high” politics of diplomacy seem far removed from the politics of everyday life that have long been the concern of gender and women's history. Until the late twentieth century, both diplomatic and women's historians were themselves inattentive to the connections between their fields and thus very few conversations took place across the disciplinary divide. Scholarly work in various disciplines since the 1980s, however, has revealed important links between American diplomacy and American culture, and the most recent scholarship reflects a more self-conscious attempt by historians to identify a dynamic interrelationship between the creation of foreign policy and the construction of gender.

Finding Women in Foreign Policy

The integration of these two seemingly disparate literatures—gender studies and diplomatic history—is ongoing, and it is important to note that this subfield is still “under construction.” Nevertheless, it is possible to describe and analyze the myriad approaches historians have used thus far. One of the first ways historians have made gender visible in foreign policy is by spotlighting the presence and contributions of the anomalous women who have shaped American foreign policy. This approach reveals how women like Senator Margaret Chase Smith, Eleanor Dulles (the younger sister of John Foster and Allen), and first lady Eleanor Roosevelt have influenced foreign policy in a variety of roles—as elected officials, lobbyists, mid-level bureaucrats, and even first ladies. More recently, women such as Jeane Kirkpatrick, Madeleine Albright, and Condoleezza Rice have risen to the highest levels of statecraft. President Ronald Reagan appointed Kirkpatrick in 1980 to be the U.S. representative to the United Nations. Kirkpatrick's staunch anticommunism and advocacy of a reinvigorated national defense fit comfortably in the Reagan administration, and she became a widely known spokesperson for Reagan's foreign policy positions. President Bill Clinton, too, selected a woman to represent U.S. interests at the UN. Albright served several years at the UN until Clinton appointed her secretary of state in 1996. Secretary Albright was the first woman to serve in that role, and in 2001, President George W. Bush made Rice the first woman assistant to the president for national security affairs.

Tracking these “firsts” and the careers of other notable but lesser known women in the diplomatic corps marks an important contribution to the literature simply because it makes women visible. Biographical information on how these women worked their way through institutions controlled by men can yield important insights about the role of feminism in paving the way for their entry, and about the challenges involved in managing a career in a field still populated with very few women. This approach also encourages scholars to not simply acknowledge women such as Kirkpatrick or Albright but to evaluate their contributions and legacies. Many critical questions have emerged from this literature about the weight of women's influence in foreign policymaking (Albright, for example, enjoyed much more access to policy inner circles than did Kirkpatrick), about whether female policymakers' contributions reflect “a woman's view,” and whether American women can effect more change if they operate inside or outside of policy circles.

Still, this quasi-biographical approach to gender and foreign policy has some significant limitations. It tends to focus on elite women, so it is narrow by definition. As a result, we lose something of the story of how the nonelite majority of
American women have shaped foreign policy through different means. Further, its “notable women” orientation just adds women to the story, leaving untapped the methods, questions, and theories that define diplomacy and the discipline of diplomatic history itself. Finally, this approach also supports (probably unintentionally) the misguided notion that truly exceptional women, with enough resources and pluck, can enter the inner circle of statesmen, and that the vast majority of women cannot, because of either native inability or subjugation by a male power structure. Neither of these notions can be supported historically, nor are they the intended arguments of writers, but the impressions remain. Many more important biographies and studies of such women need to be done, but they can contribute only modestly to the knowledge about gender and American foreign relations.

Beyond this approach lies another, broader in scope, more inclusive of nonelite women, and more sensitive to the array of historical forces that have shaped women’s inclusion or exclusion from foreign affairs. In this approach, women are written into the history of foreign relations as missionaries—emissaries of Americanism. These more prosperous white women (teachers, reformers, and members of faith communities) become part of the larger narrative about the energetic expansion of the United States in the late nineteenth century, and here they can be cast as both villains and victims. Historians have documented the ways in which women missionaries exported “civilization” to nonwhite populations through “uplift” programs that valorized whiteness, Christianity, and conventional gender and family ideologies. Some newer work has complicated this story further, suggesting that women such as turn-of-the-century female travelers abroad and the women photojournalists who documented the violence of the Spanish American War participated in missionary types of civilizing projects, even if not formally engaged in missionary work themselves. At the same time, however, all of these works acknowledge that nineteenth- and early-twentieth-century gender systems prevented women’s participation in diplomacy (and domestic electoral politics), relegating women to a separate sphere of foreign affairs. Excluded from formal policymaking, these women were still political actors; they promoted the tenets of American foreign policy through the means available to women of their status. Like their sister reformers who worked in immigrant communi-

ties in American cities, female missionaries practiced their “social housekeeping” on a global stage. In this approach, then, women become visible in the dramas of foreign policymaking as collaborators in exile, historical actors who support the worldviews and expansionist agendas of male foreign policymakers but only from a position of exclusion.

Like women missionaries, women in peace movements tried to participate in foreign policymaking from the outskirts. Historians have found in peace histories of the nineteenth and twentieth centuries a meaningful paper trail of women’s participation in important national and international debates about U.S. foreign policy. In examining the theories, strategies, and tactics of organized women’s peace movements, it becomes difficult to capture the whole of their contributions to policymaking. Historians hold different views about the degree to which peace movements generally have influenced decision makers’ choices about interventions and arms buildups. Moreover, historians of women’s pacifism have tended to focus less on the policy impact side of the story and more on the social movement story—that is, how it was that women in different eras were able to muster the ideologi-
cal and material resources to create and sustain movements that addressed foreign policy issues long considered to be “men’s business.”

It is difficult to generalize about the politics of women’s peace movements, because female pacifism has both enshrined conventional gender roles and advanced the ideas of feminism. One safe generalization might be that women in peace movements have capitalized on their outsider perspective; their very exclusion from the “man’s world” of diplomacy enabled them to criticize—more perceptively, they argued—the overseas adventurism of the United States. Many female peace activists, whether mothers or not, claimed a maternal identity as the basis of this outsider critique of American diplomacy. Although there was no national, independent women’s peace movement before 1914, there were individual women and small peace groups that lobbied in various locales. In these activities we can see a nascent feminist peace consciousness developing over the course of the nineteenth century, and much of this activism sprung from female reformers’ maternalist sensibilities. These women, largely middle class, white, and Protestant, argued that U.S. expansion overseas should not extend what they charged were male values of conquest and
acquisition, but rather should reflect women's purity, virtue, and maternal morality. By the late nineteenth century, many nationally organized women's groups, such as the Women's Christian Temperance Union (WCTU), had fully incorporated a peace plank into their reform agendas. In fact, the WCTU created a Department of Peace and Arbitration in 1887, which enabled them to link more systematically their crusade against alcohol (a critique of male violence in the family) with a campaign for peace (a critique of male violence overseas).

Over the course of the twentieth century, through both world wars and after, female pacifists continued to claim the mantle of motherhood as an entry into foreign policy politics. Like their nineteenth-century predecessors, these later activists nurtured the notion of a maternalist citizenship, a concept that included not only the demand for the vote, but a full voice in governmental affairs, electoral politics, and any other arena in which foreign policy was made. During the years of World War I, for example, we see the emergence of what Harriet Hyman Alonso calls the "suffrage-pacifists," women who saw peace issues as inextricably linked with women's suffrage. The formation of the Woman's Peace Party in 1915 reflected this fusion of peace and women's rights; its platform called for arms limitation, international jurisprudence and peacekeeping, an end to the war in Europe, and the right to vote for women. Representation from numerous women's clubs at the founding meeting, including the WCTU, the General Federation of Women's Clubs, the Women's Trade Union League, and the Women's National Committee of the Socialist Party, reveals the breadth of interest in suffrage-peace politics. Social reformer and Woman's Peace Party leader Jane Addams encouraged women already active in local matters to pay attention to international affairs—to link local with global. Addams and others noted that peace activism was a natural extension of women's nurturance of family and community, and the Peace Party's appeal to "the mother half of humanity" reflected their maternalist orientation.

Years later, well after women won the right to vote, motherhood continued to be an important identity and organizing base for women's peace groups. In 1961, Women Strike for Peace, an organization of "concerned housewives," called on President John F. Kennedy to "end the arms race—not the human race." They, too, claimed the experiences and insights of motherhood as a foundation for activism. As caretakers of the nation's children, they argued, all women had a responsibility to lobby for peace. Taking a multitude of positions on issues from the nuclear test ban treaty of 1963 to U.S. intervention in Vietnam, members of Women Strike for Peace went further than mere criticism of U.S. policies: they argued passionately that the moral, maternal citizenship they embodied promised a new path to more harmonious local, national, and international relationships.

This ideological fusion of motherhood with peace made women's entrance into national debates about global affairs more hospitable than it might have been had they argued for participation based on more feminist principles of justice and equality. But as historians have aptly pointed out, women's pacifism was a politics of feminism as well as maternalism. Indeed, women active in peace movements saw a connection between militarist diplomacy and male supremacy, and they infused their critique of American foreign policy with a critique of male domination. Maternalist peace activism enabled women to understand not only their exclusion from the military state, but also their cultural and economic disenfranchise-ment in American society as women and mothers. They identified a link between military violence abroad and domestic violence at home. They argued that the violence of war devalued and destroyed women's values and women's work, since it was women—as mothers—who created and sustained life. The war machine was male owned and operated, they claimed, and an American foreign policy based on military intervention was the logical culmination of men's domination in the workplace, politics, and the family. In this sense, many women activists (especially those in the second wave of the feminist movement) went further than mere condemnation of their exclusion from policymaking bureaucracies—they denounced the whole system itself. These ideological currents could be seen in both nineteenth- and twentieth-century peace movements, and it is significant that women's participation in peace movements often grew out of and coexisted with activism in abolitionist, suffrage, and other feminist causes.

Although the focus on women missionaries and pacifists has been instrumental in writing women into the history of American foreign policy, this approach, too, has its problems. It can often assume an essentialized femininity (the idea that women are all the same) across all racial, class, and
regional boundaries. At the same time, it can posit a theory of female difference—that women are a special class of human being, uniquely nurturant, maternal, and peaceful. As historians have suggested, this seemingly powerful vision of women can lead to their exclusion from politics and policymaking, based on the assumption that women would be unfit or somehow corrupted by the rough and tumble world of diplomacy.

More importantly, ideas about women's inherent pacifism are not true. As many studies have demonstrated, women have been an integral part of military engagements as auxiliary military forces, production workers, and home front volunteers. In fact, women themselves have invoked a maternalist ideology to endorse as well as oppose military preparedness and war. And, of course, American foreign policymakers have often depended on the rhetoric of maternalism and family to whip up popular support for their decisions. At different historical moments, American women have strenuously affirmed and participated in a whole range of military mobilizations.

Taken together, these histories reveal women's varied levels of engagement with American diplomacy. They underscore the fact that "women were there" in the making of foreign policy: there were a few in policymaking circles, more in missionary work, and even more in peace movements. Yet finding them has not made it easy to generalize about the meanings of their presence, for women were positioned differently in relation to the state that made foreign policy decisions, and they viewed and acted on those decisions in different ways. Perhaps the most important outcome of writing these women into diplomatic history is that now scholars must widen their lens as they seek to understand how foreign policy has been made and implemented by varieties of historical actors in varied political contexts.

SEEING GENDER IN FOREIGN POLICY

If finding women in foreign policy has broadened the study of American foreign relations, then locating gender has stretched the discipline even further. In the most basic sense, applying a gender analysis to the study of American foreign policy is an attempt to see things differently, or to see new things entirely. Like other tools of analysis, gender offers another angle, another peek into the complicated world of policymaking. Diplomatic historians who use gender analysis are no different than their colleagues in the field; they, too, seek answers to longstanding questions about the emergence of colonialism, the development of tariff and trade policies, the rise of anti-imperialist movements, the origins of the Cold War, and the like. The use of a gender analysis does not preclude the use of any of the customary methodologies of the historian; gender merely adds to the historian's toolbox.

As explained earlier, the emergence of gender studies has made it possible for historians not only to find women but to see both women and men as gendered actors. Indeed, the research on women and femininity as historical subjects has inspired new investigation into the histories of men and masculinity. This has opened a rich vein of scholarship that does not take men's participation in foreign affairs for granted; rather, it interrogates how masculine values and worldviews have shaped diplomacy, enabling students of foreign policy to see anew how normative ideas about manhood inform policymakers' decision making in both domestic and international contexts.

But a gender analysis shows us more than masculinity in action; it offers a critical tool for understanding power in all of its guises. Seeing gender enables historians to scrutinize the organization of power in any arena, from the most public to the most intimate. Gender ideologies can represent relationships of power as innate, fixed, or biologically rooted, but gender history can make transparent the human agency behind those "natural" relationships. Gender analysis can also reveal how ideologies of masculinity and femininity are embedded in language and social structures; the language of warfare, for example, depends on gendered ideas of strength and weakness, protector and protected, which, in turn, shape how an institution like the military utilizes men and women to carry out American foreign policy. A gender analysis can be powerful precisely because it interrogates power itself; it raises fundamental questions about how particular groups have achieved dominance by naturalizing power relations that are, in fact, humanly constituted.

Cold War history offers an illustrative, although by no means exclusive, case of how gender analysis can affect the study of American foreign policy. It was in this field where scholars first began to commingle the study of politics, culture, and gender to expand traditional narratives of diplomatic history. The Cold War's rich imagery of nuclear apocalypse and hyperbolic talk of
patriotism and subversion first caught the attention of historians of culture and social history, who sought to explain the relationship between the social-cultural politics of the postwar home front and the diplomatic politics of the Cold War. This work tended to locate gender and national security themes in popular culture (film, mass-circulation magazines) and in the burgeoning social scientific “expert” literature translated for public consumption. Scholars have traced how messages about muscular masculinity and dangerously aggressive femininity made their way into the films, novels, advice columns, and even comic book literature of the era. According to this research, new opportunities for women’s independence unleashed by World War II (as witnessed by women’s rising participation in the postwar wage labor force) generated new fears about the stability of gender roles and family practices. Female independence, often portrayed in popular culture in highly sexualized ways, was likened to the lethal potency of a mushroom cloud. Social science experts and popular advice literature advocated family stability—and female domesticity, in particular—as antidotes to the past disruptions of World War II and the future uncertainties of the nuclear age. This scholarship revealed intriguing symbolic linkages between the generalized anxiety about atomic energy and the popular apprehension about the slow but steady transformations in gender roles and family life.

In a similar vein, historians have pondered how containment doctrine, a policy hatched in high-level diplomatic circles, became a language and practice in the popular realm. Historians of the family and sexuality, for example, have explored how anticommunism and national security policies became manifest in everyday life. The

“The harsh fact of the matter is that there is also an increasingly large number of young Americans who are neglecting their bodies—whose physical fitness is not what it should be—who are getting soft. And such softness on the part of individual citizens can help to strip and destroy the vitality of a nation. . . . Thus in a very real and immediate sense, our growing softness, our increasing lack of physical fitness, is a menace to our security.”

— John F. Kennedy on men’s physical fitness and national strength, 1960

“The new stronghold of national security is in our homes. . . . For the first time, the personal defense of our homes is. . . . being rated as co-equal in importance with our military defense.”

— Katherine Howard, Federal Civil Defense Administration Women’s Affairs Division, on family responsibility and Cold War national security, 1954

“This group of women came together to protest in the name of Womanhood against the cruelty and waste of war, and to give united help toward translating the mother-instinct of life-saving into social terms of the common good.”

— Women’s International League for Peace and Freedom statement, 1919

“Exactly as each man, while doing first his duty to his wife and the children within his home, must yet, if he hopes to amount to much, strive mightily in the world outside his home, so our nation, while first of all seeing to its own domestic well-being, must not shrink from playing its part among the great nations without.”

— President Theodore Roosevelt on men’s domestic and international responsibilities, 1901

“What does all this mean for every one of us? It means opportunity for all the glorious young manhood of the republic—the most virile, ambitious, impatient, militant manhood the world has ever seen.”

— Senator Albert J. Beveridge on the annexation of the Philippines in 1900
ambient fear of nuclear annihilation, paired with concerns about the resilience of the nuclear family, spurred campaigns to “contain” the social forces that might prove disruptive to gender and family traditionalism. In fact, scholars have argued, postwar America’s red scare was as much an attempt to root out nontraditional gender roles and sexual practices as it was an effort to secure America’s foreign policy dominance. The preoccupation with national security abroad was bolstered by a security effort at home that enshrined “family values.” According to popular cold warriors, with Joseph McCarthy being merely one of a chorus of voices, only heterosexual nuclear families with breadwinner fathers, stay-at-home mothers, and children could anchor a patriotic domestic security endeavor. Anything outside of that configuration was suspect, probably subversive, a potential menace to national security.

This gender conservatism underpinning the red scare was more than simply a cultural mood. Historians have shown it had concrete policy manifestations as well. Despite the changing gender and sexual practices of the wartime and postwar years, McCarthy-era intolerance led to the criminalization of homosexuality, resulting in the federal government’s purge of gays and lesbians in government service. Advocates of the purge argued that homosexuals were “sex perverts” whose tastes and habits imperiled national security. Like communists, gays and lesbians could avoid detection and spread their propaganda under the radar screen. Homosexuals were dangerous as well because they were gender outlaws: mannish women who could not be domesticated and weak-willed, “sissified” men who could not stand firm and tall against communist aggression, at home and abroad. The theme of the “homosexual menace” pervaded postwar political culture, reaching from the very top echelons of the federal government to the most local bureaucracies and organizations. Using the screening and firing mechanisms of President Harry Truman’s loyalty-security program, anticomunist officials were able to either screen out or discharge thousands of gay and lesbian citizens from government service. This episode illustrates how policymakers, opinion leaders, and ordinary folk imagined gender and sexual dangers as foreign policy or national security dangers. Without a gender analysis, these symbolic and material linkages would be difficult to see.

This early scholarship on the gendered meanings of Cold War culture and the national security state was highly suggestive, urging historians to think about connections not yet made and pointing out directions for future study. This work took the traditional approach of historians—document analysis—and pushed it into new directions, borrowing from postmodern approaches that take discourse (written and spoken language, images, and symbols) analysis seriously. Historians saw in this Cold War discourse rich and varied gender meanings that could broaden our understanding of how language constructed the national security environment in which policymakers formulated their momentous decisions. In the broadest sense, the work on gender, culture, and foreign policy provocatively suggests that the relationship between text and context is more than incidental—that text actually constructs the historical context, it does not merely reflect it. This work has also performed an invaluable service to both diplomatic and social history, because it has successfully linked these heretofore separate historical literatures. The fusion of this previously bifurcated historiography of the postwar era has yielded a more complex understanding of the Cold War as a creature with both domestic and diplomatic dimensions.

Still, the first historians to do this work tended to look for a gender–foreign policy connection primarily in popular culture, leaving unanalyzed the gender content of the more traditional documents (letters, memos, telegrams, agency reports, treaties) found in presidential and security agency archives. In fact, there was arguably a kind of gendering of the sources themselves, whereby scholars who wanted to find gender in diplomacy tended to look at popular discourses (gendered feminine) rather than at the records of diplomacy (gendered masculine). This left the impression, as Amy Kaplan (1994) has argued, that gender “enters diplomatic history only through the aegis of culture.” More recent scholarship on gender and Cold War foreign policy has built on these earlier approaches, and historians continue to fine-tune and adapt the methodologies of literary and cultural studies to traditional historical analysis of diplomacy. Much of the newer work on gender and foreign policy now analyzes gender in sources that few postwar Americans would have laid eyes on. Cold War historians excavate the classified archival materials of presidents, defense bureaucracies, military leaders, intelligence agencies, and nongovernmental actors engaged in diplomacy at various levels. Their analysis of these institutional documents produced in relatively
remote political environments is no different than the cultural historian's analysis of documents produced for mass consumption. Like Cold War films or science fiction literature, traditional diplomatic documents are cultural artifacts that can reveal something about the operation of gender in the Cold War era.

An examination of particular moments in Cold War history from the Truman, Eisenhower, and Kennedy administrations may help readers see how this work is done. Diplomatic historians have long debated questions about the emergence of chilly relations between the United States and the Soviet Union in the aftermath of World War II. Volumes have been written about how the two superpowers sought military, economic, and territorial advantages as they tried to construct a post-war world hospitable to their own interests. Many scholars have focused on the development of the doctrine of containment, foreshadowed by the 1947 Truman Doctrine (which pledged the United States to fight communism in Greece and Turkey), and then articulated more thoroughly by George Kennan, the State Department analyst who penned the now famous “long telegram” in early 1946, followed by the “Sources of Soviet Conduct” article in July 1947. Historians have scrutinized Kennan’s policy recommendations and rhetorical flourishes for decades, but until the late 1990s, no historian had done a close textual analysis that incorporated gender analysis. In fact, the question of how gender has shaped the political assumptions, worldviews, and policies of cold warriors has yet to be asked in a systematic way for the whole of the Cold War. Nevertheless, new studies have yielded some compelling findings on particular episodes in Cold War history.

Using the insights of gender studies, historian Frank Costigliola found that George Kennan's writings were rife with gendered metaphors that represented the Cold War as an emotional, sexually charged struggle between a man and woman. Kennan’s favorite analogies to describe the changing postwar relationship between the United States and the Soviet Union depended heavily on gender, family, and sexual ideologies and imagery. For example, Kennan likened the relationship between Soviet citizens and their government to a wife who becomes gradually disillusioned with her husband and seeks a divorce from him. Russian people, in general, were gendered feminine, Kennan’s way of conveying his firm view that the Soviet citizenry was beholden to their cruel and despotic government, gendered as a hypermasculine authority figure. In his telegram, Kennan went so far as to portray the Soviet government as a rapist who tried to exert “unceasing pressure” with “penetration” into Western society. These gendered metaphors and tropes are not just casual talk; they are the stuff of politics, according to Costigliola and others. Kennan's writings shaped the political environment in which policymakers thought about and negotiated with the Soviets; the invocation of highly gendered and sexualized motifs, Costigliola notes in “‘Unceasing Pressure for Penetration’” (1997), "created an emotionalized context” that made the exaggerations of a Soviet threat seem “rational and credible," thus closing off deeper deliberation about the reality and dimensions of that threat. Other scholars, too, have delved into diplomatic sources to see how policymakers relied on gender to understand diplomatic relations between states. Historian Michelle Mart examined the gendered discourses of U.S. relations with Israel in the Truman and Eisenhower years. In this case, gender helps explain how Israeli Jews became worthy of a close relationship with the United States from 1948 through the 1950s, that is, only after they had proclaimed statehood and strenuously resisted subsequent Arab attacks. An analysis of the diplomatic exchanges between the United States and Israel reveals that the manly pursuits of statehood and warfare transformed Israeli Jews, in the eyes of the U.S. policymakers, from marginal global players to muscular fighters, sex symbols, and triumphant underdogs. Jewish “tough guys” had proven their mettle in the battle for statehood, and the reward for their virile and vigorous struggle was a dependable, long-term alliance with the United States. Gender defined the parameters of that alliance, for a tough-minded masculine orientation was considered by U.S. policymakers an important indicator of a country's fitness for a close political and military alliance with a global superpower.

A study of U.S. relations with India in the same time period reveals how the very gendered perceptions that enabled diplomatic partnership with the Israelis disqualified India as a serious player in Cold War politics. According to a study by Andrew Rotter, America's postwar relationship with India was structured, in part, by the gendered perception that India's desire to remain a neutral player in the standoff between the United States and the Soviet Union was a signal of its passivity and cowardice. American policymakers, frustrated with India's desire for neutrality, por-
tayed India itself and Indian diplomats as feminine, meaning in this case, weak-willed, irrational, naive about world affairs, and ultimately undefeatable. Cold War gender ideologies that valorized masculine rationality and decisiveness as a counterpoint to feminine emotionality and passivity thus shaped policymakers' views that India was acting like a frightened woman who could not be relied upon to sustain a long-term diplomatic alliance in Asia.

Moving forward from the Cold War diplomacy of the Truman and Eisenhower administrations into the early 1960s, scholarly work has uncovered the centrality of gender to the policy assumptions and decision making of the Kennedy administration. John F. Kennedy's cultivation of youth, energetic patriotism, and moral courage has been discussed widely. As historian Robert D. Dean argues, scholars and media observers of the Kennedy presidency have often cited President Kennedy's preoccupation with “toughness” as an issue of personal style or habit, not a matter of gender politics. In fact, Kennedy's foreign policy interests and energies were a reflection of his views that American manhood was threatened by indulgent consumption at home and communist insurgency abroad, both of which required the diplomatic muscle flexing of tough-minded cold warriors. Kennedy's physical fitness programs would strengthen youth at home, while his new Peace Corps would dispatch an energetic corps of youth to all ends of the globe to fight the Cold War with American ideology and first-world technology. Meanwhile, his countersurgency measures, embodied by the elite Green Berets, would counter Soviet aggression by discouraging any potential—and quashing any real—Soviet-sponsored indigenous uprisings. In essence, Dean claims, Kennedy's policies were a projection of his perception that American men had grown soft and idle in the post-war period, and that the antidote to this crisis of masculinity was an infusion of bellicose and brawny political leadership at home and abroad.

We can reach further back in time, to the nineteenth century, to apprehend gender meanings in American foreign policy. Kristin L. Hoganson's 1998 study about the operation of gender in the Spanish-American War, for example, nudges historians to confront difficult questions about the causal role of gender in American foreign policy decisions. Like the scholarship on gender and the Cold War, her study is premised on the notion “that the conduct of foreign policy does not occur in a vacuum, that political decision makers are shaped by their surrounding cultures,” and that “inherited ideas about gender” are a part of that culture and thus shape profoundly the views of foreign policymakers. In the case of the Spanish-American War, Hoganson states that gender ideals “played an exceptionally powerful and traceable role” in the decision to go to war. Advocates of intervention in Cuba and the Philippines believed that international aggression would fortify American nationalism and manhood at the same time. They drew on nineteenth-century ideas about “manly” character and citizenship, arguing that a war for territorial and economic expansion would energize and rehabilitate American manhood, which, they claimed, had grown soft without the challenges of frontier expansion, agricultural production, and warrior experience. Layered upon these concerns was another: women's growing political activism and their insistence on the right to vote. An imperial war, according to interventionists, would certify gender traditionalism (man as protector, women as the protected) and restore the manly (and womanly) virtues and character that were the basis of American democracy.

Interestingly, we see a striking repetition of gender themes between the foreign policy environments of the late nineteenth century and the Cold War era: a perceived crisis of masculinity (notably, associated with consumption in both centuries), an emergent anxiety about women's independence, and a confidence that a virile and robust American diplomatic posture abroad could go far to solve the twin problems of gender disorder at home and global threats abroad. In both periods of expansionist impulse, concerns about masculinity and femininity merged with concerns about affairs of state. Whatever the century or whatever the case study, then, late-twentieth-century scholarship made big and consistent claims that gender ideologies were a fundamental part of foreign policy formulation. In all of the examples cited, it appears that gender shaped the identities of foreign policymakers themselves before they arrived in Washington, and that it continued to shape their assumptions, anxieties, aspirations, and actions once they were fully ensconced in diplomatic circles.

GENDER AND THE HISTORIOGRAPHY OF AMERICAN FOREIGN POLICY

Historians who study gender will find all of the above themes familiar, but scholars who have not
yet tangled with gender analysis in their studies of foreign policy might find the approaches dubious and the conclusions unconvincing. Indeed, since gender topics first appeared in the pages of diplomatic history journals, historians have debated the merits of gender analysis at conferences, in on-line forums, in journals, and in their own monographs. One of the reasons for this debate is that some of the gender-themed studies of American foreign relations gained momentum in fields outside of diplomatic history and, indeed, outside of the history discipline itself, in the more literary-focused arena of cultural studies. Skeptics of the gender approach have wondered aloud what diplomatic historians can learn from stories about sexual metaphors, “tough Jews,” feminized Indians, and the gender tropes of imperial expansion and war. They have accused gender historians of paying too much attention to issues of representation at the cost of asking hard questions about causation. Some have argued that gender scholars have borrowed too heavily from other disciplines and have introduced questionable theories, methodologies, and insights into the field.

These criticisms are important and worth some elaboration. In fact, a great deal of the work on gender is indebted to postmodernist and cultural studies approaches, which cross disciplinary boundaries, take language seriously, and insist that historians interrogate not only the construction of reality in primary documents but the social construction of their own historical narratives. Cultural studies approaches differ, of course, but all involve close scrutiny of the unarticulated assumptions that underlay the legitimation, expression, and resistance of power. As Costigliola observes in “The Nuclear Family” (1997), “gender norms acted as silent organizers” of power in the diplomatic and political realms. Perhaps, then, what has made gender analysis controversial in diplomatic history is the fact that those who recognized these silences in their documents have also exposed some of the methodological silences of their discipline as well. Turning their critical eye from primary to secondary sources, gender scholars have provocatively suggested that gender norms might have also tacitly shaped the historiography of American foreign relations, thus calling into question some of the disciplinary “truths” of diplomatic history. Drawing on the insights of postmodernism, these scholars argue that the historiography itself is a social construction, and that narratives about foreign policy (or any historical phenomena) are human creations, subject to the inherited biases and assumptions of time and place.

Such challenges to the discipline and its historiography have evoked spirited criticism of postmodernism, gender analysis, and critical theory in general. Some historians claim that postmodernist gender approaches are jargon-filled intellectual exercises that have done little to enlighten the key debates in the field. More than a few have said that investigations of language and representation have taken diplomatic history too far afield from its traditional units of study (the nation-state, for example) and its tried and true methodology of document analysis and synthesis. In particular, critics have challenged the postmodernist claim that historical evidence does not benignly reveal a “real” world or a central “truth,” and that the evidence itself is a selective representation that can suppress multiple truths and heterogeneous realities. They maintain that such critical approaches, of which gender analysis is an elemental part, have spilled too much ink probing language and ideology rather than apprehending the real reasons for foreign policy decisions and outcomes.

While critics have argued that the new work on gender has better explained the connections between gender, culture, and diplomacy, rather than causation, those whose scholarship has been integral to this historiographical turn maintain that clear causation is hard to identify for any scholar, working on any problem, in any era. In fact, most gender scholars would agree that gender analysis does not explain reductively a single cause for a particular action, and that sometimes, gender meanings are not the most salient or significant aspects of a historical puzzle. Rather, they would argue, gender analysis abets the historian’s effort to get closer to a reasonable and reliable set of explanations about a particular historical problem. Historians who seriously engage gender do not shy away from questions about causation, but they tend to approach overarching causal explanations with caution. The precise effect of George Kennan’s “long telegram” on policymaking, for example, is impossible to discern, but it seems clear that his writings simplified what should have been a complex debate about Soviet intentions, and that his highly gendered, emotional musings naturalized—and thus rationalized—a set of diplomatic maneuvers that positioned the Soviets as unreliable allies and credible threats. In the case of the
Spanish-American War, the societal panic about masculinity in decline reveals how gender “pushed” and “provoked” warfare as an antidote to the changes in nineteenth-century family and gender relations. And in the case of President Kennedy's foreign policy programs, the gender experiences of Kennedy and his elite policy cohort, along with the gender ideologies and anxieties of the postwar era, motivated the president to respond to his Cold War environment as an Ivy League tough guy who could martial the resources to assure American hegemony.

These debates about gender and causation will, no doubt, continue, but in some ways they may miss the point. No historian has endowed gender with monocausal superpowers; in fact, many scholars of gender point out that the causal relationship between gender and foreign policy needs to be teased out even further. And although asking the “how” and “why” questions continues to be a staple of the discipline, perhaps historians need to reexamine this preoccupation with causation. The studies of Kennan and Kennedy are instructive here. As Costigliola's “Unceasing Pressure for Penetration” has made clear, the questions about gender's causal effects in foreign policy formulation “arise from the premise that there must be single, clear, unequivocal causes for policies and actions,” a premise that historians have repeatedly tested and found wanting. Even vocal critics of the gender approach have acknowledged that no single theory or explanatory framework can possibly explain the complexities of American foreign policymaking. As Dean has aptly stated, “gender must be understood not as an independent cause of policy decisions, but as part of the very fabric of reasoning employed by officeholders.” And so, too, it should be for historians—that gender become one part of the fabric of our historical analysis, not a separate, unrelated path of inquiry.

Together, women's history and gender studies have enabled historians to conceive of foreign policy more broadly, inviting more actors, methods, and theories into the endeavor. A gender analysis offers one way to recast and expand the debates about the history of diplomacy. Its newness, relative to other approaches, has generated both excitement and skepticism, and as new work is published, historians will have new opportunities to debates its impact and merits.

Globalization became a buzzword following the end of the Cold War, but the phenomenon has long been a factor in the foreign relations of the United States and has deep roots in history. To the extent that it meant the expansion of trade and investments, it can be defined as economic expansion, as in the transition from territorial expansion in the nineteenth century to the increasing internationalization of markets in the twentieth century. In the aftermath of World War II, economic internationalism, or the suggestion of growing interdependence of nations and the development of international institutions, seemed to capture the essence of what more recently has been termed globalization. But such usages are too limited; they do not adequately define a phenomenon that shaped American diplomacy and its constituent elements of economics and culture.

DEFINITION AND CONCEPTUALIZATION

“Globalization” is a fairly new term. Professor Theodore Levitt, a marketing professor at the Harvard Business School, apparently first employed it in a 1983 article in the Harvard Business Review. It is arguable, however, that the basic concept dates to the first humans. Defined broadly, globalization is the process of integrating nations and peoples—politically, economically, and culturally—into a larger community. In this broad sense, it is little different from internationalization. Yet globalization is more than this incremental process that over the centuries has brought people and nations closer together as technological innovation dissolved barriers of time and distance, and enhanced flows of information promoted greater awareness and understanding.

The focus, as the term suggests, is not on nations but on the entire globe. Consequently, a more sophisticated definition might emphasize that contemporary globalization is a complex, controversial, and synergistic process in which improvements in technology (especially in communications and transportation) combine with the deregulation of markets and open borders to bring about vastly expanded flows of people, money, goods, services, and information. This process integrates people, businesses, nongovernmental organizations, and nations into larger networks. Globalization promotes convergence, harmonization, efficiency, growth, and, perhaps, democratization and homogenization.

Globalization also has a dark side. It produces economic and social dislocations and arouses public concerns over job security; the distribution of economic gains; and the impact of volatility on families, communities, and nations. Many also worry about a growing concentration of economic power; harm to the environment; danger to public health and safety; the disintegration of indigenous cultures; and the loss of sovereignty, accountability, and transparency in government. These, too, are issues that have been topics of concern to American diplomats and foreign policymakers throughout the twentieth century.

There are two principal drivers to globalization: technological innovation and changing ideas about how to organize and regulate economic activity. Rapidly changing technologies for transportation and communications continue to dissolve the barriers of time, distance, and ignorance that once complicated long-range relationships. In the twentieth century some of the most important technological innovations that changed diplomacy were the jet plane, satellite communications, fiber-optic cables, and the Internet. Ideas also shape globalization, particularly the widespread belief that free trade, private enterprise, and competitive markets promote efficiency and economic growth. Another set of ideas also influences the globalization process: the belief among international lawyers that harmonization of stan-
dards, rules, and legal systems is the most appro-
priate way to resolve business conflicts. The
impact of technology and ideas are the building
blocks of globalization, and have shaped U.S.
power, policy, and diplomatic conduct.

The globalization process has other inde-
pendent drivers. In the history of the modern
world, a rising population in less-developed areas
frequently has triggered emigration to areas of
economic opportunity; and this in turn has fre-
quently produced a stream of remittances to fam-
ily members who remained behind. Famine and
malnourishment, as well as the need for energy
and industrial raw materials to support advanced
economies, also affect the globalization process,
perfecting greater flows of materials, food, and
goods, and thus enhancing the interdependence
of people and economies. Also, two World Wars,
a Cold War, and the Great Depression disrupted
in significant ways the ongoing globalization
process through much of the twentieth century.
Finally, leadership is an important element of all
human activity. Had the United States, as the
world's leading economic and military power in
the twentieth century, not committed its public
policy to promoting an open, and nondiscrimina-
tory, international economic system, it is quite
possible that the globalization process would
have taken a different course—perhaps one that
gave priority to regional blocs.

In explaining the emergence of globaliza-
tion, it is almost trite to observe that the underly-
ing forces of technology and economics have
transformed the traditional nation-state system
and compressed once-formidable barriers of time
and space. But post–Cold War globalization did
just that, although the process had roots in the
late-nineteenth-century growth of American
power. The concept, therefore, requires scholars
of foreign relations to leap outside of the normal
parameters of the nation-state and political-mili-
tary affairs and take into account such elements as
the flows of goods, services, and money; the
increasing international mobility of people (and
especially business professionals and skilled
workers); the emergence and growth of large cor-
porations that view the world as a single market
in which they allocate resources, shift production,
and market goods; the expansion of financial,
legal, insurance, and information services; and
the interconnections of cultures, customs, politi-
cal processes, and ideas.

Mindful that the concept addresses histori-
cal transformations, scholars in political science,
economics, linguistics, anthropology, geography,
art, and film studies help to define the term.
Political scientists, economists, and business his-
torians have accurately identified techno-eco-
nomic globalization as the precursor of other
forms of globalization, such as transnational cul-
tural exchanges. That is, the open and expanding
market, in a synergistic relationship with technol-
gy (including scientific developments), has
given rise to concomitant political, institutional,
social, intellectual, and diplomatic changes. Eco-
nomics and technology exert an enduring impact
on international relationships, seemingly pro-
ceeding on their own separate tracks but not
immune from events.

This calls into question the interpretation of
economic determinists, for globalization compi-
lates while it also complements Marxism, corpo-
ratism, and the like. To be sure, the power of
markets associated with money, goods, services,
and information facilitates international relation-
ships, but it does so in diverse ways. Wealth is
only one of the critical factors propelling the
global economy. When viewed from a perspective
of globalization, Marxism overemphasizes capital-
ism's contradictions of overproduction and
underconsumption, diverting attention from the
impact of economic and business concerns on
diplomacy. Corporatists tend to discount the
influence of strategic, humanitarian, and idealist
considerations in government circles and within
the private sector as well, while world systems
theorists draw on an international lineup of states
rather than global, private-oriented networks.

Traditional approaches to diplomatic his-
tory, including post-revisionism, also ignore the
globalization construct in that they relegate eco-
nomics and technology to a second tier in their
levels of analysis. Globalization requires attention
to nongovernmental actors, including religious
and philanthropic organizations, consumer and
environmental groups, workers, and unions,
along with those active in business and finance.
By including these groups, globalization lends an
appreciation to the variety of concerns in U.S.
foreign relations, from national security to advanc-
ing national ideals to humanitarian concerns.

Globalization is also not event or crisis
driven, which are common foci for diplomatic
historians. Instead, it explores the factors that are
significant to diplomacy in the long run. For
instance, the dispute between Guatemala and the
United Fruit Company that led to the ouster of
the government of Jacobo Arbenz Guzmán in
1954 is considered a crisis point in Cold War diplomacy. But just as important is discussion of the efforts of Carl Lindner, owner of United Fruit's successor, Chiquita Brands. He opened Western European markets to exports of Central American bananas by using the power of the purse to reward American politicians of both parties, thus placing his agenda at the cutting edge of U.S. trade diplomacy toward the European Common Market. Diplomatic history can account for such actions, which are often hidden by more traditional approaches, by placing the Guatemala episode and other flash points in the context of the globalized expansion of business and culture.

With its application to the many strands of the historiography of U.S. foreign relations, it is clear that globalization promotes new ways of explaining American diplomacy. And because globalization is a historical phenomenon, scholars and commentators can draw on it as an interpretive device to examine change and continuity across the world at various times. Technology and economics have long colluded with each other, beginning at least with the Industrial Revolution. Yet conquests, trade, slavery, and religious expansion, across the world as it was then known, have occurred farther back than that. The spread of Islam, the Crusades, the Roman Empire, and continuous agricultural revolution all represented the inexorable push of the market and technology that lay at the foundation of globalization. Economic globalization undergirded strife, growth, and interchange within and beyond local boundaries throughout history, but the globalizing economy, through the penetrating impact of technology, has also changed culture and politics. Globalization is of a synthetic quality in that it addresses the factors that comprise American diplomatic history; it helps group priorities in foreign relations and explain them in a coherent way.

**First Era of Modern Globalization: To 1914**

The current brand of globalization in American diplomacy can be traced back to the post–Civil War era, when internationalization and Americanization emerged in U.S. ideology and expressions of power. From this period to World War I, globalization came under the rubric of Anglo-American control of the transatlantic economy. From about 1850 to 1914 an international economy existed, managed by Great Britain, resting on free trade and open capital markets and reliant on colonies and developing areas as resource bases and on consumers in advanced nations. It was in the midst of this first international industrial economy that the United States rode to world power on the strength of its economic muscle and competed with Europeans, spurred on by production and technological inventions.

This period did not experience the revolutionary form of globalization that characterized the post–Cold War years, with their highly synchronized and integrated worldwide communications, transportation, and politics. In the earlier era, less production was attributed to foreign operations. Those affected by globalization were mostly of the elite, rather than the masses, in the early twentieth century. In the pre–World War I period, it was clear which nation controlled production, marketing, culture, and the like, while the multi-trillion-dollar world market of the 1990s and beyond had no natural owners. The velocity of globalization in the pre-1914 years was immensely slower than at the end of twentieth century, as were the volume and the scope. The years before World War I did not witness the fundamental transformation in the global economy that started in the last century's final two decades.

Evident in the earlier era, however, were improvements in technology and a greater volume of world economic connections that indicated the influence of globalization on American power, diplomacy, and the economy. However, remarkable changes wrought by new business networks were not fully understood by diplomats back then. Some policymakers noted the importance of new technology and economic relationships; the presidents of these times, for instance, became more aware of global economic concerns. That was particularly true of William McKinley, known for the protectionist tariff with his name but actually a far-sighted globalizer. But they could not possibly foresee all of their applications. Movement toward globalization occurred, nascent and incomplete and interrupted by events of the twentieth century though it was. Thus, it is fair to argue that globalization offered, and offers, a new paradigm in which to view not only diplomatic history, but world history as a whole.

By the twentieth century, the United States had begun to replace Britain's colonial and trans-Atlantic systems of free trade and government-run transportation and communication networks. The new form of organization was a structured but open economic system of private enterprise.
and business-friendly public support for access to foreign markets, inventions, immigration, and adherence to international law. Private enterprise could export and produce abroad, the fruits of America’s leadership in technology and intellectual property. People and ideas could move easily, facilitating the outward diffusion of America’s political ideals and cultural values. America practiced an informal imperialism—in which investment and trade accompanied missionaries and, on occasion, the military—that gradually superseded British industrial and agricultural power.

The early era of globalization, before World War I, was grease by the technological leaps of transportation improvements like the steamship, and by marvels like the Suez and Panama Canals, which sped European and American commerce around the globe. Transatlantic cables, then direct telegraph links to Latin America and connections through British cable to Asia, allowed American investors and merchants to communicate faster abroad, thus expanding their markets. The great expositions of the age—in Chicago in 1893, Omaha in 1898, Buffalo in 1901, and St. Louis in 1904, as well as later gatherings in West Coast cities—publicized American achievements and the promise of empire based on progress in technology. Global connections shrunk the world itself.

Globalization was also driven by the emergence of America in the international economy. Capital exports, the plethora of inventions with American trademarks that were sold overseas, and a greater presence in financial markets boosted U.S. power. For instance, one of the most successful exporters was a capital goods firm, the Baldwin Locomotive Works of Philadelphia, whose engines came to symbolize power, speed, and the march of civilization. In 1900 Baldwin exported an average of one engine a day, shipping locomotives to South America, Africa, Asia, Australia and Europe. Exports soared after its engines gained recognition for their speed and for hauling weight up steep grades. At the turn of the twentieth century, Baldwin locomotives climbed Pikes Peak, hauled the Trans-Siberian Express, roamed the Argentine pampas, and whistled past the Egyptian pyramids. In the British Empire, American firms won contracts for building railroad bridges in Uganda and supplying rails for the construction of Cecil Rhodes’s Cape to Cairo Railway, a project intended to develop British trade in Africa. Elsewhere, in the world’s breadbaskets, Argentine, Australian, and Russian farmers used U.S. machinery to gather grain. Here were the companies that engaged in the international economy, as well as the privately run globalized market that was outside the realm of states.

Such economic connections promoted cultural ones as well. Thus, early signs of globalization in cultural exchanges were evident in sports (the Olympic Games), marriage, tourism, entertainment (Buffalo Bill’s Wild West Show), the temperance movement, missionary work, and philanthropy. Regarding the latter, American-led internationalization in the years before World War I involved magnates like Andrew Carnegie and John D. Rockefeller, who turned to global philanthropy to counteract the label of “robber baron” and to advance their social concerns. Carnegie bequeathed millions to build public libraries in the United States and throughout the British dominions. For his part, Rockefeller established a huge foundation with a global mission to promote the well-being of mankind throughout the world. The oil baron personally contributed some $530 million to foundations and his son added another $537 million, which went for medical and scientific research, public health, education, and international exchange programs. The Foundation combated yellow fever and tropical African diseases. In China it established Peking Union Medical College to spread knowledge of medicine and sanitation, conduct research, and support the medical activities of Western missionaries. In addition, Carnegie’s associate Henry Phipps in 1908 donated enough money so that Washington, D.C., could host the sixth International Congress on Tuberculosis, a disease that had killed thousands across the world. His contemporary, Darius Ogden Mills, funded an expedition to Chile in 1912 that measured over three hundred of the brightest stars in one-quarter of the sky surrounding the South Pole.

Besides the globalization of science and medicine, the fortunes of Americans were also spent on human rights causes. Jacob Schiff, the famous head of the banking firm Kuhn, Loeb and Company, turned his attention in 1906 to funding the American Jewish Committee, an organization dedicated to alleviating the persecution of Jewry at home and abroad. A host of banking, mining, and export firms, moreover, poured money into relief projects before World War I. For example, the New York Merchants Association raised $8,000 to help the victims of the Valparaíso earthquake of 1906, Guggenheim Sons, W. R. Grace and Company, and others more than matched this amount. In sum, the rich in America transferred...
some of their wealth to the international stage, in the process moving outside the realm of nations to influence the world economy. This is the essence of globalization.

**DISRUPTED GLOBALIZATION: 1914–1939**

The period from the end of World War I to 1950 also experienced some elements of globalization as new technology joined expansion in finance, trade, investment, and culture throughout the world. Yet in a major sense this was an era of deglobalization: first, the international economic system malfunctioned or broke down; then, during the Cold War, the world divided along ideological fissures.

World War I accelerated the expansion of U.S. business overseas. American firms were especially successful in replacing dominant British firms in Western Hemisphere and Asian markets. In addition, war requirements created a soaring U.S. demand for raw materials, especially copper, iron, and other key mineral products. Soon American firms, with the help of their government, began scouring the world for essential raw materials. Rubber companies acquired plantations in Sumatra, sugar producers expanded operations in Cuba, and meat packers enlarged their operations in South America. Paper companies opened pulp and paper mills in Canada, while mining companies purchased nitrate, iron, and copper mines in Chile. Oil companies explored China, the Dutch Indies, and other remote regions and invested heavily in unstable Mexico. War needs drove much of this overseas expansion, but American business leaders were not oblivious to long-term opportunities.

President Woodrow Wilson left an enduring mark on U.S. foreign relations, especially in providing American leadership for the postwar economic and financial system. But if he was the father of internationalism, then he also presided over the disruption of globalization. The defeat of the Treaty of Versailles demonstrated the variations in thinking about globalization. Prevailing sentiment was not prepared to abandon nationalism even as the expansive course of global commerce and investment and America’s role in the world maintained their momentum. Americans would not fully adopt Wilsonian ideals until after the Cold War. In addition, globalization took a backseat to revolution. Mexico’s new constitution under the Carranza government of Venustiano Carranza provided for restrictions on foreign ownership of land and subsoil resources. This meant that American investors would be limited to oil reserves; at the broader level, the clash was between nationalism and international legalism, with the former winning out. In Russia, the Bolshevik government survived a shaky start, including a civil war in which Americans participated, to create a decidedly anti-capitalist regime. At first the Soviet Union promoted globalization of the masses but not capital, lashing out at the imperialist nature of capitalist globalization. Moscow then retreated to building a socialist state under Communist Party control at home. Thus, the world started to split ideologically and politically even as Wilson’s vision reached its expressive high point.

Yet many bankers and administration officials still sought outward, long-term solutions to promote peace and prosperity. Because Europe had bought three-fifths of American exports before the war, freer trade was a national interest after World War I. More generally, policymakers embraced internationalism. Understanding that the Great War had caused an explosion in U.S. exports and imports, that suffering farmers could be aided by overseas expansion, and that America held a key role in global finance, Republican administrations of the 1920s did not separate the international from the domestic. They pushed for globalism, albeit a less political brand than Wilson’s. Global disarmament indicated one side of Republican engagement in the world. This effort energized citizens, diplomats, and businessmen into even more cooperative, internationalist endeavors during this era than before the war.

Cultural internationalism grew stronger as nations created numerous associations designed to facilitate global ties. An International Office of Museums, and International Congress on Popular Arts, and an International Society for Contemporary Music fostered linkages and understanding. In the United States, political scientists began studying the causes of war and universities offered new courses in various national histories and languages, all a reflection of the need to understand the global context in which America operated. Americans organized hundreds of scholarly discussion groups, such as the Institute of Pacific Relations, a multinational association of journalists, academics, and businessmen based in New York City. The new Guggenheim Foundation funded artistic projects and scholarly research, focusing on Latin American intellectuals. The
Institute of International Education funded and directed foreign students to universities throughout the United States. Asians were the main beneficiaries, but increasingly, Latin American and European youth traveled to America to study. In this globalized ethos, Americans believed in peace and prosperity wrought by international contact. The influence of such private activity on foreign policy was extensive, demonstrating that globalization continued to some degree. Disarmament was one arena, regional stabilization and multilateralism another, and arbitration yet another.

Business made global connections in the 1920s. Air transport and travel became a reality under the machinations of Pan American World Airways under the leadership of Juan Trippe. American trade and investment multiplied. Along with the spread of radio, cinema was not only an American phenomenon but a global one as well; people around the world listened and watched the new media and thus developed some common cultural markers. Hollywood stars such as Douglas Fairbanks and Mary Pickford were known worldwide, for example.

Nonetheless, the onset of the Great Depression and World War II dealt a setback to further globalization. The globalizers of the 1920s—the Republican presidents and bureaucrats, the business and banking establishments—were ultimately limited by their own ideology and by the powerful concentration of forces that elevated the domestic economy over the international order. The effort at privatizing decisions and policy ultimately grounded itself on the Smoot-Hawley Tariff and imperial trade preferences of the 1930s, which reserved British Empire markets for member states and excluded or discriminated against outsiders such as America. And politics could not be taken out of the economy; businessmen could not be trusted with, nor were they capable of, running the global system of trade and finance. The Republican governments promoted the ideology of technoglobalization but often refused to take responsibility through policies of running the world economy. They were unwilling to make the tough moves that involved political haggling at home—on matters like reducing war debts and tariffs, for instance—that were requisites to continuing their brand of internationalism. This proved especially so when economic times spiraled from prosperity to misfortune during the Great Depression.

Paradoxically, however, as governments turned away from efforts to harmonize and integrate the international economy to cope with domestic distresses, advances in technology continued to erode the barriers of time, distance, and ignorance that separated nations and people. Some of the most significant improvements in air travel and mass communications, particularly the movies and short-wave radio, took place during the 1930s. At a time when dire economic circumstances compelled most government leaders to think local, a few leaders in government and business dared to speak up for closer international economic cooperation. Thus, Thomas J. Watson, Jr., the head of International Business Machines (IBM) and the International Chamber of Commerce, mimicked Secretary of State Cordell Hull in proclaiming that freer international economic relations meant world peace, and that if goods did not cross borders, he feared that armies would.

**A WORLD DIVIDED: 1940–1950**

World War II further threatened Anglo-American-style globalization. The Axis powers—a loose coalition of Germany, Italy, and Japan—resorted to military force to overthrow the post-Versailles world order and to establish closed, regional systems dominated from Berlin, Rome, and Tokyo. The conflict afforded the United States a second chance to provide leadership and to promote its vision of a peaceful, prosperous, and united world. The Roosevelt administration pressed plans for international rules and institutions that would structure the post–World War II global economic and political system. In joining technology with national security, the war forged an enduring partnership among business, government, and science. Afterward, the new military-industrial complex would sustain America as an economic and military superpower, develop endless frontiers for scientific discovery, and speed the globalization process.

In effect, scientists and their laboratories, with government funding and direction, contributed in a major way to the success of the war effort, and in the process they developed many new products that had commercial applications which would transform the postwar world. Atomic energy, for instance, had many peaceful applications, particularly as a source of electrical power. The mass production of penicillin transformed the treatment of disease. Also, radar provided the basis for microwave cooking. The first computers appeared during World War II to assist
the military with code breaking and long-distance ballistics calculations. ENIAC, one of the first, was a huge machine, occupying 1,800 square feet and using 18,000 bulky vacuum tubes. Not until the development of transistors and the microchips that resulted from them could cheap and reliable computing power be loaded into desktop and portable units. The transistor, which was developed in 1947 and 1948, grew out of wartime research on silicon and germanium at Bell Telephone Laboratories in New Jersey. The transistor led directly to the technology of the personal computer, which itself spawned the globalized information age in the last third of the twentieth century.

No industry benefited more from wartime cooperation and federal contracts than aviation. At the outbreak of war the Boeing Company of Seattle, renowned for its seaplanes and engineering skills, had fewer than two thousand employees and was on the verge of bankruptcy. From this inauspicious beginning the company flourished on the strength of its bombers (the B-17 Flying Fortress and the B-29 Superfortress). Employment rose to nearly forty-five thousand. At the end of the war Boeing, on the strength of its experience and reputation in military aircraft production, turned its attention to the civilian market, using the B-29 as the basis of the luxurious 377 Stratocruiser that Pan American used on Atlantic routes. It contained a spiral staircase and a downstairs bar, but was soon superseded by the four-engine 707 passenger jet, launched in 1954. The latter also had roots in military work to develop a jet tanker and from wind tunnel experiments with jet engines during World War II. Thus, with government assistance, American companies like Boeing, Douglas, and Lockheed would come to dominate the rapidly expanding world market for civilian aviation.

Growth was also in order for consumer goods, which were also foundations for later globalization. Robert W. Woodruff, who had taken over the Coca-Cola Company in 1923, aimed to make his beverage an ordinary, everyday item for Americans and people around the world. He built on his foreign operations, particularly in Europe, during World War II by having Coke accompany the military overseas. Soldiers not only identified with Woodruff’s product during and after the war but heroes requested it—as did an American pilot who crashed in Scotland and asked, upon regaining consciousness, for a Coke. The beverage was so pervasive that the Nazis and Japanese denounced it as a disease of American society. By war’s end the company ran sixty-three bottling plants across the globe, on every continent. Its net profits in 1948 soared to $35.6 million, elevating it to near-universal acceptance as the world’s beverage of choice.

The Cold War dashed the hopes of internationalists who would have facilitated the globalization of the world economy, but still strides were made toward the technoglobal system, induced particularly by governments working through the United Nations. In these instances, officials instilled international law and arbitration processes in the international economy, yet another foundation of globalization. For instance, the International Civil Aviation Organization (ICAO) pushed for global rules to govern the dynamic medium of air transport and travel. The objective was to establish international law, as well as promote order, safety, and efficient development in aviation, although ICAO authority remained limited by national desires to control lucrative commercial air traffic. The ICAO, established on a permanent basis in April 1947, provided the framework for the vast expansion of commercial airspace after World War II. By the late 1960s its 116 member nations connected markets around the world more closely by integrating various technical aspects of airplane transport, such as air navigation codes, as well as by devising a mechanism to resolve civil disputes, promote simpler procedures at borders, and boost Third World development in civil aviation—all enhancing globalization through air transport.

The protracted Cold War struggle that divided the world into two spheres of influence—one led from Washington, the other from Moscow—prompted national security considerations, rather than invisible market forces, to define international relationships. Governments continued to regulate trade and financial exchanges, despite efforts to lower barriers and promote commerce. But America’s technological advantage, adaptable production processes, and access to resources, so decisive in the struggle against Axis aggressors, helped win the conflict. Also, a new generation of U.S. political and corporate leaders, familiar with mistakes made at the end of World War I when the United States shunned overseas responsibilities, chose to accept this second opportunity to guide the world. Furthermore, as it turned out, these internationalists were also better salesmen than Soviet leader Joseph Stalin and his heirs, who presided over a
GLOBALIZATION UNDERCURRENTS: 1951–1972

The indicators of globalization were present throughout the superpower struggle. Prosperity and peace brought greater individual mobility. Before World War I an average of 1.5 million people arrived annually at U.S. shores, with about half that many departing. Travel lagged until after World War II and then revived. Two million people arrived in 1956, 10 million in 1970. Immigration, which fell to a low of 24,000 in 1943 and stagnated during the Depression and World War II, revived slowly after the war, reaching 327,000 in 1957. The largest numbers of immigrants—many of them war refugees—continued to come from Europe, and at this time particularly from Germany. Air travel also took off. Before the 1940s the typical traveler from abroad came by sea; after World War II the traveler arrived by air. On domestic routes the number of revenue passengers rose rapidly from 6.6 million passengers in 1945 to 48.7 million in 1957 and 153.4 million in 1970. On international routes the rise was equally dramatic: from 476,000 in 1945 to 4.5 million in 1957 and 16.3 million in 1970.

Despite Cold War crises and the further regionalization of the world economy, highlighted by the launching of the European Common Market in 1957 (which lured massive American investment), a revolution in critical technologies—including transatlantic telephone service, satellite communications, computers, and jet travel—accelerated the globalization process and ushered in a new era of rapid intercontinental travel, instantaneous communications, and economic interdependence. America’s humbling experience in Vietnam, dollar woes, and the rise of oil exporting nations in the 1970s did not dampen globalization. Americans still enjoyed the benefits of unprecedented prosperity spurred by technology and economic expansion overseas. They bought new homes equipped with the latest labor-saving appliances, vacationed and studied abroad, and followed breaking news and sporting events abroad on new color television sets receiving signals transmitted via space satellites. Despite domestic political turmoil, technoglobalization continued to press forward, gradually transforming the world of separate nations.

Marshall McLuhan, a Canadian who analyzed the impact of mass media on society, made the metaphor of the “global village” famous in 1962 as a reference to the new electronic interdependence that had recreated the world. At the time, McLuhan was concerned largely with how noninteractive communications like radio and television were homogenizing the world: everyone watched the same sporting events, news, and soap operas. He identified a significant trend. The late 1950s was a period of enormous change as technical developments in aviation, transportation, and communications brought cost reductions and improved service. People, goods, and capital began to move across borders, creating interactive bonds among people and between nations. These flows integrated markets, harmonized tastes, and homogenized cultures.

Some of the most significant advances involved air transportation for people and freight. In 1957, Boeing, having gambled 25 percent of its net worth on development of a long-range passenger jet, launched the 707-120, designed as both a tanker for the air force and a civilian jet. Equipped with long-range Pratt and Whitney J-57 engines, it halved flying time across the Atlantic and opened the era of cheap air travel. The number of passengers departing internationally on scheduled airliners rose 340 percent (from 4.3 million to 18.9 million) from 1957 to 1973 as airlines introduced tourist-class fares. A round-trip flight, New York to London, fell to $487. The
arrival of the wide-bodied Boeing 747 in 1969 further expanded capacity and drove down costs. Originally designed as a cargo carrier, it could accommodate two containers side by side that could be transferred to trucks; soon, high-value goods were moving swiftly by jet freighter. It also offered lower operating costs at a time when fuel prices were rising.

Thus, by the early 1970s improvements in air transport made it possible for business to source suppliers and serve markets globally. From 1957 to 1973 the number of revenue ton miles for air cargo on scheduled international flights rose 866 percent from 128.2 billion tons in 1957 to 1.2 trillion ton in 1973. It would be a decade before the full impact of these improvements worked their way through the marketplace. Air service continued to expand rapidly and airfares fell. Charter service grew rapidly on the transatlantic route and fares on scheduled airliners fell below $200 (New York to London) by 1970. Millions of college students read Arthur Frommer’s best-seller, Europe on $5 a Day (first published in 1957), put on their backpacks, and set out to see Europe and learn about “foreign affairs.” Meanwhile, improved engine design and weight reduction led to longer-range planes. In 1976 Boeing launched the 747 SP, which had the capacity to carry 233 passengers nonstop with full payload between New York and Tokyo. By 1989 Boeing was producing the 747-400; it could carry 412 passengers for up to twenty hours at subsonic speeds.

Along with the arrival of reliable, efficient jet freight in the late 1960s, other important cost-saving developments occurred in maritime shipping, including containerization. In the 1950s longshoremen could typically handle from ten to fifteen tons of cargo per hour. The use of truck-trailer, standard-size containers, brought productivity up to from six hundred to seven hundred tons per hour. This meant faster ship turnaround, better coordination, and lower transportation costs. Beginning in April 1956, when the trucking executive Malcolm McLean first moved loaded trailers between two U.S. port cities on an old World War II tanker, containerization took off. Grace and Matson lines adopted it in 1960 and the rush to containerization peaked in 1969, during the Vietnam War. In addition, the international shipping industry developed specially designed ships for automobiles (the first auto carriers could handle from one thousand to two thousand cars) and LNG (liquified natural gas) tankers after the 1973 war in the Middle East.
Improvements in communications also boosted the globalization process. Until the mid-1950s individuals could not communicate quickly and easily across the Atlantic and the Pacific Oceans. In 1927 commercial telephone service using high-frequency radio opened between New York and London. But this interactive advance was not designed for mass communications. Radio telephones were noisy, unreliable, and costly—forty-five dollars for the first three minutes. September 1956 brought the most significant improvement in communications in over a century when American Telephone and Telegraph opened the first transatlantic telephone cable (TAT-1) by using microwave amplification techniques. The number of transatlantic telephone calls soared—climbing slowly from 10,000 in 1927 to 250,000 in 1957, and then jumping to 4.3 million in 1961. Soon large corporations such as Ford began using the telephone cable to exchange information and coordinate their overseas operations from their U.S. headquarters. While telephone cables improved business communications among metropolitan centers, large areas of the world could not take advantage of telephone communications. Starting in the 1980s, satellite communications ended this isolation and made the emerging global village truly interactive.

The arrival of jet planes and transoceanic telephones facilitated business expansion, but so did American scientific leadership. World War II and the early Cold War saw many technological advances, and U.S. firms moved quickly to commercialize products from military research. Between 1945 and 1965 the number of patents granted in America more than doubled, rising from 25,695 to 62,857. Five times as many patents went to U.S. firms as to foreign corporations. As late as 1967 the United States accounted for 69 percent of research and development in major countries. A good illustration was the transformation of IBM, which took its domination into the global marketplace.

The Cold War generated momentum for globalization in other ways, too. National Science Foundation, National Space and Aeronautics Administration, and Defense Department contracts spurred basic research throughout the 1960s, and space research particularly spun off growth in intelligence gathering, electronics and engineering, and weaponry. Laboratories hired thousands of corporate engineers to work on missile and aerospace projects, and clusters of companies and laboratories sprouted up near major academic institutions. The space program’s budget steadily increased to $1.2 billion by 1962, and steps were taken to orbit a man around the earth (via the Mercury Project from 1959 to 1962), and eventually to send him to the moon (through the Apollo Project in 1969). These were the precursors to the space shuttle and satellite communications of the 1980s and beyond, which fueled the globalization of information.

**DECENTRALIZATION ACCELERATES: 1973–1989**

From the mid-1970s onward the process of world political and economic decentralization, so essential to globalization, picked up momentum. The technological transformations allowed American and other multinational firms to escape national regulations, and also helped free ordinary people from the boundaries of the nation-state. In addition, the rise of the OPEC (Organization of Petroleum Exporting Countries) oil cartel shifted global economic power away from the West. Free exchange rates, unfixed from the gold-dollar standard, gave great flexibility to international investors. American businesses would weather the energy crises and the final phase of the Cold War in different ways. With U.S. tariff barriers continuing to fall and foreign competition surging into the American market, high-cost domestic industries such as steel, autos, and machine tools lost market share to new entrants from abroad. But many big- and medium-sized firms did well in a changing, competitive environment. Firms with leading-edge technologies took advantage of market-opening opportunities to expand abroad. In the era of jet travel and networked business communications, the battle for market share was increasingly fought on a global playing field, involving all of the world’s major high-income markets—Japan, Europe, and North America. Companies and nations converged as global markets for standardized consumer products appeared; transnational companies now sold the same reliable, low-priced goods in Brazil as they did in Biafra.

Even as the economic changes occurred, however, and despite the re-ignition of Cold War tensions during the late Carter and early Reagan administrations, ideological shifts occurred that reflected the emerging age of globalization. One was a new international outlook encouraged by better communications, transportation, open borders, deregulation, and the revival of nineteenth-

144
century, laissez-faire liberalism. Business leaders began to think globally and to develop global networks that could exert influence over national political leaders through money and ideas. During the energy crisis of 1973, America's corporate elite reached out to foreign business leaders. Led by Chase Manhattan's David Rockefeller, they formed the multinational Trilateral Commission in 1973, with members from business, politics, law, and academia in America, Western Europe, and Japan. The idea was to facilitate cooperation among resource-rich nations, but outside of government supervision. Similarly, European business leaders began to meet in Davos, Switzerland, in 1982 to develop a common international strategy for European business. This network expanded in the 1980s to include world business and political leaders. In those years it launched the annual World Economic Forum, held every January and bringing together the world's movers and shakers to network, deal, and discuss public policy issues. Similarly in America during the Carter and Reagan years, business lobbying expanded from initial efforts to contain unions to the pursuit of an active agenda of deregulating markets, cutting taxes, and promoting free trade.

The deregulatory business agenda reflected another important paradigm shift that encouraged globalization. The Washington consensus had stressed an active and expansive role for the federal government, but in the 1970s economic thought turned toward a less-regulated marketplace. Under the influence of academic economists Murray Weidenbaum and Milton Friedman, a neoclassical attack on Keynesian interventionism was launched during the Reagan years. It emphasized entrepreneurship, reliance on the Federal Reserve System and monetary policy to manage the economy, tax relief, labor-market competition, deregulation, fluctuating exchange rates, and free trade in goods. In time, this consensus came to include free trade in money, or capital account convertibility.

President Ronald Reagan can be credited with fostering the second era of techno-economic globalization by expounding on the possibilities for freedom, political and economic, under U.S. leadership. He was the first president to push openly for free trade and privatization of government services, and one of the first to appreciate how new technologies of communication were transforming the marketplace and weakening the authority of totalitarian regimes. As he left office the technoglobal revolution was accelerating, bringing major changes to economics and politics, and to culture and society as well. His successors wrestled with the implications of globalization at home and abroad. They initiated new integrative bodies that restructured the global economy, such as the North American Free Trade Agreement (NAFTA) and the World Trade Organization (WTO), institutions that emphasized a rules-based economic system and liberalization of international commerce and that further integrated business processes worldwide. The freer exchanges of goods, capital, and culture inherent in globalization arose from the Cold War's ashes and took America into a new era in which transnational contacts rivaled state power.

**AMERICAN-LED GLOBALIZATION: 1990–2001**

The Clinton administration perceived that globalization had the potential to harmonize behavior, customs, and politics and usher in prosperity, development, and democracy. As the world's only superpower, the United States would lead the way toward openness, free access, and political stability. Also, President William Jefferson Clinton's enthusiasm for globalization was not shared by all Americans; many wondered if globalization was both inevitable and desirable. As the new millennium began, the business community seemed united in support of globalization, but among ordinary people there were concerns about jobs, food safety, harm to the environment, sovereignty, cultural homogenization, and the like. Americans were as unsure about the costs and benefits of this second era of globalization as they had been during the first one before World War I.

The Clinton administration veered from postwar history and adopted the universalist, integrative, and democratic posture of globalization. Economics replaced security on the U.S. policy agenda; globalization was the focus. The administration tied free markets to democracy. After the Mexican peso crisis of 1994, the president placed economic diplomacy at the center of foreign policy, supporting the consolidation of market democracy throughout the world, an ideology that put him in stride with global business but at odds with many in his own party who were tied to the traditional big government, worker-protection liberalism of the past.

The outpouring of analyses of globalization grew during the mid-1990s. Scholars, journalists,
and politicians focused on the concept and process, but above all, on its influence. The widespread use of the Internet (304 million people in 2000) brought the issue into homes throughout the world. When added to the Clinton administration’s oftentimes single-minded purpose of expanding American trade and investments overseas, the establishment of NAFTA and the WTO, and the soaring rebound of the U.S. economy from a recession early in the 1990s, globalization had a certain cachet among Americans of all political stripes and economic status.

Americans were not the only ones anxious over globalization. In western Europe and many developing countries, globalization was a dirty word, associated in the public mind with American sneakers, blue jeans, burgers, and videos. The French were most skeptical. In one poll, 65 percent said globalization increased the gap between rich and poor; 56 percent thought it threatened national identity. The French Ministry of Culture sought to rally Europeans and to restrict access for Hollywood films and American television programs.

Around the world, defenders of traditional values sought to block the spread of American-style pop culture, but globalization proved a worthy foe. Iranian religious fundamentalists raided homes to confiscate videos and satellite dishes, and in neighboring Afghanistan the Taliban closed movie theaters, burned films, and denied schooling to women. Try as they might, the fundamentalists could not eradicate this powerfully projected alien culture. Their efforts merely benefited smugglers and the flow of contraband. Many discreetly hid satellite dishes to access Western television. The failure of Islamic fundamentalists to stamp out Western influences, like the inability of state-controlled societies in Eastern Europe to block the appeal of Western democracy and consumerism, demonstrated the power of mass communications in the era of satellites and videocassettes. It also underscored the global appeal of American values to the young, the well-educated, and the affluent, an amorphous yet tangible element of U.S. power in the world.

Yet the argument that globalization led to American cultural dominance ignored the appeal of the competition. At the time anti-globalization demonstrators were protesting in Seattle against the WTO in December 1999, children throughout America were gripped by the Japanese fad game Pokemon. Film industries in India and Hong Kong presented competition to Hollywood, and MTV discovered the need to vary its formula in the world’s various regional markets—providing, for example, Chinese music in China and Hindi pop in India. True cultural globalization, not just Americanization, was in effect.

Among the world’s cosmopolitan elite—business leaders, government officials, academics, and media types—the requirements of globalization produced a convergence. English became the predominant language of commerce and transnational communications, and business and government leaders wore Western business suits, flew in the same airplanes, stayed in the same hotels, read the same newspapers (the Wall Street Journal and the Financial Times), and communicated with cellular phones and e-mail. The acceptance of American-style globalization reflected the success of U.S. business, the need to play by the rules of the world’s largest open market, U.S. leadership in technological innovation and the information revolution, and the attraction of America’s universal values. It also reflected the victories over fascism, militarism, and communism during the twentieth century that allowed the Anglo-American powers to establish the United Nations system, design the institutions of international economic and financial collaboration, and press for acceptance of common standards and the rule of law that were so crucial to globalization.

The post–Cold War era of economic globalization, however, also represented a synergistic dimension in which changes in technology, business strategy, and government policies combined to produce effects far more profound than the sum of incremental steps. The changes hinged on the integration of capital markets, the growing irrelevance of national borders, and the technological leveraging of knowledge and talent worldwide. As the Internet was empowering ordinary people with information, governance of the global system became more segmented in functional supranational institutions run by specialized elites. The International Monetary Fund (IMF), the World Bank, the WTO, and the Bank for International Settlements set the rules and handed out sanctions.

Integration and mobility were keys. Production, capital flows, and workers were increasingly integrated into a global marketplace dictated by transnational corporations. In 1970 there were 7,000 transnational corporations; in 2000 the numbers were some 63,000 parents and 690,000 foreign affiliates as well as a large number of interfirm arrangements. Gross product affiliated with the production of transnationals increased faster than global GDP and global exports. The foreign
affiliates of transnational corporations employed six million persons and had foreign sales of $2 trillion. Their reach in every aspect of the world economy—from production to distribution—grew exponentially. In the last half of the twentieth century, international trade accelerated. The world economy grew sixfold in that time, climbing from $6.7 trillion in constant prices to $41.6 trillion in 1998, while global exports of goods rose seventeenfold, from $311 billion to $5.4 trillion. Much of the growth occurred among units of transnational corporations and involved services, which represented one-fifth of total world trade at the end of the century. From 1970 to 2000, the volume of foreign direct investment rose almost fifteenfold; in the latter year it was twice that of 1990. By then, dozens of nations had enacted special laws to attract foreign capital.

Financial globalization, reflecting the integration of equity and bond markets, was another powerful factor driving world economic integration and growth. As in late-nineteenth-century Britain, the upper and middle classes increasingly invested their savings overseas. The assets of U.S.-based international and global mutual funds climbed from $16 billion in 1986 to $321 billion in late 1996. Forty-four million American households held mutual funds, compared to 4.6 million in 1980. Moreover, the velocity of foreign exchange transactions spiraled. In 1973 average daily turnover in foreign exchange markets was $15 billion compared to $60 billion in 1983, $880 billion in 1993; and an estimated $1.5 trillion in 1998. Moreover, in a world of electronically integrated financial markets, money flowed in and out of countries in response to changing market conditions. In 1996 foreign investors put $100 billion into Asia; the next year they withdrew $100 billion.

Technology abetted globalization. World production of technology multiplied six times between 1975 and 1986; international trade in technology soared nine times. Improvements in communications and transportation abetted the process. In 1956, eighty-nine telephone conversations took place simultaneously through the transatlantic telephone cable. By the end of the millennium, about one million conversations occurred simultaneously by satellite and fiber optics. Add in e-mail and faxes and the ease, speed, and volume of communications have been magnified. Between 1955 and 1998, ship tonnage rose sixfold; the unit cost of carrying freight by sea fell 70 percent between 1920 and 1990. The volume of air freight soared from 730 million to 99 billion ton-kilometers. As with shipping, costs fell sharply. Between 1930 and 1990 the average revenue per mile for air transportation dropped from 68 cents to 11 cents (in constant dollars).

Cheaper airfares also enhanced individual mobility. Between 1950 and 1998 international tourist arrivals rose twenty-five-fold—from 25 million to 635 million. By 2000, two million people crossed a border somewhere in the world every single day. Some of them were political refugees; others simply seeking economic opportunities. At the end of the twentieth century, some 150 million people lived outside the country of their birth. This amounted to 2.5 percent of the world's population, or one in every forty people. Many of them remitted earnings to families and relatives in native countries. From 1970 to 1998, the number of immigrants living in America tripled from 9.6 million to 26.3 million. It is estimated that immigrants from Central America remitted $8 billion a year to their home countries during the last years of the twentieth century. Many of the foreign students who entered the United States for graduate education remain, contributing to the brain drain from developing lands but augmenting the supply of highly trained professionals in America. In 1990 one-third of Silicon Valley's scientists and engineers were foreign born.

Many of the less educated who remained in their homelands, moving from countryside to city, have joined the global economy. Labor became part of a global assembly line; transnationals working for the Nike Company and other multinational firms assembled products from components manufactured in factories throughout the world, while management, administration, and research and development were done at the headquarters. Service jobs in law firms, insurance, and data entry focused on electronic production, which meant that jobs flowed in and out of countries at great speed. Globalization had, simply, changed the world and its business, including the projection of national power and diplomacy.

Along with the globalization of brands like Nike, McDonald's, Coca-Cola, and Marlboro, the process also benefited sports teams. Michael Jordan's star qualities, as well as the global reach of satellite television, established a worldwide following for the Chicago Bulls. Soccer's Manchester United and baseball's New York Yankees also appealed to extensive audiences. An influx of eastern European players strengthened the international appeal of the National Hockey League. The National Basketball Association's open-door policy
to talent attracted forty-five foreign players from twenty-nine countries, and as a result the NBA broadcast in 210 countries and forty-two languages. Major League Baseball, which began opening its season in foreign locations, inaugurated the 2001 season with 854 players, 25 percent of them born outside the United States. As a result of Ichiro Suzuki’s success with the Seattle Mariners, the team’s home games were televised live in Japan. Thousands of Japanese baseball fans even flew to Seattle to attend home games of a club owned by Nintendo president Hiroshi Yamauchi.

Along with rapid growth and increasing integration of markets, however, the age of globalization produced greater volatility. The Mexican peso crisis of 1994 and the Asian economic crisis of 1997–1998 underscored the vulnerability of the market-driven globalization system and how quickly strife could spread in a world linked by high-velocity communication, financial, and transportation networks. The Asian economic crisis also showed globalization’s impact in the political arena. It aroused concerns about the merits of Western-style, free-market globalization to an extent that street protests, stimulated by the economic downturn, forced Indonesia’s dictator of thirty-two years from power while politicians jockeyed for control in Thailand, the Philippines, South Korea, and Malaysia.

Over the preceding decade Wall Street, Washington, and international financial institutions had encouraged emerging economies to deregulate capital markets and open to foreign banks and financial institutions, but countries in Latin America and Asia paid for the deregulatory bonanza. By opening their markets, they made themselves susceptible to pressures from abroad and the international economy; and also lost independence over their fiscal policies. Abrupt changes in one country, region, or the world economy reverberated throughout these poorer nations, causing crises. Yet the bankers and U.S. financial officials blamed the catastrophic consequences on crony capitalism, the lack of transparency and inadequate disclosure of financial data, the absence of independent regulatory authorities, and the inadequacy of accounting standards. They stressed the benefits of liberalization under the process of globalization.

Opposition to the pro-globalization agenda emerged among a disparate alliance of activists concerned about the environment, labor standards, and national sovereignty. In 1992 the first Bush administration had refused to accept the entire Rio de Janeiro Treaty that protected biodiversity of plant and animal species. An argument also erupted over the existence of global warming, which many scientists and environmental groups blamed on the emission of carbon-based gases into the atmosphere. A total of 150 nations, including the United States, signed the Kyoto accord of 1997 that pledged to reduce such global emissions to 5.2 percent below the 1990 level. America would cut its release of carbon-based gases by 7 percent. But President Bill Clinton faced staunch opposition from powerful business interests such as the Business Roundtable, the Chamber of Commerce, and the National Association of Manufacturers who thought the agreement flawed. The Senate voted 95 to 0 to oppose the protocol if developing countries like China and India were not also required to cut their emissions. As a result, the administration never sent the agreement to Capitol Hill for ratification. The debate over global warming continued into the 2000 election when Democratic candidate Al Gore insisted that America join the Kyoto pact nations and GOP candidate George W. Bush countered that additional studies were needed to better understand the problem. It was clear that, just as with the economy, globalization of environmental concerns might require international intervention. Environmental concerns indicated that there was not a consensus on globalization.

Many people, especially in the labor and environmental movements and within academia, shunned this new globalization system, and argued that globalization undermined stability and prosperity and was leading to the disintegration of national economies and cultures. According to this view, workers had become pawns in transnational corporate agendas, the environment had been deregulated by the free-market rules of the WTO, and financial markets had been so decontrolled that the joint efforts of a handful of individuals could destabilize entire nations (as in Indonesia in 1997). The anti-globalization protesters took to the streets to voice their objections. The WTO ministerial meetings convened in Seattle in December 1999 to plan a new set of world trade negotiations called the Millennium Round, but huge demonstrations shut down the meetings. Seattle turned out not to be an isolated event; there were later demonstrations at gatherings sponsored by the United Nations, the IMF and World Bank, and Davo’s World Economic Forum.

There were also optimists who saw the free market and meteoric advances in technology as a
great boon or as an irreversible phenomenon that could not be halted. They announced that the world had entered a period of unity (unlike the divisive forty-five-year Cold War) that rewarded flexibility, high technology, and individualism.

Public opinion polls showed Americans divided on such issues as globalization and free trade. In general, those in the middle class and below voiced protectionist sentiments or questioned the fairness of NAFTA and the WTO. Among those warning of the perils of globalization were Pope John Paul II, UN Secretary General Kofi Annan, and former South African president Nelson Mandela.

As the twenty-first century opened, the globalization revolution continued to roll forward. While the global spread of information, the integration of markets, and the erasure of borders had the potential to promote global peace, prosperity, and the convergence of basic values, there was a dark dimension often ignored by corporate boosters. For one, globalization benefited organized criminals as well as corporations. The turnover of the criminal economy was estimated at about $1 trillion annually. Narcotics accounted for about half, but a trade in people was also lucrative. Gangs moved from four to five million people annually and earned some $7 billion in profits. In the health area, globalization presented a number of challenges. Public health officials worried that increased human mobility enhanced opportunities for microbes. The risks ranged from trade in illegal products and contaminated foodstuffs, divergent safety standards, indiscriminate spread of medical technologies and experimentation, and the sale of prescription drugs without approval of national authorities. With some two million people crossing borders daily, industrialized nations faced threats from emerging infectious diseases, exposure to dangerous substances, and violence such as chemical and bioterrorist attack. Furthermore, the spread of information on the Internet empowered individual terrorists like the Unabomber to exact their own revenge on global society.

Globalization was a phenomenon of the twentieth century, although it was often hidden from view. Its effects on diplomacy were enormous. In the age of instantaneous communication, rapid transport, and volatile markets, it was apparent that complexities of international relationships had moved far beyond the expertise of professional diplomats and foreign ministries. Diplomats and governments no longer served as gatekeepers. In the networked world, individuals, nongovernmental organizations, and officials communicated rapidly and regularly. But while technological innovation and information had networked millions of individuals into a system without central control, it is worth emphasizing that governments helped fund the networking revolution. The U.S. government had supported basic research in high-speed computers, telecommunications, networking, and aviation, all essential to the interconnected world of globalization. Moreover, Washington's commitment to market opening, deregulation, and liberalization of trade and finance provided the policy impetus that led to a variety of international agreements and arrangements promoting an open world order. Thus have diplomacy and techno-economic globalization been linked since the post–Civil War era.

**BIBLIOGRAPHY**

The phrase “humanitarian intervention and relief” reflects recent usage. Yet the types of activities that it incorporates have a long history. At times, natural disasters such as floods, hurricanes, or human-compounded disasters such as famine or war, have caused great human suffering and material damage, resulting in efforts to provide relief in the form of basic necessities such as food, clothing, and shelter. Despite the view that Americans have shown exceptional generosity, the practice of caring for the victims of disasters is as old as human communities and is widespread among cultures. The scale of the human response to human suffering has changed, however, largely because of the development of institutionalized structures to provide relief, and Americans have been at the forefront of such development. In the modern era, the idea that states or peoples should respond to victims of calamities in other states has grown dramatically. Especially since World War II, nongovernmental and intergovernmental organizations for humanitarian assistance have multiplied and become institutionalized.

Debates about humanitarian assistance abroad have increasingly focused on whether states have a right and even a duty to alleviate distress, and whether the acceptable means include forcible intervention to end suffering and protect human rights. Intervention implies interfering in a situation in order to change an outcome. It may or may not indicate the use of force in achieving its objectives, although in the recent past that has been a key issue in its definition. Humanitarian relief and intervention implies short-term rather than long-term action. In the period after World War II, however, what began as efforts to prevent imminent harm increasingly took on the character of efforts to promote social and economic development or provide longer-term protection of civilians during intractable civil conflicts. Nation building, efforts to promote economic and social development, and peacekeeping seemed to follow efforts at humanitarian intervention and relief, with the distinction between these efforts becoming increasingly blurred.

Both humanitarians and self-interest have inspired actions by individual Americans and the U.S. government to provide assistance and relief to people of other nations. The idea that individuals, nations, or governments intervene purely to promote the well-being of other humans is contested. Some believe that the essence of being human is to be humane, to act out of compassion, kindness, and sympathy so as to aid fellow humans in distress or danger. Others, however, believe that people act only out of self-interest. Indeed, some biologists conduct research to understand what they deem as the aberrant behavior of individuals who sacrifice their personal interests for the good of others. Considerations of whether humans behave solely on the basis of survival mechanisms largely ignore moral and ethical studies, religious or otherwise. The most common position avoids extremes, holding that humans often act out of humanitarian impulses, but that these are neither purely altruistic nor purely selfish.

The question of how states or governments respond used to be less murky. National self-interest, including the promotion of the well-being of the state's citizens and its survival, has been the raison d'être for the state. Yet with economic, demographic, and technological change in the twentieth century, some observers suggest that the erosion of borders has created an international community in which old conceptions of national interest are inappropriate. The interrelationships of a global community, and increasingly common values as evidenced by the development of international law in support of human rights, seem to warrant international responses to human distress wherever it may be found.
EARLY HISTORY OF AMERICAN FOREIGN RELIEF

The United States and the other nations born of the Enlightenment laid claim to the notion that nations could be based on ideals as well as interests. Religious beliefs also contributed to American conceptions of their role in the world. In addition to developing a vision of a city on a hill, a model community as exemplar to the world, the Puritans and other Christian groups emphasized the importance of doing good, which was interpreted in light of the biblical injunction to love thy neighbor. In the nineteenth century, millennial hopes of hastening the Kingdom of God also inspired some Americans to work for an ideal society that elevated or protected human rights. To many Americans the expansion of liberty through the spread of American-style institutions promised to free humanity everywhere from political oppression, and in the twentieth century, to free them from poverty.

A commitment to public good in the colonial and early national eras resulted in providing relief for the poor or those injured by disasters, which was usually conducted by those closest to the victims, members of one's religious organization, or local communities, but at times by colonial or state governments. There was some stigma attached to poor relief, but victims of fires or floods received greater public sympathy. Emergency relief escaped the stigma associated with poor relief, because victims of disasters were viewed as suffering only temporary misfortune. Such victims escaped questions as to whether they were morally unfit or somehow deserved their fate. Indeed, in times of emergency Americans quickly proved adept at organizing; they created private agencies to alleviate human suffering, since generally that was not seen as the responsibility of the state. Most assistance went to local communities. Early in the Republic's history, however, there were both public and private efforts to help victims of disaster abroad.

In 1812 a Venezuelan earthquake resulted in as many as ten thousand deaths. Concern about the extent of devastation, sympathy with the republican cause in Latin America, and hopes for commercial ties should Venezuela win its independence from Spain resulted in an appropriation of $50,000 from Congress for the purchase of food to avert famine. This type of federal appropriation was rare in early American history. Fires in Canada in 1816 and 1825 spurred private donations in Boston and New York, primarily raised by merchants and churches. Certainly, much human suffering occurred during this period, and when reports from merchants or consuls or other Americans stirred sympathy, Americans sent aid to, for example, survivors of French floods or to victims of famine and disease in the Cape Verde Islands.

Americans often responded to international crises because of cultural and political affinity. The prospects for republican government in Latin America and in Europe sometimes led to calls for intervention, but Congress resisted the impulse to do so. George Washington's pleas to remain neutral and avoid entangling alliances deeply impacted American views of their role in the world, particularly after the War of 1812. In 1821 Greeks rose against Turkey. Some Americans saw themselves as heirs to the freedom represented by ancient Greece. The portrayal of Muslim Turks as barbarous and the Christian Greeks as noble and civilized fed American prejudices. Support for the Greek cause provoked interest by groups as diverse as women's organizations and university students in a spate of fund-raising, and even in talk of government support. In 1824 Congress debated a resolution in support of Greek independence. It failed, however, and the government refused to allocate funds for either the Greek cause or Greek relief. Some Americans volunteered to fight, but they were few in number. Money already raised was used to purchase limited amounts of arms. In 1827 and 1828, however, the most significant support was in the form of relief assistance to the victims of violence. Individuals, churches, and other organizations like the Ladies Greek Committee of New York raised funds, purchased clothes, foodstuffs, and other supplies, and shipped them to Greece. Around $100,000 worth of goods was sent during the spring of 1827 and another $59,000 the next year. Samuel Gridley Howe, a Boston doctor and later an ardent reformer, helped coordinate the delivery of the relief aid. Americans, largely missionaries and diplomats, supervised the distribution of clothes and food, which were designated for civilians. As would future deliverers of relief aid, Howe soon engaged in efforts to provide more lasting assistance. Granted government lands for the purpose, he organized an agricultural colony that eventually included fifty families.

The next instance of large-scale relief led to an ardent debate in Congress over the constitutionality of congressional appropriations for for-
eign assistance. Senator John J. Crittenden of Kentucky proposed that the United States provide $500,000 for famine relief for Scotland and Ireland in 1847. Some proponents of relief argued that doing nothing was unconscionable, even if providing help violated the constitution. Some suggested pointedly that the United States was willing to coerce Mexico to “sell” land but was unwilling to alleviate human suffering in Ireland. Opponents argued that the measure was unconstitutional, and their argument won. On the other hand, naval vessels helped in delivering assistance raised through voluntary donations. Relief assistance came largely as a result of humanitarian and religious appeals whose effectiveness was increased by anti-English sentiment. The hope that feeding starving Irish would keep them in Ireland and away from American shores motivated some contributions. According to Merle Curti in American Philanthropy Abroad: A History (1963), some Americans contributed as a way to relieve personal and national guilt for participation in the Mexican-American War. Americans sent aid, but they did not distribute it. This was left to British government officials, the Catholic Church, and the Central Relief Committee of the Dublin Society of Friends (Quakers).

In the nineteenth century, opposition to relief led on occasion to criticism of the political and economic systems that created the conditions leading to famine, as in the case of Ireland and later Russia. Relief assistance, however, did not come with expectations or requirements for change. Except for isolated instances of technical missions, and more often in the case of missionary efforts, there was little attempt to reorder other societies in the nineteenth century.

Instances of relief efforts grew along with the nation, almost all of it on a voluntary basis. Famine was the most common disaster that brought forth American resources, although concern for victims of war or political violence also stimulated American relief efforts. Missionaries and diplomats often brought word of the need for assistance in places like Crete, Persia, China, and Turkey. Areas like Africa that had been colonized by other nations were hardly ever at the forefront of American concern. While the U.S. government rarely appropriated funds for the relief of disasters in other countries, there were occasional episodes in which American military forces provided limited assistance. For example, if a U.S. naval vessel was nearby, crew members sometimes assisted local populations in disaster, as in St. Thomas, Virgin Islands, in 1825; Nicaragua in 1852; Peru in 1873; and Chios, Greece, in 1881.

THE CIVIL WAR AND THE ORIGINS OF THE AMERICAN RED CROSS

In the latter half of the nineteenth century, international law and various institutions addressed the issue of humanitarian relief to those involved in war. In Europe, a movement emerged to improve treatment of the wounded in the wake of the Crimean and Austro-Italian wars. Swiss philanthropist Henry Dunant inspired the founding of the Red Cross after witnessing the hardships faced by the wounded and medical personnel at the Battle of Solferino. Within the space of two years, support for his idea led to the Geneva Convention of 1864, which elaborated the principle that both the injured and medical personnel should be treated as neutrals during war. Later Geneva conventions and protocols extended these provisions to war at sea, then to prisoners of war, and later to protection of civilians in enemy and occupied territories, with an emphasis on the needs of refugees and displaced persons. But although it had a tradition of neutrality, the United States was slow to join this international movement because of America's tradition of avoiding noncommercial treaties.

When these international developments began, the United States was in the midst of a destructive Civil War. In America's early wars, care of wounded soldiers was provided by family members and limited numbers of military medical personnel. Local communities, religious groups, and women's groups sometimes organized relief efforts to get supplies and medical care to their loved ones.

The Civil War, with wider consequences than previous calamities requiring American assistance, witnessed even greater voluntary mobilization. Women of high social prestige in both Union and Confederacy established organizations like the Women's Central Association of Relief in New York to help provide clothing and other supplies. The growing movement for an expanded role for women in nursing during war as well as desperate need led other women to volunteer for a more direct role in the relief of suffering. This voluntary relief movement had lasting importance, since women tapped into popular conceptions of gender roles, arguing more and more successfully that women brought uniquely feminine compassion to assist the
wounded. Professional standards for nursing, a
gendered profession, would expand in the late
nineteenth and early twentieth centuries. Ladies'
Soldiers Aid Societies provided food and other
services at camps behind the front lines.

The mobilization of relief during the Civil
War set new precedents in organization. In
addition to local efforts, the United States San-
tary Commission, a voluntary yet government-
approved organization, was established with
the aim of coordinating the activities of the
local groups. The Sanitary Commission organ-
ized the collection and delivery of supplies and
appealed for funds, raising $5 million by the
end of the war.

The Civil War also provided experience in
dealing with refugees. Inspired to action first by
the needs of “contrabands”—slaves fleeing the
ravages of war who went behind Union lines—
sympathetic individuals founded voluntary
organizations called freedmen's aid societies to
provide food and clothing to contraband camps.
Soon, Congress entered into relief and refugee
efforts, creating the Bureau of Refugees, Freed-
men, and Abandoned Lands, established in
March 1865 to provide relief assistance to south-
erners, black and white. The Freedman's Bureau,
as it evolved, also came to provide rehabilitation
or reconstruction, making efforts not only to
feed and clothe refugees but also to provide
freedmen with education and assistance in nego-
tiating job contracts and in leasing or purchasing
land. The issue of the constitutional right of the
federal government to engage in these kinds of
activities led to fierce struggles over the Freed-
man's Bureau and contributed to its eventual
demise. The pattern of dealing with emergency
needs to relieve human suffering, followed by
attempts to create conditions in which the vic-
tims of disaster could build or rebuild institu-
tions and sustainable economic activity, would
be repeated in the twentieth century.

Civil War experiences raised hopes for U.S.
approval of the Geneva Convention of 1864.
Although the United States did not participate
officially in the 1864 conference, Charles S.
Bowles, a member of the Sanitary Commission,
attended the convention as an American observer
and reported on the commission's experience.
Congress was reluctant to support an interna-
tional treaty that seemed to undermine the Amer-
ican principle of nonentanglement with other
nations. Secretary of State William Seward refused
to consider the treaty, arguing that it was political
and would violate the principle of U.S. neutrality.
Henry W. Bellows, who had headed the Sanitary
Commission, Bowles, and other members of the
commission created the American Association for
the Relief of Misery on the Battlefield in 1866,
lobbying futilely for Congress to ratify the Geneva
Convention. Seward and, later, Secretary of State
Hamilton Fish continued to reject U.S. participa-
tion in the treaty.

Another veteran of Civil War relief efforts
was ultimately more successful in convincing
American statesmen to support the Geneva Con-
vention. In 1870 Clara Barton, who had gained
pubic attention during the Civil War for her relief
activities, met members of the International Com-
mmittee of the Red Cross in Geneva. Inspired, she
worked with the national organizations of the Red
Cross during the Franco-Prussian War and later
during the Russo-Turkish War of 1877. She tire-
lessly argued for a Red Cross in the United States,
and wrote a pamphlet, The Red Cross of the Geneva
Convention: What It Is (1878). In it she empha-
sized not only the potential for Red Cross activi-
ties in war, but the role it could play in peacetime
in the United States to provide relief in the wake
of disasters and emergencies. Recent devastating
fires in Chicago and Boston as well as floods,
industrial accidents, outbreaks of disease, and
other emergencies required organized action and
Americans in growing numbers supported the
Red Cross largely because of its potential to help
at home. Barton also petitioned Presidents
Rutherford B. Hayes, James A. Garfield, and
Chester A. Arthur to promote the ratification of
the Geneva treaty. Barton's success came all at
once. She finally succeeded in establishing an
American Red Cross (ARC) in 1881 and in 1882,
with the support of Secretary of State James G.
Blaine, the United States Congress ratified the
Geneva treaty.

In its early years the ARC was mostly
involved in disaster relief at home rather than
relief to victims of war, but its future role in world
affairs would be extensive. Although a latecomer
to the League of the Red Cross, the name of the
federation to which national organizations
belong, the ARC had some impact on the interna-
tional movement. Henry Dunant had suggested
the Red Cross should also assist in disaster relief,
and the International Committee of the Red Cross
considered such activities as a part of their role.
The adoption by the ARC in 1884 of an explicit
article calling for relief of suffering in times of
peace was known as the American Amendment.
HUMANITARIAN RELIEF AND INTERVENTION IN THE AGE OF IMPERIALISM

United States approval of the Geneva Convention occurred in the context of increasing engagement in international political affairs. Motivated by a search for markets for increasing industrial and agricultural production, a desire to enhance security and expand influence, and a sense of national importance and confidence in its political values and institutions, the United States flexed its power and asserted its role as a force for human improvement. A global economy was increasingly connected through enhanced transportation and communication technology. People, goods, and information flowed rapidly among areas of the world that were far apart. While the reporting of world events had long influenced public sentiment in favor of relieving human suffering, the expansion of diplomatic, commercial, missionary, and recreational connections spawned wider interest in distant wars and disasters. Competition for circulation and low journalistic standards prompted sensationalized accounts of human distress. Large efforts focused on Russian famine relief in 1892, when Americans offered $1 million in goods and services. A former missionary to India, Louis Klopsch, the editor of the Christian Herald, supported the Russian famine effort and relief for victims of the Indian famines of 1897 and 1900. The Christian Herald, like other newspapers, published lurid accounts of the effects of starvation and guilt-inducing appeals for relief funds.

Although in the 1890s the ARC primarily engaged in domestic disaster relief, it cooperated with three major relief efforts abroad. The first was in response to the famine in Russia in 1892. The second was a relief mission in 1895–1897 to Armenians in Turkey. Again, the media played an important role in galvanizing American opinion to intervene. In the first instance, Russian crop failures from drought brought sympathetic outpourings of grain and other food supplies from the Midwest. Various groups participated in the effort, and the American Red Cross coordinated the shipments. An estimated 700,000 people were saved in one month from starvation. Not long after this effort, news came from American missionaries and diplomatic personnel of the persecution of Armenian Christians in Turkey, allegedly by Kurds with the tacit approval of Ottoman officials. Americans were outraged by the reports. Pleas for assistance came from the American Board of Foreign Missions and the Armenian Relief Committee. After hope for European intervention dimmed, the ARC—led by Clara Barton—undertook a relief mission to Turkey. Barton convinced Turkish officials that the ARC would play a neutral role, assisting all victims of the ethnic and religious conflict. Under the protection of the Turkish government, the ARC team traveled into the zones where conflict had occurred, appalled at the loss of life, hunger, malnutrition, and disease they witnessed. The relief efforts included distribution of food and medicine, but American relief assistance also involved efforts to help restore economic activity through aid in reopening shops to gifts of seeds and tools to reestablish agriculture. These activities ceased after several months because of a lack of funds and reports of further carnage.

However, the attempt to provide humanitarian relief set a precedent for action within a country where the state was implicated in violence against minorities or insurgents. There had been hopes of a more official intervention. But a congressional resolution to intervene and to support the establishment of an independent Armenia never got out of committee, although Congress did pass a joint resolution that called on the president to support European powers in pressuring the Turkish government to end the carnage. Humanitarian relief had widespread support; humanitarian intervention did not.

The United States was about to emerge as an imperial power, complete with subject colonies. Yet this development originated with humanitarian concern for the victims of a repressive government and violence spawned by a Cuban struggle for independence from Spain in the 1890s. As Cuban rebels waged guerrilla war, both insurgents and Spanish officials engaged in acts of cruelty and excessive violence. Governor General Valeriano Weyler y Nicolau initiated the infamous reconcentrado policy, in which civilians were moved into reconcentration camps to isolate the rebels from the civilian population. Spanish atrocities were easy to believe for Americans, many of whom harbored anti-Spanish and anti-Catholic bias. Moreover, the initial refusal of Spanish officials to undertake reforms frustrated first Grover Cleveland’s and then William McKinley’s administration to seek a diplomatic solution.

The American press, including the competing New York Journal of William Randolph Hearst and New York World of Joseph Pulitzer, reported sensational accounts of Spanish abuses. Then
came the sinking of the USS Maine in Havana harbor in 1898, which was widely viewed as a Spanish act. Still, McKinley resisted forcible intervention. He did, however, call upon the public for relief funds, to be forwarded to a Central Cuban Relief Committee that included the ARC, the New York Chamber of Commerce, and the Christian Herald. Fund-raising ran into some difficulty because some Americans thought forceful action to end Spanish rule, rather than relief or charity, was necessary. The Red Cross in Havana coordinated the distribution of food, clothing, and medicine. A turning point in American support for intervention came after Senator Redfield Proctor traveled to the Cuban reconcentration camps, accompanied by an entourage that included Barton. Appalled by the miserable conditions in the camps, including inadequate food, sanitation, and health care, Red Cross personnel provided relief supplies and set up health facilities for the internees. Back in Congress, Proctor outlined to his colleagues the appalling conditions facing civilians in the camps. McKinley's efforts at diplomacy increasingly turned on ultimatums, which the Spanish refused to accept. In April 1898 McKinley and Congress opted for war.

Humanitarian reasons motivated many Americans to support war with Spain. The desire to end the needless hunger and deaths of innocents seemed a just cause, even a Christian duty. Furthermore, proponents of American intervention could refer to the Teller Amendment—which proclaimed that the United States had no intention of annexing Cuba—as evidence of U.S. selflessness. Some, though, were caught up in an emotional frenzy of nationalism, seeking national prestige and power through “unselfish” intervention. U.S. intervention in the Cuban war for independence had economic and political reasons as well, namely to end the destruction of American property in Cuba and to bolster the political standing of the Republican Party. At the end of the war, moreover, U.S. imperialists, like their European counterparts, justified annexation of territory by citing a duty to uplift and civilize other peoples for their ultimate good. Violent means to that end, especially in the Philippines, shook Americans who believed the United States acted out of altruism, not selfishness.

With the outbreak of the Spanish-American War, the largest international relief activity in the nation's history to that point began. Much of the relief activity was coordinated by the ARC, which faced its biggest undertaking to that point. McKinley declared the ARC the sole representative of the International Committee of the Red Cross under the Geneva Convention, and it followed a pattern that would recur in future wars. In wartime, the national Red Cross organization served the state. Competition between the Army Medical Corps and the Red Cross limited the activities of the Red Cross in some ways, and much of its work involved helping the military at home; after the war, however, the ARC also aided the victims, both military and civilian, in Cuba. Around six thousand tons of food and clothing, valued at $500,000, were distributed by the ARC in Cuba, and further assistance was provided in Puerto Rico.

THE PROGRESSIVE ERA

The Spanish-American War set off alarms that the United States was ill-prepared to fight in war. The “splendid little war,” as it was called by John Hay, U.S. ambassador to Britain, was actually a lesson in poor management and planning, with soldiers suffering disease exacerbated by inadequate sanitation and poor food. Progressive-era efforts at the rationalization and organization of modern society extended to the military, but they also affected relief efforts of the kind conducted primarily by the ARC. Increasingly, the ARC faced charges of inept management, and foes targeted the personal leadership of its founder. In 1900 the ARC was incorporated by Congress and in 1905 it underwent reorganization and reincorporation. The ARC was subjected to a national audit by the War Department and officials of the government were placed on its Central Committee. In a sense the ARC, recognized under the provisions of the Geneva treaty, was now a quasi-governmental institution. While still funded by private donations, it was now akin to other Red Cross organizations in other nations in its relationship to the state. Still, the organization remained small and had difficulty in raising funds, especially on a consistent basis.

Before World War I natural disasters rather than wars were the focus of the international activity of the ARC and other, more spontaneous (ad hoc), organizations. The most significant assistance went to Asia and Italy, with lesser amounts going in response to crises such as an earthquake in Costa Rica, a fire in Istanbul, a typhoon in Samoa, and a cholera outbreak in Tripoli's Jewish community. Occupations by U.S. armed forces in
the Caribbean region led to military relief efforts during disasters, but given the larger consequences of occupation, the assistance did little to endear the United States to local populations. Limited assistance was provided for civilian victims of war in the Balkans and in Mexico. Famines in Japan and China drew sympathy. Missionaries and commercial interests there drew attention to the plight of the starving after crop failures in Japan and flooding in China. While many voluntary organizations participated, Theodore Roosevelt designated the ARC as the official relief agent to deal with the crisis in Japan. Over $245,000 worth of money, food, and supplies was sent to Japan, where the Japanese Red Cross oversaw the receipt and distribution of relief assistance. The large foreign presence in China was the context for an international effort composed of diplomats, businessmen, missionaries, and some Chinese, who created the Central China Famine Relief Committee. In addition to providing foodstuffs, the committee promoted public works and distributed seed. Much of the U.S. aid was funneled through the ARC, which participated in the relief effort.

The deep American economic and missionary involvement in China and concerns about the poverty and vulnerability of the local population led to efforts to move beyond temporary relief measures. American observers noted that repeated flooding along the heavily populated rivers of northern China resulted in frequent famine. Dismayed that relief efforts were required again and again, and confident that American engineering could find a solution to the underlying problems, the ARC initiated flood control schemes, a major departure from its customary practice. The Chinese government paid for American engineers retained by the Red Cross to study the problem and propose a solution. In 1914 they completed a proposal for a flood control project in the Huai River basin, with a cost estimated at $30 million. The ARC agreed with the Chinese government to assist in rallying U.S. bankers to the cause, but the eruption of World War I sidetracked their efforts. The Red Cross had spent over $1 million in China before World War I and would again provide relief. However, despite later Chinese requests that the Red Cross again join in supporting the Huai River project, the ARC determined that it was outside the scope of its activities.

Another departure from early Red Cross practice occurred in Italy. In 1908 southern Italy suffered a destructive earthquake and tidal wave near Messina. The resulting campaign to raise contributions to the Red Cross disaster fund was wildly successful. Americans provided over $1 million. Some relief money went directly to Italian relief agencies, but in contrast to the experience in Japan, charges of abuses of funds and unwise expenditures led to a decision by ARC officials to direct relief efforts themselves. American missionaries and religious organizations also participated in relief efforts. Once again, the Red Cross experimented in this period with assistance that went beyond the scope of immediate relief of hunger or sickness. Because so many Italians were left homeless, Congress appropriated funds for the construction of housing for the displaced. The ARC combined its resources with this federal funding and, along with U.S. naval personnel and Italians, participated in an early experiment in prefabricated home construction using partially constructed cottages shipped from the United States.

Before World War I the ARC primarily involved itself in disaster relief, but there were exceptions. The Mexican Revolution posed a special dilemma for humanitarian relief efforts because the United States occasionally intervened in the conflict. The ARC was presumably neutral, but matters were confused by its recognition by the
government and the fact that at this time the president of the United States was also the president of the ARC. In this era legal problems arose because the Mexican revolution was a civil conflict. The judge advocate general of the army ruled that the Geneva provisions for Red Cross neutrality during war did not apply, because the belligerents in this conflict had no legal status. Practically, the American Red Cross could operate only insofar as warring factions agreed to give it protection.

WORLD WAR I

World War I transformed humanitarian relief. The magnitude of the conflict, the extent of civilian suffering, particularly in occupied areas, and the destruction and consequences after the end of hostilities accelerated the rationalization of humanitarian relief. Organizations, both temporary and permanent, embraced the challenge of alleviating human suffering, creating new precedents for international cooperation. Among the new organizations was one that would have a long legacy in foreign assistance, the American Friends Service Committee (AFSC), an association of Quakers. Spontaneous organizations such as the American Committee for Armenian and Syrian Relief, the American Jewish Relief Committee, Christian Science Relief, and the Smith College Relief Unit sprang up. Established organizations like the Rockefeller Foundation, which set up a War Relief Commission, and the YMCA and the Salvation Army participated. In all, 130 U.S. agencies involved themselves in war relief. The ARC, the oldest and most organized relief group in 1914, had less than 150 chapters and twenty thousand members. The agency had a new national headquarters in Washington, D.C., signifying its arrival as part of the American establishment. When World War I began in Europe, the ARC offered war relief only to sick and wounded combatants. It sent medical and hospital supplies, and at first even established hospital units. Soon it was obvious that civilians were in dire straits, particularly in occupied nations like Belgium. Under the leadership of Henry P. Davison, chair of the War Council of the ARC, the organization engaged in intensive fund-raising and publicity. The ARC raised $400 million during the war and immediate postwar for relief. Membership grew from 250,000 in early 1917 to 21 million at the start of 1919.

An individual whose reputation took on heroic proportions emerged as the most important figure in the history of American humanitarian assistance and relief, with the singular exception of Barton. Herbert C. Hoover, Quaker, Stanford-trained engineer, and millionaire had spent his early career in international mining endeavors, primarily in Australia and China. His first experience at providing relief came in Tientsin, when he and his wife, Lou, helped distribute food and supplies to anti-Boxer Chinese. Appalled by the devastating effects of German occupation, American diplomats called for relief for Belgium. They asked Hoover, who was in Europe, to head what became the American Commission for Relief in Belgium (CRB) and was later transformed into an international undertaking. The primary goals of the CRB were to provide food to prevent starvation and, by its neutral presence, to offer protection to the population. It was the start of almost a decade of American relief efforts in Europe.

Efforts to provide relief required close cooperation with the belligerents. The image of starving Belgians swayed British officials to reject the seemingly callous position of those like Winston Churchill, who believed that feeding Belgians helped Germany and impeded Britain’s war goals. Conflicts with the belligerents emerged, yet Hoover cajoled and manipulated German and British officials throughout the war to keep the relief program going.

Hoover attempted to distribute relief assistance in ways that kept the Belgian economy functioning. Although some food was handed out freely, Hoover purchased wheat (mostly from the United States) and sold it at fixed prices to millers, who then sold flour at fixed prices to bakers, and so on to consumers. Belgian town leaders also helped distribute food in an equitable manner. While Hoover favored voluntary efforts, he sought public funds since the CRB required more resources than the organization could raise through private donations. Voluntary contributions totaled $52 million to the CRB. But the organization spent about $1 billion between November 1914 and August 1919. Much of it was Belgian money in banks outside of Belgium, British and French government funds, and U.S. government loans, which came after 1917.

The CRB also coordinated relief in northern France after 1915, and made some effort to provide relief in other parts of Europe. Suffering in Poland and Serbia in particular gained American attention. The CRB cooperated in a limited way with the Rockefeller Foundation to extend relief
to Poland, but Britain opposed Polish relief. Talk of starving Poles bolstered public support for the war. Despite U.S. diplomatic pressure on Britain to permit food for Poland and on Germany to stop requisitioning Polish food, both countries remained intransigent and little was accomplished, except for some food shipments for children. These relief attempts, however, spurred later support for Polish independence, in part by promoting the organization of Polish American lobbies, which along with Polish constituents in other countries rallied to press for Polish interests. Also, while President Wilson was already moving toward support for Polish independence, the failure of relief to Poland helped stimulate sympathy and thus domestic political support for an independent Poland. Efforts to provide relief to Serbia won more support from Britain than the United States. Hoover thought Serbian relief too complicated and he resented British efforts to tie Polish relief to relief in the Balkans.

When the United States entered the war, Belgian relief was turned over to the Comité Hispano-Hollandais, with figureheads at the helm in the persons of the king of Spain and the queen of Holland. Hoover still ran the show, but now he did so from Washington. The CBR ended its activities in 1919. According to auditors, its overhead costs came to only about one-half of one percent. Some 2.5 million tons of food at a value of $300 million fed nine million people in France and Belgium. As David Burner concludes in his biography *Herbert Hoover: A Public Life* (1979), these projects "constituted a superb accomplishment, technically, morally, and practically."

**ARMISTICE AND REHABILITATION**

When America entered the war, Hoover headed to Washington, D.C., as U.S. food administrator; he was a volunteer receiving no salary. His goal was to rationalize the production and distribution of food for the war effort. When the war ended in November 1918, Hoover transformed the Food Administration into the American Relief Administration (ARA) to help Europe recover from the devastating aftermath of the war. On 24 February 1919 Congress appropriated $100 million for the ARA. Undamaged by war, the United States provided the bulk of relief assistance, including food, medical supplies, other goods, and credits to Europe after World War I. Concerned for efficiency and for U.S. public relations, Hoover insisted that Americans, rather than the Allies, supervise the relief efforts.

Hoover and other Americans were motivated by humanitarianism and other factors. Food surpluses in pork, wheat, and other commodities, fostered by the Food Administration's efforts to stimulate production to support the war effort, now served to feed Europe. Hoover was criticized for being motivated more by concern for the American economy than by genuine humanitarian feeling. Hoover claimed food was not political, but it occasionally was. He ensured the flow of food to nurture new countries in eastern Europe, but to discourage Bolshevism in Hungary, Hoover temporarily withheld food aid from Bela Kun, leader of the communist revolution there. Certainly, Hoover believed that food and other supplies would help provide greater order and stability. Food promoted peacemaking in that sense, and if at the same time it reduced the appeal of Bolshevism, all the better. On the other hand, Hoover opposed an Allied invasion of Soviet Russia.

After the armistice the Allies held back humanitarian relief to the defeated powers until Germany signed the peace terms. When they did, Hoover tried to get food to Germany partly to use up the American surplus but largely out of his desire to feed hungry people. The AFSC helped coordinate relief assistance to Germany. In some ways it served as a buffer between the ARA, which had helped Belgium and was seen as anti-German, and the German American community. It was expected that the German Americans would offer substantial support for German relief, especially since they had contributed proportionately less after the war than Hungarian, Polish, and South Slavic Americans.

Hoover assisted the German relief effort by providing $5 million in ARA funds. The ARC became deeply involved in providing civilian relief once the war ended. The Inter-Allied Relief Commission recommended that the ARC focus on civilian relief in eastern Europe. Surplus army food, equipment, and supplies were handed over to the Red Cross following congressional approval. It was not until 1923 that the American Red Cross brought the last of its foreign civilian relief workers home. Once again, while relief was intended to respond to an emergency, occasional attempts were made to have a lasting impact on the societies where relief was provided. For example, in central and eastern Europe the Red Cross helped communities develop health centers that were designed to promote child welfare.
In late 1919 the publicly funded ARA endowed private organizations for specific tasks, essentially privatizing the relief effort. One such organization was the Children's Relief Bureau, later renamed the American Relief Administration Children's Fund. Although it continued to provide important feeding and health services to Europe's children, it also was the vehicle by which the ARA became a private relief agency under Hoover's leadership. Although Hoover had objected to U.S. intervention against the Bolsheviks, he used the ARA to provide support for the anti-Soviet White Russian forces. The ARC also offered relief to the anti-Soviet forces.

In 1921 Hoover, now secretary of commerce, responded to word of a devastating Russian famine in the Volga region. American assistance for famine relief included the work of the ARA, the Volga Relief Society, the Southern Baptist Convention, the American Friends Service Committee, the Laura Spelman Rockefeller Memorial Fund, and others. Despite concern in the United States that the assistance would succor the Bolshevik regime, Hoover was successful in rallying new congressional appropriations for the ARA. Agricultural interests supported such funding because of eagerness for subsidies, but the measure passed largely because of a widespread understanding that regardless of anti-Bolshevik feeling, this famine threatened large-scale suffering. Soviet authorities, at first suspicious, cooperated with Hoover, and American relief assistance prevented the loss of millions of lives.

Domestic American support for the relief effort was high when the war ended, but Americans soon turned inward, disillusioned by the results of war in Europe, consumed by developments at home, and eager to return to their regular peacetime pursuits. Despite pleas by ARC officials that relief work counteracted the threat of Bolshevism, Americans were less willing than during the war to support relief efforts either through volunteer activities or financial contributions. Despite the decline in giving, it still exceeded prewar levels. In 1919 and 1920, $35 million was spent in the United States and $75 million was spent for overseas relief. By the end of 1922, $15 million in additional funds went to foreign relief.

Total U.S. relief efforts in the armistice and rehabilitation period were approximately $1.255 billion. Much of it came from the ARA, the European Relief Council, and other U.S. agencies (including loans and congressional appropriations); about 10 percent came from the Red Cross.

In an unprecedented effort, a cooperative fund-raising campaign called United War Work raised $200 million for seven relief organizations. Despite extensive American generosity, loans required repayment and would later spark European resentment against the United States.

While many relief organizations had ceased operations by the early 1920s, some, like the AFSC, became permanent. The American Red Cross grew dramatically. Increasingly, the ARC was operated by paid professionals rather than volunteers. The monthly payroll grew from less than $12,000 per month in 1914 to $1 million in 1919. As support for foreign relief fell, ARC officials determined to expand domestic operations. Increasingly, the ARC engaged in activities designed to promote health and well-being on a permanent basis rather than concentrating on responding to emergencies. While this shift focused largely on the domestic front during the interwar period, it set precedents for an expanded understanding of the role of relief agencies that was later applied abroad.

THE INTERWAR PERIOD

In the 1920s public interest in international affairs declined, partly out of weariness with Europe and disillusionment with international diplomacy. However, Americans still responded to disasters abroad such as famines and earthquakes. A Japanese earthquake in 1923 led to a large outpouring of relief assistance, which the navy helped deliver.

The 1930s saw a renewal of international conflict, and while Americans strongly supported neutrality, they contributed to relief efforts in China and Spain and for persecuted Jews. Economic hardship during the Depression, however, reduced the success of fund-raising. In 1938 the ARC tried to raise $1 million for China relief. It was unsuccessful. The Committee for Impartial Civilian Relief in Spain failed to reach its goal of $300,000. But while Americans sought to stay out of war, the conflicts in China and Spain provoked partiality toward one side or another.

European Jews suffered increasingly from harsh anti-Semitic policies as the decade wore on. Jewish Americans had long participated in relief efforts, and in 1914 the Joint Distribution Committee (JDC), a multinational organization, had been formed to provide relief to Jews persecuted in Europe. Much more than a relief agency, its
leaders sought to combat anti-Semitism and promote a Jewish homeland in Palestine. The JDC did not just assist Jews. For example, it assisted in famine relief in Russia without regard to religion. The JDC and other Jewish organizations such as the American Palestine Appeal grew in the 1920s, although they differed over the goal of Zionism, which was the creation of a Jewish homeland in Palestine. The JDC and other groups provided relief assistance in the 1930s for Jews in Europe and migrants to Palestine and elsewhere.

The Japanese war in China led to a great outpouring of sympathy for the plight of the Chinese. Chinese Americans raised relief funds, as did the American Red Cross, churches, missionaries, and business leaders. Seven agencies working together established United China Relief, buoyed by such prominent supporters as Time publisher Henry Luce, who had long promoted Chinese cultural affinity with the United States; Pearl Buck; Paul G. Hoffman; David O. Selznick; Thomas Lamont; and John D. Rockefeller III. The honorary chairman was Eleanor Roosevelt. Despite its success, United China Relief was criticized for its high administrative costs. Still, funds sent to China provided basic necessities and supported Chinese Industrial Cooperatives that employed Chinese refugees and produced a variety of goods, including some for the military resistance to Japanese. The immensity of Chinese suffering continued as China fought Japan and faced civil conflict.

The Spanish Civil War represented the type of civil conflict in which even neutral groups like the ARC had been reluctant to operate. To provide relief assistance, specialized organizations such as the Spanish Child Welfare Association and the Committee for Impartial Relief of Spain joined with the ARC and long-established religious relief groups, including the Mennonite Central Relief Committee, the Brethren Board of Christian Education, and the American Friends Service Committee, all from religious peace traditions. The most active group was the American Friends Service Committee, which coordinated relief and fed hundreds of thousands of hungry people, especially children. Shortages of supplies led to the practice of weighing children and keeping records to determine who most desperately needed food. While a desperate compassion motivated this practice, it was also consonant with the growing rationalization of relief efforts. The ideological nature of the conflict led to tension both within the AFSC and between the relief effort and Americans at home who chose sides. The U.S. government, despite neutrality legislation, provided agricultural surpluses through the U.S. Federal Surplus Commodities Corporation, which was given authority by Congress to offer wheat to the Red Cross in 1938.

After the outbreak of war in 1939, organizing and fund-raising activity for relief purposes expanded. The Neutrality Act of 1939 required voluntary agencies engaged in relief to register with the State Department and keep it apprised of their activities. The law did not apply to areas outside of Europe, like China, the Soviet Union, or Finland, but only to belligerent nations. It also exempted the ARC. From 1939 to 1941, when the United States entered the war, almost $50 million was raised for the relief of civilians and refugees by registered voluntary agencies. Congress appropriated $50 million for the ARC, which continued to receive donated funds. The Department of Commerce reported $174.4 million in goods and funds sent abroad, which included relief sent to areas not covered by the neutrality legislation.

WORLD WAR II

During World War II the U.S. government extended its role in relief and rehabilitation assistance. It also asserted control over the many voluntary agencies that were a hallmark of the American experience in humanitarian relief. The neutrality legislation of 1939 required detailed information from organizations involved in activities with states at war. Philanthropic organizations engaging in foreign activities, including relief organizations, had to be licensed by the State Department. The department refused to allow relief assistance for refugees in Axis-occupied countries. This limitation, of course, continued after the United States entered the war. Despite the efforts of Herbert Hoover, who organized the Committee on Food for the Small Democracies to undertake relief along the lines of the CRB in World War I, President Franklin D. Roosevelt refused to allow relief to German-occupied countries on the grounds that this would help Germany.

Public criticism of frivolous and unscrupulous fund-raising and of high overhead by some agencies gave credence to the U.S. effort to oversee the voluntary agencies, but the primary goal of the State Department was to assure that they operated in the service of larger policy goals. During the war the government sought to keep the relief agencies’ operations efficient and to avoid overlap.
with the ARC, with which it preferred to work. In the spring of 1941, Roosevelt named Joseph E. Davies to head the new Committee on War Relief Agencies, later the Relief Control Board (RCB). Through consolidation, the number of licensed voluntary agencies was reduced from 300 at the end of 1941 to 67 by war's end. The agencies were organized into country groups. After the war the Relief Control Board became the Advisory Committee on Voluntary Foreign Aid, which did not require licensing, although it did decide which private groups would get government funds. In addition, during the war a private group known as the Council of Voluntary Agencies worked with the RCB. Although voluntary groups continued to raise funds from the American public, they relied heavily on government resources. From 1939 through 1954 government funding to voluntary groups totaled $54 million for Russia, $38 million for Great Britain, $36 million for Palestine, $35 million for China, and $30 million for Greece.

During World War II the ARC made a sharp distinction between civilian war relief and services for American armed forces. While the ARC provided supervisory and coordinating functions for relief to civilians, it generally did not send personnel to direct civilian war relief during World War II, except for some milk distribution to children in North Africa and limited efforts in Italy. Instead, civilian war relief delivery became the province of the state through the armed forces, the Office of Foreign Relief and Rehabilitation (OFRR), the United Nations High Commissioner for Refugees (UNHCR), and the United Nations Relief and Rehabilitation Administration (UNRRA). The Red Cross spent as much as half of its funds on returning servicemen and women and their dependents. The government's extensive role in relief and rehabilitation contrasted sharply with its practice in World War I.

Another departure from World War I regarded measures for providing relief to prisoners of war, the latest addition to the Geneva Convention role for the Red Cross. The combatants in World War II were, except for the Soviet Union and Japan, signatories to the 1929 Geneva Convention Relative to the Treatment of Prisoners of War. The convention established the principle that national relief societies could work among prisoners of war to assure humane treatment, with the assumption that the International Red Cross would direct such activities. German authorities allowed the Red Cross to send packages according to the rules, but the Japanese government had never ratified the Geneva Convention and did not permit International Red Cross inspection of its prisoner of war camps or give safe conduct to neutral relief ships. During World War II, attempts by relief organizations to provide relief to prisoners of war set enduring precedents. The State Department gave the ARC authority to coordinate all relief supplies to American soldiers held by enemy powers. In addition to government financing and cooperation from the navy and army, the ARC spent over $6 million providing relief to prisoners of war with weekly food packages to American prisoners of war and monthly packages to many Allied prisoners of war. Other supplies, including clothing, toiletries, and medicine, were sent as well. The International Committee of the Red Cross also carried out inspections to make sure camp authorities complied with the terms of the Geneva Convention. Standards were uneven in the various camps and over time, but given the hardships of the war, it was clear that the Geneva Convention and the activities of the Red Cross ensured humane treatment for prisoners of war of nations signatory to the agreement. Unfortunately, since the Soviet Union had not signed the Geneva Convention, its prisoners of war were badly treated by the Germans, and prisoners of Soviet forces also faced harsh conditions and brutal treatment.

Most prisoner of war relief supplies went to prisoners in Europe. Some International Red Cross officials were permitted to inspect Japanese prisoner of war camps in some parts of the Philippines and Japan, but inspectors were not permitted in most camps in Asia. Japanese officials permitted limited delivery of relief supplies, but not on a regular basis, and some relief supplies sat in Vladivostok until the end of the war, when they were finally distributed to liberated prisoners.

German concentration camps were filled with civilians (including political prisoners) and did not come under the purview of the Geneva Convention. Whether detention or extermination camps, internees faced intolerable conditions, and the International Red Cross was not permitted to inspect them. Millions died in such camps, including Jewish victims of the Final Solution, the Nazi campaign to eliminate European Jews.

RECONSTRUCTION

The United States cooperated with other nations to provide relief in World War II, but as in the previous world war, the leadership and resources
came largely from the United States. In 1942 President Roosevelt placed the OFRR under the direction of Herbert H. Lehman, and when it merged into the UNRRA he made sure Lehman headed the new multinational agency. Despite Herbert Hoover’s protests that the UNRRA would allow too much Allied influence on American relief, Roosevelt saw to it that the UNRRA would largely be directed by the United States. The UNRRA provided relief assistance to refugees and communities devastated by the effects of war.

By 1946 President Harry Truman was worried that some UNRRA funds were going to communists, so he stopped providing U.S. contributions. The United States continued to provide relief and rehabilitation assistance, particularly in occupied Germany and Japan, with the U.S. Army administering much of it until 1947. Concern for reconstruction as well as relief guided U.S. policy. The United States oversaw the creation of the International Bank for Reconstruction and Development at the end of the war; it offered loans so that governments could purchase needed supplies. The Marshall Plan, or the Economic Recovery Program (ERP), initiated in 1947, represented a commitment by the United States government to foster the long-term rehabilitation of Europe and its dependencies through massive foreign aid, including grants and loans. While initiated out of concern for continued suffering and fear of communist inroads among discontented populations in Europe, the ERP signaled an end to emergency relief efforts and the transition to foreign aid for development.

The ARC also stepped up its activities with the war’s end, playing a particularly valuable role in dealing with refugees and displaced persons, including prisoners of war and internees of concentration camps. Voluntary agencies, some representing church groups, labor organizations, and colleges and universities, offered relief services as wartime control measures were lifted. The government welcomed such groups, which extended the resource base for operations and demonstrated overwhelming generosity and concern by Americans moved by extensive suffering. Some groups focused on non-European regions such as China, but most American attention and resources went to Europe.

THE COLD WAR
As the Cold War began, an institutional framework to respond to humanitarian emergencies came into existence. The United States played a primary role in the development of the major institutions of the international relief and rehabilitation network—including the United Nations International Children’s Emergency Fund (UNICEF), the Food and Agriculture Organization (FAO), and the World Health Organization (WHO)—and contributed significantly to the funding of such organizations. Although the United States could not completely control the directions of these institutions, the State Department carefully oversaw U.S. relations with these intergovernmental organizations, and their growth did not displace unilateral efforts. Voluntary organizations, increasingly institutionalized, frequently served the larger purposes of American foreign policy as well as their own relief goals.

The functions and priorities of U.S. government agencies, intergovernmental organizations, and nongovernmental organizations shifted from emergency relief to economic and social development. Rising aspirations for political and economic independence in European colonies sparked greater U.S. attention to these underdeveloped areas, later known as the Third World. Fear of Soviet communist expansion into those areas generated efforts to promote economic development in order to undercut communist appeal. Increasingly, foreign aid became a permanent practice. The academic community produced development studies that emphasized the need to link political, economic, and social development and which suggested that the United States could assist nations to develop. Organizations involved in foreign assistance proliferated and moved from a focus on emergency relief as a response to disaster to attempts to solve underlying conditions of poverty that often led to crises. During the immediate postwar era, much relief was sent to Europe; afterward it went increasingly to the Third World. While some voluntary agencies resented government efforts to use them in the service of American foreign policy, others revel ed in the role. As the government expanded its involvement in foreign relief, federal grants became easy money in comparison to the tremendous effort required to raise private funds.

An organization that reflects many of these trends is the Cooperative for Assistance and Relief Everywhere (CARE). In 1945, twenty-two American organizations collaborated to found what was originally called the Cooperative for American Remittances in Europe. At first a parcel service, the organization shipped “CARE
packages” of Army surplus food to friends or relatives of Americans in Europe. Soon, specially prepared packages of purchased items were being sent to strangers in Europe, and then to Asia and the developing world. CARE packages captured the imagination of the American public, and celebrities like Ingrid Bergman helped spread the organization’s appeal. CARE eventually stopped sending the famous packages and, like other such organizations, expanded from relief during emergencies into other areas including health care and development advice and assistance. CARE relied heavily on government grants as well as private donations.

During the Cold War, much CARE activity was focused on areas of strategic significance to the United States, such as the Phillippines in 1949, Korea in 1951, and Vietnam in 1966. In the early 1950s, relief assistance was targeted to areas of political concern including Korea (through UN auspices, during the Korean War), Yugoslavia (to encourage its break with the Soviet Union), and India (which was offered food loans, not grants). In 1954 Congress passed the Agricultural Trade Development and Assistance Act (Public Law 480), later known as Food for Peace. Under Title I of this legislation food surpluses, owned by the U.S. government, were sold at reduced rates to foreign nations and could be sold in the open market. This use of the market was intended to deter charges that the United States was dumping its surplus and to alleviate concerns about fostering dependence on relief assistance. Title II provided for U.S. food surplus to be used as grants for humanitarian assistance. Most of this food surplus was distributed through the auspices of the nongovernmental groups, especially CARE and Catholic Relief Services. In practice, both Title I and Title II food aid usually went to allies or friendly governments.

In the early 1960s the Kennedy administration reconsidered food assistance, hoping that the rationalizing of food needs and distribution would combat world hunger and malnutrition. Food assistance remained political, although the new emphasis on economic development meant that food aid went to development programs as well as for emergency assistance. The United Nations, increasingly conscious of the significance of food, created the World Food Programme (WFP) in 1963. Reflecting the new emphasis on development, only 25 percent of WFP funds were targeted for emergency relief. U.S. organizations like CARE continued to work with the American government through the Agency for International Development (AID), which was charged with coordinating both relief and economic development assistance, with the priority on development. The world’s reliance on U.S. food to handle world crises led President Lyndon B. Johnson to call for greater multilateral cooperation to handle famines like those faced by India in the mid-1960s. Indeed, world agriculture was changing, with nations like Canada also being well-endowed with agricultural surpluses. However, in the early 1970s a world food crisis emerged as the U.S. agricultural surplus dwindled and bad harvests in the Soviet Union and elsewhere taxed world food supplies. The wealthier food-importing nations purchased at higher prices, leaving the poorer nations unable to afford what remained. Food assistance reflected U.S. strategic priorities. Food shipments to Southeast Asia made up half the commodities under the Agricultural Trade Development and Assistance Act in 1974, leaving less available for the Sahel region in western Africa, wracked by famine caused by an extended drought.

Increasingly, a network of organizations responded quickly to humanitarian crises. While relief organizations extended their functions to focus on development, most retained their capacity for responding to disasters. Despite the more permanent character of a large number of institutions like CARE, Save the Children, American Near East Refugee Aid, Catholic Relief Services, World Vision, and Lutheran World Relief, ad hoc responses to natural disasters sometimes led to the creation of short-term organizations or committees to handle a crisis, often but not always by coordinating through other, more permanent, relief agencies like the American Red Cross. Such emergencies as flooding in Bangladesh, an earthquake in India, a hurricane in Central America, and famine in Ethiopia led to outpourings of voluntary private assistance as well as government aid. Refugees from civil conflicts, such as the thousands of Southeast Asians who fled Vietnam and Cambodia in the 1970s and 1980s, generated similar outpourings of assistance, with the added complication that relief organizations had to work with suspicious governments. In such cases, while intergovernmental organizations sought to help, the nongovernmental organizations were often able to maneuver more successfully to provide relief. While critics complained of overlapping and duplication of effort, inefficient fund-raising, inadequate or unfair distribution of food, cultural...
insensitivity and racism, excessive emphasis on institutional self-preservation, impersonal and unfeeling treatment of the suffering, corruption and mismanagement, poor analysis by media and relief organizations, inattention to underlying causes of crises, and a host of other flaws in the network, international relief was largely effective in reducing immediate suffering and resolving emergencies.

The phrase “repeat disasters” came into use as certain areas faced recurring crises. For example, in the early 1970s famine in western Africa resulted in hundreds of thousands of deaths. Some of the same regions faced an even worse crisis in the 1980s. Such events heightened calls for means to prevent or mitigate disasters. In the 1960s and 1970s foreign aid came under increasing criticism, and some of those criticisms were applied to relief assistance. Food aid often undermined self-reliance, injuring indigenous agriculture by reducing incentives to produce and tempting governments to rely on free or inexpensive foreign food to the detriment of their own farmers. Critics pointed out that food relief, not just food aid, could have this effect, citing as an example the response to a 1976 Guatemalan earthquake. An abundant Guatemalan harvest spoiled as people stood in line for free food. Short-term relief of disaster rarely faced such criticisms, but short-term relief efforts continued to face charges that they failed to address underlying political, social, and economic conditions that lead to continued distress. Efforts to reduce the effects of dependence and to foster dignity resulted in renewed emphasis on developing indigenous organizations for relief, particularly in areas subject to recurring crises. International assistance increasingly operated in cooperation with such local organizations, some private, many governmental.

Much of the criticism of foreign aid was linked to the political uses to which it was sometimes put. Clearly, all disasters did not receive the same response. When Nicaragua suffered a devastating earthquake in 1972, President Richard M. Nixon provided aid to the dictatorial pro-U.S. regime. When Hurricane Fifi devastated Honduras in 1974, the regime of General Oswaldo López was out of U.S. favor because he supported labor and land reforms and had nationalized the timber industry. Fifi left 8,000 dead and as many as 300,000 Hondurans homeless, yet U.S. assistance was not forthcoming. López slowed the pace of reform and eventually resigned.

HUMANITARIAN INTERVENTION DURING THE COLD WAR

Humanitarian assistance had long implied the potential of forceful intervention. International responsibility for the protection of human rights and alleviation of human suffering led to the development of international institutions, including the multinational United Nations. The development of international law, from the Geneva conventions to the response to the Holocaust at Nuremberg and the UN Declaration of Universal Rights increasingly reflected the idea that the international community could hold individuals and nations responsible for violations of human rights. Still, what this meant in practice was not clear, and the United Nations was based on respect for national sovereignty. So despite some precedents for humanitarian intervention, the notion that states could intervene in other nations’ affairs to protect human rights was not pursued with great vigor until after the Cold War had ended.

Still, Cold War competition led to numerous interventions by the United States and the Soviet Union. Since the Cold War was not only a strategic contest but also an ideological one, each side felt compelled to proclaim the moral basis for their actions, resulting in dubious claims that such interventions as that of the Soviet Union in Hungary in 1956 and Czechoslovakia in 1968, and that of the United States in the Dominican Republic in 1965 and Grenada in 1983, were for humanitarian purposes.

Each side could argue that their political and economic system served humanity's interests, while the other side's represented oppression and the violation of human rights. In such a contest, the definition of “humanitarian intervention” could apply to any superpower attempts to influence a nation to choose sides. By the late 1960s and the 1970s, backlash against this idea spread as some Americans grew frustrated with the nation's foreign policy as a whole, but in particular toward its policy in Southeast Asia. The Vietnam intervention, ostensibly to uphold freedom in the face of communist aggression, alienated Americans as they realized the vast physical, ecological, and human destruction it was causing and as they grew to doubt not necessarily the ability of the United States to defeat the enemy, but its capability to build a nation. By 1979 and 1980, when Vietnam intervened in Cambodia to end the murderous holocaust initiated by Pol Pot and the
Khmer Rouge, Americans supported relief efforts for the tens of thousands of Cambodian refugees. On the other hand, they did not support U.S. intervention. The relief efforts were carried out almost entirely by nongovernmental relief agencies, such as Oxfam, a British relief agency, Catholic Relief Services, and the AFSC.

Although there was a revival of support for intervention in the name of humanitarianism during the presidency of Ronald Reagan from 1981 to 1989, it was highly contested. For example, Congress placed curbs on the ability of the Reagan administration to assist the contras in Nicaragua against the leftist Sandinistas, despite administration claims that the Sandinistas were violating the human rights of Miskito Indians. In fact, during the 1980s Reagan faced constant criticism from voluntary humanitarian organizations regarding the administration’s policy toward El Salvador. They charged his administration with failing to intervene on behalf of victims of that nation’s civil war, choosing instead to support the government despite its failure to curb abuses by the military and right-wing death squads.

THE POST–COLD WAR ERA

The end of the Cold War brought tremendous changes. Triumphalists hailed the victory of democracy over communism, claiming it heralded a new age of freedom. New ideas circulated regarding approaches to humanitarian relief and intervention, many of them reflecting a new optimism, even hubris, about the ability of humans, in the form of the international community, to reduce human conflict and suffering. Perhaps the approaching millennium influenced such trends. In 1989 the United Nations General Assembly declared the 1990s the International Decade for Natural Disaster Reduction. The goal of reducing vulnerability to destruction was not new, witness Red Cross flood control planning in China in the early twentieth century. Meteorological advances after World War II led to progress in predicting some natural disasters. Satellite imaging later increased information on creeping desertification, the process by which land grew increasingly arid and unsupportive of vegetation.

There was also awareness of the human role in magnifying the effects of natural disaster, both because of political crises and human pressures on the environment. Environmental degradation in the form of deforestation and desertification were the result of human decisions. Poor urban populations settled on tree-denuded hillsides, for example, vulnerable to the impact of flooding and mudslides from hurricanes. Growing confidence in the ability to reduce the impact of disasters emerged from a sense that there was a confluence of helpful technology with greater understanding of the human sources of disaster. In *Anatomy of Disaster Relief: The International Network in Action* (1987), Randolph Kent wrote, “In the final analysis disasters are about vulnerability, and vulnerability—whatever the disaster agent—is created by mankind.” Absent was a sense of fatalism or talk of “acts of God.” If humans created problems, humans could solve them. In 2001, the USAID/OFDA (Office of Foreign Disaster Assistance) website declared cheerily “Where There’s A Will, There’s A Way.” “Prevention, reduction, preparedness” were the focus of USAID/OFDA, resulting in such programs as the Central American Mitigation Initiative (CAMI). After Hurricane Mitch hit Central America in 1998, President William Jefferson Clinton promised $11 million to establish CAMI to assess vulnerability and suggest plans to reduce it.

As the disaster relief network sought ways to prevent future disaster by relying on science, engineering, and organization, there were also increasing calls for building democracy. Humanitarianism was no longer narrowly defined as a compassionate response to human suffering but included the responsibility to protect human rights. Human rights were defined to include universal rights to basic material goods like food, clothing, and shelter and to political freedom as well. If these rights were denied, the human community had an obligation to intervene to preserve and protect them, whether this violated the sovereignty of nations or not. Whether or not the United States should undertake such interventions alone or multilaterally was another question hotly debated, but the idea of a responsibility to police other nations grew as the twenty-first century began.

Proponents of humanitarian intervention sometimes sought to support and enhance the leadership role of the United States. They might prefer that the United States intervene multilaterally, but believed it should lead its allies and international community. To others, the end of the Cold War paved the way for intergovernmental institutions to grow in effectiveness, unhampered by competition between superpowers. They believed in the idea of a global community.

In the 1990s the United States, in conjunc-
In the 1990s scholars and pundits spoke of the “media effect” or the “CNN effect” because of their sense that the American public responded to foreign crises based on visual images. Concerned with the consequences of the immediacy of information, critics worried that the U.S. government, under public pressure, would make decisions based on emotional responses and inadequate analysis. Thus, television images of precision bombing in Iraq led to American confidence in the humaneness of contemporary war, while images of emaciated, starving Somali children and the brutal indifference of other Somalis resulted in cries for intervention.

Critics of the media complained that journalists often misunderstood the crises about which they reported, relying on relief or aid workers for information, or even intentionally manipulating opinion to foster public pressure on politicians on behalf of the journalists’ pet causes. Americans were accustomed to seeing images of starving children on television as relief and development organizations sought to raise funds by evoking compassion. Save the Children pioneered in television and print advertisements of pitiful, blank-eyed children to help raise funds for its efforts. World Vision filmed and aired documentaries of its activities, often showing actress Sally Struthers caring for unclothed and hungry children while appealing for assistance. Critics charged that such images bolster stereotypical perspectives of other peoples, and imply helplessness and victimization rather than resourcefulness and dignity.

Sensationalized accounts of human suffering, however, have long been used to enhance giving. In the early days of the American republic, broadsides, newspapers, and sermons offered dramatic descriptions to promote fund-raising. In 1832 initial reports of hunger in the Cape Verde islands stirred little sympathy until dramatic accounts of misery (including a comparison to Dante’s Hell) spurred citizens from Portland to Philadelphia to Richmond to raise generous funds. In the 1890s sensationalist press accounts stirred support for intervention in the Cuban struggle for independence against Spain. Less well-known are similar stories of starving Russians, with reports of desperate peasants eating hair, leather, grass, leaves, and even each other. This type of reporting was powerful. Indeed, Clara Barton found it helpful to assure skeptical Turkish authorities that she did not have any journalists with her. The power of words and images to evoke compassion has long been problematic.
protection. Because the Kurds could be isolated geographically, it was easier to intervene at a low cost in lives (although not in military resources) than in the later Bosnia and Kosovo crises.

Despite its strategic purposes, the Persian Gulf War had the flavor of a humanitarian intervention because although Hussein continued to defy Western attempts to weaken his regime, his military power and potential to wage destructive war was limited as UN inspectors discovered and oversaw the destruction of chemical, biological, and nuclear weapons capabilities. On the other hand, a new humanitarian crisis emerged as the Iraqi people suffered from an embargo to force Hussein's compliance. The embargo reduced stocks of food and medicine as well as stifling the flow of oil. Measures to increase the flow of basic items were restored after harsh criticism of this policy.

The United States had occupied Haiti in the early twentieth century. Resulting mostly from strategic and economic concerns, the early occupation was also a result of an American sense that the United States could make Haiti reform its political institutions to provide greater democracy. Reforms also included efforts to improve the health and well-being of Haitians. Near the end of the twentieth century, the United States intervened again. A political crisis in Haiti resulted when in 1991 a military faction toppled the elected regime of President Jean-Bertrand Aristide. For three years a military regime ruled Haiti, with as many as five thousand dying in the political violence that ensued. Meanwhile, Haitians left the country in boats, creating a refugee crisis. The OAS and the UN's efforts at mediation failed. The UN, attempting to monitor human rights in Haiti, was expelled in mid-1994. Pressure mounted for a military intervention to restore Aristide to power. President Clinton favored a multilateral response, and along with the United Nations prepared a multinational force (MNF) to enter Haiti. With the MNF on the way and in the midst of talks with former President Jimmy Carter, the military government of General Raoul Cedras agreed to permit the MNF to land and oversee a peaceful governmental transition. Troops numbering twenty-one thousand landed in Haiti. Initially hailed as a successful humanitarian intervention, disillusion grew as the Haitian political situation deterorrated. Troops remained in Haiti, although their mission was redefined to peacekeeping in 1995 and then peace building in 2000, after the last of the U.S. troops departed.

In the early 1990s scenes from Somalia, located on the horn of Africa and wracked by civil war, stirred Americans. In addition to images of skeletal, desperate people, they also witnessed the abuse of the weak at the hands of the strong as the private armies of competing warlords stole food sent through humanitarian auspices. Guilt may also have moved Americans. During the Cold War the United States had been a patron of dictator Siad Barre after he left the Soviet orbit in 1977. U.S. economic and military assistance had distorted the Somalian economy. With the end of the Cold War, aid to Somalia dried up and Barre lost out in an emerging civil war. American and international humanitarian organizations sought to provide relief to civilians caught up in this turmoil, but they found themselves in danger and the relief supplies at the mercy of competing warlords.

The United States had developed criteria for intervention that fostered mediation between rival clans. Although the Somalian crisis was different from the Bosnian, it seemed that intervention in Somalia would save hundreds of thousands of lives by halting starvation. In addition, it seemed that while political efforts to promote mediation would be required, the whole process could be done quickly. This was important, because in the post-Vietnam era the United States had developed criteria for intervention that called for an “exit strategy” to avoid open-ended commitment. Another factor that may have stirred Bush was the desire to expand the post–Cold War mission of the American military in response to some domestic pressures to downsize and others to maintain a strong military. Humanitarian intervention might satisfy both sets of critics. Operation Restore Hope was thus initiated in December 1992, when Bush sent in 23,150 U.S. troops. Americans celebrated as Operation Restore Hope met its early goals by organizing and protecting the distribution of relief supplies and fostering mediation between rival clans. Although the United States had intervened militarily with the blessing of the UN secretary general, the United Nations oversaw much of the relief effort.

Unfortunately, the U.S. presence in Somalia soon became an irritant to Somalians. President Clinton reduced U.S. forces, but left a small contingent as part of a larger UN peacekeeping force.
General Mohamed Farah Aidid, with whom the Americans had cooperated to conduct relief operations, began to harass the UN troops. After twenty-four Pakistani troops were killed by Aidid’s forces, the U.S. forces sought to capture or kill Aidid. Hostilities between the United States and Somalis grew as U.S. forces were increasingly viewed as an imperial, invading power. After eighteen U.S. Army Rangers were killed and dragged through the streets of Mogadishu, Clinton made plans to bring all U.S. forces home, leaving the United Nations with the responsibility to oversee peacekeeping in Somalia. In retrospect, observers agreed more on intervention in Somalia than in Haiti. The general consensus was that the widespread starvation had been averted by the time of the killing of U.S. forces, and that the intervention failed when the political goal turned toward capturing Aidid. Earlier recognition of the consequences of growing anti-Americanism might have led to a complete withdrawal of U.S. troops. What troubled critics of humanitarian intervention was what they saw as the unrealistic goal of nation building. Competing perspectives over whether it was more moral to respond only to an immediate emergency or also to address the underlying conditions that led to the emergency seemed irreconcilable.

In 1991 and 1992 Yugoslavia dissolved into civil war. The demise of the Communist Party’s monopoly on power in 1989 had paved the way for the rise of nationalist political leaders who sought greater autonomy or even independence for their regions. Croatia and Slovenia declared independence in 1991. In turn, Serbia and Montenegro under the leadership of Serbian president Slobodan Milosevic created a new federal Republic of Yugoslavia and initiated policies to intimidate non-Serbian ethnic groups in Croatia and Bosnia. With assistance from Milosevic, the Serb minority in Croatia fought the Croat ethnic majority, and the Serb minority in Bosnia battled the Croat and Muslim majority. Croatia won its independence. In Bosnia, the civil war dragged on, although it declared independence in April 1992. The international community watched these developments in horror, because one of the characteristics of this civil war, practiced by all sides on at least some level, was what came to be called ethnic cleansing. Villages or entire regions were violently swept clean of Serbs, or Croats, or Muslims by opposition forces who hoped to gain control of an area for their own ethnic group. The shooting of unarmed women and children shocked observers, as did reports of mass rapes of Muslim women by Serbs. Despite comparisons by some to the Nazi holocaust and talk of genocide, however, both Americans and Europeans reacted in uncertain fashion.

The question of intervention to prevent human suffering, to prevent holocaust, was debated in multiple arenas: in Europe, in the United States, in the United Nations. Using force for humanitarian purposes provoked ambivalent responses. Moreover, historical precedents for intervention in civil war were not promising. The specter of Vietnam loomed in the United States, as did the more recent fiasco in Lebanon in 1983. There were political consequences and emotional anguish when American service personnel lost their lives in what many Americans viewed as hopeless endeavors. Therefore, the United States thus at first portrayed the problem as a European one and encouraged European solutions. Europeans had similar concerns, and in addition Germany faced constitutional limits on its ability to use force except in self-defense or in defense of allies. The international community understood the complexity of ethnic animosities in the former Yugoslavia and the intransigence of such conflicts to political solution. Stopping the carnage seemed undeniably important, yet assigning resources to what promised to be an indefinite, long-term commitment seemed unwise. Most of the military options in which the Europeans and United States were willing to engage involved air strikes that, while punitive, seemed unlikely to promote a long-term cessation of ethnic violence. As chairman of the U.S. Joint Chiefs of Staff, Colin Powell, opposing intervention, pointed out that the only effective way to end violence was to send in ground troops, which all sides were reluctant to do.

President Bill Clinton wavered indecisively from indications of possible forceful action to declarations that the United States could not fix Balkan problems. In February 1994 Clinton gave Serbs surrounding Sarajevo an ultimatum to abandon their siege. At the last minute the Serbs complied, although only after several Serbian planes had been shot down by U.S. jets acting under NATO auspices. Attempts to mediate the conflict were finally successful, resulting in the 1995 Dayton Peace Accords. The settlement partitioned Bosnia between Muslim and Croats on the one hand and Serbs on the other. This political solution seemed the only way to prevent continued violence, yet it worried many observers because old animosities continued to simmer. The diplomatic solution, achieved through threat of force, was seen
as an example of successful humanitarian intervention. But the violence was not over, and international attention soon turned to Kosovo, a predominantly ethnic Albanian area of Yugoslavia.

In the name of the Serbian minority in Kosovo, Milosevic encouraged the repression of Kosovar Albanians, often through the offices of the Serbian police in Kosovo. In response, the Kosovo Liberation Army retaliated with bombings and attacks on Serbian police and government officials. In 1988 UN resolutions denounced the abuse of civilians by the police, established an embargo against Yugoslavia, and warned that the international community would consider “additional measures to maintain or restore peace and stability in the region.”

Representatives of the United States, the European Community, and the Russian Federation mediated peace talks. In mid-March 1999 the talks broke down, and on 20 March, Serbia launched an offensive in Kosovo, burning homes, killing ethnic Albanians, and driving them into the mountains and into neighboring Albania and Macedonia. With U.S. approval, NATO began forceful humanitarian intervention in the form of air strikes on 24 March, which Russia condemned. NATO targeted sites in Belgrade such as the Yugoslav and Serbian interior ministries, Milosevic’s Serbian Socialist Party headquarters and his home, and Serbian state television. But air strikes also killed civilians, including sixty-four Kosovars in a convoy and eighty-seven Kosovar Albanians in an air attack on Korisa. In addition, three U.S. airmen were captured by Serbia and several pilots were killed. An international incident occurred when NATO planes hit the Chinese Embassy in Belgrade, killing three. Russia continued to criticize the bombings and suggested to China that the bombing of its embassy was deliberate.

Meanwhile, relief to refugees in Bosnia, Albania, and Macedonia was undertaken primarily by organizations of the United Nations such as UNHCR that oversaw the needs of refugees in Bosnia, Albania, and Macedonia. Some refugees gained temporary or even permanent entry into the United States. As more and more reports of ethnic cleansing seemed verifiable, the UN war crimes tribunal indicted Milosevic and four other Serbians for crimes against humanity.

This was no disaster relief operation. In Kosovo providing relief from suffering meant intervention to stop mass killings. While traditional relief aid was offered by UN agencies, the International Red Cross, and nongovernmental organizations, an additional goal of the operation was the protection of civilians, not only Kosovar Albanians but also Serbs who faced vengeful reprisals. Getting in, restoring “normal” life, and getting out was not a viable option. As in Somalia, it was clear that humanitarian intervention had to be followed by peacekeeping, which in UN practice had to come to mean efforts to maintain ceasefires while remaining neutral between warring parties. British, French, and U.S. troops were chosen for the purpose. In 2001, forty thousand NATO troops remained in Kosovo and in Macedonia, where ethnic tensions threatened to create a new humanitarian emergency.

Rwanda gained international attention in the spring and summer of 1994. Presidents Juvenal Habyarimana of Rwanda and Cyprien Ntaryamira of Burundi were killed when their plane was shot down, an incident followed by terrible slaughter in a competition for power fueled by ethnic rivalry between rival Hutus and Tutsis. The Rwanda Patriotic Front moved through the countryside, murdering civilians, mostly Tutsis, as they went. UN forces in the country left, having no mandate to intervene. Some human rights organizations called for international action to stop the massacres, which resulted in over half a million dead. French forces created a safe zone in southern Rwanda, but that was the extent of international intervention. As over 800,000 Rwandan refugees fled to neighboring Zaire, American and other relief organizations swung into high gear, offering typical relief assistance. Cholera swept through refugee camps and shortages of supplies plagued the relief effort. Some criticized the relief community for failing to do more, expressing confusion over the roles and responsibilities of the relief community. Should the relief network do something to stop the genocide, to relieve suffering under dangerous conditions, to use its cumulative voice in the international community to explain the political sources of the violence? The decision by the United States not to intervene disappointed even some critics of intervention, who could agree with interventionists on stopping genocide. Charges of racism and inconsistency in American foreign policy were made.

CONCLUSION

There is no question that forceful humanitarian intervention violates state sovereignty. Debates on international law and philosophy focus on this
problem. Do human rights inhere only in states, which reflect particular cultures, or are there universal rights that supersede the laws of states? Statists argue that human rights can only be guaranteed by the state, not by an international community. International law is between states, not individuals. If a state violates a people’s rights or restricts their liberty, it is up to the people to make the necessary changes. Liberty, by its very nature, cannot be won by outsiders. Supporters of intervention argue that states which fail to protect citizens’ rights forfeit their international rights. They point to the weakness of many oppressed peoples, who have no recourse to advance their own liberty without assistance. Moreover, some proponents of humanitarian intervention argue that not only does the international community have a right to intervene, but a duty to do so. The history of genocide in the twentieth century, from the massacres of Armenians to Jews to Cambodians, has impacted both interventionists and non-interventionists, with even many of the latter supporting intervention in the case of massacre or genocide. The problem is more complex when it is asked what rights so violate international norms that states should intervene. What if a state engages in torture or kills its opponents? Is one such death enough for intervention or thousands or more? If parts of the population are denied basic needs or rights like free speech and the right to organize, should other states intervene? Most interventionists argue for proportionality, the idea that the response of the international community should be proportional to the nature of the violations. This includes calculations of the damage to property and loss of life that will occur when force is applied as well as the extent of the violations. While there has been much discussion on these points in recent years, the underlying tension between these positions has a long history. Statesmen like George Washington and John Quincy Adams warned of the dangers of intervention and advocated a position akin to the Puritans, that the republic of liberty should stand as a beacon, living by its example rather than seeking to mold other peoples. As the United States emerged as a world power in the late nineteenth and early twentieth centuries, such a limited view became increasingly unpopular—but, ironically, largely because of a similar underlying premise, that the United States should use its power to advance human progress. In the late twentieth century, U.S. policy reflected ambivalence and competing perspectives. Confidence in American values and institutions and the seeming convergence of liberal values in the world seemed reason enough to assert American power to protect human rights. On the other hand, historical experience seemed to suggest that nation building was a complicated task and that well-intentioned intervention could lead to unhappy consequences. Another factor at century’s end was that in many ways the United States not only led, but followed, as international nongovernmental human rights organizations and intergovernmental organizations like the United Nations also set agendas. In the 1990s Pope John Paul II and UN Secretary General Boutros Boutros-Ghali both pressed for humanitarian intervention in certain cases as not merely a right, but a duty.

Humanitarian assistance (as opposed to intervention) is designed to relieve suffering and prevent imminent loss of life that results from natural or human-made disasters. Despite growing dissatisfaction with the limited scope of humanitarian relief, its short-term duration, and its inability to promote fundamental structural changes in societies, relief efforts will continue so long as humans respond as humans. The American-led international relief network reflects historic continuities. Despite institutionalization and pressures toward self-preservation and bureaucratization, U.S. nongovernmental institutions for humanitarian relief reflect diverse segments of American society, experience wide success at raising funds, and offer compassionate service to ameliorate human distress in crisis situations.

Since its inception as an independent nation, the United States has claimed a special relationship with the issue of human rights. When Thomas Jefferson wrote the Declaration of Independence, he captured—as well as spoke to—the yearnings of the colonists along the eastern seaboard of North America to break free from tyrannical rule across the Atlantic Ocean. Theirs was a collective action, of a people striving to achieve the right to determine their own form of government, but Jefferson’s rhetoric struck a balance between those collective aspirations and the rights of individuals. It is worth noting that his most famous words on the subject of individual rights—“We hold these truths to be self-evident, that all men are created equal, that they are endowed by their Creator with certain unalienable Rights, that among these are Life, Liberty, and the Pursuit of Happiness”—are preceded by the collective right of “one people to dissolve the political bands which have connected them with another.” Since 1776, Jefferson’s sentiments as both an expression of collective as well as individual human rights have continued to draw the attention of peoples around the globe. Although Jefferson was primarily concerned with focusing on the specific grievances and complaints the colonists had against the British king George III, his language gave expression to larger sentiments, coming partly from the Enlightenment philosophy that had recently swept the Western world. As a result, his words seemed transcendent in thought, though they were not necessarily so in their application.

Indeed, there was one major problem with what Jefferson wrote. The nature of his insistence on the collective right of peoples to determine their own form of government, not to mention the right to pursue happiness as individuals, when juxtaposed with his ownership of slaves and his subsequent refusal to disavow the practice by releasing them, draws attention to the danger of assessing the United States’ stand on human rights by national rhetoric alone. Or as David D. Newsom expressed it more recently, “United States diplomacy in the human rights field suffers inevitably from the contradictions between promise and fulfillment.” Ever since 1776, America’s diplomatic policymakers have spoken to the issue of human rights in both the collective and individual manifestations, and no one more eloquently than Thomas Jefferson. But as Newsom warned, the actual implementation of policies designed to address those concerns have not always lived up to their high-sounding intentions.

A major surprise occurred 225 years after Jefferson wrote the Declaration of Independence, when the United States failed to retain its seat on the United Nations Human Rights Commission. Coming in fourth in the voting in May 2001, behind France, Austria, and Sweden, the United States missed out because only three spots were available. Representatives from forty-three countries had pledged to Secretary of State Colin Powell prior to the vote that they would cast their ballots for the United States, more than enough for the United States to keep its place. But when the results were tabulated, it became clear that fourteen of them had not done as promised, leaving the United States off the commission for the first time since its creation in 1947.

At first glance, the removal of the United States, while Sudan, Libya, and China kept their seats because of the geographical division of placings, seemed almost Orwellian. That the land of Thomas Jefferson, Woodrow Wilson, Eleanor Roosevelt, and James Earl Carter, to name only four of the nation’s most ardent and eloquent proponents of human rights, was excluded from the panel, while on it sat clear violators of their own people’s rights like Sudan, where slavery still exists and where religious persecution and civil war have raged for decades, Libya, where dictator Muammar Qaddafi has ruled for decades through brutality against his own people and whose sup-
port of terrorism has been documented on a number of occasions, and China, where the government massacred protestors at Tiananmen Square in 1989 and where the persecution of groups like Falun Gong continued a decade later despite international pressure, appeared to make a mockery of the whole notion of a commission dedicated to monitoring and improving human rights conditions around the world.

In the aftermath of the vote that removed the United States, columnists and political pundits in Washington called the act outrageous, and cartoonists had a field day with images of Libya, Sudan, and China setting the human rights agenda. The consensus seemed to be that the United States had been wronged and that the nation’s absence from the commission ridiculed the entire notion of promoting human rights. But the long history of America’s relationship with human rights displays a series of domestic and international contradictions between the policies pursued and the rhetoric espoused by administration after administration. Considered in total, these contradictions raise serious questions about the nation’s commitment to the very idea of human rights. In short, Newsom is right: the gap between ideal and practice has been substantial, and upon closer scrutiny, the American record on human rights has been far more ambiguous, less consistent, and marked by more blemishes than jingoistic boosters of national honor would like to admit.

INITIAL CONTRADICTIONS

For the first century of its existence the United States, despite the language of the Declaration of Independence, did not advocate policies to effect human rights changes in other countries. Until 1865 the country faced a serious problem: no matter how eloquent Jefferson’s pronouncement that all men are created equal, slavery remained a contentious domestic matter, indicating quite clearly that some men were not as equal as others. Slaves were considered property, not individuals, and the Supreme Court endorsed this idea with the Dred Scott decision in 1857. A resolution came only through a bloody, four-year civil war. Notwithstanding a northern victory and aggressive efforts by Radical Republicans in Congress to reform the South in the late 1860s and 1870s, the states of the South moved shortly after those years to impose a system of economic and political control over African Americans through sharecropp-
government as the Austro-Hungarian Empire collapsed at the end of the war.

Wilson's call to liberalism came at a moment in world history when the United States rose from a regional power to a global one. American economic prowess provided the equipment and munitions France and Great Britain needed to fight the Central Powers from 1914 until the American entrance into the war in 1917. When they could no longer pay cash for the goods, the United States provided loans. In short, Woodrow Wilson possessed the economic and military clout to back up his calls for recognizing the collective rights of certain peoples.

The president's international commitment in this area, however, was not matched by any personal dedication to ensure that African Americans be allowed to participate in the domestic political process, nor did his push for self-determination extend to the victims of European colonialism in Africa, India, or East Asia. Like his predecessor from Virginia, Thomas Jefferson, Wilson was both eloquent and passionate on the theoretical rights of peoples, and he had problems reconciling his rhetoric with his practices. In addition to offering a hearty endorsement of D. W. Griffith's virulently racist film *Birth of a Nation* (1915), for example, Wilson pursued a domestic program shortly after coming into office that segregated the federal service, one of the few places where African Americans could enjoy some semblance of equal employment opportunities.

Regionally, Wilson acted with what had become customary American arrogance when he dispatched marines to Haiti in 1915, denying Haitians the right to determine their own political system. Indeed, Wilson intervened with military force more times in Central America and the Caribbean than any other president. He also spurned the inclusion of a racial equality clause at the Versailles Conference in 1919 when the matter was raised by the Japanese delegation. Better for the Japanese to be given territory in China against Chinese wishes than have any language referring to racial equality make its way into the final text.

Despite his actions toward nonwhites inside and outside the United States, Wilson managed to articulate the notion of peoples freely determining their own government, an idea that continues to draw the attention of repressed peoples around the world. Unfortunately, Wilson was thinking solely of those peoples in eastern Europe who had lived under the Austro-Hungarian Empire. In part, he was worried about how to contain the spread of communism coming out of the Soviet Union after the Bolshevik Revolution of 1917, and one way he hoped to achieve that goal was through the creation of a series of small states in the region, a sanitary cordon to thwart the movement of communism westward.

Wilson's rhetorical proclamations notwithstanding, the United States found it difficult to implement diplomatic policies that adhered to his commitments regarding democracy and collective rights. If anything, starting in the 1920s the United States began a consistent policy of supporting right-wing dictatorships around the world. As the historian David F. Schmitz has astutely noted in his study of U.S. support for these types of leaders, “promoting human rights and democracy demands a toleration of instability and change in regions considered crucial to American business or defense, often leaving no clear choice between conscience and self-interest and making strong, stable right-wing dictators attractive to policymakers.” Thus, the ability of Italian dictator Benito Mussolini to bring stability and order to his nation during the 1920s meant more to American policymakers than his fascist inclinations. All three Republican presidents during the decade agreed that “order and stability had to be the primary considerations,” stated Schmitz.

**FRANKLIN D. ROOSEVELT AND THE ATLANTIC CHARTER**

When President Franklin D. Roosevelt issued the Atlantic Charter in August 1941 in conjunction with British prime minister Winston Churchill, the two leaders followed in Wilson's footsteps by renouncing any intentions for territorial acquisition and by proclaiming the right of all peoples to determine their own form of government. This did not mean that the British prime minister had suddenly experienced a change of heart and was now prepared to recognize the independence of all His Majesty's colonies. Churchill understood the provisions differently from Roosevelt, and the president did not have a problem with that, although he did ultimately wish to see an end to European colonial holdings. The context to this announcement, of course, was World War II, which had begun in September 1939, and which was not going well from the Allied perspective at the time of the Atlantic Charter. Germany had defeated
France, invaded the Balkans, and was aggressively pushing back Soviet troops along the Eastern front. Great Britain stood alone in the West, since the United States had yet to enter the war. Roosevelt and Churchill wanted to cast the struggle in moral terms, with the one side committed to freedom and collective rights in clear contrast to the despotism of the fascist nations.

Domestically, Roosevelt acquiesced to political pressure by issuing the executive order that allowed Japanese Americans along the West Coast to be rounded up and placed into camps in the interior. In all, 110,000 Japanese Americans were moved and the Supreme Court, which ruled the infringement on their civil rights to be perfectly legal in Hirabayashi (1943) and Korematsu (1944), once again acquiesced in the denial of individual liberties.

Although he did not take up the interventionist approach in Latin America with the same degree of alacrity as Wilson, neither did President Roosevelt press on the issue of human rights. He ignored the actions of the brutal dictator Rafael Trujillo in the Dominican Republic. He reached agreements with fascist leaders in Spain (General Francisco Franco), Vichy North Africa (Admiral Jean Darlan), and Italy (Pietro Badoglio from 1943) in an effort to win the war. Human rights were not expressly a part of the fight against fascism in Asia and Europe, but they were very much a part of the basic differentiation between the two sides.

Their different ideas about fundamental human rights became glaringly obvious at the end of the war as Allied troops made their way into the concentration camps set up by Germany to oversee the extermination of the entire Jewish population in Europe. Scenes of mass graves, crematoriums, and emaciated survivors testified to the Nazi determination to commit genocide.

THE UN DECLARATION OF HUMAN RIGHTS AND PRESIDENT HARRY TRUMAN

With the defeat of Germany, Italy, and Japan, the United States stood militarily triumphant and economically prosperous in 1945. Whereas the rest of the world's powers had suffered from the fighting, the United States possessed a combination of military, economic, and political power that, when combined with strong moral leadership, meant that its pronouncements on human rights could, if provided with sufficient backing, carry real weight.

In the place of Wilson's failed League of Nations came the United Nations, and prominent amongst its considerations was the issue of human rights. In 1948 the United Nations issued its Declaration of Human Rights, which listed, among others, the right to life, liberty, security of person, nationality, recognition before the law as a person, and freedom of movement, including leaving one's country of residence. People had the right to marry, own property, think freely in conscience and religious beliefs, have an opinion and express it freely, assemble peacefully, and take part in the functioning of government—thirty articles in all. It stated that people shall have the right to a free education, at least at the elementary level; people shall have the right to work; they shall have the right to “rest and leisure,” and the right to “a standard of living adequate for the health and well-being” of the individual and family, “including food, clothing, housing and medical care and necessary social services.” Playing a crucial role in the adoption of the Declaration of Human Rights was Eleanor Roosevelt.

President Harry S. Truman offered his strong support for the UN's human rights work. At the same time that he spoke out in favor of protecting human rights worldwide, the president experienced political disappointment domestically. He failed in his effort to secure passage of a federal antilynching law. In many parts of the South, white citizens took matters into their own hands when it came to offering justice to African Americans who had either committed crimes or were simply thought to have committed them. Many times a mob hunted down the alleged perpetrator and executed a swift form of punishment, which usually involved hanging without the benefit of the legal proceedings. That this practice still existed in postwar America, and that certain senators refused to allow the passage of federal legislation outlawing it, spoke all too chillingly to the failure of the United States to practice what it espoused in the field of human rights.

Truman pressed ahead just the same. At a ceremony for laying the United Nations building's cornerstone on 24 October 1949, he spoke of the link between individual human rights and security: “The member nations have learned from bitter experience that regard for human rights is indispensable to political, economic, and social progress. They have learned that disregard of human rights is the beginning of tyranny and, too often, the beginning of war.” Truman indicated
that the success of the UN would be “measured by the extent to which the rights of individual human beings [were] realized,” and he also included “economic and social progress” in the equation for determining success in realizing those goals.

The next year at Gonzaga University, Truman brought his message of individual human rights into the domestic sphere, speaking of the need to prevent “discrimination in our country because of religion, color, or national origin,” all three of which were basic tenets of the UN Declaration of Human Rights. Truman then indicated that “the same moral principles that underlie our national life govern our relations with all other nations and peoples in the world.” Domestically, the president backed up his talk with action. He appointed a presidential Committee on Civil Rights to investigate the domestic situation; asked Congress in February 1948 to pass legislation to address the recommendations made by the committee; barred discrimination in federal employment that July; and moved to end discrimination in the armed forces, though the last of those would not be accomplished until the Korean War.

Much of what Truman did in the area of civil rights was politically motivated, to be sure, but Truman also worried about the ability of the Soviet Union to exploit America’s racial problems internationally. His administration decided to support, through a legal brief, the effort to overturn the Supreme Court–sanctioned discrimination against African Americans as set forth in the Plessy v. Ferguson decision. The president and many of his staff recognized the problems created internationally by the country’s hypocritical position: publicly advocating human rights for peoples worldwide, while systematically denying those very same rights at home to some of the nation’s citizens because of their skin color.

BROWN V. BOARD OF EDUCATION AND THE EISENHOWER ADMINISTRATION

Unlike Truman, Dwight D. Eisenhower possessed, at most, a tepid commitment to human rights, and his noticeable lack of enthusiasm evidenced itself in a number of telling ways. First, Eisenhower supported the involvement of the Central Intelligence Agency in overthrowing or attempting to overthrow governments in Iran (1953), Guatemala (1954), and Cuba (1960, though it was President Kennedy who ultimately authorized the ill-fated Bay of Pigs mission in April 1961). Indeed, in the case of Guatemala, the CIA abetted the overthrow of the democratically elected leader, Jacobo Arbenz Gúzman, ostensibly because his government was riddled with communists and constituted a threat to regional stability, although questions of land reform and their impact on U.S. business interests clearly played a role.

Eisenhower occasionally echoed Wilson’s commitment to see peoples around the world determine their own form of government, but he did so primarily as part of a broader anticommunist effort. Secretary of State John Foster Dulles was particularly strident in his anticommunism, but his rhetorical calls for Eastern European freedom ran into problems in 1956 when Hungarians sought to control their own destiny and withdraw from the Warsaw Pact. The Soviet Union, under the leadership of Nikita Khrushchev, found such actions unacceptable. In November, Soviet troops arrived in Budapest to quash the revolution. Shortly after the brutal outcome to the episode was apparent, President Eisenhower used the occasion of Human Rights Day on 10 December 1956 to express the nation’s “deepest sympathy” for “the courageous, liberty-loving people of Hungary.” But that was all; nothing more was done.

The real problem for the administration came in the form of the civil rights movement domestically and the growing attention it received outside the United States. The Supreme Court reversed Plessy in its historic decision in Brown v. Board of Education of Topeka, Kansas in May 1954, a ruling followed in 1955 by the Montgomery bus boycott in Alabama, and then by the refusal of Arkansas governor Orville Faubus to allow the integration of Little Rock’s Central High School in the fall of 1957. A clearly distressed Eisenhower was compelled to call in the National Guard to enforce the court’s decision and to protect from mob violence the African American students who were scheduled to attend the high school.

The embarrassment over strident domestic opposition to integration and to the equal participation by African Americans in the nation’s social and political systems hurt the nation’s image abroad. At the 1958 World’s Fair in Brussels, as Michael L. Krenn has insightfully noted, the Eisenhower administration ran into trouble with the American exhibit. One State Department memo observed that continuing racial discrimination, along the lines of what had happened in Little Rock the previous year, “clearly result[ed] to some extent in the weakening of our moral position as the champion of freedom and democracy.” Want-
ing to assert the nation's moral superiority vis-à-vis the Soviet Union, but having to concede that there were continuing domestic problems over integration, the State Department sent an exhibit to Brussels, "Unfinished Business," that acknowledged some of the problems still faced by African Americans. Although popular with audiences that visited the American pavilion, "Unfinished Business" closed for "renovations," which was a euphemism for deleting the sections that dealt with segregation and thus raised the ire of southern politicians back home. Senator Herman Talmadge, for example, a Democrat from Georgia, declared that segregation "was an issue for the individual states of America and 'cannot by any stretch of the imagination be said to be one of legitimate concern to the citizens of other countries.'" Of course, that has traditionally been the argument of all governments accused of violating their citizens' human rights, whether it be the United States in the 1950s; the apartheid government in South Africa in the 1960s, 1970s, and 1980s; China after Tiananmen Square; or the Taliban government in Afghanistan early in the twenty-first century.

THE KENNEDY, JOHNSON, NIXON, AND FORD PRESIDENCIES

David P. Forsythe has argued that not much with respect to human rights happened during the 1960s, largely because the Kennedy administration was cut short by assassination and the Johnson administration became preoccupied with Vietnam. Yet however brief his time in the White House, President John F. Kennedy recognized the problem created by opposition to civil rights at home for the nation's international standing. Speaking before the United Nations in 1963, nearly fifteen years after the UN Declaration of Human Rights, Kennedy remarked, "The United States of America is opposed to discrimination and persecution on grounds of race and religion anywhere in the world, including our own nation. We are working to right the wrongs." Indeed, Kennedy, who argued that the competition with the Soviet Union was moving from Europe to the countries of the Third World, where mostly darker-skinned peoples lived, understood the need to address prejudice at home in order to appeal effectively to those peoples abroad. For his part, Lyndon B. Johnson ushered through two of the most important pieces of civil rights legislation in American history: the Civil Rights Act of 1964 and the Voting Rights Act of 1965. Johnson brought the power of the federal government to bear so as to ensure that the states could not continue discriminating against African Americans. The United States was finally beginning to act in the domestic sphere in accordance with its proclamations internationally.

Human rights lost ground as a matter of importance in the nation's diplomacy under President Richard M. Nixon and his national security adviser (and, later, secretary of state), Henry Kissinger. The two emphasized geographical, political, and strategic considerations. Human rights, whether individual or collective, were of little concern to them. In his rush to embrace Communist China in a geostrategic partnership against the Soviet Union, for example, Kissinger basically cast aside the collective rights of the Taiwanese, who had been America's ally in the Pacific against communist aggression since 1949. Kissinger's disdain for human rights came through clearly at other times, too. From the administration's support for the military overthrow of the democratically elected socialist Salvador Allende in Chile in 1973 to the secret bombing of Cambodia from 1969 to 1973, the Nixon White House valued anticommunism, the exercise of power, and promoting stability over human rights.

Richard Nixon resigned in August 1974 and his successor, Gerald Ford, did not exhibit any greater concern for human rights. Later, Ford would claim credit for supporting human rights by virtue of his signing the Helsinki Accord, also known as the final text from the Conference on Security and Cooperation in Europe, which was signed by thirty-three nations in Helsinki, Finland, in 1975. At the time, however, the Ford administration thought of the agreement as more of a strategic pact than as one that brought a new human rights emphasis to U.S. diplomacy. It was the western European nations that insisted on the insertion of Breadbasket Three, which asserted that "the participating States will respect human rights and fundamental freedoms, including freedom of thought, conscience, religion or belief, for all without distinction as to race, sex, language or religion." Since the Soviet Union also signed the agreement, this language later became useful in criticizing Soviet practices in Eastern Europe.

CONGRESSIONAL ACTIVISM

A backlash arose from the lies about the Vietnam War told to Congress by Presidents Johnson and
Nixon, and from Nixon's blatant usurpations of power, leading to the rise of what became known as the imperial presidency. In the 1970s representatives and senators took matters into their own hands and asserted themselves more aggressively into the nation's diplomatic processes, including the area of human rights. One of the most prominent in this respect was a Democratic representative from Minnesota, Donald Fraser. Beginning with hearings in 1973 before his subcommittee of International Relations Committee, Fraser repeatedly raised the issue of human rights and made it a matter of legitimate diplomatic discussion. Human rights would no longer be an afterthought.

More than simply discussing the issue, moreover, Congress decided to act. In 1974, it strengthened law relating to trade and human rights when it passed the Trade Assistance Act; section 504 specifically dealt with human rights, indicating that aid should be linked to human rights considerations. In 1978 that language was changed to make mandatory the link between assistance and human rights considerations. Also in 1974, Congress passed the Jackson-Vanik Amendment to the Trade Act. Named after Democratic Senator Henry Jackson from Washington and Democratic Representative Charles Vanik from Ohio, the amendment insisted that for other nations to receive most-favored-nation status for trade purposes, they had to be certified as allowing their citizens the right to emigrate. The amendment targeted the Soviet Union for its refusal to allow Jews to leave for Israel. In 1976 Congress created the position of coordinator of human rights in the Department of State. As a result, the State Department reports on human rights conditions in countries receiving U.S. aid, totaling eighty-two in 1977. Twenty-three years later, and no longer focusing solely on aid recipients, the State Department published reports on 195 countries through its Bureau of Democracy, Human Rights, and Labor. In short, congressional action during the 1970s brought human rights into the nation's diplomatic considerations to an unprecedented degree.

**PRESIDENT JAMES EARL CARTER**

In this human-rights-friendly environment, Jimmy Carter was elected president in 1976. Carter has justly received much attention for emphasizing human rights as part of his administration's diplomacy; he did not, however, invent the issue. Gaddis Smith has, along with other writers, shown that, in Smith's words, "Carter joined the crusade and made it his own.” The principle impetus came from Congress, to the point that even such a strong supporter of human rights as Carter found himself arguing that Congress took human rights considerations too far. Still, Carter was more committed to promoting human rights than any other president into the early twenty-first century, in both words and action. As he wrote in his memoirs, “Our country has been strongest and most effective when morality and a commitment to freedom and democracy have been most clearly emphasized in our foreign policy.”

Having grown up in the rural segregated South, Carter linked the issue of civil rights for African Americans with the promotion of human rights abroad and cited President Truman, of all the recent presidents, as “the strongest and most effective advocate of human rights on an international scale.” He acknowledged problems with the nation’s past conduct, admitting that “much of the time we failed to exhibit as an American characteristic the idealism of Jefferson or Wilson,” but he rejected the accepted wisdom that the nation had to choose between realism and morality: “To me, the demonstration of American idealism was a practical and realistic approach to foreign affairs, and moral principles were the best foundation for the exertion of American power and influence.” His secretary of state, Cyrus Vance, concurred fully in the need to promote human rights; even National Security Adviser Zbigniew Brzezinski, himself more in tune with the geopolitical and strategic mind-set of Henry Kissinger than were Carter or Vance, conceded in his memoirs that “a major emphasis on human rights as a component of U.S. foreign policy would advance America's global interests by demonstrating to the emerging nations of the Third World the reality of our democratic system, in sharp contrast to the political system and practices of our adversaries.”

Carter understood the inconsistency in the nation's past talk about human rights when considered alongside its efforts to deny rights to some of its own citizens. In his memoirs, he acknowledged that “I know perhaps as well as anyone that our own ideals in the area of human rights have not always been attained in the United States, but the American people have an abiding commitment to the full realization of these ideals.” The problem for Carter was that despite his efforts to ensure that the nation's commitment to human rights was total and unconditional, he like his predecessors (and successors) had to deal with
the international situation as it was, not as he wanted it to be. Thus, while he criticized certain governments, including the Soviet Union and the military regime in Argentina, for violating their people's basic human rights, he laid himself open to charges of inconsistency, if not hypocrisy, by ignoring violations in strategically vital allies like Iran, the Philippines, and South Korea.

Still, Carter made human rights a public commitment for his administration, in contrast to many of his predecessors. Speaking before the United Nations on 17 March 1977, he told the delegates, “The basic thrust of human affairs points toward a more universal demand for fundamental human rights. The United States has a historical birthright to be associated with this process.” Secretary of State Vance spoke on 30 April 1977 at the University of Georgia School of Law on the integrity of the person, the fulfillment of basic needs, and classical civil and political liberties that required protection. Vance raised certain questions that needed to be asked when investigating human rights in other nations: What were the specifics of the human rights situation under examination? What were the prospects for effective action to bring about change? What were the historical and other perspectives needed to evaluate the situation reasonably? He also offered a slightly tempered sense of what could be expected: “We must always keep in mind the limits of our power and of our wisdom. A sure formula for defeat of our goals would be a rigid, hubristic attempt to impose our values on others.”

President Carter followed on 22 May 1977 with a commencement speech at the University of Notre Dame, where he outlined his administration’s premises for the nation’s diplomacy. The first item that he mentioned was human rights: “We have reaffirmed America’s commitment to human rights as a fundamental tenet of our foreign policy,” he stated.

Carter followed these words with deeds. First, on 1 June 1977 he signed the American Convention on Human Rights, an agreement that was reached between the United States and the other nations of the Western Hemisphere seven and one-half years before on 22 November 1969 but not officially endorsed by either Presidents Nixon or Ford. Second, although it was Congress that mandated so many of the changes that led to greater attention being paid to human rights during the 1970s, it was Jimmy Carter who appointed an assistant secretary of state for human rights effective August 1977. His choice for the post was Patricia M. Derian, an aggressive advocate for civil rights albeit lacking diplomatic experience. That, however, did not cause her to back down from confrontations with seasoned diplomats. She repeatedly clashed with more traditionally minded State Department personnel, like Assistant Secretary Richard Holbrooke on East Asian issues or Ambassador Terence Todman on Latin American matters. Derian did not shape every position the administration took, but she gave concrete evidence of a newfound commitment to human rights, however short lived it ultimately turned out to be.

As international events unfolded in 1978 and 1979, Carter began to focus his energies on more traditional considerations in the nation’s diplomacy. First came the war between Somalia and Ethiopia in the horn of Africa, which National Security Adviser Brzezinski viewed as a Soviet proxy war for control over yet another vital region. Further difficulties arose with the collapse of traditional right-wing allies in Nicaragua (Anastasio Somoza in 1979) and Iran (Shah Mohammed Reza Pahlavi in 1979). Andrew Young’s resignation as ambassador to the United Nations in August 1979 effectively ended Carter’s push on human rights in that international organization. And things only got worse. In Iran, students stormed the American embassy in Tehran in November 1979 and took Americans hostage. A month later the Soviet Union invaded Afghanistan. Concern over human rights quickly fell into the background, and nowhere did that become clearer than in South Korea. When President Park Chung Hee was assassinated in October 1979 and succeeded by a military regime led by Chun Doo Hwan in December, and when that government decided to suppress brutally an uprising in the southern city of Kwangju in the spring of 1980, Carter said nothing, despite his earlier criticisms of Park’s record on human rights. Administration officials feared that South Korea could become another Iran. In short, even a president as rhetorically committed to promoting human rights as Jimmy Carter found himself overwhelmed by strategic considerations that weighed in on the side of protecting stability.

PRESIDENTS RONALD REAGAN AND GEORGE H. W. BUSH

Congress and President Jimmy Carter made enough of human rights as a central tenet of American diplomacy so that subsequent chief executives could not ignore the issue entirely, regardless of
how little attention they really wanted to give the matter. The Reagan administration, for example, took Kissinger's emphasis on geographical, strategic, and political considerations, combined that with its own brand of politically conservative, fervent anticommunism, and added the requisite dose of human rights rhetoric in castigating the Soviet Union, all the while supporting right-wing dictators throughout the world. The spokesperson for the administration on this topic was the ambassador to the United Nations, Jeane Kirkpatrick. In a 1979 article she had criticized the Carter administration for failing to discern the difference between authoritarian (good) and totalitarian (bad) regimes around the world. The former were to be embraced as friends and allies, because of their ability eventually to change and their present inflexibility when it came to communism. The latter regimes not only would not change, they were communist. Matters of human rights abuses by authoritarian leaders were far less important in her schematic than their willingness to tow the anticommunist line. This was the theoretical framework the administration wanted to employ in its support of right-wing dictators.

The Reagan administration, therefore, offered its full support for repressive governments in places like El Salvador and Guatemala. In both countries the administration lied and covered up numerous atrocities and human rights abuses by the military, all in the name of supporting anticommunism. But from President Reagan's perspective, his predecessor's policies had fared no better. In a 1981 interview with Walter Cronkite, Reagan said with respect to the Carter administration's contradictory behavior on human rights, "We took countries that were pro-Western, that were maybe authoritarian in government, but not totalitarian . . . [that] did not meet all of our principles of what constitutes human rights, and we punished them at the same time that we were claiming detente with countries where there are no human rights." Secretary of State George P. Shultz assessed the situation similarly. He pointed to the differences between the East and West on moral principles, principles from which their basic policies arose. He argued that human rights could not be used to spurn other nations. That was a cop-out, he insisted, stating that although it made certain Americans feel better about themselves in their righteous indignation, it did not promote the kind of real change that improved human rights. On the contrary, according to Kirkpatrick and Shultz, U.S. pressure on Iran, Nicaragua, and South Vietnam in the 1970s to conform to certain human rights practices brought about these regimes' downfalls, which decidedly worsened the day-to-day circumstances faced by the millions of peoples in those countries.

The practical test for the Reagan administration position came in South Africa, where the administration took to the idea of working with the apartheid regime in the hope of bringing about affirmative changes in race relations there. Assistant Secretary for African Affairs Chester Crocker coined the term "constructive engagement" when discussing the administration's policy toward the white minority government. The idea was to reassure the South African leaders of American support in their time of transition to democracy. That was the option preferred by the administration; the other was to isolate South Africa through sanctions in an effort to force the situation. Congress, as it had during the 1970s, took a more activist position and in 1986 passed the Comprehensive Anti-Apartheid Act, which imposed economic sanctions on South Africa until significant changes were made, in direct opposition to the Reagan administration's constructive engagement policy.

Elsewhere, the Reagan administration appeared to have better luck, though not because of its dedication to constructive engagement or democratic principles. In the Philippines, long-time dictator Ferdinand Marcos stepped aside and allowed the election of Corazon Aquino in 1986, but the principal impetus for change came from the Filipinos. Reagan hesitated at key moments until the matter was all but decided.

The Bush administration made much the same argument on constructive engagement with respect to China in 1989, even after the government had cracked down on the Tiananmen Square protestors, using the People's Liberation Army to crush them on 3 June. Bush secretly sent two high-ranking advisers—National Security Adviser Brent Scowcroft and Deputy Secretary of State Lawrence Eagleburger—to Beijing on 30 June to assure the Chinese leadership that his administration still intended to promote Sino-American relations once the furor over Tiananmen died down. The president sent the two to China again in December, the same month that the administration announced the release of $300 million in business contracts between American corporations and the Chinese government that had been suspended in the wake of Tiananmen. The administration was intent on downplaying human rights violations.
On 20 December 1989 the United States invaded Panama. The official reasons floated for the invasion ranged from harassment by Panamanian Defense Forces of American military officials (and their wives), to Panamanian leader Manuel Noriega’s involvement with drug trafficking, to human rights violations. The drug connection was well-known in the early 1980s, but Noriega then cleaned up his act to the point where he received a letter from the Drug Enforcement Agency in 1986 that thanked him for his cooperation in stopping the drug trade. In short, Pinochet could be held legally accountable for his actions while head of state.

In 1999, Henry Kissinger published the third volume of his memoirs, in which he explained the reasons why the Nixon and Ford administrations supported Salvador Allende’s overthrow in 1973 and then endorsed the regime under General Pinochet that followed. First, he asserted that the dangers posed by communist expansion in the Western Hemisphere were real, citing Fidel Castro in Cuba and leftist guerrilla activities elsewhere. Second, Kissinger argued that Allende was determined to destroy the democratic institutions in Chile and replace them with a communist dictatorship. Kissinger’s defense thus turned on denying involvement in Allende’s overthrow and recalling the Cold War context to justify supporting Pinochet.

The Pinochet ruling in Britain gave some officials reason for pause: the United States has held other nations and their leaders accountable for violating human rights, but eventually American leaders may be placed under the same microscope. There is something very chilling, and quite healthy and appropriate, about the prospect of some deliberative body being able to sit in judgment of actions taken by the United States. The notion that American leaders will be held accountable for violating human rights is certainly dim, but such accountability would bring equity to the way in which human rights violations are handled around the world.
to avoid the issue through linguistic parsing than acknowledge what was truly happening and doing something about it. President Clinton apologized for America’s inaction while visiting Rwanda in 1998, but that was years after 800,000 people had been massacred.

The proliferation of independence movements in the wake of the Soviet Union’s collapse apparently arose in partial response to Woodrow Wilson’s call at the end of the First World War to support such efforts. To their surprise, however, those groups seeking U.S. assistance in their attempts to form independent governments ran into traditional American worries about instability possibly ensuing. In 1999, to cite one example, the leaders of Kosovo traveled to Rambouillet, France, to discuss its status within Yugoslavia. Meeting with American secretary of state Madeleine Albright, they found the United States much less keen than they had hoped regarding their desire to separate from Serbia and what remained of the Yugoslav republic. From the American perspective, supporting independence for Kosovo would set a dangerous precedent: What of the Kurds in Iraq and Turkey, the Tibetans in western China, and the Taiwanese? If those peoples also publicly asserted their desire for independent states, the consequences could possibly involve the United States in a major war, especially in the case of Taiwan. Hence, the Clinton administration remained exceedingly cautious about supporting the collective human rights of the Kosovars, despite their obvious suffering at the hands of the Serbian authorities led by Slobodan Milosevic.

**AMERICA’S RECORD AT HOME**

In 2001, Francis Fukuyama wrote about the debate between “rights” and “interests” and what difference it makes to speak of “human rights” as opposed to “human interests.” More specifically, he delved into why certain groups assert claims to rights when what they are really discussing are interests. In a sense, this is merely a broadening of what Jefferson began when he wrote of the “right” to “life, liberty, and the pursuit of happiness.” The United Nations declaration is about “universal human rights,” not human interests, and after incisively noting the distinction between the two, Fukuyama concluded that the reason for the proliferating assertions of “rights” in the half century after the UN’s declaration had to do with how “rights trump interests because they are invested with greater moral significance.” The problem with injecting human rights issues into the nation’s diplomacy, he insisted, was that they set up a basic premise for the nation’s diplomacy that could never really be fulfilled: “A country that makes human rights a significant element of its foreign policy tends toward ineffectual moralizing at best, and unconstrained violence in pursuit of moral aims at worst.” Jimmy Carter seemed to have discovered that the hard way.

On another level, Americans still fail to understand how arrogant some of their national pronouncements on human rights seem to peoples in other countries. While condemning human rights infractions elsewhere, Americans blithely go about ignoring or rationalizing their own society’s violations. To cite one example, polls generally show that a vast majority of Americans consider the death penalty a domestic matter, and popular support for allowing states to execute prisoners convicted of certain crimes remains high, although revelations in the late 1990s and early 2000s demonstrated the inconsistent, indeed arbitrary, way in which the death penalty is frequently applied, not to mention the fact that a good number of death-row inmates had recently been proven innocent through DNA testing. The governor of Illinois went so far as to suspend all executions pending a review of the state’s legal system regarding capital cases. Nongovernmental organizations that monitor human rights abuses around the world, including Amnesty International and Human Rights Watch, regularly cite the use of the death penalty as a violation of human rights, and the United States receives special mention since some of its states also allow for individuals under the age of eighteen to receive the death penalty for certain crimes. That puts the United States in the same league as Iran, Nigeria, Pakistan, Saudi Arabia, and Yemen, nations not normally listed as standing at the forefront of the world’s human rights protectors. And it gets even worse. In 2001, 52 percent of all death-row inmates were African American or Latino, far in excess of their percentage of the general population, which in 2000 stood at 24.8 percent, suggesting a disparity based on racial and ethnic prejudice. Yet the Supreme Court has ruled that statistical findings of uneven sentencing across racial lines regarding capital cases do not constitute sufficient evidence of racial bias. An intent to discriminate must be proven in each case, the court ruled, a nearly impossible burden for defen-
dants appealing their convictions. The United States signed the UN Covenant on Civil and Political Rights but by 2001 had not ratified it, largely because of objections to the covenant’s prohibition against using the death penalty on individuals under the age of eighteen.

PRESIDENT GEORGE W. BUSH

That the United States failed to retain its seat on the UN Commission on Human Rights, on second thought, begins to look less and less outrageous when the long history of the nation’s own violations is considered. Compounding those problems is resentment at the fact that the United States is the only truly global power. The administration of George W. Bush has not done much to allay concerns or ease tensions. Its unilateral decision to reject the Kyoto Agreement on curbing global warming, its resolve to withdraw from the Antiballistic Missile Treaty with Russia in order to pursue a National Missile Defense plan, and the refusal to send Secretary of State Colin Powell to the UN Council on Racism in Durban, South Africa (and then the withdrawal of the delegation) all seemed to mark even more examples of American arrogance.

The Bush administration argued that it sent only a low-level delegation to Durban to protest the language already proposed by Arab delegates calling Israeli’s treatment of Palestinians as racist; the president also objected to discussing reparations for past acts of slavery. Whatever the reasons, the Bush administration should have weighed the importance of the nation’s past leadership in the field of human rights against its displeasure over particular language in draft texts prior to the start of the conference. David D. Newsom was right to call attention to the disparity between the ideals articulated by the likes of Thomas Jefferson, Woodrow Wilson, or Eleanor Roosevelt and the reality of the actions pursued or not by the United States. But Jimmy Carter was right when he argued that the nation could not shirk its duty to promote human rights just because of its own imperfections.

In the last few decades of the twentieth century diplomatic historians increasingly turned their attention to the study of ideology. Previously scholars had largely ignored ideology, choosing instead to focus upon economic or political interests in their explanations. More and more, however, historians found explanations centered on economic imperatives and geopolitical calculations insufficient, even anemic, and many began drawing on new approaches borrowed from other disciplines. The work of the anthropologist Clifford Geertz, in particular, has proven influential among historians and social scientists, offering a powerful tool for understanding the content of ideology and for uncovering its role in policymaking. Geertz’s conception of ideology as part of the context within which social interactions unfold has played a significant role in the renewed interest in how ideology influences foreign policy. A rich literature has developed around this subject. Nevertheless, scholars of American foreign policy still disagree sharply over the importance of ideology in the policymaking process and precisely how it determines outcomes. Even those who emphasize the primacy of ideology in shaping policy concede it is an elusive concept. In particular, at the level of specific policy decisions—and foreign relations historians in the United States have tended overwhelmingly to focus their attention on policymaking—ideology has a way of disappearing. Moreover, little consensus exists over theoretical issues such as definition.

Nevertheless, scholars of American foreign policy still disagree sharply over the importance of ideology in the policymaking process and precisely how it determines outcomes. Even those who emphasize the primacy of ideology in shaping policy concede it is an elusive concept. In particular, at the level of specific policy decisions—and foreign relations historians in the United States have tended overwhelmingly to focus their attention on policymaking—ideology has a way of disappearing. Moreover, little consensus exists over theoretical issues such as definition.

Nowhere has the debate been more intense than among scholars of the Cold War. This dynamic in part results from the intense attention that diplomatic historians have devoted to the superpower conflict—a quick glance through a half dozen back issues of the journal Diplomatic History makes clear just how overrepresented the post-1945 period has been. But the nature of the Soviet-American rivalry has also forced scholars to confront the issue of ideology, because both superpowers used strongly ideological rhetoric during the period. Did policymakers during the Cold War believe the ideological claims they made about the world in their public statements, and shape policies accordingly? Or did ideology represent an instrument of politics used to win over their publics and serve as a kind of ex post facto justification for decisions reached on other grounds? Despite the lack of consensus, the intense and ongoing debate over the Cold War highlights both the challenges and the importance of examining ideology.

WHAT IS IDEOLOGY?

According to Webster’s Tenth New Collegiate Dictionary, “ideology” is “visionary theorizing.” Alternatively, it is “a systematic body of concepts especially about human life or culture,” or “a manner or the content of thinking characteristic of an individual, group, or culture.” Malcolm Hamilton, in his article “The Elements of the Concept of Ideology,” offers a more scholarly formulation, writing that ideology is “a system of collectively held normative and reputedly factual ideas and beliefs advocating and/or justifying a particular pattern of political and/or economic relationships, arrangements, and conduct.” The historian Michael Hunt, meanwhile, views ideology in more specific terms as performing a particular function: it is “an interrelated set of convictions or assumptions that reduces the complexities of a particular slice of reality to easily comprehensible terms and suggests appropriate ways of dealing with that reality.” These are just a few examples of scholars’ many efforts to define ideology.

Expanding upon these three examples, however, we may construct a meaningful definition. It might read as follows: Ideology is a shared belief system that may serve at once to motivate and to
justify. It generally asserts normative values and includes causative beliefs. How do things happen? What does it all mean? An ideology may be utopian and progressive or protective of the status quo. It offers a way in which to order the world, defining enemies and allies, dangers and opportunities, us and them. Ideologies are formal, structured, and involve their own particular logic, often appearing in the guise of science or objective knowledge. Ideology is implicated in collective action, as criticism, goad, explanation, or promise. It is represented in symbols and beliefs held by a community and is publicly expressed. Ideology is at once philosophy, science, religion, and imagination.

ANTECEDENTS

The concept of ideology is generally considered to date from the early nineteenth century, when French theorists, the idéologues, sought through a science of ideas to discover truth and dissolve illusion. For the idéologues, ideology represented a neutral, scientific term. It soon, however, took on a more negative and even pejorative connotation. (The contemporary term “ideologue” derives from this history.) The nineteenth-century reaction against the French Revolution, which for conservatives represented Enlightenment rationalism taken to dangerous extremes, struck the first blow to ideology’s reputation. But it was the work of a nineteenth-century revolutionary that truly sundered ideology from its rationalist beginnings.

For Karl Marx ideology had more to do with illusion than truth. In his best-known works, such as Capital, the German philosopher and revolutionary provides surprisingly little explanation of either the role or the nature of ideology. Yet Marx has had a lasting influence on the understanding of ideology. Marxist theory finds the determinants of social reality in material factors and especially in economic structures. Marx argued that human society was passing through a series of historical periods or stages. A different form of economic organization—feudalism, capitalism, and eventually communism—each with its own dominant class defined the various stages. And this is where ideology comes in: For Marx ideology served the interests of the dominant class, whether kings or merchants. Ideology acted as a camera obscura, to use one of his many metaphors for the concept, providing individuals with a distorted view of reality. The view through the camera obscura concealed the realities of class conflict that define social relationships. It created the alienation of workers in capitalist society and slowed the inexorable revolutionary progress toward the end of history, the communist utopia. Only Marxist theory, which offered a true vision of history, was free from ideological distortion.

Marx’s views proved enduring. Although subsequent theorists further developed his ideas the outlines of his view remained largely unchanged, and ideology continued well into the twentieth century to be understood as an instrument to justify power. Lenin represents perhaps the most significant and influential of Marx’s successors. To Marxist theory Lenin added a revolutionary caste of intellectuals who could provide an ideology for the working class. These revolutionary intellectuals exposed the economic and social realities obscured by the ideology of the dominant class, thereby intervening in the progress of history. In Leninist theory revolution became not just inevitable but also intentional. Ideology took on a more conspiratorial aspect, since now it could be created and manipulated. The revolution of 1917 in Russia, engineered in part by Lenin’s Bolsheviks, seemed to attest to the connection between ideology and revolutionary upheaval.

Marxist ideas, however, came under challenge in the early decades of the century by sociologists such as Karl Mannheim and Max Weber, who sought a more objective understanding of the term. Mannheim, for one, understood ideology as a worldview, or Weltanschauung, shared by a particular social group. For Mannheim, Marxism represented just one example of an ideology. But common usage still largely followed the dictates of Marxist theory: ideology was distorting and irrational, an instrument of power. Max Lerner, writing in the 1930s, declared that ideas were weapons. Most Americans shared this view, and influenced by the events of 1917 and the experience of World War II, identified ideology with totalitarianism. The particulars of Marxist-Leninism and the excesses of Nazi Germany linked ideology with the enemies of American ideals. It was something others—like Hitler or Stalin—had. Students of totalitarianism such as Hannah Arendt reinforced these views. In her influential The Origins of Totalitarianism (1951), Arendt wrote that totalitarian states had introduced into international affairs a new and dangerous dynamic. To these states she attributed a neglect of national interests, a contempt for utili-
tarian motives, and an unswerving faith in an ideological fictitious world. Terror and ideology became inseparable in her interpretation. Yet at the same time, amidst the explicitly ideological rhetoric of the Cold War, many American observers remained curiously blind to the importance of ideology in American society.

The work of realist writers such as George F. Kennan and Hans Morgenthau, however, challenged the notion that American foreign policy remained devoid of ideology. The “realists,” as they came to be known, emphasized the role of political economy in international affairs. In the early 1950s, for these writers, ideology acted as a cover for the “real” interests that drove foreign policy. In Morgenthau’s 1948 *Politics Among Nations*, the struggle for power that defined international politics wore an ideological guise. This disguise might prove impenetrable to even the policymaker himself. For realists like Morgenthau ideology holds the danger of distraction and delusion while at the same time serving as justification and cover. Whereas in Marxist theory ideology provided a camera obscura image of class interests, for these writers state interests represented the “reality” that ideology distorted. The idea of ideology as obscuring power politics and “real” interests appeared in Kennan’s writing explicitly tied to American foreign policy. In *American Diplomacy*, Kennan described American foreign policy in the twentieth century as woven with “the red skein” of legalistic moralism. Kennan argued that legalistic-moralistic tendencies had long marred American diplomacy and called on policymakers to remove their ideological blinders and pursue a policy based upon calculations of interest. Kennan never explicitly labeled this moralistic-legalistic “approach” as ideology. Yet the analogy remained clear.

Beginning in the 1960s revisionist historians and New Left critics such as William Appleman Williams further developed the idea of ideology as at once driving and distorting American policy. For Williams, the problem with American foreign policy lay not in its moralism. Rather, drawing on the Marxist link between ideology and political economy, Williams in his 1959 *The Tragedy of American Diplomacy* discovered the “open door.” He defined open door ideology as a belief that American prosperity and security depended upon an informal empire of markets around the globe. Market capitalism underlay this ideology, of course, and Williams argued that it had served only to lead American policymakers astray. In his revised 1972 edition of *Tragedy*, he wrote that Vietnam offered a clear example. Williams described the war in Vietnam as a disaster born of efforts to extend the reach of America’s informal empire abroad. It represented one more incident in a history of “blustering and self-righteous crusades.” In the context of Vietnam, the realists and the New Left agreed on this point, if little else: American ideology served to obscure and distort American interests, drawing the United States into an endless, and hopeless, crusade against communism. Ideology thus stood reaffirmed as a corrosive blight rather than a creative force. Williams’s take on ideology and foreign policy proved influential among historians and shaped scholarship during the 1960s and 1970s. The Marxist connection between political economy and ideology along with the conception of ideology as distortion remained alive and well.

But in the field of anthropology, Clifford Geertz was turning away from these ideas. No longer should ideology carry the negative baggage of distortion and concealment traditionally loaded upon it, he argued. Beginning in the 1970s Geertz began to separate it from the role of maintaining power relationships. Instead the anthropologist redefined ideology as an integrated and coherent system of symbols, values, and beliefs. Although still at times the province of a dominant class or group and able to act in the context of power, ideology takes on a broader meaning in Geertz’s interpretation. Rather than obscuring social relationships, ideology both formulates and communicates social reality. Geertz’s understanding of ideology depended upon his conception of culture, which offers a context within which events can be “thickly” described and which is embodied in public symbols. Within the context of culture, ideology provides a necessary symbol system to make sense of the world, especially significant in times of crisis or rapid change. And here is a crucial distinction between Geertz’s understanding of ideology and Mannheim’s Weltanschauung: For Geertz, ideology is publicly expressed and can be found in the rituals and symbols of a society, not just in the heads of individuals. Thus for the student of culture ideology offers an entrée into the ways in which societies understand their collective experiences, daily realities, and identities. Through the lens of ideology one can read the truth of a culture and society.
Subsequently, Michael Hunt extended the insights of Clifford Geertz to the study of American foreign policy. And for many in the field, Hunt's book proved a revelation. In *U.S. Ideology and Foreign Policy*, Hunt argues that three main ideas constitute American ideology: the promise of national greatness, a hierarchy of race, and a fear of social revolution. American ideology entwined the fate of liberty at home and abroad with a sense of mission and a belief in America as an agent of progress. The efforts of Woodrow Wilson in 1918 to secure acceptance of his Fourteen Points provide a case in point. In Hunt's view Wilson sought a leading international role for the United States, promoting liberty abroad and ensuring Anglo-Saxon cultural supremacy. Like the critics of the 1960s and 1970s, Hunt finds that ideology had largely led Americans astray. Significantly, however, it was the details of the ideology Americans had adopted rather than ideology in itself that had caused all the trouble. By changing the symbols and language of American foreign policy, Hunt offers the possibility of altering its substance.

Other scholars working across disciplinary lines of sociology, political science, and history have similarly turned their attention to the close study and interpretation of ideology and culture. Drawing on the work of French theorists such as Michel Foucault and Jacques Derrida, they examine the language used by policymakers and analyze the meanings, or "genealogies," of the very words that compose policy. By placing language at the center of social reality, the "linguistic turn" reaffirms ideology's importance. For postmodernists, language constitutes reality; that is, we cannot understand the world around us outside of the words that we use to describe it. For these theorists language serves to replicate and reinforce power relationships much in the way that ideology had in Marxist theory. Postmodernist scholars of the Cold War have explored the meaning of national security and the images of contagion and disease that were often used in the context of Cold War foreign policy. Others, like David Campbell, have examined closely the ways in which foreign policy and the language used to describe it reinforce identity and serve to define a state. In *Writing Security*, Campbell argues that the United States represents an imagined community par excellence, which relies on the language and metaphors of its foreign policy to affirm its existence. For these scholars, the ideas and the language are the reality of foreign policy.

**HOW DOES IDEOLOGY CAUSE POLICY?**

The renewed interest in ideology and the demand by scholars like Geertz that social scientists and historians must take it seriously has prompted a crucial question: How does ideology cause foreign policy? In Geertz's work this question was intentionally evaded. In his view ideology could not be a cause of action. Ideology is a part of culture and as such acts as the context of, and provides the language and symbols for, social action. Postmodernist theorists have proven similarly uninterested in traditional questions about the causes of the phenomena they study. But for historians, the question of causes, of how things happen, is central to their project. Critics of Hunt's work have raised just this question. How, for example, did the American belief in a hierarchy of race influence particular decisions? Neither have political scientists proved willing to abandon the question of causes. Although theorists of foreign policy increasingly accept that ideas and ideology, not just interests, matter in foreign policy, for many political scientists and historians, ideology needs a "causal mechanism"—a way to act on policy—in order to be useful in explaining events.

This remains a sharply contested issue. Some scholars have focused on institutions and groups of policymakers, arguing that over time these take on a shared culture and world view that influences policy. Others have taken a biographical approach, searching through personal papers in an effort to uncover the beliefs and cultural heritage of individual policymakers. The work of the theorist Walter Carlsnaes suggests one answer to the problem of causation. Like Geertz, Carlsnaes views ideology as a contextual variable in decision making. In *Ideology and Foreign Policy*, Carlsnaes argues that ideology does not cause foreign policy; the decisions of statesmen do. Yet those decisions are made in a particular context, in which ideology is significant. Policymakers react to a particular situation and draw on ideological and cultural resources to make their decisions. While ideology does not intervene in international politics directly, it thus remains a significant determinant of policy by influencing the participants.

This formulation suggests an important pair of insights: Foreign policy cannot be understood in terms of ideology alone, but neither can ideology be ignored. Policymakers struggle for power and respond to threats and opportunities just as realists like Morgenthau have long held. But ide-
ology provides a context—open to analysis in the way of Geertz—that serves to condition those responses and shape the particulars of decision making. The sociologist Max Weber, in his 1913 essay “The Social Psychology of the World’s Religions,” aptly envisioned ideas as determining the track along which action is pushed by the dynamic of interest. Ideas and interest are separate yet entwined. Interests come out of the context in which policymakers operate and are revealed in the language and the form of their decisions. In this way ideology, despite not serving as a direct cause of policy, remains a significant part of foreign policy.

**IDEOLOGY AND AMERICAN FOREIGN POLICY**

Four themes in particular form the frame for American foreign policy during its first hundred years: independence, territorial expansion, belief in a national destiny, and commerce. Throughout, ideological visions combined with a hunger for land and territory, a healthy respect for European power, commercial interests, and fears for American security. From the vantage point of the present, American foreign policy during the eighteenth and nineteenth centuries appears relatively inactive and isolationist. Compared with the global reach of American foreign policy during the Cold War and after, the Monroe Doctrine, for example, seems a small thing. Yet the experiences of the early republic contributed lasting pieces to the ideological perspective from which Americans came to view the world in the twentieth century and beyond.

The history of American foreign policy begins with the assertion of independence. One historian, Bradford Perkins, has characterized the American Revolution as “an act of isolation.” Although the colonial relationship with Britain was soon severed by the Treaty of Paris (1783), the theme of independence reoccurred throughout the foreign policy of the early Republic. Americans envisioned a New World free from what they saw as the corrupting influences of the old. John Quincy Adams, for one, articulated a “Doctrine of Two Spheres,” dividing the Old World and the new. And George Washington famously warned in his Farewell Address in 1796 against “entangling alliances” with Europe.

Perhaps the most significant expression of new world separatism came in the Monroe Doctrine of December 1823. The Monroe Doctrine had two main elements. First, President James Monroe asserted that the Americas were “not to be considered as subjects for future colonization by any European powers.” Although the United States did not propose to challenge existing colonial territories, it pledged to resist any further extension of European power into the Western Hemisphere. The second aspect of the Monroe Doctrine asserted U.S. opposition to European intervention in New World conflicts. The president declared that his government would view any European effort to intervene in Latin American affairs as “the manifestation of an unfriendly disposition toward the United States.” Monroe set up his country as the protector of the New World, though he had little power as yet to back up his claims. The Monroe Doctrine was nonetheless of lasting significance: As Bradford Perkins has written, the 1823 statement amounted to a “diplomatic declaration of independence.”

The great powers of Europe, especially Britain, France, and Spain, did not acquiesce all at once to this division of the world. Following the war for independence from the British empire, the United States spent the early years of the nineteenth century in the Quasi-War with France after refusing to join Napoleon’s war against Britain. Then, after an embargo on both British and French trade failed, the republic found itself again at war with Britain. The United States fought the War of 1812 to protect neutral trading rights, but most contemporaries viewed it as a second war for independence. The Treaty of Ghent (1814), which ended the war, changed little, but it did ratify American independence from Britain. Although Europeans generally denied the legitimacy of the Monroe Doctrine, characterizing it as a statement of ambition rather than reality, none of the great powers openly challenged it, allowing Americans to believe themselves successful. Throughout the nineteenth century European preoccupations such as the Crimean War (1854–1856) left Americans largely to their own devices, encouraging the illusion of isolation from European conflicts and a belief in a true separation of the Old World from the new.

A second theme of early foreign policy was a belief in American destiny. Few among the early generation of Americans questioned that their new nation was meant for greatness. In part this belief came from the Puritan heritage. The United States represented a “city on a hill” that God had chosen for a special destiny and mission in the
world. This mission was understood over time in different ways, but the survival of America’s republican government remained central. Early Americans believed that republican government was fragile, easily corrupted into tyranny from above or anarchy from below. After all, the republican experiments of the past had ended in failure. Moreover, the French Revolution raised significant questions for Americans about whether republican government could succeed elsewhere in the world. The excesses of the French Revolution, in particular the Terror (1793–1794) and the eventual rise of Napoleon as emperor (1804), reinforced a sense of exceptionalism and superiority in the American mind. This sense of superiority also had a racial aspect. American destiny was an Anglo-Saxon destiny. As Hunt explains, belief in racial hierarchy was part and parcel of American ideology.

The mixture of mission and race played out in a third theme of early foreign policy: expansion. For nineteenth-century Americans geography was destiny. To the west lay an empty continent, and expansion was nothing less than inevitable. For Americans at the time the same divine providence that had guided the founding seemed to sanction a right to expansion. In the 1840s the writer John O’Sullivan gave name to this impulse: manifest destiny. O’Sullivan believed in the inevitability of American greatness and the necessity of the American example for the world. Americans must “carry the glad tidings of peace and good will where myriads now endure an existence scarcely more enviable than that of the beast of the field,” he wrote. The United States had a mission “to overspread the continent allotted by Providence for the free development of our yearly multiplying millions.” The new nation would make “manifest” the virtues of freedom and Anglo-Saxon civilization. As the historian Anders Stephanson explains, manifest destiny served as a legitimizing myth of empire. Manifest destiny helped reconcile the national mythology of exceptionalism and virtue with ambition and acquisitiveness. Americans thus understood their territorial expansion in a particularly American way, drawing on ideas deeply embedded in their cultural heritage and self-identity.

And the United States quickly overspread the continent. Thomas Jefferson’s Louisiana Purchase (1803) marked the first major expansion, extending the boundaries of the United States to the Mississippi River. Subsequently, John Quincy Adams became a key architect of American expansion, negotiating the 1819 Transcontinental Treaty with Spain, which extended American claims all the way to the Pacific. These claims did not go entirely unchallenged, as the British sought to retain their foothold in the Pacific Northwest and Mexico claimed significant portions of the Southwest. Moreover the issue of slavery complicated considerably the process of admitting new states into the union. And of course the continent was not empty: The Cherokee and Iroquois among others tried desperately to keep their ancestral lands. But with a combination of war and treaty the United States managed to secure hold over much of the continent by mid-century. Racial attitudes of superiority helped rationalize the bloody and dangerous work of subduing the native populations, as did the ideology of destiny and divine mission. At the same time, race paradoxically limited American expansion to the south. During the Mexican-American War (1846–1848), President James K. Polk turned away from conquering the whole of Mexico, believing that Latin Americans were not ready for republican government. This belief in Latin American inferiority proved lasting, though ambivalence toward spreading democracy did not.

The final ingredient of early foreign policy was commerce. Revisionist historians such as William Appleman Williams argue that the search for markets has driven American foreign policy from the beginning. Commerce and efforts to protect American trade in particular have always been an element of foreign policy. Americans have long shown a tendency to assert universalistic claims and champion neutral rights that serve American interests. The rebellion against Britain was in part over trading privileges. Even more so was the War of 1812. There were territorial issues and domestic political positions at stake in the War of 1812, but maritime rights were central to the American grievance with Britain. The United States opposed the British efforts to blockade France by decree, known as a “paper blockade,” and demanded that Britain recognize the principle of “free ships free goods.” Goods transported by neutral American shipping should be immune from seizure by British naval forces and American seamen free from impressment into the British navy; argued the Madison administration. The War of 1812 did not resolve these issues, though the principles of free trade and neutral shipping won some protection under international law in subsequent decades.
At the end of the nineteenth century, Secretary of State John Hay passed the Open Door Notes to the other great powers. Hay hoped to establish the principle of free trade and open markets. The subject was the China trade, but the principle involved transcended the particulars. Much as the Monroe Doctrine expressed a long-held belief in the separation of the Old and New Worlds, the open door notes signified the importance of trade and commerce to American policymakers. Williams has argued that the open door represents the keystone of American foreign policy. Americans have throughout their history sought to secure global markets, an open door, for American goods. To Williams and other revisionist scholars, the impetus of the open door has made for an inherently expansionist U.S. policy that has in effect created an informal empire under the guise of asserting neutral rights. Revisionists exaggerate, perhaps, the dominance, the power of the open door, but trade and commerce nonetheless have remained central elements of the story.

Until the end of the nineteenth century American ideology had little influence beyond its borders. The mythology of the founding and the other tenets of American identity served to reinforce unity at home. Most Americans perceived the United States as a nation apart and clung to isolationist attitudes. But growing American power and widening commercial and political interests meant a turn to a more activist foreign policy beginning in the early years of the twentieth century. The first president of the new century, Theodore Roosevelt, proved an able champion of American power, sending his new navy around the world. Roosevelt also involved himself in Old World diplomacy, winning a Nobel Peace Prize for his role in negotiating an end to the Russo-Japanese War (1904–1905). Events in the Old World soon ensured that Roosevelt’s successors would see little alternative but to continue the project of asserting American power.

World War I (1914–1918) and the 1917 Bolshevik Revolution in Russia stand together as the defining events of the twentieth century. World War I brought to an end the Habsburg and Turkish empires, opening the question of nationalism and self-determination in eastern and central Europe. The Bolshevik Revolution, meanwhile, introduced a new ideology to the world: Marxist-Leninism. The conflicts created by the combination of declining empires, unleashed nationalisms, and new ideologies proved lasting, shaping events for the rest of the century. President Woodrow Wilson, who served from 1912 to 1920, proved a pivotal figure who redefined American traditions to meet the new circumstances of the twentieth century. The growing power of nationalism, the ideological challenge of Marxist-Leninism, and the revolutions set loose by retreating empires: to these challenges Wilson brought a distinctly American response.

Wilson has remained a controversial figure. Scholars have variously seen him as a starry-eyed idealist and as a wise statesman who pursued a kind of enlightened realism. An idealist Wilson certainly was. The president believed in the perfectibility of man and his institutions and that extending democracy could make for a more peaceful world. He sought to channel nationalism into democratic direction and find an alternative to the political arrangements of the past, in particular the secret treaties and multinational empires he believed had brought about the Great War. He hoped the orderly legal arrangements of the League of Nations would prevent conflict while at the same time protect traditional American interests in free trade and neutrality.

With a liberal’s fear of radicalism Wilson intervened in the Mexican revolution (1910–1915) to “teach Mexicans to elect good men.” With equal distaste for conservatism he saw little reason to regret the breakup of the multinational Habsburg empire in central and eastern Europe. And with a traditional American ambivalence toward social change he sought to turn back revolution in Russia, fearing the challenge to property rights Marxist-Leninism seemed to represent and the instability the revolution threatened. The president believed in democracy. But he also saw spreading democracy abroad as a way to ensure the American way of life at home. In this he abandoned his predecessors’ pessimism about the possibilities for republican government elsewhere. The United States should not only serve as an example, but also actively promote liberal values abroad. In Wilson, moralism, ideology, and interest entwined in an activist, universalist liberalism. That Wilson’s vision ran aground against the radicalism of revolution, the impossibility of intervention on behalf of self-determination, and the institutionalized rivalries of the European great powers in no way lessened its lasting influence.

Yet despite the universalist implications of the Wilsonian vision, the United States in the interwar period limited its involvement in world affairs, refusing to join the League of Nations. This is not to say that the U.S. withdrew entirely
from the world during the 1920s and 1930s. It participated in naval conferences with the other great powers and tangled with Japan in the Pacific, but not with the kind of far-reaching universalist claims and hopes of 1918. For all the importance Wilsonian ideology seemed posed to have in shaping American foreign policy in the aftermath of World War I, it was rivaled by isolationism. Prosperity at home took precedence over idealism abroad, particularly after the onset of the Great Depression in 1929.

But this aloofness from the world could not last. The 1933 Nazi seizure of power in Germany meant little to most Americans at the time, but its effects soon rippled throughout the international system. After the invasion of Poland in 1939 the United States was not entirely uninvolved in World War II but proved able to avoid direct intervention. Instead President Franklin D. Roosevelt made his country an arsenal for democracy against Germany and its allies. After Japanese pilots bombarded Pearl Harbor on 7 December 1941, however, events again drew the United States into a pivotal role in world affairs, and it faced the challenge of reconciling its traditions and self-image with the ways of the world.

Although Wilsonianism was held responsible by the 1940s for the failed peace settlement of Versailles, it still exerted a powerful hold on the American imagination. The bipartisan support for the United Nations, the new collective security organization proposed in 1945, and Roosevelt’s wartime rhetoric testified to the continued power of Wilsonian ideals. But against these hopes the post–World War II peace felt fragile, in part as a result of the new vulnerability that technology imposed and Pearl Harbor symbolized. The lessons of history hard learned at Munich and Versailles combined with old beliefs in American mission and exceptionalism as policymakers of the 1940s wrestled with the dilemmas of the postwar world. It soon became clear, even as World War II peace felt fragile, that chief among these dilemmas was the reality of Soviet power. Within two years of the end of the war, a unique kind of conflict, soon dubbed the Cold War, was on. America’s new vulnerability had an agent, Soviet communism, and a panacea, the strategy of containment.

THE COLD WAR

Traditional scholarship on the Cold War assigned a central but sharply circumscribed role to ideology. The writers of the 1950s drew on the official rationales that the Truman administration had used to explain the nature of the Cold War and the necessity for the American Cold War policy of containment. This literature portrayed the Soviets as bent on expansion, driven by a combination of traditional interests and Marxist-Leninist ideology. The United States in response acted prudently and pragmatically to defend its interests against this obvious security threat. This view did not go unchallenged. Although initially an advocate of containing the Soviet Union, George Kennan soon joined another realist critic, Walter Lippmann, and turned against his creation. Kennan argued that the Truman Doctrine overcommitted the United States by defining American interests in ideological and expansive terms. For Kennan and Lippmann both, ideology influenced not only Soviet but also American policymakers. Beginning in the 1960s revisionist scholars turned traditional scholarship on its head, arguing that American, not Soviet, policy was ideological, and that the Soviet actions in the immediate postwar period were motivated by legitimate security needs.

In reaction to the sharp disjunction between revisionist and traditional scholarship, historians working in the 1970s and 1980s set aside ideology altogether and redefined the Cold War as a traditional conflict of interests between two great powers. This conflict came as the inevitable outgrowth of World War II and particularly the power vacuum in central Europe resulting from the destruction of Germany. Louis Halle in The Cold War as History famously describes the two superpowers as scorpions in a bottle. They could not help but come into conflict. Writing very much in this tradition, Melvyn Leffler argues in his award-winning account of the Truman administration, A Preponderance of Power, that American policymakers were driven by national security considerations and sought to increase American power in the postwar world. In A Preponderance of Power, ideology has little to do with American policy. Instead, American policymakers acted out of fear for American security. Truman and his advisers were prudent in reacting to the possibility of Soviet aggression, yet they were foolish to seek so exaggerated a security for the United States. Although the wisdom of American policymakers and the question of Soviet intentions remained a subject of scholarly disagreement, ideology seemed to fall out of the picture. For a time, there the debate rested.
But in the 1990s newly available archival sources from the Soviet side of the conflict reopened the question of the relationship between ideology and the Cold War. Writing in 1997, John Lewis Gaddis declared in *We Now Know* that the new Cold War history must of necessity concern itself with ideology. Similarly, Martin Malia in *The Soviet Tragedy*, an account of Soviet foreign policy, places ideology at the center of the conflict between East and West and argues that the 1917 Bolshevik Revolution virtually guaranteed the Cold War that followed. The Russian scholars Vladislav Zubok and Constantine Pleshakov also emphasize ideology in their interpretation of Cold War Soviet foreign policy, though in their account Marxist-Leninism and self-interest combined to shape Stalin's decision making.

American ideology has received less attention, but the arguments of this new scholarship implied a role for American ideology as well. Two scholars in particular, Odd Arne Westad and Anders Stephanson, emphasize the importance of American ideology during the Cold War. As Westad states in his 2000 Bernath Lecture, “It was to a great extent American ideas and their influence that made the Soviet-American conflict into a Cold War.” Meanwhile, Stephanson finds in Cold War documents a particularly American language of politics built around the opposition between “freedom” and “slavery.” The kind of ideological absolutism embodied in Patrick Henry's famous “Give me liberty or give me death” lived on in America's conceptions of the Cold War world. Ideology thus seemed to have returned to a central place in the analysis of the Cold War.

Amidst this rediscovery of ideology, however, Marc Trachtenberg, in an important 1999 book, *A Constructed Peace*, argues precisely the opposite: the Cold War in fact had little to do with ideology at all. In Trachtenberg's view the central problem of the postwar world was power, specifically German power. Soviet and American leaders in the postwar period understood this reality, and far from being influenced by ideology pursued their interests with cool calculation. This is not to say that the superpowers did not distrust one another, or that there were not very real conflicts of interest between them. But the conflicts were precisely that: of interest, not of ideology. Trachtenberg argues that the Cold War began as a result of Soviet actions in Iran in April 1946, actions that American policymakers perceived as signaling expansive intentions. In response the United States tightened its hold on western Germany, and the Cold War rivalry ensued. The crucial question of the Cold War continued to be the problem of Germany, although much of the actual conflict took place on the periphery. Once the superpowers reached a settlement on Germany, which Trachtenberg argues occurred in 1963, the Cold War was for all intents and purposes over.

The gap between those who write in terms of national security and those who emphasize ideology remains wide. The relationship between ideology and national security is often portrayed as an either-or proposition: either ideology or national interest motivates policymaking. Ideology tends to be associated with irrational or particularly aggressive actions. And in fact the literature has tended to portray the more aggressive side of the Cold War rivalry as the more ideological. For traditionalists this meant the Soviet leadership acted according to the tenets of Marxist-Leninism, while for revisionists it was American policy that had fallen victim to the siren song of ideology. In this respect the literature treats ideology as a kind of pathology of policymaking. Moreover, national security is often treated as a given, a kind of objective truth that exists unchanging across time and space. By this logic leaders on all sides of the Cold War conflict understood the risks and opportunities they faced in much the same way. Each calculated his (and they were all men) options and reactions carefully and rationally and shared similar goals of ensuring territorial security and increasing state power. Calculations complete, policymakers reached into the same toolbox for the means to achieve their goals. Perhaps they did.

But as Tony Smith asserts in his study of twentieth-century American foreign policy, *America’s Mission*, “security definitions arise out of particular domestically engendered perceptions of foreign affairs.” Ideology acts to define the boundaries of legitimate action and to define what is dangerous and what is not. It is thus complicit in the process of creating interests and defining national security, because ideology provides the context within which policy decisions are made. As a result we must take seriously historical experience, the language policymakers use, and the very different tools on which they rely to pursue their ends. Foreign policy decisions are rarely made in a vacuum, and domestic political debates influence the process. During the Cold War, and particularly in the United States, ideological context conditioned foreign policy outcomes. Ideology defined the issues at stake.
For Americans the issue at stake became the survival of freedom, and Soviet communism became the primary threat. This view did not come all at once. Although suspicious of Soviet intentions, to be sure, Truman and especially his secretary of state James Byrnes remained open to efforts at accommodation and compromise with the Soviet Union throughout 1945 and the early months of 1946. Meanwhile, officials like Secretary of the Navy James Forrestal and George Kennan, chargé d'affaires in Moscow, were raising the alarm, prompting debate within the administration over how to deal with the Soviets in the postwar world. In February 1946, Kennan telegraphed some eight thousand words from his post at the embassy in Moscow. His Long Telegram offered one of the first interpretations of Soviet policy. Similar views were already floating around the corridors of Washington policymaking bureaucracies, but Kennan, as he would do several more times in the early Cold War, put American attitudes into articulate form.

Kennan described the Soviet Union as committed “fanatically” to the belief that there could be “no permanent modus vivendi” between East and West. In Kennan’s view the Kremlin’s perspective resulted from a combination of Marxist-Leninist ideology and a traditional and instinctive insecurity. Marxist-Leninist ideology and the closed society that limited contact with the outside world had a hypnotic effect on Soviet officials, leaving them unlikely and unable to question their assumptions about the West. Kennan argued that Soviet policy could not be changed by talk; it was “highly sensitive to the logic of force.” He warned that much depended upon the “health and vigor” of American society and urged his colleagues in Washington to have the “courage and self-confidence” to protect American traditions. “World communism is like a malignant parasite. . . . This is point at which domestic and foreign policies meet.”

The Long Telegram echoed earlier traditions of exceptionalism and mission, which likely in part explains its appeal to official Washington. Kennan’s analysis made the rounds (it appears in the personal papers of nearly every major figure in the Truman administration), and most agreed with its analysis. The Soviet Union represented a clear threat to American values and to freedom at home and abroad. The Kremlin sought to expand communist influence throughout the world, and it would not be deterred by negotiation. The American way of life increasingly appeared under siege to many of these officials. Soviet actions in eastern Europe, particularly in Bulgaria, Hungary, and Poland, as well as the April crisis in Iran, seemed only to confirm these fears. So too did the emergence of strong communist parties in France and Italy. At the same time, however, the crisis in Iran proved resolvable by diplomacy when Iran made a protest to the United Nations. Even better, the apparent Soviet acceptance of the UN’s decisions in the case suggested that the new organization was not doomed as many had feared. Moreover, in July 1946 the Paris Peace Conference began and by the end of the summer successfully concluded peace treaties with the Axis powers, though a German peace treaty and particularly the problem of reparations remained on the table. Despite the alarmist language of many administration officials in their private memos and growing public suspicion of Soviet intentions, the possibility of postwar settlement was not yet foreclosed.

But the limited diplomatic successes of the Council of Foreign Ministers and the Paris Peace Conference could not erase the growing fears of the threat Marxist-Leninism posed to American society and interests. A September 1946 report prepared by White House staffers Clark Clifford and George Elsey reveals that the perspective expressed by Kennan’s Long Telegram was taking hold throughout the administration. The Clifford-Elsey report expressed the opinion of its authors to be sure, but the two officials drew on documents prepared by all of the major policymaking institutions, and their views were thus informed by the combined wisdom of the Departments of State, War, Navy, and Commerce. The report placed the U.S.–Soviet relationship at the center of American foreign policy. It expressed no ambiguity about Soviet intentions: “Soviet leaders appear to be conducting their nation on a course of aggrandizement designed to lead to eventual world domination by the U.S.S.R.” This aim could not be turned aside by conventional diplomacy, and the authors borrowed Kennan’s interpretation that the Kremlin leadership believed in the impossibility of peaceful coexistence between Marxist-Leninism and capitalism. Like Kennan, Clifford and Elsey took Soviet rhetoric and ideology seriously. The pronouncements of Kremlin leaders such as Stalin and Vyacheslav Molotov represented the reality of Soviet policy. The United States must prepare itself for total war, the authors declared. Economic aid programs and an information policy (propaganda, like ideology,
was something the other side had) articulating the benefits of American society and the goals of U.S. policy should not be neglected. But the United States should never lose sight of Soviet preparations for eventual war with the “capitalistic powers,” preparations that represented a direct threat to American security. By autumn 1946 the language and content of the Clifford-Elsey report was emblematic of the emerging consensus held by official Washington.

The fate of Secretary of Commerce Henry Wallace signaled perhaps more than anything else the hardening of this new perspective. Wallace had long argued for negotiations with the Soviets, and in September 1946 he expressed his views publicly in a speech at Madison Square Garden. Wallace argued that the United States should work to allay Russian suspicions and distrust and recognize Soviet security needs in eastern Europe as legitimate. In retrospect there seems to be little in Wallace’s speech that is particularly radical. But his apparent support for a Soviet sphere of influence in eastern Europe set off a firestorm of controversy. The tone of the speech created a dissonant echo amidst the increasingly hard-line atmosphere of official Washington. An embarrassed President Truman, who had upon cursory reading endorsed Wallace's address, demanded the secretary's resignation. Arguments that the United States should attempt to resolve the diplomatic disputes that separated the superpowers and that the Soviets acted in eastern Europe out of legitimate security concerns slipped increasingly to the margins of mainstream opinion. Consensus about ideological conflict in the postwar world, the expansive tendencies of Soviet Union, and the necessity for a policy of containment was taking hold, and American policy evolved to match these views.

By the end of 1946 American officials increasingly turned away from negotiating with the Soviets. When Secretary of State James Byrnes returned from a December conference of foreign ministers meeting in Moscow, where he had attempted to conclude agreements on eastern Europe and international control of atomic energy, he faced sharp criticism. To American observers Stalin showed every sign of emulating Hitler in his efforts to expand Soviet power, his allegiance to ideology, and his willingness to break agreements. Both policymakers and the informed public drew on the analogy of the Munich Conference (1938), at which British Prime Minister Neville Chamberlain bargained away territory in Czechoslovakia in the hope that he could achieve peace for all time. Chamberlain failed. And the lesson Americans learned was that dictators could not be trusted, appeasement only fed greater ambition, and negotiations suggested weakness. It is striking how powerful in fact this analogy became and how often officials referred to it during the postwar period. The decision largely to renounce negotiation and the tools of traditional diplomacy held an appeal linked to the American heritage of exceptionalism and aloofness from the messiness and compromise of European politics. The failed diplomacy of 1939 fit neatly into the existing preconceptions and predisposition of American diplomacy. And the “lessons” of history seemed to lend legitimacy to the desire to contain Stalin’s Soviet Union and wait for it to fall victim to its own “internal contradictions.”

But containment meant more than a policy of waiting. Beginning in spring 1947 the United States turned ideas into action. In late February the British government notified the Department of State that the British would be forced for financial reasons to withdraw its support from Greece. In the midst of a civil war, Greece had become a site of a great power contest, lying as it did in a strategic corner of the Mediterranean. Anxious to prevent Soviet influence from taking hold in Greece, the Truman administration resolved to take action. The decision resulted from a combination of ideological and strategic interests: Greek geography rendered it significant from a strategic perspective. But American policymakers also feared the spread of communism into Greece and believed that from Greece the contagion would almost certainly spread to Italy and France. Greece offered a test.

It was a test that Harry Truman met with a commitment to defend freedom throughout the world. In a speech before both Houses of Congress on 12 March 1947, Truman asked Congress to fund economic and military aid to Greece and to neighboring Turkey. The president emphasized that the United States had a responsibility to protect freedom worldwide, declaring that “the free peoples of the world look to us for support in maintaining their freedoms.” Continued peace depended upon American leadership. Truman drew a close connection between poverty and totalitarianism and argued that the United States must provide economic and political support for freedom. The United States should stand on the side of self-determination—by intervention, if necessary. “I believe we must assist free peoples to work out their own destinies in their own way,”
the president told Congress. Implicit in Truman's statement, of course, was the belief that most of the world's peoples would choose a way of life compatible, if not identical, with that of the United States. A New York Times article declared that "the epoch of isolation and occasional intervention" was over. An "epoch of American responsibility" was just beginning. The American impulse to withdraw from the world, suggested by the decision to "contain" the Soviet Union, stood alongside the Wilsonian mission to spread democracy. The tension between these two impulses determined the nature of America's Cold War policies.

In part the ideological content of Truman's speech represented a tool of politics. Truman required congressional support to put his policy into action, and the administration needed to head off any perception that the U.S. decision to intervene in Greece represented an effort to shore up the British empire. Yet the ideological content went deeper than public rhetoric, since these were terms that had appeared in confidential government documents such as the Clifford-Elsey report throughout the preceding months. Officials within the administration thought in these terms themselves, and thus public rhetoric matched private perceptions. Subsequently, with the announcement of the Marshall Plan in June 1947, the United States added economic aid to Europe to its arsenal against the Soviet Union. Secretary of State George C. Marshall declared that the policy was not aimed at any particular country but instead against "hunger, poverty, desperation, and chaos." But to most observers, the goal was clear. A rebuilt western Europe tied to the United States by a flow of dollars and trade would offer a significant barrier to Soviet expansion. The parasite of communism preyed upon societies weakened by poverty and unstable institutions. The Marshall Plan offered an answer.

The following month in an article published in Foreign Affairs, George Kennan summarized the new consensus for the educated public. The Soviet Union holds within it the "seeds of its own destruction," he declared. Despite Kennan's claims to objectivity, his analysis of "The Sources of Soviet Conduct," as the article was entitled, revealed as much about the ideological content of American conduct as it explained about the Soviet Union. Kennan declared that "the political personality of Soviet power as we know it today is the product of ideology and circumstances." Marxist-Leninism provided the ideology, which together with geography, a history of invasion, and Stalin's personal paranoia resulted in dangerous and expansive tendencies. Kennan argued that Soviet ideology taught that the outside world was hostile and not to be trusted. Capitalism and socialism could not long coexist. Moreover, in Kennan's interpretation, the Soviet Union pictured itself as a center of socialist enlightenment adrift in a dark and misguided world. The logic of history was on its side and in the long run, revolution was inevitable. Here was a rival city on a hill.

To Kennan the challenge that Soviet communism posed to the United States offered a test of faith and an opportunity for reaffirmation. In the closing paragraph of the article he wrote that the Soviet challenge offered "a test of the overall worth of the United States as a nation among nations." Kennan believed that American virtue and strength at home translated into power to meet the Soviet threat abroad. By maintaining its free society the United States could best counter the appeal and the promise that Marxist-Leninism offered. The United States stood as a model of freedom for the world, an alternative to totalitarianism, and a shining example in a hostile world. He wrote that the United States should "offer gratitude to providence," which had chosen the United States for the great task of resisting the spread of Soviet communist oppression and protecting freedom at home and abroad. For history had "plainly intended" that the United States bear the burdens of moral and political leadership. The city on a hill must become the leader of the free world. Failing to arrest the spread of communism would lead to destruction and the end of freedom everywhere. Although Kennan came to be identified as the father of containment, he came to question the implications of his creation, criticizing American foreign policy as overly ideological in 1951 in American Diplomacy. Ironically, he failed to realize the degree to which his own worldview was shot through with "the red skein" of ideology.

Realist scholars like Marc Trachtenberg are correct to emphasize that American policymakers reacted to the perceived dangers and opportunities of particular situations. In this respect external conditions drove America's Cold War foreign policy. The problem of Germany, the occupation of Japan, and the future of Europe represented real dilemmas for policymakers. And the global political and economic instability of the immediate postwar period posed a potential danger to American security and prosperity. But American
policymakers’ interpretations of these threats and opportunities was influenced by American concerns about freedom, independence, exceptionalism, and democracy. For them the source of both economic and political instability came from the Soviet Union and in particular the nature of the Soviet state. Truman and his key advisers defined the Soviet Union in explicitly ideological terms. The threat was not the power of the Soviet state (in fact, most administration officials considered the Soviets the weaker of the two superpowers) so much as the appeal of Marxist-Leninist ideology and the promise of revolution that it held.

Contrast this with the perspective of the British Foreign Office, which in the early months of the postwar period retained its nineteenth-century concern with maintaining a balance among the main European powers and protecting their imperial holdings. For British policymakers, at least initially, the threat to postwar peace came from an unequal division of the spoils and an extension of Soviet power. This distinction between the worldviews of the Foreign Office in London and the Department of State in Washington highlights the role of ideology in providing the context for policy decision making. For realists ideology is an instrument of policy; it serves to rationalize and justify decisions already made. Yet as Stephanson explains in “Liberty or Death,” “an instrumental view of ideology as rhetorical means to strategic ends misses the question.” Why did policymakers choose the particular language they did and how did they come to “inhabit” it? While the power vacuums and risks of the postwar world may have provided the occasion for a more activist foreign policy, American ideology determined the form American intervention in the world would take, defined the nature of American national interests, and informed the decisions that issued from Washington. Ideological suspicion of communism reinforced distrust of Soviet intentions. Americans viewed all dictators as the same, and all compromise as appeasement. At the same time, these fears warred with traditional American ambivalence toward European affairs and intervention abroad. American Cold War policy grew out of these contradictions. Containment drew from the ideological foundations of liberalism, anticommunism, and American mission.

The superpower conflict soon stalemated in Europe. By the 1960s Soviet and American positions had hardened, and little change seemed likely. Moreover, the ideological rivalry seemed to ease, such that some commentators such as Walter Lippmann began to believe by the early 1960s that the Cold War might be ending. Yet despite signs of a willingness to coexist in Europe and to open the way to a more “normal” diplomatic relationship through arms control and the like, the Soviet-American rivalry continued unabated in the Third World. Throughout the postwar period instability and conflict infected the old colonial areas of Southeast Asia, the Middle East, Africa, and Latin America as the imperial powers retreated. Rapid social and economic change hit the newly created postcolonial states, and they became ripe for outside intervention. Here was a crucial arena of the Cold War conflict.

At times at the invitation of local elites and at times of their own decision, the two superpowers intervened throughout the Third World, playing a violent and risky game of dominos. And like Wilson in Mexico, American policymakers throughout the postwar period attempted to curb the radicalism of social change and to intervene on behalf of self-determination. Under the Cold War imperative of containing the spread of communism, they argued that the United States was spreading democracy abroad and acting on the side of right. Often, however, the United States supported very undemocratic regimes, such as those of Anastasio Somoza in Nicaragua and Carlos Castillo Armas in Guatemala. The effort to contain communism more often than not contradicted the lingering Wilsonian heritage. A deep ambivalence toward social change and revolution conflicted with the goal of spreading democracy abroad, particularly in societies long subject to colonial control. Thus, for every Alliance for Progress, the Kennedy administration’s economic development program for Latin America, there was a Somoza in Nicaragua or a Ngo Dinh Diem in South Vietnam.

Nowhere did the contradictions among American ideals and the demands of American interests explode so spectacularly as Vietnam. And like the scholarly debate over the Cold War, the literature on Vietnam is rich with disagreement. Two studies of the Johnson administration illustrate this disjunction clearly. Lloyd Gardner in Pay Any Price emphasizes what he sees as the powerful hold that liberal ideals had over President Johnson. For Gardner, Johnson’s intervention in Vietnam resulted from a deeply held belief in liberalism and an effort to promote American ideals abroad. A student of Williams, Gardner similarly finds tragedy amidst the ruins of American
policy. Johnson's efforts to transplant liberalism and promote economic development amidst social revolution in Vietnam could not but end in failure.

Fredrik Logevall, by contrast, finds that liberal ideology mattered relatively little in Johnson's decision making. The president, Logevall argues in Choosing War, certainly had a vision for the future of Vietnam, a future shaped along liberal principles. But the driving force in his decision making was not that vision but rather his fears for his domestic political as well as his personal credibility. In Logevall's account the president and his advisers were gloomy realists on Vietnam in the key months following the 1964 election. Many of them were pessimistic about the prospects for success in the war, and many privately questioned whether the outcome really mattered to U.S. security. Thus Johnson's liberal rhetoric and economic development programs provided the window dressing for what was in reality a cynical and self-serving use of American power.

CONCLUSION

The disparity between these two accounts highlights the complexity of ideology and the continued disagreement among scholars over its role in the policy process. Moreover, the experience of the United States in the Third World reveals clearly how difficult it is to understand the role of ideology and how ambiguous that role can be. How, for example, do we reconcile American ideology of liberalism with the support of dictators such as Somoza? Must we see ideology as little more than a cynical tool of justification? Or did American officials truly believe in the rhetoric they used? If they believed it, did it drive their decision making? The answer to these questions seems to be an unsatisfying “sometimes.” But that in itself is significant. “Sometimes” means that as scholars we must approach the empirical evidence with an open mind, willing to find ideology as a primary cause of decision making or as mostly irrelevant to the policy process. It seems reasonable to conclude that some periods of American history proved more ideological than others, and that some administrations were more influenced by it than others. Moreover, while ideology may always lurk in the background, it may be pushed aside by other considerations in the evolution of particular decisions.

In the context of the Cold War, an open-mindedness toward ideology seems especially important. The Cold War was not only a classic political power struggle, but neither was it a purely ideological conflict. The Cold War rivalry arose over the traditional problems of creating a stable postwar settlement and in particular finding a solution for the instability of central Europe. But the Cold War was also a rivalry between two states that each embraced a universalist ideology (Marxist-Leninism and liberal democracy, respectively), each made certain predictions about the future, and each held certain causative assumptions about the world. American foreign policy during the Cold War thus entwined ideology and interest. A close study of the period shows us the importance of ideology in foreign policy. To ignore ideology in the context of the Cold War is, in some respects, to miss the point.

At the same time, however, renewed scholarly interest in ideology and the continuing debate over its significance has revealed the difficulties the concept entails. For foreign relations historians, causality is a central concern. They want to zero in on why appeasement failed in the 1930s, or how the Cold War began, or why exactly the United States intervened in Vietnam. Finding the role of ideology in the context of these questions is quite a task. Little wonder that many have dismissed ideology altogether, and that even those who have embraced it have often done so with misgivings and qualifications. Yet despite these complexities, we should not too quickly consign ideology to the scholarly rubbish heap. As Geertz has pointed out, events unfold within the bounds of culture, which is open to interpretation. Thus, an awareness of the ideological context of particular decisions adds a layer of complexity and richness to our analysis. It allows us to understand why some policy options appeared more appealing than others, and why some received no attention at all.

Consider for a moment one final example. During the 1962 Cuban missile crisis, some among John F Kennedy's advisers argued that the president should authorize a surprise attack on Cuba in an effort to destroy the Soviet missiles. It would have been a dangerous move. Moreover, it is likely that practical considerations would have prevented the plan from progressing beyond the conference table. Yet in rejecting the idea, Kennedy cited none of these reasons. Instead the president referred to the Japanese attack on Pearl Harbor. At the time Franklin Roosevelt had called it a day that would live in infamy. For Kennedy, a surprise attack on Cuba did not fit his image of
the United States, and this policy option was quickly ruled out. To be sure, ideology did not determine the outcome of the missile crisis. But an examination of the ideological context of the decision offers us a greater degree of understanding of the Kennedy White House.

Immigration and immigration policy have been an integral part of the American polity since the early years of the American Republic. Until late in the nineteenth century it had been the aim of American policy, and thus its diplomacy, to facilitate the entrance of free immigrants. From the 1880s until World War II—an era of immigration restriction of increasing severity—the diplomacy of immigration was chiefly concerned with the consequences of keeping some people out and, after 1924, when Congress made the diplomatic establishment partially responsible for immigration selection and its control, with keeping some prospective immigrants out. Since 1945, after only seemingly minor changes in policy during World War II, and partly due to the shift in American foreign policy from quasi-isolation to a quest for global leadership and hegemony, immigration policy has become less and less restrictive. Cold War imperatives plus a growing tendency toward more egalitarian attitudes about ethnic and racial minorities contributed to a change in immigration policy.

Many foreigners clearly understood that there were certain ironies in these long-term changes. No one was more aware of this than the Chinese leader Deng Xiaoping. Visiting Washington in 1979 during a time when the United States was urging the Soviet Union to allow more Jews to emigrate, the Chinese leader, according to Jimmy Carter's memoirs, told the American president: "If you want me to release ten million Chinese to come to the United States I'd be glad to do that." Obviously, Deng was "pulling Carter's chain," but it is not clear from the text whether the Georgian realized that. Immigration was part of the raison d'être of the early Republic. One of the complaints in Thomas Jefferson's Declaration of Independence was that George III had "endeavoured to prevent the population of these States; for that purpose obstructing the Laws for Naturalization of Foreigners; refusing to pass others to encourage their migrations hither, and raising the conditions of new Appropriations of Lands." The Constitution, while not mentioning immigration directly, did instruct Congress "to establish an uniform Rule of Naturalization" (Article 1, Section 8) and provided that naturalized persons might hold any office under the Constitution save only President and Vice President. (Article 2, Section 1). The only other reference to migration referred obliquely to the African slave trade, providing that "the Migration or Importation of such Persons as any of the States now existing shall think proper to admit, shall not be prohibited by the Congress prior to the Year one thousand eight hundred and eight" (Article 1, Section 9).

In 1790 Congress passed the first naturalization act, limiting those eligible to "free white persons." This put the new nation on a collision course with Great Britain, which, although it had naturalization statutes of its own, often refused to recognize the switch of allegiance of its subjects. The question of the impressment of seamen was one of the issues that troubled Anglo-American relations from 1787, when the first of many American protests against impressment was made, until the end of the War of 1812. Foreign Secretary George Canning put the British case nicely when he declared that when British seamen "are employed in the private service of foreigners, they enter into engagements inconsistent with the duty of subjects. In such cases, the species of redress which the practice of all times has . . . sanctioned is that of taking those subjects at sea out of the service of such foreign individuals." Impressment, of course, became one of the issues that led to the War of 1812. After that the British recognized, in practice, the right of naturalization, but one of the ongoing tasks of American diplomatic officials has been trying to ensure that naturalized American citizens are recognized as such when they visit their former native lands. This has been particularly a problem for men of military age during time of war.
While barring the African slave trade at the earliest possible moment in 1808, immigration “policy” in the new nation universally welcomed free immigrants. American leaders understood that immigration was necessary to fill up their largely empty and expanding country and would have endorsed the nineteenth-century Argentine statesman Juan Bautista Alberdi’s maxim that “to govern is to populate.” Even Millard Fillmore, while running for president on the nativist American Party ticket in 1856, found it necessary to insist that he had “no hostility to foreigners” and “would open wide the gates and invite the oppressed of every land to our happy country, excluding only the pauper and the criminal.” Actually the gates were open, and Fillmore’s suggestion of restriction on economic grounds would not become law until 1882. As long as American immigration policy welcomed all free immigrants there were no policy issues for American diplomats to negotiate. Immigration first became a special subject for diplomatic negotiation during the long run-up to the Chinese Exclusion Act of 1882.

A few Chinese had come to the United States—chiefly to East Coast ports—in the late eighteenth century in connection with the China trade. After American missionaries were established in China, some Chinese, mostly young men, came to the eastern United States for education without raising any stir. But relatively large-scale Chinese immigration, mostly to California beginning with the gold rush of 1849, produced an anti-Chinese movement. Before this movement became a national concern, Secretary of State William H. Seward appointed a former Massachusetts congressman, Anson Burlingame, as minister to China in 1861. He was the first to reside in Beijing. A radical former free-soiler and antislavery orator, Burlingame supported Chinese desires for equal treatment by the Western powers. While still in Beijing, he resigned his post in late 1867 and accepted a commission as China’s first official envoy to the West. With an entourage that included two Chinese co-envoys and a large staff, he traveled to Britain, France, Germany, Russia, and the United States seeking modification of China’s unequal status. He was successful only in Washington. There he negotiated in 1868 what became known as the Burlingame Treaty—actually articles added to the Treaty of Tientsin (1858). The 1868 agreement, China’s first equal treaty, was ratified without controversy and contained the first immigration clause in any American treaty:

The United States and the Emperor of China cordially recognize the inherent and inalienable right of man to change his home and allegiance and also the mutual advantage of free migration and emigration . . . for the purposes of curiosity, of trade, or as permanent residents . . . but nothing contained herein shall be held to confer naturalization upon the citizens of the United States in China, nor upon the subjects of China in the United States.

The United States would never again recognize a universal “right to immigrate,” and by 1870 the anti-Chinese movement was becoming national. Spurred by economic distress in California and a few instances of Chinese being used as strikebreakers in Massachusetts, New Jersey, and Pennsylvania, anti-Chinese forces stemming largely from the labor movement made increasingly powerful demands for an end to Chinese immigration, usually blending their economic arguments with naked racism. That summer Congress was legislating the changes in the existing naturalization statute impelled by the end of slavery and the Fourteenth Amendment. Republican Senator Charles Sumner and a few other radicals wanted to make the new naturalization statute color blind, but the majority did not wish to extend that fundamental right to Chinese. The new statute amended the eligibility from “free white persons” to “white persons and to aliens of African nativity and persons of African descent.”

In 1876 Congress created a joint congressional committee to investigate Chinese immigration. It took testimony in the Palace Hotel in San Francisco just before and after that year’s presidential election. By that time both national party platforms had anti-Chinese planks. The Republican version was somewhat tentative, declaring it “the immediate duty of Congress to investigate the effects of the immigration and importation of Mongolians.” The out-of-power Democrats denounced “the policy which tolerates the revival of the coolie-trade in Mongolian women held for immoral purposes, and Mongolian men to perform servile labor.” The majority report of the joint congressional committee claimed that the Pacific Coast had to become “either American or Mongolian,” insisting that there was “not sufficient brain capacity in the Chinese race to furnish motive power for self-government” and that “there is no Aryan or European race which is not far superior to the Chinese.” The committee report urged the president to get the Burlingame Treaty modified and Congress to legislate against
“Asiatic immigration.” The report was presented to Congress while it was settling the election of 1876, so no immediate action was taken. After much debate the next Congress passed the so-called Fifteen Passenger bill, which barred any vessel from bringing in more than fifteen Chinese immigrants. The sticking point for many was the existing Burlingame Treaty: some wanted to override it completely while others wanted to wait until the treaty was revised. The bill also instructed the president to notify the Chinese that portions of the treaty were abrogated, which passage of the bill would have accomplished.

Rutherford B. Hayes responded with a reasoned veto message that accepted the desirability of stemming Chinese immigration. He argued that the Chinese manifested “all the traits of race, religion, manners, and customs, habitations, mode of life, segregation here, and the keeping up of the ties of their original home . . . [which] stamp them as strangers and sojourners, and not as incorporated elements of our national life.” But, he insisted, there was no emergency to justify unilateral abrogation of the treaty, which could have disastrous consequences for American merchants and missionaries in China. He promised that there would be a renegotiation of the treaty.

A somewhat protracted diplomatic renegotiation was completed by the end of 1880, and the new treaty was ratified and proclaimed in October 1881. It unilaterally gave the United States the right to “regulate, limit, or suspend” the “coming or residence” of Chinese laborers, but it allowed Chinese subjects “proceeding to the United States as teachers, students, merchants, or from curiosity, together with their body and household servants, and Chinese laborers now in the United States to go and come of their own free will and accord.”

In the spring of 1882, Congress passed a bill suspending the immigration of Chinese laborers for twenty years. President Chester A. Arthur vetoed it, arguing that while a permanent bar to Chinese labor might be eventually justified, prudence dictated a shorter initial term. Congress responded by repassing the bill but with a ten-year suspension, and Arthur signed it into law in May 1882. The law prohibited the entry of Chinese laborers—defined as “both skilled and unskilled laborers and Chinese employed in mining”—after 4 August 1882. It also provided that any Chinese who was in the country on 17 November 1880—the effective date of the Sino-American treaty—or had come between that date and 4 August 1882 had the right to leave and return. The law, as opposed to the treaty, did not spell out who was entitled to enter, although it did specify that diplomats and other officials of the Chinese government doing government business, along with their body and household servants, were admissible. Fines for bringing Chinese in illegally could run as high as $1,000 per individual, and vessels landing Chinese illegally were liable to seizure and condemnation.

Thus, what is commonly called the Chinese Exclusion Act—its proper title is “To Execute Certain Treaty Stipulations Relating to Chinese”—became law. The typical textbook treatment is a sentence or two, sometimes relating it to other discriminatory treatment. Its real significance goes much deeper than that. Viewed from the perspective of the early twenty-first century, the Exclusion Act is clearly a pivot on which subsequent American immigration policy turned, the hinge on which the poet Emma Lazarus’s “Golden Door” began to swing toward a closed position. It initiated what can be called an era of steadily increasing restrictions on immigration of all kinds that would last for sixty-one years. It was also the first time that immigration policy per se became a focal point of a bilateral diplomatic relationship between the United States and another nation.

During the exclusion era—1882–1943—the problematic enforcement of changing immigration statutes and regulations for Chinese created future diplomatic problems, brought the principle of family reunification into American immigration policy, shaped the culture of immigration enforcement in the United States, and established a precedent for negotiations about American immigration policies. Various changes, generally of a more restrictive character, were added to the Chinese exclusion laws and regulations between 1882 and 1902, when a modified law extended them “until otherwise provided by law.” These changes exacerbated relations and triggered repeated negotiations between the two nations.

The most significant of these negotiations occurred in the aftermath of the Geary Act of 1892, which not only extended exclusion for ten years but also required that all Chinese in the United States get a residence certificate (a kind of internal passport) within a year or be deported. The statute also reversed the usual presumption of innocence and provided that “any Chinese person or person of Chinese descent” was deemed to be in the country illegally unless he or she could demonstrate otherwise. This set off a mass civil disobedience campaign orchestrated by Chinese-
American community organizations. They urged Chinese Americans not to register and hired a trio of leading constitutional lawyers to challenge the statute. Their suit, *Fong Yue Ting v. United States* (1893), was expedited to the Supreme Court, which quickly ruled, five to three, against Fong and two other litigants. Justice Horace Gray, writing for the majority, held that Chinese, like other resident aliens, were entitled “to the safeguards of the Constitution, and to the protection of the laws, in regard to their rights of persons and of property, and to their civil and criminal responsibility,” but insisted that the Constitution could not shield them if Congress decided that “their removal is necessary or expedient for the public interest.”

At the time of the Court’s ruling only some 13,000 Chinese had registered; perhaps 90,000 had not and were presumably liable to immediate deportation. But both cabinet officers responsible for enforcement—Treasury Secretary John G. Carlisle and Attorney General Richard Olney— instructed their subordinates not to enforce the law. Carlisle estimated that mass deportations would cost at least $7.3 million and noted that his annual enforcement budget was $25,000. Secretary of State Walter Q. Gresham confidentially informed the Chinese minister, Yung Yu, that Congress would soon amend the law so that Chinese could register even though the deadline had passed. In November 1893, Congress extended the deadline by six months, and in that time about 93,000 additional Chinese registered and received the disputed certificates.

While relations between China and the United States were complicated by actions of the federal government toward immigrants, those between Italy and the United States deteriorated because of discrimination by lesser governmental bodies. There was widespread violence directed against Italian Americans, but one outbreak in particular had the most serious international consequences. On 15 October 1890 the police superintendent in New Orleans was murdered by a group of men using sawed-off shotguns; before he died he whispered that the Italians had done it. He had been investigating so-called Mafia influence among the city’s large Italian-American population. New Orleans authorities quickly arrested almost 250 local Italian Americans and eventually indicted nineteen of them, including one fourteen-year-old boy, for the murder. Nine were brought to trial. On 13 March 1891 the jury found six not guilty and could not agree on three others. All nine were returned to jail for trial on another charge. The day after the verdict, a notice signed by sixty-one prominent local residents was placed in the morning newspaper inviting “all good citizens” to a 10 A.M. mass meeting “to remedy the failure of justice.” A mob of perhaps 5,000 persons assembled, and, led by three members of the local bar, went first to the arsenal where many were issued firearms and then to the parish prison, where they shot and killed eight incarcerated Italians and removed three others and lynched them. Three or four of the victims were Italian citizens and the others were naturalized American citizens. None of the mob was ever punished.

Local public opinion hailed the result, as did much of the nation’s press. The *New York Times* wrote that the victims were “sneaking and cowardly Sicilians, the descendants of bandits and assassins” but insisted in the same editorial that the lynching “was not incited by any prejudice against Italians.” The Italian government protested, demanding punishment for the lynchers, protection for the Italian Americans of New Orleans, and an indemnity. President Benjamin Harrison himself, acting during an illness of Secretary of State James G. Blaine, directed the American minister in Rome to explain “the embarrassing gap in federalism—that in such cases the state alone has jurisdiction,” while rejecting all the demands. There was nothing new about this. Similar responses had been made by the federal government in a number of previous instances, most notably in 1851 when Spaniards had been killed in New Orleans; in 1885 after the Rock Springs, Wyoming, massacre of twenty-eight Chinese miners; and in a whole host of other outrages, mostly against Chinese in the Far West. In all of these cases the president eventually called upon Congress to make an ex gratia payment. Congress, after debate, did so, and the matters were ended. For the Rock Springs affair, for example, the payment was nearly $150,000.

The lynching of Italians in New Orleans took a somewhat different course to the same essential result. Exasperated by the initial stonewalling, the Italian government recalled its minister in Washington but did not break relations. There was foolish talk of war in the press—all agreed that the Italian navy was superior to the American—and naval preparedness advocates used the speculation to their advantage. Eventually good relations were restored, but Harrison settled the matter without the traditional reference to Congress. In his December 1892 message to Congress Harrison reported the payment of
$24,330.90 (125,000 francs) to the Italian government, a little over $6,000 per person. The money was taken from the general appropriation for diplomatic expenses. Congress was furious—or pretended to be—because of executive usurpation of its prerogatives and reduced the fund for diplomatic contingencies by $20,000.

A more complex and potentially more serious situation developed from the mistreatment of Japanese in the United States—more serious because of the growing hostility between the United States and Japan over conflicting plans for Pacific expansion and more complex because both local and national discrimination was involved and because major tensions about Japanese immigrants continued for more than two decades. Long before diplomatic tensions over Japanese immigration to western states and the Territory of Hawaii surfaced, Tokyo had shown concern about possible mistreatment of its immigrants in America. As early as the 1890s internal Japanese diplomatic correspondence shows that there were fears in Tokyo that emigrant Japanese workers in the United States, who in many places were filling niches once occupied by Chinese workers, would eventually evoke the same kinds of official treatment—exclusion—that Chinese workers had experienced. This, Japanese officials were convinced, would negatively affect Japan's ambitions to achieve great-power status. The greatest fear—Tokyo's worst nightmare about this subject—was that someday there would be a “Japanese Exclusion Act.” This fear—and eventually resentment at the result, which was in effect exclusion—so pervaded Japanese culture that for decades Japanese visitors had been excluded from the public schools. This, Japanese officials were convinced, would negatively affect Japan's ambitions to achieve great-power status. The greatest fear—Tokyo's worst nightmare about this subject—was that someday there would be a “Japanese Exclusion Act.”

Anti-Japanese activity had flared in race-sensitive California as early as 1892, when there were fewer than 5,000 Japanese persons in the entire country. In 1905 the state's leading newspaper, the San Francisco Chronicle, began what can be called an anti-Japanese immigrant crusade—a crusade that the rival publisher William Randolph Hearst soon made his own. In the same year San Francisco labor leaders organized the Japanese and Korean Exclusion League, the California legislature passed a resolution calling on Congress to “limit and diminish Japanese immigration,” and two California congressmen introduced the first bills calling for exclusion of Japanese into Congress.

Although these events all took place beneath the radar of national press consciousness, they did not escape the notice of the man in the White House. In May 1905, Theodore Roosevelt fumed in a (private) letter about the “foolish offensiveness” of the [mostly Republican] “idiots” of the California legislature, while indicating sympathy for the notion of exclusion of Japanese and muttering about their being “a serious problem in Hawaii.” Two months later he instructed the U.S. Minister to Japan, Lloyd C. Griscom, to inform Tokyo that “the American Government and . . . people” had no sympathy with the agitation and that while “I am President” Japanese would be treated like “other civilized peoples.” In his prolix annual message of December 1905, Roosevelt insisted that there should be no discrimination “against any man” who wished to immigrate and be a good citizen, and he specifically included Japanese in a short list of examples of acceptable ethnic groups. In the next paragraph, Roosevelt, who had signed the 1902 extension of Chinese exclusion without hesitation, made it clear that Chinese laborers, “skilled and unskilled,” were not acceptable.

Almost a year later, on 11 October 1906, the San Francisco Board of Education ordered all Japanese and Korean pupils to attend the long-established “Oriental” school in Chinatown. The announcement attracted little attention in the San Francisco press and seems to have been ignored outside California until nine days later, when garbled reports of what had happened were printed in Tokyo newspapers claiming that all Japanese pupils had been excluded from the public schools. Roosevelt reacted quickly. He wrote his high-ranking Harvard classmate Baron Kentaro Kaneko that he would take action; he also met with and gave similar assurances to the Japanese minister, Viscount Siuzo Aoki, and dispatched a cabinet member and former California congressman, Secretary of Commerce and Labor Victor H. Metcalf, to San Francisco to investigate the matter. In his December 1906 annual message the president formally recommended legislation “providing for the naturalization of Japanese who come here intending to become American citizens.” Roosevelt made no serious effort to get such legislation introduced, let alone passed, and just two months later Secretary of State Elihu Root, in reacting to a Japanese proposal that acceptance of exclusion be traded for naturalization, informed American negotiators that “no statute could be passed or treaty ratified” that granted naturalization.

Secretary Metcalf’s report was made public on 18 December 1906 and showed that rather
than the hundreds or thousands of Japanese pupils discussed in the press there were only ninety-five Japanese students in the entire San Francisco school system, twenty-five of them native-born American citizens. He did find that twenty-seven of the aliens were teenagers enrolled in inappropriate grades because of language problems; the most extreme example was two nineteen-year-olds in the fourth grade. Metcalf's report recommended that age-grade limits be enforced, something that was acceptable to the Japanese community. Otherwise Metcalf found the segregation order unjust and against the public interest. But since the Supreme Court's decision in Plessy v. Ferguson (1896) had affirmed the legality of racial segregation in the United States, the federal government had no power over a state's right to practice it. California politicians of all parties, undoubtedly representing the will of their constituents, adamantly refused to mitigate their discrimination in any way, and, in the session of the legislature that began in January 1907, proposed enacting more anti-Japanese legislation. Roosevelt and Root set to work to ameliorate the situation, and, in something over a year, worked out a solution that is known as the Gentlemen's Agreement, the substance of which is contained in six notes exchanged between the two governments in late 1907 and early 1908. It is instructive to note that Root actually instituted an action in the northern federal district court of California to prohibit segregation of alien Japanese schoolchildren, who enjoyed most-favored-nation rights under the existing commercial treaty with Japan, but could do nothing for the pupils who were American citizens.

In the event, no suit was necessary. Roosevelt summoned members of the school board to Washington, jawboned them in the White House, and got them to rescind their order in February 1907. (The only Japanese pupils actually segregated in California were in a few rural districts around Sacramento. Although that segregation continued, no fuss was made about it, so the Japanese government, which was concerned with "face" rather than principle, never complained.) Then Congress passed an amendment, drafted in the State Department, to a pending immigration bill, which enabled the president to bar by executive order persons with passports issued for any country other than the United States from entering the country. Japan, in turn, agreed to mark any passports issued to laborers, skilled or unskilled, who had not previously established American residence, as not valid for the United States. But the eventual agreement allowed Japan to issue passports valid for the United States to "laborers who have already been in America and to the parents, wives and children of laborers already resident there." Thus the principle of family reunification, which would become a hallmark of American immigration policy, was first introduced as a part of the process of restricting Asian immigration.

The Gentlemen's Agreement is an excellent example of the "unintended consequences" that have characterized much of the legal side of American immigration history. The diplomats and politicians involved assumed that with labor immigration at an end the Japanese American population would decline and the problems that its presence created in a white-dominated racist society would gradually fade away. They did not realize that through the family reunification provisions of the agreement tens of thousands of Japanese men would bring wives to California. Many if not most of these were "picture brides," women married by proxy in Japan to men who in most instances they would not see until they came to America. Most of these newly married couples soon had children who were American citizens by virtue of being born on American soil, which meant that the American Japanese population grew steadily. Eventually the anti-Japanese forces in the United States campaigned without success for a constitutional amendment that would repeal the "birthright citizenship" clause of the Fourteenth Amendment and make the children of "aliens ineligible to citizenship" similarly ineligible. (In the 1970s nativist forces in the United States revived such demands but with a different target: they proposed making the American-born children of illegal immigrants ineligible for automatic citizenship.) When the Gentlemen's Agreement went into effect there were probably some 60,000 Japanese persons in the continental United States, the vast majority of them aliens. By 1940 there were more than 125,000, more than two-thirds of them native-born American citizens. Many white Californians and other concerned westerners who had been assured that the Gentlemen's Agreement was tantamount to exclusion came to believe that they had been betrayed by the uncaring politicians back east.

But even before the demographic consequences of the Gentlemen's Agreement became clear, a second crisis arose over Japanese immigrants. This one erupted in 1913 and focused on land rather than on people. Although most Japan-
ese immigrants had come to California as laborers, many soon were able to become agricultural proprietors. As early as 1909 bills had been introduced into the California legislature barring the sale of agricultural land to Japanese, but Republican governors then and in 1911—the California legislature met only every other year—cooperated with Republican presidents in Washington and “sat upon the lid,” as Governor Hiram W. Johnson put it. But in 1913, with Johnson still governor and Democrat Woodrow Wilson in the White House, the lid was off. Although Washington was again taken unawares by the crisis, Tokyo had been expecting it. Its consul general in San Francisco had warned in November 1912 that “the fear-laden anti-Japanese emotion of the people [of California] is a sleeping lion.” By the time Wilson took office on 4 March 1913, bills restricting Japanese and other alien landholding had made considerable progress in the California legislature. The Japanese ambassador, Sutemi Chinda, called on the president during Wilson’s second day in office: his dispatch to Tokyo quoted Wilson as saying “that the constitution did not allow the federal government to intervene in matters relating to the rights of the individual states.” After much debate and publicity, in mid-April the California legislature passed legislation forbidding the ownership of agricultural land by “aliens ineligible to citizenship.” This, of course, pointed the bill at Japanese, although it also affected other Asians. Californians argued that the discrimination—if such it was—was caused by federal rather than state law.

Even before Governor Johnson signed the bill, angry anti-American demonstrations erupted in Tokyo: the California legislature had again helped to create an international crisis. The Wilson administration, while trying to adhere to traditional states’ rights doctrines, nevertheless felt that it had to at least seem to be taking action. Wilson sent Secretary of State William Jennings Bryan on a cross-country train trip to Sacramento to meet with Governor Johnson and the legislature and urged that the bill not be enacted before Bryan arrived. In the event, Bryan’s trip was anticlimactic. Unlike Roosevelt and Root, Wilson and Bryan had nothing to offer the Californians in return for moderation. Bryan returned to Washington, and Johnson signed the Alien Land Act into law: eventually ten other western states passed similar measures.

The California law, which was strengthened in 1920, was relatively ineffective. Japanese farmers and the white entrepreneurs with whom they dealt evaded the law in a number of ways, most of which had been foreseen by Johnson and his advisers. The two major methods were placing land in the name of citizen children or leasing rather than purchasing the land. For a few relatively large-scale operators adoption of a corporate form was also effective. When the California legislature passed an amendment to the land act barring “aliens ineligible to citizenship” from exercising guardianship over their citizen children, the federal courts ruled that such a statute violated the constitutional rights of those children to have their natural parents as guardians.

These disputes, of course, helped to poison relations between Japan and the United States, which were already problematic on other grounds. During the Versailles treaty negotiations and in early sessions of the League of Nations, Japan tried to get questions of immigration and racial equality discussed but the imperialist powers successfully stifled every attempt. (Of course Japan did not have clean hands in such matters, but that is another story.) The final and most traumatic act in the conflicts between the Pacific powers over immigration came in 1924 and involved federal rather than state discrimination.

By the 1920s the American people and the Congress were ready for a general and massive curtailment of immigration. Prior to that time statutory immigration restriction based on race or national origin had been directed only at Asians. The Immigration Act of 1917—best known for imposing a literacy test on some immigrants—had created a “barred zone” expressed in degrees of latitude and longitude, which halted the immigration of most Asians not previously excluded or limited. The first statute to limit most immigration, the Quota Act of 1921, placed numerical limits on European immigration while leaving immigration from the Western Hemisphere largely alone; it did not directly impact Japanese immigration, which was still governed by the Gentlemen’s Agreement of 1907–1908. Under the 1921 act Japan got a small quota, and Tokyo could not and did not complain that the law was discriminatory. Had Japan been treated as European nations were in the 1924 statute, it would have received the minimum quota of 100, but the version of the more generally restrictive 1924 law that passed the House contained overt discrimination against Japanese by forbidding the immigration of “aliens ineligible to citizenship.” In an ill-starred attempt to preserve the Gentlemen’s Agreement, Secretary of State Charles Evans Hughes suggested verbally that
Japanese Ambassador Masanao Hanihara wrote him a letter explaining the Gentlemen's Agreement, whereupon the American would transmit the letter to the Senate in an attempt to get the offending phrase removed. The note, which was not in itself either threatening or blustering, did contain the phrase “grave consequences” in referring to what might happen if the law were enacted with the offending phrase. Henry Cabot Lodge and other senators insisted that the phrase was a “veiled threat” against the United States and stampeded the Senate into accepting the House language. In The Presidency of Calvin Coolidge (1998), the historian Robert H. Ferrell presented evidence suggesting that Hughes and others in the State Department either drafted or helped to draft the original note, something that all those concerned categorically denied at the time and later.

How grave were the actual consequences? No one can say. Japan and the United States might well have engaged in what became a “war without mercy” even if no Japanese immigrant had ever come to America. But some authorities, such as George F. Kennan, have argued that the “long and unhappy story” of U.S.–Japanese relations were negatively affected by the fact that “we would repeatedly irritate and offend the sensitive Japanese by our immigration policies and the treatment of people of Japanese lineage.”

The 1924 act, which established a pattern of immigration restriction that prevailed until 1965, also established a “consular control system” by providing that aliens subject to immigration control could not be admitted to the United States without a valid visa issued by an American consular officer abroad. Visas were first required as a wartime measure in a 1918 act and were continued in peacetime by a 1921 act, but they were primarily an identification device. The 1924 act for the first time made the visa a major factor in immigration control. Although the State Department often claimed that Congress had tied the government’s hands, the fact of the matter is that since 1924 much actual restriction of immigration has been based on the judgment of the individual federal officials administering it. That responsibility has been shared between the State Department and the Immigration and Naturalization Service (INS), then in the Department of Labor but switched to the Department of Justice in 1940. The diplomatic control is exercised by granting or failing to grant visas; the INS control is exercised largely at the borders, although since 1925 some INS personnel have been attached to some American embassies abroad as technical advisers. (The number of foreign countries with INS personnel has fluctuated. At the outset of the twenty-first century they were operating in thirty-
eight countries. In Canada and a few other places, mostly in the Western Hemisphere, it has become possible to clear U.S. immigration and customs while still on foreign soil.)

The American foreign service—which was white, Christian (overwhelmingly Protestant), and elitist—had long exercised a largely negative influence on American immigration policy. Consular reports had provided much ammunition for the immigration restriction movement since the late nineteenth century. The tenure of Wilbur J. Carr as, in effect, head of the consular service from 1909 to 1937, placed a determined and convinced anti-Semitic nativist in a position to shape the formulation of both immigration and refugee policy. We now know that Carr, a skilled and manipulative bureaucrat, regularly fed anti-immigrant excerpts from unpublished consular reports to restrictionists such as Representative Albert Johnson, chief author of the 1924 immigration act. One Carr memo to him described Polish and Russian Jews as "filthy, Un-American and often dangerous in their habits." Many American consuls shared these views. Richard C. Beer, for example, a career officer serving in Budapest in 1922–1923, complained that the law forced him to give visas to Hungarians, Gypsies, and Jews who were all barbarians and gave his office an odor that "no zoo in the world can equal." Other consular officials, who might not have held such views, took their cues from their chief and the whole tone of the foreign service. During what was left of the "prosperity decade" after 1924 the INS and the State Department were pretty much on the same nativist page, although some INS officials resented their loss of control.

Although there were no statutory limits on immigration from independent nations of the Western Hemisphere until 1965, President Herbert Hoover administratively limited Mexican and other Latin American immigration by use of the highly subjective "likely to become a public charge" clause that had been on the statute books since 1882. The clause had originally been designed to keep out persons who for reasons of physical or mental disability were patently unable to support themselves. From the Hoover administration on, the clause has been interpreted at times to bar persons who were able-bodied but poor. The prospective immigrant could be stopped at the border or at an immigrant receiving station by INS personnel or could have a visa denied by someone in the diplomatic service in the country of origin.

The onset of the Great Depression temporarily reduced immigration pressures—during two years in the early 1930s more immigrants left the United States than entered it—but an entirely different situation developed after the Nazi seizure of power in Germany. The unprecedented situation of large numbers of refugees and would-be refugees stemming from a western European power had not been foreseen by the drafters of American immigration legislation. The United States had an immigration policy but not a refugee policy. Congress had previously been favorable to political and religious refugees. Restrictive immigration acts dating from the nineteenth century barred persons with criminal records but always specifically excluded those convicted of political offenses. As late as 1917, in the part of a statute imposing a not very strenuous literacy test as a criterion for admission, Congress specifically exempted any person seeking admission "to avoid religious persecution."

By 1933, however, under the stresses of the Great Depression and after going through what John Higham has aptly termed the "tribal twenties," Congress was in no mood to ease immigration restrictions. And although some of the later apologists for the lack of an effective American refugee policy before the onset of the Holocaust put all or most of the onus on Congress, the administration of Franklin D. Roosevelt must share that blame. There was nothing even resembling a new deal for immigration policy. To be sure, New Dealers at the top of Frances Perkins's Department of Labor, which continued to administer the INS until 1940, were much more sympathetic to immigrant concerns than the labor movement bureaucrats who had previously run the department. But the anti-immigrant culture of the INS continued. Moreover, the State Department's personnel and policies about immigration and many other matters were little affected by the New Deal. The administrative regulation of immigration was tightened during the early years of the Depression by both sets of government agents: the consular officials abroad and the INS at the borders.

Jews and others seeking visas in the 1930s quickly learned that some American consuls were better than others. George S. Messersmith, consul general in Berlin in the early 1930s and minister to Austria before the Anschluss, at a time when the German quota was undersubscribed, gained a positive rating from Jewish individuals and organizations. Even more proactive for refugees was Messersmith's successor in Berlin, Raymond
Geist, who on occasion actually went to concentration camps to arrange the release of Jews with American visas. Although there is no thorough study of the work of American consular officials in Europe during the period between 1933 and Pearl Harbor, it is clear that men like Messersmith and Geist were exceptions and that the majority of consuls were indifferent if not hostile to Jews desiring American visas. The signals consuls received from Carr and other officials in the State Department certainly encouraged them to interpret the law as narrowly as possible.

For example, when Herbert Lehman, Franklin Roosevelt’s successor as governor of New York, wrote the president on two occasions in 1935 and 1936 about the difficulties German Jews were having in getting visas from American consulates, Roosevelt assured him, in responses drafted by the State Department, that consular officials were carrying out their duties “in a considerate and humane manner.” Irrefutable evidence exists in a number of places to demonstrate that, to the contrary, many officials of the Department of State at home and abroad consistently made it difficult and in many cases impossible for fully eligible refugees to obtain visas. One example will have to stand as surrogate for hundreds of demonstrable cases of consular misfeasance and malfeasance. Hebrew Union College (HUC) in Cincinnati, the oldest Jewish seminary in America, had a Refugee Scholars Project that between 1935 and 1942 brought eleven such scholars to its campus. The 1924 immigration act specifically exempted from quota restriction professors and ministers of any religion as well as their wives and minor children. There should have been no difficulties on the American end in bringing the chosen scholars to Cincinnati. But in almost every case the State Department and especially Avra M. Warren, head of the visa division, raised difficulties, some of which seem to have been invented. In some instances the college, often helped by the intervention of influential individuals, managed to overcome them. In two instances, however, the college was unsuccessful.

The men involved were Arthur Spanier and Albert Lewkowitz. Spanier had been the Hebraica librarian at the Prussian State Library, and after the Nazis dismissed him, a teacher at the Hochschule für die Wissenschaft des Judentums. After Kristallnacht in November 1938, Spanier was sent to a concentration camp. The guaranteed offer of an appointment was enough to get him released from the camp but not enough to get him an American visa. The president of Hebrew Union College had to go to Washington even to discover why this was the case. Warren explained that the rejection was because Spanier’s principal occupation was as a librarian and because after 1934 the Nazis had demoted the Hochschule (a general term for a place of higher education) to a Lehranstalt (educational institute), and an administrative regulation of the State Department not found in the statute held that a nonquota visa could not be given to a scholar coming to a high status institute in the United States from one of lower status abroad. Lewkowitz, a teacher of philosophy at the Breslau Jewish Theological Seminary, did get an American visa in Germany. Both men were able to get to the Netherlands and were there when the Germans invaded. The German bombing of Rotterdam destroyed Lewkowitz’s papers, and American consular officials there insisted that he get new documents from Germany, an obviously impossible requirement. Visa-less, both men were sent to the Bergen-Belsen concentration camp. Lewkowitz was one of the few concentration camp inmates exchanged, and he reached Palestine in 1944. Spanier was murdered in Bergen-Belsen. If highly qualified scholars with impressive institutional sponsorship had difficulties, one can imagine what it was like for less well-placed individuals.

Apart from creating difficulties for refugees seeking visas, the State Department consistently downplayed international attempts to solve or ameliorate the refugee situation. For example, in 1936 brain trusters Felix Frankfurter and Raymond Moley urged Roosevelt to send a delegation that included such prominent persons as Rabbi Stephen S. Wise to a 1936 League of Nations conference on refugees. The president instead took the advice of the State Department and sent only a minor diplomatic functionary as an observer. It was then politic for him to accept the State Department’s insistence that “the status of all aliens is covered by law and there is no latitude left to the Executive to discuss questions concerning the legal status of aliens.” When Roosevelt wanted to do something to he could almost always find a way. Immediately after the Anschluss, he directed that the Austrian quota numbers be used to expand the German quota, and shortly after Kristallnacht, he quietly directed the INS that any political or religious refugees in the United States on six-month visitor’s visas could have such visas extended or rolled over every six months. Perhaps 15,000 persons were thus enabled to stay in the United States. On more public occasions however,
such as the infamous early 1939 voyage of the German liner *Saint Louis*, loaded with nearly a thousand refugees whose Cuban visas had been canceled, he again took State Department advice and turned a deaf ear to appeals for American visas while the vessel hove to just off Miami Beach. The *Saint Louis* returned its passengers to Europe, where many of them perished in the Holocaust.

After the Nazis overran France, Roosevelt showed what a determined president could do. In the summer of 1940 he instructed his Advisory Committee on Refugees to make lists of eminent refugees and told the State Department to issue visas for them. An agent named Varian Fry, operating out of Marseilles and with the cooperation of American vice consuls, managed to get more than a thousand eminent refugees into Spain and on to the United States. Those rescued by these means included Heinrich Mann, Marc Chagall, and Wanda Landowska. But at the same time, Roosevelt appointed his friend Breckinridge Long as assistant secretary of state. A confirmed nativist and anti-Semite, Long was in charge of the visa section and thus oversaw refugee policy. The president eventually became aware of the biases in the State Department, and when he decided in mid-1944 to bring in a “token shipment” of nearly a thousand refugees from American-run camps in Europe, he put Interior Secretary Harold L. Ickes in charge. Vice President Walter Mondale’s acute 1979 observation that before and during the war the nations of the West “failed the test of civilization” is a sound assessment of American policy.

Two other wartime developments should be noted. First, the State Department became involved in American agricultural policy in connection with the wartime Bracero program, which brought temporary Mexican workers to the United States for work in agriculture and on railroads. The Mexican government was, with good reason, apprehensive about the treatment they might receive, so the State Department was in part responsible for the United States living up to its agreement. Second, the State Department was responsible for the wartime exchanges of diplomats and other enemy nationals with the Axis powers. It was also concerned with the treatment of American civilians in enemy hands, particularly Japan, and because of that justified concern persistently argued for humane treatment for both the few thousand interned Japanese nationals in INS custody and the 120,000 Japanese Americans, both citizen and alien, who were in the custody of the War Relocation Authority.

The war years also witnessed a historic if seemingly minor reversal of American immigration policy with the 1943 repeal of the Chinese Exclusion Act. Few episodes show the connection between immigration and foreign policy so explicitly. President Roosevelt sent a special message to Congress urging the action. Speaking as commander in chief, he regarded the legislation “as important in the cause of winning the war and of establishing a secure peace.” Since China was a U.S. ally and its resistance depended in part on “the spirit of her people and her faith in her allies,” the president argued for a show of support:

We owe it to the Chinese to strengthen that faith. One step in this direction is to wipe from the statute books those anachronisms in our laws which forbid the immigration of Chinese people into this country and which bar Chinese residents from American citizenship. Nations, like individuals, make mistakes. We must be big enough to acknowledge our mistakes of the past and correct them.

In addition, Roosevelt argued that repeal would silence Japanese propaganda and that the small number of Chinese who would enter would cause neither unemployment nor job competition. The president admitted that “While the law would give the Chinese a preferred status over certain other Oriental people, their great contribution to the cause of decency and freedom entitles them to such preference. . . . Passage will be an earnest of our purpose to apply the policy of the good neighbor to our relations with other peoples.”

The repeal of Chinese exclusion was thus sold as a kind of good-behavior prize not for Chinese Americans, thousands of whom were then serving in the U.S. armed forces, but for the Chinese people. Nevertheless, Roosevelt’s hint about future policy was right on the mark. Within three years Congress would pass similar special legislation granting naturalization rights and quotas to Filipinos and “natives of India,” and in 1952 it would enact legislation ending racial discrimination in naturalization policy. By that time the emphasis was on winning “hearts and minds” in the Cold War.

**THE COLD WAR AND BEYOND**

Even before the Cold War came to dominate almost every facet of American policies toward the rest of the world, attitudes about immigration and immigration policies were beginning to
change, as were the policies themselves. The increasing prevalence of an internationalist ideology, membership in the United Nations, and a growing guilt about and horror at the Holocaust all combined to impel the United States to do something about the European refugee crisis symbolized by the millions of displaced persons there. After some crucial months of inaction, Harry Truman issued a presidential directive just before Christmas 1945 that got some refugees into the United States. One important and often overlooked aspect of this directive enabled voluntary agencies, largely religious, to sponsor refugees, which virtually negated the application of the “likely to become a public charge” clause in such cases. Previously, sponsorship of most refugees without significant assets had to be assumed by American relatives. But it was only after passage and implementation of the Displaced Persons Acts of 1948 and 1950 that the United States could be said to have a refugee policy, one that the increasingly more diverse personnel of the State Department helped to carry out. That legislation brought more than 400,000 European refugees into the United States and expanded the use of voluntary agencies—later called VOLAGS (Voluntary Agencies Responsible for Refugees)—such as the Catholic and Lutheran welfare organizations and the Hebrew Immigrant Aid Association. In addition, U.S. sponsorship of the United Nations Relief and Rehabilitation Administration and membership in its successors, the International Refugee Organization and the United Nations High Commission for Refugees, contributed to changed attitudes about and policies toward refugees even though general immigration policy remained tied to the quota principle introduced in 1921–1924, which lasted until 1965.

Even the notorious McCarran-Walter Immigration Act of 1952—a quintessential piece of Cold War legislation that passed over Truman’s veto and seemed merely to continue the restrictive policies begun in 1921 and 1924—contained liberalizing provisions that were more significant than most of its advocates and opponents realized. Chief of these was the total elimination of a color bar in naturalization. While some of the impetus for this came from liberals on racial issues, the push from those impelled by Cold War imperatives was probably more important. State Department representatives and others testified how difficult it was to become the leader of what they liked to term the “free world” when American immigration and naturalization policies blatantly discriminated against the majority of the world’s peoples. In addition, a growing understanding that an important diplomatic objective was to win the hearts and minds of peoples and not just the consent of governments made diplomats more aware of the significance of immigrants and immigration. For example, when Dalip Singh Saund, the first Asian-born member of Congress, was elected in 1956, the State Department and the United States Information Agency sponsored him and his wife on a tour of his native India.

Although the word “refugee” does not appear in the 1952 immigration act, an obscure section of it gave the attorney general discretionary parole power to admit aliens “for emergency reasons or for reasons in the public interest.” This was the method that Roosevelt had used in 1944, without congressional authorization, to bring in nearly a thousand refugees. This allowed the executive branch to respond quickly to emergency situations such as the Hungarian revolt of 1956 and the Cuban revolution of 1959. Between the displaced persons acts of the Truman administration and the inauguration of Ronald Reagan in 1981 about 2.25 million refugees were admitted, with about 750,000 Cubans and 400,000 refugees from America’s misbegotten wars in Southeast Asia the largest increments. Since during that period some 10.4 million legal immigrants entered the United States, refugees accounted for some 20 percent of the total.

Although most textbook accounts trace the transformation of post–World War II immigration and immigration policy to the act signed by Lyndon Johnson in the shadow of the Statue of Liberty in 1965, that is a gross exaggeration. The reality can be better glimpsed by considering the numerical incidence of immigration to colonial America and the United States over time. No official enumeration of immigration took place before 1819, but most authorities agree that perhaps a million European and African immigrants came before then. Between 1819 and the enactment of the 1924 immigration act some 36 million immigrants arrived. Between 1925 and 1945—with immigration inhibited first by the new restrictive law and then much more effectively by the Great Depression and World War II—nearly 2.5 million came, an average of fewer than 125,000 annually. In the decade before World War I more than a million came each year. Well into the post–World War II era, many authorities felt that as a major factor in American history immigration was a thing of the past, but as
the table indicates, based on INS data, this was a serious misperception.

With the self deconstruction of the Soviet Union at the end of the 1980s, domestic policy began to reassume paramount importance in American policy, including immigration policy. Input from the Department of State assumed less significance in immigration matters than during the Cold War era, although the increased volume of immigration greatly taxed and often overtaxed American embassies and consulates. For example, the State Department was given the responsibility of administering the lottery provisions of the Immigration Reform and Control Act (IRCA) of 1986 and its successors. The department announced on 10 May 2001 that for the 2002 lottery its Consular Center in Williamsburg, Kentucky, had managed to sift 10 million qualified entries while rejecting an additional 3 million applicants for not following directions and notified 90,000 potential winners chosen at random what they had to do to gain admission to the United States as resident aliens. Each overseas applicant would have to pass an interview examination for eligibility at an American consulate; those applying from within the United States would apply through the INS. Only a maximum of 50,000 of the 90,000 could actually win and gain admittance to the United States along with certain of their qualified dependents. All paper work would have to be completed by 30 September 2002. Anyone who did not have a visa by then lost the presumed advantage of winning.

The major functions of IRCA were the so-called “amnesty,” which legalized some 2.7 million immigrants illegally in the United States, the majority of whom were from Mexico, and the promise of effective control measures to “gain control of our borders” by more effective interdiction of illegal border crosses and intensified deportation of remaining resident illegals. This created great fears in many nations of the circum-Caribbean, particularly the Dominican Republic and El Salvador, whose economies were greatly dependent on immigrant remittances, that large numbers of their citizens would be excluded and their remittances ended. These fears were chimerical; borders remained porous. But, in the meantime, to cite just one example, President José Napoléon Duarte wrote President Reagan in early 1987 requesting that Salvadorans in the United States illegally be given “extended voluntary departure” (EVD) status, an aspect of the attorney general’s parole power enabling illegal immigrants to remain. While EVD was usually granted on humanitarian grounds, Duarte stressed the economic loss if immigrant remittances ceased. Assistant Secretary of State Elliot Abrams, who had opposed EVD on humanitarian grounds, now supported it, but the negative views of the Department of Justice and the congressional leadership prevailed. Forms of EVD or its equivalent were put into place during the Clinton presidency for Salvadorans and Nicaraguans by both the administration and Congress.

The State Department also had to deal with increasing complaints from foreign countries about the execution of its citizens by the criminal justice systems of American states, most of which had been practicing capital punishment with increased enthusiasm at a time when many nations had abolished it. Since it is a legal action, the United States cannot even consider paying compensation of any kind.

The more than 25 million post-1950 immigrants, as is well known, have changed the face of America. As late as the 1950s, immigrants from Europe, who had contributed the lion’s share of nineteenth- and early-twentieth century immigrants, still were a bare majority of all immigrants. By the 1980s, thanks largely to the liberal 1965 immigration act and the Refugee Act of 1980, the European share was down to about 10 percent, and immigrants from Latin America and Asia predominated. Although anti-immigrant attitudes again came to the fore in 1980s—sparked in part by Ronald Reagan’s warnings about being overrun by “feet people”—and some scholars saw “a turn against immigration” and predicted effective legislative restriction of immigration, those
feelings were not turned into an effective legislative consensus. At the beginning of the twenty-first century, immigration continued at a very high rate, and screening and facilitating that influx continued to be an important aspect of the work of American diplomacy.

Imperialism, in its most precise traditional usage, means the forcible extension of governmental control over foreign areas not designated for incorporation as integral parts of the nation. The term is commonly used to mean any significant degree of national influence, public or private, over other societies; but to some it refers principally to foreign economic exploitation with or without other actions. In all usages, however, the essential element is that one society must in some way impose itself upon another in a continuing unequal relationship. Thus, American expansionism dated from the beginning of the national experience, while its evolution into true imperialism occurred only in the later nineteenth century.

CONTINENTAL EXPANSION

The expansion of the United States from 1803 to 1853 into contiguous areas such as Louisiana, Florida, Texas, the Oregon territories, and the Mexican cession is not best described as imperialism, although it contained related elements. This expansion involved lightly populated areas in which the influx of settlement from the older portions of the nation soon constituted the great bulk of the inhabitants. The Northwest Ordinance of 1787, a profoundly anti-imperialist measure, had early defined the process by which such areas could be divided into prospective states and ultimately brought into the union as equal members. The resulting expansion represented the continuous extension of a single society over vast neighboring areas, rather than the takeover of one society by another.

The North American continent was not unoccupied; indigenous Indian tribes were found in every part of it, while the areas taken from Mexico contained many scattered settlements, particularly in California and around Santa Fe. Neither the people nor the government of the United States showed much interest in such pre-existing societies; the aim of the United States was to brush them aside and replace them with the society and culture of the incoming majority. This was particularly true in regard to the Indians; rather than take over Indian society, the whites virtually destroyed it. The process was tragic for its victims, and Americans' constant assertions that they were peopling an empty continent contained the seeds of hypocrisy. There were nevertheless important differences between the movement of such a settlement frontier and the establishment of a true empire. For example, while the United States acquired half of Mexico's national territory between 1845 and 1848, the transfer entailed less than 2 percent of the Mexican population. Broadly speaking, the Mexican War was fought to gain territory, not a captive people, and the land thus gained would be populated largely from the existing United States. For purposes of comparison, the activities of the British in India, where they ruled a teeming alien society, and the British in Australia, where they settled a continent and built a self-governing nation, were so dissimilar that the use of a single term to describe both cases does more to obscure than enlighten. Prior to the Civil War, American expansion came closer to the Australian example, though dispossessing a more numerous indigenous people, and the end result cannot be accurately classified as imperialism.

There were, of course, common features in the earlier expansion and later imperialism of the United States. Chief among these were a strong sense of national mission and special destiny, a general confidence in the unique superiority of American institutions, a belief in the inequality of races and peoples, and the very habit of expansion itself. The expansionism of “manifest destiny” could lead toward true imperialism, as in the abortive movement to annex all of Mexico during the Mexican War. If westward expansion
was not the same as imperialism, it furnished some of the materials out of which the latter could grow.

POST–CIVIL WAR PERIOD

The purchase of Alaska in 1867 ended the period when new territory was assumed to be on the path to eventual statehood. By that time the nation's policymakers were already debating a new and more truly imperialist form of expansion. Schemes to acquire Cuba, by purchase or otherwise, had been current from 1848 onward, while in 1870 the Ulysses S. Grant administration negotiated the annexation of the Dominican Republic, only to see the Senate reject the instrumental treaty. Critics of this latter scheme were quick to point out the break with tradition implicit in the quest for territory already compactly settled by an alien society. Such a society could be assimilated into the nation proper only with great difficulty and over a long period, or more probably it could not be assimilated at all. Thus, the United States had to choose between incorporating an unassimilated people into its federal system, thereby endangering its integrity, or ruling them as colonial subjects in violation of the right to self-government supposedly inherent in the American political system. Foreshadowed by the earlier opposition to the all-Mexico movement of the late 1840s, the Senate debate over the annexation of the Dominican Republic developed the main lines of the controversy over imperialist expansion and marked the maturing of an active anti-imperialism in the United States.

For a generation after 1870, projects for further expansion attracted little support in the United States, and most people assumed that imperialism had become a dead issue. A number of developments, however, prepared the nation for imperial ventures at the end of the century. Chief were the rapid industrialization and soaring productivity of the national economy, which made the United States the leading industrial power by 1900. Increasingly conscious of their numbers, wealth, and strength, and proud of their unique institutions and sprawling territory, Americans began to aspire to a place for their country among the world's great powers. The severe economic depression of the 1890s added material aims to the drive for prestige, as the nation's business leaders and political spokesmen hoped for economic salvation in increased exports of American manufactures. By the mid-1890s, a new mood had brought a reappraisal of America's world position.

While largely internal forces first prompted the nation's leaders to look outward, the global sweep of European imperialism was reaching its high point, providing both the model and the final impetus for the new activism. Initially, Americans reacted to European imperialism as a threat to be repelled, fearing its penetration into the Western Hemisphere. Still mindful of France's incursion into Mexico in the 1860s, Americans were startled by a French project in 1879 to build a ship canal across the Isthmus of Panama. Later they also came to see Great Britain as a potential interloper, inspiring Secretary of State Richard Olney to a famous warning against such penetration during the Venezuelan crisis of 1895. Fears of European encroachment undoubtedly added urgency to the drive for Hawaiian annexation after 1894 and figured in discussions of Caribbean expansion later in the decade. One result of such fears was advocacy of a sort of preemptive imperialism, a conviction that the United States should seize desirable areas before a rival power got them.

In addition, the constant example of the European powers in time led many in the United States to take a more positive view of imperialism. Thirsting for national prestige, they saw that colonies were highly valued status symbols in Europe and that colonial empires had already swallowed up most of the non-Western world. Furthermore, if Europeans claimed to spread civilization to unenlightened peoples, did not the United States have a more compelling mission to implant its own superior institutions? Finally, the theorists of the Old World had proclaimed that colonial empires could provide strategic bases, captive markets, raw materials, and investment opportunities—in short, could alleviate the persistent distresses from which the American economy suffered.

By 1895 a small but growing number of American politicians, publicists, naval officers, and businessmen supported a modest expansionist program. This generally included the annexation of Hawaii, the acquisition of one or more base areas in the West Indies, and the construction of an isthmian canal across Central America to facilitate naval and mercantile movement between the eastern United States and the Pacific Ocean. Some also aspired to the peaceful annexation of Canada, while others wished to challenge
British political and economic leadership in South America. But virtually all limited their ambitions to the Western Hemisphere, and most to areas traditionally within the sphere of American interests. While this program fell short of a full-fledged scheme of empire, it gave a specific direction to expansionist currents and reinforced the appeal of the imperialist idea.

Many Americans continued to be suspicious of imperialism, but others found that it was increasingly easy to identify imperialism with many aspects of the American tradition. Territorial expansion, a strong sense of national mission, and a dynamic economic growth had been dominant themes in American history. The belief in the inequality of man, which imperialism demanded, offered few problems at a time when the South was even then perfecting a system of segregation and disfranchisement of blacks, the West was in the final stages of suppressing the Indians, and the East fulminated against the inferiority of the new immigrants from southern and eastern Europe. Currently popular theories of social Darwinism held that the various races of man progressed at differing rates according to their place on the evolutionary scale, or failed to progress and fell victim to “natural selection.” No one believed more devoutly in progress than Americans, and the presumed duty of carrying progress to backward lands was popularly called "the white man's burden." This combined belief in progress and human inequality, along with boundless self-confidence and a hope of gain, constituted the principal attitudes that underlay imperialism.

Whether the imperialist appeal was chiefly economic, psychological, nationalist, or idealistic has long been the subject of contention. In fact, it was all of these, and perhaps more. The most fundamental explanation of the global imperialism of the nineteenth century was that the Western world, containing a relatively small minority of the world's people, had achieved a virtual monopoly of effective power. The development of the nation-state enabled the effective mobilization of a society's resources, and coincided with the growth of modern science and industrialization. The latter developments created societies of unprecedented wealth and armed them with weapons of unparalleled destructiveness, while the steamship, the railroad, the telegraph, and the oceanic cable greatly diminished the distances that separated the Western peoples from the rest of the world.

The disparity of power between "modern" and preindustrial societies reached its maximum in the nineteenth century, and it was this disparity that was, quite directly, the driving force behind the breakneck colonialism of the period. Conscious of their strength and brought into close contact with weaker peoples, Europeans quickly developed a sense of superiority and discovered desirable goals to seek in vulnerable foreign places. The process soon created its own mystique, which could be shared by almost any member-state in the Western world. While American imperialism had special national characteristics—as did that of England, France, Germany, and other nations—during the 1890s, American imperialism was not essentially different from the parent European variety. Its American disciples believed otherwise, having as firm a faith in their own uniqueness as their European rivals.

THE ERA OF GLOBAL IMPERIALISM

Although this new thinking rapidly gained ground during the 1890s, it took the shock of tangible events to bridge the gap between ideas and action. After a revolution in Hawaii, which American officials actively abetted, the proposed annexation of Hawaii in 1893 reawakened the debate over colonial expansion but was blocked by the transfer of the presidency from Benjamin Harrison to Grover Cleveland. It was rather the revolt that began in Cuba in 1895 that ultimately mobilized the emotions and ideas of the new expansionism. In 1898 the United States was drawn into a struggle between Cuba and Spain that had brought mass suffering and wholesale destruction to its very borders. An aggressive national pride, emotional partisanship in favor of the Cubans, and tangible damage to American trade and property—all worked to arouse the public and the press, while the dramatic destruction of the battleship Maine acted as a spark to these combustibles. Originally regarded by most Americans as a crusade to free Cuba, the Spanish-American War quickly took on an expansionist thrust. The retention of Puerto Rico, Spain's other Caribbean colony, was soon regarded as a necessary war reparation. Strategically the key to the Pacific, Hawaii was annexed during the war by a joint resolution of Congress. Even the cries to free Cuba gave way to protests that the Cubans needed a period of tutelage before essaying complete self-government.
It was the Philippine Islands, however, that most forcefully brought the imperialist issue to a head. Large, populous, alien, and distant, they neither fell within the traditional geographical scope of American expansionism nor seemed even remotely assimilable to the American federal system. In the United States there had been little thought of acquiring the Philippines before the Spanish-American War, but once war came, the U.S. armed forces attacked them because they represented valuable enemy territory that was highly vulnerable. The initial American victories quickly led to a national conviction that the United States now controlled the islands and was responsible for determining their destiny. Expansionists were quick to argue that the nation should not turn the Filipinos back to Spanish misrule, while to let them drift would invite an Anglo-German struggle for their control. On the other hand, American rule could bring enlightenment to the islands, and their proximity to China might aid American penetration of what was assumed to be one of the great world markets of the future.

Expansionism carried the day, and the peace treaty with Spain provided for American possession of Puerto Rico, the Philippines, and Guam. Hawaii had already been separately annexed, and Cuba was subjected to a three-year military occupation followed by a theoretically sovereign independence in 1902. In fact, however, Cuba became a self-governing protectorate of the United States, with the latter nation retaining important governmental controls and the right of military intervention at its discretion, under the terms of the Platt Amendment of 1901. In the Philippines, meanwhile, an armed independence movement revolted against American rule in 1899, and the ensuing three-year Filipino-American War introduced the Americans to the frustrations and mutual atrocities characteristic of antiguerrilla warfare. The public had expected the Filipinos to greet the advent of American rule with cheers and were disillusioned to meet with hostility instead. Critics questioned the utility of the new colony and the morality of subduing it by force. While U.S. forces finally succeeded in crushing all resistance, anti-imperialists made the most of the contradictions inherent in spreading enlightenment at the point of a bayonet. Colonial empire quickly lost its glamour in the United States, while less formal techniques of expansion gained easier acceptance from the relative success of the Cuban protectorate program. In the twentieth century, American imperialism would be characterized by the extension of influence or control rather than by the outright annexation of territory.

**THE ADVENT OF INFORMAL EMPIRE**

After 1900 the American public lost interest in its new colonies, but the United States continued to expand its power in essentially imperialist ways. This was true principally in the Caribbean region, where the creation of formal and informal protectorates characterized American foreign policy in the period after the Spanish-American War. The war had spurred interest in the building of an isthmian canal, which was to be built as a national project; and following Panama's secession from Colombia in 1903, the project became a reality. The great strategic importance of the Panama Canal, thereafter joined with the considerable American stake in Cuba and its direct sovereignty over Puerto Rico, drew the nation further into Caribbean affairs.

Still fearful of European intervention and solicitous of the growing American economic interest in the area, policymakers in Washington viewed the chronic political instability of the Caribbean and Central American nations as an invitation to foreign penetration and an obstacle to local development. The Roosevelt Corollary to the Monroe Doctrine, enunciated by President Theodore Roosevelt in 1904, claimed for the United States an “international police power,” which entailed a general right to intervene and keep order in the Western Hemisphere. Not only Roosevelt but his successors, William Howard Taft and Woodrow Wilson, steadily expanded American hegemony in the Caribbean. By World War I, Cuba, Panama, the Dominican Republic, Haiti, and Nicaragua were in some kind of protectorate status, while Puerto Rico remained an outright colony. Actual military interventions occurred in Cuba (1906–1909), Haiti (1915–1934), the Dominican Republic (1916–1924), Nicaragua (1912, 1927–1933), and Panama (intermittently and on a lesser scale).

Besides the use of special treaty relationships and military force, the United States attempted to maintain a “monopoly of lending,” under which Caribbean governments would borrow money only in the United States; it also established customs receiverships in several countries, which effectively placed their government revenues under control of the United States. Meanwhile, private enterprise had permeated the region with
American investment and business activity, while the one-crop economies of the Caribbean nations made them heavily dependent upon the American market. Thus, the nominally sovereign states of the Caribbean area were subject to American controls, both formal and informal, which made their real status essentially colonial.

After 1898, the United States was also active in the Far East, but its impact was weaker there than in the Caribbean. Faced with a huge and populous China, and competing with most of the other major world powers, American policymakers could not aspire to regional dominance or military solutions. The “dollar diplomacy” of the William Howard Taft administration (1909–1913) attempted to foster American investment in China and to create international financial arrangements, which would impose a Caribbean-style “monopoly of lending” upon the government of China. This attempt to mobilize American economic strength as a diplomatic tool accomplished little in the Far East, however, on account of both the difficulties of the situation itself and the limited interest of the nation’s business and financial leaders. The earlier Open Door policy of 1899–1900, therefore, remained the principal basis of policy. It represented little more than an attempt to obtain a general agreement to preserve the existing treaty system of shared control in China, and thus equality of economic opportunity in China for the United States. The policy was not very effective, and the Chinese market never came near to meeting the inflated expectations of the West. In general, the limited objectives and relative ineffectiveness of American activities in the Far East fell well short of real imperialism in this period, although the United States was long a party to the treaty system by which the Western powers jointly had imposed a limited protectorate upon China.

**ISOLATIONISM AND THE WORLD WARS**

American participation in World War I led to a revulsion against overseas commitments, which reached its peak in the Senate rejection of the Treaty of Versailles (1919) and the new League of Nations. Rising domestic criticism in the 1920s brought about the liquidation of Caribbean military interventions and moderate relaxation of American political controls elsewhere in the Caribbean. At the same time, however, the U.S. government and business community cooperated in pushing American exports and foreign loans, leading some later historians to envision an “open door imperialism” based on American economic influence abroad. An alternate view was that the United States did indeed seek such economic influence, but that most Americans then thought it possible to separate the political and economic aspects of international relations in a manner considered unrealistic by later generations.

The Great Depression of the 1930s brought an even greater emphasis on the economic side of foreign policy and a corresponding decline in interest in other aspects. The Good Neighbor policy of Franklin D. Roosevelt brought the dismantling of Caribbean military interventions and
political protectorates, at the same time that Latin America was tied more closely to the American economy by means of reciprocal trade agreements. The Philippine Islands were set on the path to independence in 1934, while the Neutrality Acts of 1935–1938 were designed to minimize economic ties to belligerents in foreign wars. The Monroe Doctrine took on a new theoretical formulation as an association of hemispheric equals for collective security, and the isolationist majority in the United States eschewed any national interest in the world's affairs outside the Western Hemisphere. American imperialism was declared to be dead, never to arise again.

At the end of the 1930s there was a rapid reversal of thinking largely caused by the early victories of Nazi Germany during the new European war, and particularly by the shock created by the fall of France in 1940. Americans quickly became internationalists, the new consensus being that the world's democracies must stand together to check the crimes of "gangster nations" like Germany, Italy, and Japan. It now appeared that peace was indivisible and that the United States must be concerned with events in every corner of the globe. With the Japanese attack on Pearl Harbor late in 1941, the United States went to war in both Europe and Asia. During World War II, the United States fought as a member of a coalition that included Great Britain, the Soviet Union, Nationalist China, and many lesser members—a circumstance that drew the United States even further into global affairs. Mobilizing enormous fighting power and productivity, Americans found themselves at the close of the struggle with their armed forces deployed in Europe, Asia, North Africa, the Middle East, Australasia, and Latin America.

THE COLD WAR AND ITS AFTERMATH

World War II humbled or drastically weakened every great power except the United States and the Soviet Union, both of which emerged with greatly enhanced power and prestige. In a world full of power vacuums, this dangerously simplified bipolar balance contributed to a growing rivalry between the two superpowers, as did the strong but mutually contradictory ideas of mission that each possessed. Initially competing for hegemony in Europe, this postwar rivalry soon became global in scope, and American military and political commitments proliferated. At the same time, the preeminent economic position of the United States at the end of World War II much enhanced its influence abroad and gave it great weight in shaping the economic structure of the noncommunist world. Thus, American influence over other societies reached a new high and took many different forms. In the Caribbean, the United States supported anticommunist military ventures in Guatemala (1954) and Cuba (1961), and in 1965, out of fear that a leftist government would come to power, intervened in the Dominican Republic. In East Asia, South Korea, Taiwan, and, later, South Vietnam and Cambodia became heavily dependent upon U.S. military aid. Japan grew into an economic giant but retained close ties to the United States. Other initiatives in the Middle East, Africa, and elsewhere made American activities truly global.

In the economic sphere, the United States overwhelmingly became the chief investor, source of credit, and supplier of new technologies. From the 1940s to the 1960s, the American dollar was the yardstick of international currency exchanges, while an American-sponsored drive toward freer world trade facilitated American exports of goods and money. The purchase of foreign subsidiaries and the development of multinational corporations gave American business enterprise increased influence abroad, while many foreign nations found their principal export markets in the United States.

The political and economic impact of the United States was accompanied by significant social effects. American-style mass consumption spread its appeal everywhere, as the elite of half the globe rushed to emulate the lifestyles of New York and California. American tourists, motion pictures, and television programs went everywhere, while students flocked to American universities from all over the world. Even an economically advanced country like Japan assimilated American models of dress and amusement, and readily accepted bondage to the automobile.

Some viewed the international vogue of American lifestyles and consumer products as cultural imperialism, or a thinly veiled form of economic exploitation. Others deplored the subversion of native cultures and the consequent destabilization of traditional societies by the tide of westernization. Many twenty-first-century scholars, however, are skeptical of the idea of a one-sided cultural aggression, citing the eagerness with which Eastern Europeans and others sought Western fashions, films, and popular
music even when their governments attempted to shut these things out. In this view, developments in the Western world have set off an irresistible global cultural change, in which cross-fertilization complicates any notion of a simple one-way influence. Terms such as “modernization” and “globalization” are used to suggest a generalized force beyond the control of any one society. It was nevertheless the United States that led the way in the process.

In any case, the worldwide distribution of U.S. military bases, security agreements, investments, multinational corporations, foreign-aid programs, and open and undercover political activities gave rise to the charge that American imperialism had not only revived but had expanded over enormous areas. Some critics described an “open door empire” in which American foreign policy sought to impose everywhere the conditions necessary for the penetration of American exports and enterprise, while keeping underdeveloped nations in a state of perpetual economic colonialism. From this point of view, the term “imperialism” applied to virtually every overseas activity of the United States.

Given the undeniably great impact of the United States in the postwar world, the issue was not whether there had been an American influence on other societies but whether that influence was best described as imperialism. Since the United States annexed no territory during the period in question, the most obvious form of imperialism does not apply; there was no formal empire. There were, however, attempts at neo-imperial control of other states. In 1965 the Dominican Republic experienced a U.S. military intervention that imposed a new president, who was retained in power for many years by the active use of American influence and machinations of the Central Intelligence Agency. The Ronald Reagan administration (1981–1989) supported civil wars in El Salvador and Nicaragua in an attempt to bolster right-wing regimes against leftist opponents. Other cases could be cited, but blanket assertions of imperialism went too far. It was doubtful terminology to apply that label to the postwar American record in Europe. It is true that the United States threw its influence into an effort to erect a liberal-capitalist system in Western Europe, just as the Soviet Union worked for Marxist-Leninist states in Eastern Europe. Given a virtual power vacuum in one of the world’s vital centers, no less was to be expected of either superpower. It is also true that the Marshall Plan and companion policies were designed not only to aid European economic recovery but to boost European purchases of American exports. Yet the end result was not merely exploitive, for it helped to recreate in Western Europe one of the great industrial centers of the world, which soon offered stiff competition to the United States itself. Like Japan, West Germany pressed American manufacturers hard in their own markets and often bested them in markets abroad. In time, many European states became effective competitors. To call this performance economic imperialism is both misleading and intellectually counterproductive.

The U.S. military intervention in Southeast Asia during the 1960s ended in the following decade in humiliating failure and a national reappraisal of the American role abroad. For a time, the shadow of Vietnam inhibited further overseas adventures, but the global network of American commitments and interests continued largely intact. Foreign involvements reappeared with the previously mentioned Reagan administration’s activities in Central America, as well as its military deployments in Grenada (1983) and Lebanon (1984), but on a limited scale.

The end of the Cold War in 1989 and the subsequent breakup of the Soviet Union changed the global situation fundamentally, leaving the United States as the only superpower. The Cold War justification for foreign military interventions thereby disappeared, but new reasons for such ventures multiplied. In varying scales of magnitude, U.S. armed forces were deployed in Panama (1989), Somalia (1992), Haiti (1994), Bosnia (1995), and Kosovo (1999), the latter including a bombing campaign against Serbia. By far the largest overseas operation was the Gulf War of 1991 against Iraq, which involved more than 500,000 U.S. troops to protect the industrial world’s oil supply, but motives for the other interventions varied widely. In Somalia, for example, where no visible U.S. interests were at stake, the goal was to remove the obstacles to feeding a starving population, and in Bosnia and Kosovo it was to prevent the outbreak of regional war and prevent mass genocide. Some saw the United States as world policeman, others as global bully, but none could deny the reality of the nation’s power and influence virtually everywhere on the globe.

As the world’s strongest and wealthiest nation for the last half century, the United States was responsible for its full share of neo-imperialist hegemony. At times, however, it acted abroad in conjunction with less powerful nations that
lacked the American capacity to project force quickly to crisis areas. The North Atlantic Treaty Organization and the Gulf War both saw U.S. military power enlisted in the service of a broad coalition of nations and interests. Operating within a highly competitive global economy, U.S. economic power was great but hardly hegemonic, while its cultural influences were eagerly received in large parts of the world even if deeply resented in others. No single definition can contain the enormous variety of American activities, motives, and effects on the world; certainly the term “imperialism” cannot.

Observers over the years have provided many definitions for the term “intelligence.” Many of these definitions are burdensome, or technical, or drawn directly from the term of art. Intelligence is simply information, gathered however necessary and arranged in such fashion as to be of use to those who require it. In foreign policy (and national defense) intelligence guides the hands of policymakers and helps them conduct relations wisely. (However, there are aspects of intelligence that can be obstacles to wise policy.) Foreign policy without intelligence can succeed, but at greater cost and difficulty than well-informed initiatives. In American foreign policy, at least since the end of World War II, there has been a conscious effort to harness intelligence in service of national goals.

THE INTELLIGENCE CYCLE

Careful selection, integration, and analysis distinguish intelligence from other information. In the United States, where practitioners have made a greater effort than in most other nations to develop a conscious theory of intelligence, the terms “intelligence cycle” and “intelligence process” now denote the procedure by which information is brought to the support of policymakers. Because in the theory the word “process” is also used as a verb—to mean the act of taking information and converting it into useful intelligence—this essay will use the term “intelligence cycle.”

The intelligence cycle consists of a number of sequential stages, beginning with realization of what is unknown or uncertain. Officials can ask to find out about those subjects, or intelligence officers themselves may point out a gap in information, actions that lead to an order to collect data on that topic, known as an “intelligence requirement.” Some kinds of information can come only from particular sources, so the capability to gather data from a particular source may be limited, or indeed there may be several ways to get at a piece of knowledge. This means that how to meet an intelligence requirement is a matter of choice, another stage of the cycle. The act of choosing how to gather given intelligence is known as “collection tasking.” What many people think of as the totality of intelligence—the act of actually securing the data—is a stage of the cycle called “collection.”

In principle, in developing any kind of fact-based knowledge, collection must necessarily be by source, while appreciation is by subject. Many facts from a variety of sources may bear on a given subject. Different sources might be a photograph, a radio intercept, a newspaper article, a report from a spy, a diplomatic exchange, a scholarly paper, a radio broadcast, or the like. A given source may supply information on more than one subject, and subjects can be as diverse as a nation’s military power, its economic position, or the health of a leader. Therefore, an act of transformation must occur in the cycle; this is termed “processing.” The American conception is that “raw” information data is processed to become “finished intelligence.” Occasionally, raw dispatches are given to policymakers, but most often they benefit from the skills of professionals who analyze the data to compile finished intelligence reports. This analysis is a further stage of the intelligence cycle, and the act of printing or otherwise creating the finished report, called “production,” is another. Of course, the report is useless unless it actually reaches the policymaker who needs it; circulation of finished intelligence constitutes a stage of the cycle called “dissemination.” Users of the data can then supply feedback on what they liked or did not like, or what they still want to know or find out, thereby completing the cycle by generating new intelligence requirements. Obviously, this is an oversimplified account of a series of repeated and interrelated
steps that may impact on each other as well as on the finished intelligence report, but it does supply a basic picture of how intelligence is derived.

To make this picture more concrete, consider the Cuban missile crisis of 1962. In that event of Cold War history, the United States was gravely concerned over Russian military aid to Cuba. President John F. Kennedy publicly warned the Soviet Union not to supply Cuba with certain types of weapons. That created a collection requirement for U.S. intelligence to verify that the specified categories of weapons were not in Cuba. Russian cargoes arrived in Cuba by ship, and the United States had a number of spies in Cuba, as well as reports from Cuban refugees arriving in the United States. In addition, the United States had access to diplomatic and intelligence reporting from allied nations, primarily the United Kingdom and France. U.S. intelligence also had its own diplomatic and intelligence reporting from Eastern European countries and direct from the Soviet Union. These sources enabled U.S. intelligence to see that Soviet shipments were arriving in Cuba in great numbers.

The Central Intelligence Agency, one of the primary entities in the American effort, responded with a program of aircraft reconnaissance over Cuba, using U-2 spy planes to photograph suspicious targets. One U-2 flight brought back pictures that caused the CIA director to suspect the Russians of deploying weapons (antiaircraft missiles) in such fashion as to deny a reconnaissance capability over Cuba, an action he believed was intended to enable the quiet placing of Soviet offensive weapons (the kind Kennedy had warned against) in Cuba. A few weeks later, several refugee and agent reports indicated a possibility that offensive missiles were being deployed at certain locations in Cuba. Previous intelligence reports by the CIA and the U.S. intelligence community, called national intelligence estimates (NIEs), had found no offensive weapons in Cuba, but additional U-2 flights were eventually scheduled, and one of them checked the suspect areas identified by agents. That flight discovered Soviet missiles on 14 October 1962, leading President Kennedy to decide on a quarantine (blockade) of Cuba and other diplomatic actions. Maritime intelligence subsequently kept close track of the progress of Soviet ships steaming toward Cuba, aerial intelligence monitored the cargoes aboard the ships and the progress of the missile sites in Cuba, and intelligence reports thereafter kept Kennedy closely informed.

A WORLD OF SECRETS

Almost every kind of information can be relevant to intelligence, as becomes evident by reviewing the variety of intelligence outputs. Diplomacy requires information on the private opinions, negotiating positions, and political factors impinging upon actors with whom foreign relations are being conducted. This political intelligence may need to be supplemented by economic intelligence, which covers such areas as resources, national economic organization and strength, labor skills, industrial processes, long-term growth trends, foreign trade, balance of payments, and other information. Military intelligence is of key import and ranges beyond simple counting of numbers of men, ships, and planes. Naval and air intelligence may consider necessary information different from that needed by ground force experts. All will want material on foreign forces, but also predictions on how those forces may change in the future, and on the quality and flexibility of their support systems, weapons technology, trained manpower, planning processes, and the like. Filling in those blanks, in turn, requires more recourse to economic intelligence, as well as scientific and technical intelligence. The latter attempts to judge the capabilities of weapons by reference to data regarding scientific achievement, industrial base, research and development programs, general levels of technological sophistication, and other information.

Judgments in any of the particular intelligence fields may be influenced by additional kinds of information. These include biographical intelligence on the individuals who may be key actors in policies or programs in which intelligence may be interested. In addition, there is basic intelligence, which is a compendium of social, demographic, geographic, economic, and other data about societies of interest to the analyst.

There is also intelligence that is primarily about the adversary’s own intelligence organizations and activities. A foreign nation, even a friendly country, may be of interest for the intelligence operations it conducts, the results achieved with a given style of organization, the threat it poses, some opportunity offered, some specific activity parallel to or interfering with friendly activities, or for many other reasons. In addition, separate intelligence requirements, collection, and analysis may be conducted for the precise purpose of carrying out an operation against a foreign intelligence service, most commonly in espionage or in attempts to recruit an agent.
The above represents a wide panoply of information that can be relevant, truly a world of secrets. The concept that so much raw information is required is a relatively recent development. In the United States, with arguably the most sophisticated approach to intelligence, the practice of closely meshing and piecing together huge arrays of information of many different kinds to derive knowledge on a single discrete question dates from only about World War II (1939–1945). At that time, benefiting from British (and other) experience, and building on a foundation of code breaking, the United States fashioned methods that relied upon several pillars of intelligence, representing different kinds of collection techniques. In the Cold War period and after, those techniques were successively improved and integrated, in a process that continues today. In contrast, prior to World War II, intelligence reporting remained episodic, focused on a single (or a few) sources, and did not explicitly aim at information for policymakers, except where given reports seemed to demand it.

A good example of crosscutting influences and the impact of different kinds of intelligence reporting is the history of U.S. intelligence on Soviet nuclear missile programs. In the period immediately after World War II, scientific, economic, and biographical data, along with intelligence sharing with British allies, enabled the United States to discover that the Soviet Union was pursuing creation of an atomic bomb. Predictions by U.S. military intelligence and the nascent CIA were not accurate on when the Soviets would acquire nuclear weapons, in part due to Soviet espionage, which reduced the technical uncertainties associated with the Soviet program. On the other hand, U.S. scientific intelligence in the form of atomic test monitoring aircraft provided instant knowledge that a nuclear test had been carried out in August 1949.

Predicting the rate at which the Soviets might manufacture nuclear weapons; their ability to deliver such weapons against the United States, either by bomber aircraft or by ballistic missiles; and the attendant production rates for those weapons became priority issues for U.S. intelligence. These concerns drove intelligence tasking and even technological research and development programs (especially those for the U-2 and SR-71 aircraft and the CORONA/Discoverer KH-4 photographic reconnaissance satellite) through the 1950s and even into the 1960s. The CIA sought to recruit agents for information in these same areas, and defectors leaving Russia, along with German scientists returning from working in Russia, were interrogated for their knowledge. Estimates of Soviet factory floor space, fissile materials availability, and other items were compiled from the intelligence and used to predict the size of the Soviet bomb and the delivery vehicle inventory.

In intelligence estimates between 1955 and 1960, the CIA successively overestimated Soviet bomber and missile forces. These estimates led to decisions by President Dwight D. Eisenhower to build up U.S. bomber and missile forces to very high levels, in fact levels that arguably led Soviet leaders in the 1960s to create land- and submarine-based missile forces far greater than required for basic security. Meanwhile, Eisenhower’s confidence in his intelligence also led him to offer, at the Geneva Summit of 1955, an “Open Skies” plan for mutual verification of nuclear forces and confidence building, which Soviet leader Nikita S. Khrushchev rejected. In a negative impact of intelligence, in 1960 another Eisenhower-Khrushchev summit scheduled for Paris was aborted as a consequence of the shooting down of an American U-2 spy plane over the Soviet Union on 1 May 1960.

The planes and satellites provided U.S. intelligence with unprecedented information-gathering abilities. They served as platforms for high-resolution cameras to take pictures or for sensitive radio and electronic recording equipment to monitor radio communications or electronic emissions of all kinds. Even though Eisenhower prohibited further overflights of the Soviet Union after the U-2 was shot down, satellite capabilities soon replaced and outshone those of the aircraft. In this period, as John F. Kennedy took office as president in January 1961, the United States also enjoyed excellent data from a Russian agent, Colonel Oleg Penkovsky, an officer of the Soviet military intelligence with access to much highly secret information of interest to the CIA.

During the 1960s the arms race between U.S. and Russian missile forces continued to be the focus of the secret world of intelligence. This arms race was punctuated by the Cuban missile crisis of 1962. It was not until after the crisis that the Russians had a dependable ballistic missile capable of mass deployment in a protected mode. The Soviet Union began to build these missiles at an increasing rate. President Kennedy, who had discovered that the gap in missile strength actually favored the United States, relied upon this intelligence in canceling further U.S. production, capping the land-based missile forces at 1,052.
The Soviets continued to deploy until they reached the figure of 1,512 in the early 1970s.

Predicting how quickly the Russians would increase their missile force, at what level they might curtail deployment, and whether they would also field novel technologies such as ballistic missile defenses or multiple independently targetable warheads became the key intelligence issues of the 1960s. The CIA and other agencies, even with the considerable intelligence gathered by their machine spies, underestimated the numbers of Soviet missiles in the long term (that is, beyond those under construction, which could be directly observed by reconnaissance satellites). On the other hand, the intelligence estimates did much better on predicting when the Russians would acquire new technologies. However, the estimates seem to have been less influential in the major weapons decisions made by the administration of President Lyndon B. Johnson, who initiated multiple warhead programs for both land-based (Minuteman III) and sea-based (Poseidon) missiles, as well as development of an advanced manned strategic aircraft (eventually the B-1 bomber).

Growth in Soviet strategic forces moved the United States to seek arms control negotiations with the Soviet Union. The Johnson administration concluded a nonproliferation treaty and other agreements prohibiting nuclear weapons on the seabed or in outer space. Johnson also attempted to open talks on strategic nuclear weapons, but the effort was canceled in August 1968, when the Soviets invaded Czechoslovakia. The administration of Richard M. Nixon followed up and actually began Strategic Arms Limitation Talks (SALT) in mid-1969, culminating in the SALT I agreement, signed on 26 May 1972. The course of those negotiations was influenced by diplomatic intelligence the United States picked up from Russian officials—in particular a technical collection program code-named “Gamma Guppy,” in which the United States intercepted radiotelephone conversations among Russian leaders, as well as information gleaned directly from Russian negotiators. The intelligence estimates also gave the Nixon administration confidence that its negotiations covered relevant issues and that it had a handle on what Soviet strength would be under various possible outcomes. After the SALT I agreement, intelligence verified compliance, tracked technological developments, and assisted follow-up negotiations for SALT II and the two Strategic Arms Reduction Treaties (START I and START II), plus the Intermediate Range Nuclear Forces (INF) Treaty. Various intelligence disputes occurred in the 1970s and 1980s that affected these negotiations and U.S.–Soviet bilateral relations, but the essential point is that many types of intelligence reporting were relevant and that the intelligence had crosscutting influence.

**TYPES OF INTELLIGENCE REPORTING**

In the U.S. system there are various documents that reflect intelligence appreciations, each with different standing. With knowledge of the generic type of an analysis, the observer can better understand the importance of intelligence.

**National Intelligence Estimates** The national intelligence estimates (NIEs) represent the highest category of intelligence document (or “product”). The director of central intelligence (DCI), the official who heads the entire American intelligence community, is responsible for the NIEs. He is advised in this by the National Foreign Intelligence Board, a committee on which sits the head of each U.S. agency in this field. The NIEs are drafted by a subordinate unit on the basis of “contributions” from the member agencies. Since 1973 the drafts have been written by area specialists known as national intelligence officers, who collectively constitute the National Intelligence Council. Before 1973 the drafters were generalists in an office subordinate to the Board of National Estimates. Some DCIs (including all since 1973) have had the council/board within their own office; a few earlier intelligence leaders subordinated the board to the CIA’s Directorate for Intelligence. Either way, the director has always had the power to require that specific language (and therefore particular substantive judgments) be included in an NIE. There is also a procedure whereby agencies belonging to the National Foreign Intelligence Board can take exception to a conclusion in the NIE, usually expressed as a footnote to the main text. (At times these dissents have appeared as footnotes or as appendices to a paper or have been written in the main text, depending on the preferences of the director, but the colloquialism for a dissent in an NIE remains to “take a footnote.”) A change in intelligence appreciations that occurs after an NIE has been issued is reflected in a paper known as a “memorandum to holders” of the NIE. A more important change can require a fresh estimate. Presidents, national security advisers, and top officials have varied in the amount of attention they pay to NIEs. Dwight D. Eisenhower
and Lyndon Johnson accorded them great importance; Ronald Reagan and George H. W. Bush paid little heed; others have been somewhere in the middle. Perhaps the main significance of NIEs has been political—these documents represent the considered opinion of the U.S. intelligence community; their substance can be expected to leak if presidents take actions contrary to them, embarrassing the senior policymakers. The NIEs also have a more formal role in weapons system acquisition decisions and military budget planning that should not be ignored.

Special National Intelligence Estimates Like the NIEs, special national intelligence estimates (SNIEs) are created by the interagency process of drafting and review. Their scope and content differ, however. The NIEs tend to be long-term studies of large subjects, for example, the NIE 11/3-8 series, which were five-year predictions for the evolution of Soviet nuclear forces. The SNIE is an analysis of the near-term impact of a specific course of action. For example, in July 1965, when the United States intervened in South Vietnam with massive ground forces, SNIE 10-9-65 analyzed foreign reactions to the new deployment. Similarly, in July 1961, when the United States considered military intervention in Laos, SNIE 58-2-61 predicted probable reactions to this and several other possible courses of action. The national estimates tend to be produced following set schedules, and the SNIEs most often at the request of the president or other senior officials. Partly for this reason the SNIEs can garner more attention than the NIEs.

President's Daily Brief President Harry S. Truman was the first chief executive to demand daily intelligence on key subjects. Since then every president has gotten this kind of reporting, though the form has varied. For Eisenhower, the reports went to his staff secretary, Colonel (later General) Andrew J. Goodpaster, who created summaries he related to the president. John F. Kennedy and Lyndon B. Johnson were provided a president’s intelligence checklist, and the president’s daily brief (PDB) nomenclature was in use by 1968. During the Clinton administration a vice president’s supplement has been added to reflect that official’s special concerns. The PDB is an example of “current,” as opposed to estimative (predictive), intelligence. Because it reflects immediate events and concerns, the PDB tends to get the most attention. For example, Lieutenant General Brent Scowcroft, national security adviser to President George H. W. Bush, related that Bush devoured the PDBs but had little time for the NIEs.

Other Current Intelligence Publications In the United States, intelligence has long supported the government with daily, weekly, or other periodic reports containing the latest data. These range from daily briefings for directors (the CIA takes care of the DCI; the Defense Intelligence Agency, of the secretary of defense; and the Bureau of Intelligence and Research, of the State Department), to newspaper equivalents to digests of communications intercepts or photo imagery. The Central Intelligence Bulletin, published since the 1950s, and the National Intelligence Daily, started in the 1970s, are classic examples of the genre. At the turn of the millennium, excluding the PDB, intelligence published about ten different dailies containing current intelligence items and at least as many weeklies or monthlies, including such titles as Terrorism Review, Narcotics Monitor, Organized Crime Report, Illicit Finance Review, Proliferation Digest, and Arms Trade Report. Burgeoning U.S. interest in global trade is reflected in the daily (five times a week) started under the Clinton administration, Economic Executives’ Intelligence Brief. In general, the current intelligence field is characterized by increasing specialization, which follows from explosive growth in interagency centers focused on single issues or sets of issues.

A further initiative of the 1990s, a product of the computer age, is a distributed information network connecting intelligence analysts and policymakers. Originally called Intellink, this system gives users immediate access to current data on subjects of interest. The system also permits officials to rise above the simple database and contact analysts directly for the most current knowledge. This kind of distributed network has the potential to change the way current intelligence is disseminated, modifying the intelligence cycle by reducing the importance of publication of reports as part of intelligence production.

One more type of intelligence product from specialized intelligence agencies or staffs also bears mention. The National Security Agency produces a paper, The SIGINT Digest, which describes daily developments, the knowledge of which is derived from signals intelligence. Similarly, the National Imagery and Mapping Agency produces World Imagery Report, which serves the same function, although it is produced in the for-
Warning Intelligence. A significant type of intelligence, usually ignored because of its similarity to current intelligence, is data intended to warn policymakers of sudden major developments, such as the outbreak of wars, military coups, or comparable crises. The director of central intelligence employs a national intelligence officer (NIO) for warning who is specifically responsible for this function. The NIO is backed by an interagency committee of second-tier officials from the intelligence community that meets weekly. Both the committee as a group and the NIO have the authority to issue warning memoranda that activate crisis management efforts by the U.S. government. The warning committee also maintains a checklist of potential hot spots and troublesome situations anticipated in the next half-year or so. The committee reports twice a month on the countries and issues carried on the list. An example of warning occurred in the Gulf War of 1990–1991, when the Iraqi invasion of Kuwait on 2 August 1990 included a military buildup along the Kuwaiti border that caught the attention of the NIO and led him to issue a warning memorandum some hours before the invasion began.

Basic Intelligence. Much analytical work builds upon data maintained and updated on a constant basis. Economic statistics; biographies of foreign leaders and officials, not to say adversary intelligence officers; and information on nations’ populations, political parties, transportation infrastructures, and the like are all necessary from time to time. The intelligence agencies all utilize research libraries and have units that produce such basic intelligence. At the CIA the Office of Support Services (formerly the Central Reference Service) performs this task. Its best-known publication is called The World Factbook, though it also produces monthly statistical collections and biographical registers.

PILLARS OF INTELLIGENCE

With outputs of so many different kinds, it is clear that information requirements must necessarily be massive. Intelligence has long since ceased to be a game of spy versus spy and has become a field in which almost every imaginable source is plumbed for its contribution to the whole. Alongside the secret agents are ranged what former CIA director Richard Helms called in a 1967 speech the “machine spies.” The raw information is massaged by analysts and value is added to it by careful comparison, review, and fitting together what are, in effect, jigsaw puzzles. Intelligence authorities are loath to discuss these “sources and methods,” but the outlines of the process are readily apparent and an understanding of this process is important to according intelligence its correct place in American foreign policy.

Until the early nineteenth century, spies remained virtually the only source of intelligence, while intelligence organizations were most notable by their absence. Both organizations and technical means of intelligence collection began to enter the field about the time of the American Civil War. Scientific inventions drove these changes as the twentieth century opened, World War I demonstrated a continuing need for intelligence, and World War II provided a huge impetus for all kinds of intelligence collection methods. The coherent theory of intelligence discussed in this essay also began to come into focus with World War II. The sophistication of all techniques has improved constantly since then, and the Cold War served to spotlight evolving methods. Intelligence is now characterized by a synergistic dynamic in which information requirements drive technological improvements, while scientific talent solves collection problems, thus making new information important and creating fresh requirements.

Agents. Spying has been characterized as “the second oldest profession,” in the sense that its attempts to divine an adversary’s intentions and capabilities are recorded throughout history. Agents remained important even in the era of the machine spy, for some kinds of information cannot be gathered by technical collection means. In the post–Cold War era, with an intelligence focus dominated by terrorism, drug trafficking, international criminal activity, and concerns regarding the proliferation of weapons of mass destruction, much of the key thinking and decision making of adversaries took place in a manner more accessible to the spy than to the machine. As cost became a factor as well, it was evident that in many cases spies were cheaper than machines, even with the extensive networks of the CIA and
other agencies for the care and feeding of spies. At the beginning of the twenty-first century, spies were the province of the CIA’s Directorate of Operations and the Defense Human Intelligence Service of the Defense Intelligence Agency. There were continuing conflicts, to some degree inherent in the nature of this kind of activity, between employment of spies to gather intelligence and their role in covert action, political action, or other fields. In addition, there were difficulties from a human rights perspective, because individuals recruited as agents frequently had checkered pasts. Only in the 1990s did the United States establish standards for personal character in individuals recruited as agents, and these were sometimes honored more in the breach than in the observance. Spies remained a necessary evil.

Individuals to be recruited were often identified by a third party and sometimes solicited by them as well. All aspects of the agent’s relationship with intelligence were handled by a case officer, a CIA (or other agency) person who was not himself or herself the spy. The case officer typically reported to the CIA station in the country in which the espionage took place, though in exceptional cases a relationship might have run directly to headquarters. Material from agents was rewritten by “reports officers” before being circulated to analysts who used it to compile finished intelligence of the kinds noted already. Some policymakers, for example national security adviser Zbigniew Brzezinski during the Carter administration, insisted upon being shown the raw agent reports.

**Attachés** The diplomatic service assigns individuals to posts in foreign capitals as commercial, economic, and cultural attachés. These posts are often used by the CIA and other agencies to provide a cover occupation for intelligence officers overseas. More important, the military services openly send officers to foreign countries as attachés. These officers provide a channel of communication between the U.S. military and foreign services, provide occasional diplomatic assistance, and more or less openly gather intelligence. The practice of sending military attachés in general dates from the late eighteenth century and was adopted as a standard by Napoleonic France (1799–1815). In the United States, the army colonel Emory Upton conducted a two-year research visit to Europe and Asia in the 1870s and demonstrated the value of military officers gathering information abroad.

The U.S. Navy also conducted such roving visits beginning in 1870. Naval attachés (the Marine Corps shares in naval attaché assignments) have been permanently stationed in foreign nations since 1882, army attachés since 1889, and air force attachés (first as part of the Army Air Corps) since the 1930s. The Defense Intelligence Agency (DIA) administers the attaché program, using officers seconded from all the armed services. Reports go to DIA, where they are used in publications and circulated to other intelligence agencies. Attachés can provide considerable amounts of information, even from closed societies. For example, in 1954 an air attaché in Moscow furnished the initial intelligence on a Soviet heavy jet bomber. Similarly, U.S. naval attachés in Japan before World War II reported on Japanese technological improvements, including early data on oxygen-powered torpedoes, the highly capable Zero fighter, the large-caliber guns of the Yamato-class superbattleships, and other matters. Military attachés in Czechoslovakia (now the Czech Republic) during that same period sent home valuable material on Soviet military doctrine and organization.

**Combat Intelligence** Often ignored, combat intelligence is acquired by military forces in the course of their activities, and not only in wartime. A wide variety of intelligence can be encompassed by this category, which includes things learned by scout patrols sent out by ground forces, data from interrogation of prisoners (and defectors), lucky finds by forces in the field, and observations made during normal operations. Information from defectors proved a fruitful source during the Cold War, and would merit its own category except that interrogation of prisoners—the same function—fits more naturally into this category.

A few examples illustrate this category nicely. Union armies in the Civil War made a lucky find in September 1862 when a copy of General Robert E. Lee’s orders to his Army of Northern Virginia was discovered wrapped around some cigars shortly before the Battle of Antietam. In World War II, German prisoners taken before the Battle of the Bulge (December 1944) revealed details of preparations for an attack that were not taken seriously, leading to surprise of U.S. troops along the front. Beginning in March 1978, in the course of normal operations, the submarine USS Batfish detected and followed a Soviet Yankee-class ballistic missile submarine for some seventy-seven days,
thereby gaining key information about the practices and habits of these Soviet strategic forces. In 1983 information from the Russian intelligence officer and defector Oleg Gordievsky proved critical in interpreting a series of Soviet moves indicating they believed nuclear war might be at hand. The case of the war scare of 1983 also shows directly how this kind of intelligence can be reflected in analytical reports, since Gordievsky’s information was incorporated in a special NIE done in early 1984.

**Scientific Intelligence** Scientific intelligence is gleaned from study of technical or scientific documents (often research papers) produced by the intelligence target, or from direct examination of equipment or machinery captured from an enemy in wartime or somehow acquired during peace. Scientific intelligence reached a takeoff point during World War II when the effort to gather information in this fashion first became systematic. Notable examples from that period include British successes in counteracting radio navigation systems used by German bombers in the Battle of Britain (1940), and in deceiving the Germans as to the accuracy of their rockets and ramjets (V-weapons) launched against Great Britain in 1944–1945. A U.S. example is the capture and analysis of the Japanese Zero fighter aircraft, results of which were incorporated into the design of a countering aircraft, the Grumman F6F Hellcat. A Cold War example is how the United States learned of Soviet aircraft design techniques from examining a MiG-25 supersonic aircraft whose pilot flew it to Japan to defect in 1977.

**Electronic Intelligence** Related to scientific intelligence in that it is also analyzed by scientists, electronic intelligence, too, received a great boost in World War II. It involves the reception and recording of electronic emissions, usually from radars, or of the telemetry transmissions from guided missiles, ships, or aircraft undergoing testing. Scientists are able to deduce from this information the radio frequency bands and other characteristics of radars, or a variety of information about systems being tested. Submarines, surface ships, aircraft, and space satellites have all been used to gather electronic intelligence. From the 1940s until at least the 1980s the United States maintained a vigorous program of flights by aircraft equipped to collect electronic intelligence along the periphery of the Soviet Union, China, and other communist countries. These flights, known in the trade as “ferret” operations, numbered over 20,000 and account for the vast majority of the planes shot down in the course of Cold War spy flights. In August 1964 the American destroyers involved in the Gulf of Tonkin incident in the Vietnam War were on an electronic intelligence mission. The same was true of the ship *Liberty*, attacked by the Israeli air force during the Six-Day War (June 1967), and the ship *Pueblo*, captured by North Korea in January 1968. Similarly, a U.S. Navy EP-3E reconnaissance plane off the southern Chinese coast became involved in an incident on 1 April 2001, when a jet fighter of the People’s Republic of China subjected the American plane to such intense harassment that the two craft collided. The Chinese aircraft was lost, and the American plane had to make a forced landing in China, where the crew was held in custody for eleven days, until the United States made a formal statement that could be taken as an apology. In general, gathering electronic intelligence has been among the most dangerous kind of intelligence missions, and has provoked serious diplomatic repercussions as well. On the other hand, electronic intelligence can be quite useful. An example can be taken from 1978, when telemetry data from Russian missile tests indicated that a certain Russian ICBM was being tested with more reentry vehicles than it was credited with by diplomats negotiating the SALT II treaty. In this case the result was to negotiate new definitions for the treaty on how to count missiles for inclusion in the categories allowed by the treaty.

**Communications Intelligence** Communications intelligence is a large subject that includes secret writing, codes and ciphers, transmission and interception, and decryption. All these are aspects of the process of gaining access to, and then knowledge of the contents of, the private communications of a target, whether an individual or a state. This type of intelligence has probably existed as long as there have been spies, given the advantages of knowing what a spy was reporting. Government messages have long been sent in code, and breaking those codes offers knowledge of the inner thoughts of the opponent. In modern usage, messages are most often sent by radio, cable, teletype, E-mail, or other forms of electronic transmission. These communications are subject to interception, and this source of intelligence is considered among the best (and most sensitive, from a security standpoint). The general label of “communications intelligence” used
here encompasses all aspects of contriving to intercept messages, analysis of the transmissions, decryption and decoding of the contents, and translation and making the results available to friendly intelligence analysts. In the United States each of the armed services has a component dedicated to communications intelligence, and all feed material to an umbrella civilian unit, the National Security Agency (NSA). With increasing technical sophistication the personnel requirements for collection of radio transmissions have decreased—the armed services alone employed roughly 120,000 people for this purpose in the 1960s, but the number went down to about half of that by 2000. The NSA employs approximately 20,000 people. With much of the burden of collection switched to satellites, ground stations have been abandoned in Pakistan (1969), Ethiopia (around 1975), Subic Bay in the Philippines (1985), and Berlin (about 1995). In 2000 there were still ground stations in Turkey, Japan, South Korea, and, by means of liaison relationship, in China. Diplomacy and foreign aid required to maintain communications intelligence ground stations have been a complicating factor in U.S. foreign policy.

Special collection operations are sometimes conducted by the CIA or other agencies for the benefit of the NSA. Best known of these are the tunnels built in Vienna (1949) and Berlin (1945–1955), and under the Russian embassy in Washington, D.C. (1985–?), for the purpose of placing listening devices and taps on telephone or teleprinter cables. Diplomatic fallout adverse to the United States occurred when these operations were revealed. In almost every case the target became aware of the special collection activity before its public revelation, and used that knowledge to feed false information to U.S. intelligence. Another special activity involved the use of submarines to secretly place taps on telephone cables underwater in the Russian Far East.

Communications intelligence works like a huge vacuum cleaner, and for all of its difficulties has proved a highly valuable intelligence source. Communications provided key information on the structure and activities of Soviet armed forces; important insights into negotiating aims of Soviet-American arms control talks from the 1970s to the 1990s; data on Chinese involvement in the Korean War; vital information on North Vietnamese commands and on the Ho Chi Minh Trail during the Vietnam War; material on Soviet maneuvers in various international crises; knowledge of the activities of drug cartels and others using telephone communications from the 1980s on; and much else. Communications intelligence played a huge role in World War II, a significant role in World War I, and evolved continuously from the moment when Morse code telegraphy began in the 1850s.

**Photographic Intelligence** Images taken with a camera have been an intelligence source since World War I. Observation from above ground level increases the scope of this intelligence, and aerial observation has been in use since a French officer used a balloon to watch the Austro-German enemy at the Battle of Fleurus in 1794. In the American Civil War balloons were used in this manner, and the first recorded instance of aerial photography dates from that time. The airplane was an important scout in World War I, with cameras soon added, and purpose-built cameras and aerial photography reached a stage of advanced development in World War II. During the Cold War the U.S. Air Force used specialized reconnaissance squadrons for overhead photography. In the mid-1950s the CIA joined the effort, first with high-altitude photo planes (the U-2 and SR-71) and then space satellites (CORONA, or KH-4, with follow-ons, currently up to KH-12). Sophisticated films, cameras, computer-driven digital readout techniques, and database-linked photo interpretation techniques have made overhead reconnaissance a premier intelligence source. The National Reconnaissance Office, formed in 1960 but whose existence was admitted only in 1992, controls the production and operation of satellite systems (aircraft reconnaissance systems known today remain under the auspices of the air force). Interpretation of imagery and circulation of intelligence reports based on photographic intelligence is the province of the National Imagery and Mapping Agency, formed in 1995 from components merged from the CIA and the Pentagon.

Some photography other than overhead reconnaissance is also important to intelligence. Submarines have taken pictures through their periscopes of coastal targets ranging from invasion beaches to adversaries’ naval bases. Casual pictures taken by private citizens (“Aunt Minnie photographs”) may show objects of intelligence interest. In addition, a quite critical contribution through photography is made by the miniature cameras that secret agents use to surreptitiously photograph documents, and the microdot and
other photographic methods used to assist the communication of secrets from agent to handlers. These aspects of photography, and related research and development to create the cameras, are the responsibility of the CIA's directorates of administration, science and technology, and operations.

**Domestic Collection** Intelligence services acquire some information directly from Americans or from foreign citizens who are not agents or spies in any traditional sense. An individual traveling to a foreign country might be asked about impressions gained during the visit. Journalists, missionaries, and others residing abroad have frequently been a source for well-grounded local information. Academics expert in a certain field can provide information or perspectives of which agency personnel are unaware. Businesspeople may have valuable contacts and knowledge. At times, such as the period of the communist Union of Soviet Socialist Republics, this kind of collection from individuals was such a significant source that the CIA made efforts in advance to ask persons traveling to that country to be alert for information on specific matters. This technique remains useful in closed societies. At one time the CIA maintained the Domestic Contact Service to gather this information. The function still exists, although the work of that office has been subdivided elsewhere within the agency.

**Open Source Information** Evaluations of sources of intelligence consistently find that perhaps 80 to 90 percent of information necessary to intelligence can be obtained from sources that are completely public. The term “open sources” has become current for this category of material, which includes newspapers, magazines, technical journals, scientific papers, books, video programs, information that appears on the Internet, and similar items. Since the mid-1990s there has been a more explicit effort to improve the collection and use of open source material. For a short time the CIA contemplated a major directorate for open sources, but eventually settled on the Office for Open Source Collection, which today is located within the Directorate for Science and Technology. Open source information is highly desirable in that its collection involves no political or diplomatic obstacles, often includes material that already has been analyzed to some extent, and is relatively inexpensive compared to data gathered from technical collection sources. A significant drawback lies in the fact that intelligence officers and the policymakers who rely upon them often attribute greater credibility, almost automatically, to information that is “born secret,” simply because it is secret.

**Liaison with Friendly Intelligence Services** Foreign intelligence services with which the United States is allied or maintains private relations are significant sources of information. The best known of these relationships is that with the British, forged during World War II and regularly renewed since. Similar relationships exist with Canada, Australia, New Zealand, Japan, France, Germany, Italy, Turkey, Greece, Israel, and other nations. Some relationships are multilateral and general in nature, similar to military alliances. Others pertain to specific subjects. Some relations exist even with former enemies, such as between the United States and Russia on organized crime. Sharing of intelligence information varies with the degree of trust—for example, the United States shares a wide range of information with Great Britain, but much less with France. The use of the CIA as an intermediary, such as between Israel and the Palestinian Authority from 1998 to 2001, can also have diplomatic aspects. The question of liaison relationships is also complicated by efforts of the partners to spy on one another. United States–Israeli intelligence cooperation soured after 1985, when naval intelligence analyst Jonathan J. Pollard was revealed as an Israeli agent. More recently, French–U.S. relations have been complicated by allegations that the nations engaged in industrial spying against one another, a situation that led to the recall of a CIA station chief in Paris in February 1995. Interests in preserving intelligence relationships may factor in diplomatic initiatives in many instances.

**Counterintelligence** The work of uncovering foreign spies in one's own country or intelligence services is termed counterintelligence or counterespionage. This work predates creation of the Office of Strategic Services in World War II, having been a major focus of U.S. naval intelligence even during the prewar years. From its inception the CIA had a counterintelligence staff within the Directorate of Operations; in recent years this has risen to the status of a center combining both CIA and FBI resources and headed by an FBI official. Counterintelligence can be a double-edged sword. The knowledge and access to secret infor-
mation of counterintelligence units made them a favorite target for the Soviet secret service during the Cold War, as epitomized by the Russian recruitment of British counterintelligence chief Harold ("Kim") Philby, who, after years of suspicion, fled to Russia in early 1963.

The existence and duration of counterintelligence investigations can also have a negative impact on an intelligence organization. During the 1960s, when James J. Angleton headed the CIA’s counterintelligence staff, inquiries aimed at suspected (but innocent) agency officers came close to paralyzing the CIA's foreign intelligence effort against the Soviet Union. Some observers argue that the reaction to the excesses of the 1960s was to dismantle much of the counterintelligence effort, leading to a permissive climate in which espionage flourished—thus "the year of the spy" in 1985, during which half a dozen major spies for Russia or China were uncovered, and the cases of Aldrich Ames (1994) and Robert Hanssen (2001), each of whom succeeded in spying for Russia for at least a decade without being caught.

Counterintelligence failures like these invariably lead to more stringent security regulations and regular monitoring and reinvestigation of veteran intelligence officers. In the United States there are demands for the broad use of polygraph (lie detector) tests, whose utility and accuracy are disputed. The net effect of heightened security, aside from catching spies, is that at some level the work of everyone engaged in intelligence becomes more difficult due to the compartmentalization, degree of precaution, and breadth of disclosure to security officials. In turn, this makes personnel retention a problem. In addition, stringent counterintelligence regimes inhibit the recruitment of spies in the adversary's camp because of the fear that the agents are enemy personnel deliberately attempting to mislead the side recruiting them. Consequently there is a trade-off between efficiency of intelligence work (with danger of espionage as a result) and tight security (with the consequence of lowered morale and performance from intelligence officials). The United States has not yet been able to solve this equation and has vacillated between extremely permissive and tight regimes.

Leaks of information owing to espionage damage the credibility of intelligence, with both policymakers and the public; relations with cooperating intelligence services (which fear information they share may end up in the hands of enemies); and the cohesion of the intelligence community. Counterintelligence is necessary but poses a continuing dilemma.

**EVOLUTION OF U.S. INTELLIGENCE**

A factor in American history since the revolutionary war, the intelligence community that uses the methods here discussed and produces the kinds of data enumerated is necessarily the product of a long evolution. At the time of the Revolution, there was no such thing as the "community" of today; there was not even an organization in the conventional sense. Spying was largely a freelance business. Paul Revere’s ride in April 1775 alerting colonists to a British foray from Boston—a classic example of warning intelligence—was a personal initiative. For the most part, generals ran spies directly as part of their scout services. This was the relationship between British General Henry Clinton and his agent Major John André, as well as that of George Washington with spies John Honeyman and Joshua Merserai, and scouts like Knowlton's Rangers (Nathan Hale, possibly the best known revolutionary war spy, was a volunteer from that unit.) This approach continued through the Civil War, which saw the beginnings of a distinct intelligence mission. In 1861–1862 General George S. McClellan relied upon Allan Pinkerton’s organization, the Pinkerton National Detective Agency, for both intelligence and counterespionage work. Many of the Pinkerton reports exaggerated Confederate strength, and McClellan’s successors terminated the Pinkerton connection, but spying nevertheless became much more systematic. No formal arrangements for spying existed on the Confederate side, but there, too, agents were often used. Scholars of the period have identified more than 4,200 persons who functioned as spies, informants, guides, scouts, and so on. President Abraham Lincoln’s assassin, John Wilkes Booth, certainly a Confederate sympathizer, may have been a southern agent as well.

After the Civil War the U.S. military began to collect information on foreign militaries more systematically. In 1866 the Assistant Secretary of the Navy Gustavus Fox went to Russia on an official information-gathering mission. In 1882 the Office of Naval Intelligence became the first official U.S. intelligence agency. The army created an information office in 1885 that became the Military Intelligence Division in 1918. World War I stimulated growth of both units, as well as the
Cipher Bureau within the State Department on 17 June 1917. The latter contained a code-breaking unit that achieved notoriety (revealed in the 1930s) for unraveling Japanese instructions to their diplomats at the Washington Naval Conference of 1921–1922, an early illustration of the utility of intelligence. The code-breaking unit was abolished in 1929, but State continued to play a coordinating role among U.S. agencies in the field right through World War II.

The need for coordination grew when President Franklin D. Roosevelt ordered the Federal Bureau of Investigation, previously entirely involved in crime solving, to carry out counterespionage activities in Latin America. Roosevelt also created a propaganda organization with quasi-intelligence functions, the Office of Coordination of Information, in 1941. This soon evolved into a true intelligence organization, the Office of Strategic Services (OSS), with propaganda left to the Office of War Information. The OSS developed both analytical and operational sides, greatly benefiting from the pillars of intelligence developed during the war. When the OSS was abolished in 1945, its espionage (and counterespionage) elements went to the War Department, while its analytical unit was absorbed by the State Department, eventually becoming the Bureau of Intelligence and Research that exists today. The other former OSS elements, meanwhile, had a difficult time within the War Department, where OSS counterespionage was seen to be in competition with the army's Counterintelligence Corps, and its espionage nets as having little to contribute.

A far cry from the dreams of former OSS chief General William J. Donovan for a peacetime permanent intelligence service, the postwar situation resulted from decisions by President Harry S. Truman, who was concerned primarily with ending the ravages of war, and not especially fond of Donovan or his ideas. With a growing Cold War in 1946 and later, Truman worried more about intelligence. He approved formation of the National Intelligence Authority in January 1946, under which the former clandestine units from OSS were gathered with the Central Intelligence Group. This order also created the post of director of central intelligence. But the National Intelligence Authority proved to be moribund, and the Central Intelligence Group, of very limited utility, was stymied by the departments of government in competition with it. In 1947, as part of the National Security Act (Public Law 80-253), which also established the Department of Defense and National Security Council, the Central Intelligence Agency became the legally authorized U.S. foreign intelligence organization. As Truman described his intentions to an aide several years later, he had wanted a unit to take the intelligence flowing to him from “200 different sources” and boil it down to make presentations—exactly the kind of activity at the heart of the intelligence cycle described at the outset of this narrative. Functions of the National Intelligence Authority were taken over by the National Security Council (NSC) while the CIA absorbed the Central Intelligence Group.

For several years the CIA grew slowly and gradually acquired missions. Covert operations and political action were added to the agency's basic analytical and espionage functions with the formation of the Office of Policy Coordination by NSC directive in 1948. A 1949 review by a panel of outside consultants found flaws in CIA operations and led to covert action and espionage both being merged in the Directorate of Operations (called the Directorate of Plans until 1973). Agency work interpreting photography led to formation of the National Photographic Interpretation Center in 1953, which the CIA ran on behalf of the entire intelligence community until the 1995 creation of the National Imagery and Mapping Agency. The need for development of machine spies obliged the director of central intelligence to conduct certain research programs, such as U-2, SR-71, and CORONA development, directly out of his own office, but this became formalized in 1962 with creation of the Directorate of Science and Technology (called Directorate of Research until 1964). The Directorate of Administration is responsible for support, security, data processing, recruitment, printing, finance, logistics, training, and other functions.

Air Force General Hoyt S. Vandenberg, who played a key role in the elaboration of the original legislation creating the CIA, left intelligence shortly before the actual creation of the agency. President Truman continued to appoint military officers as his directors of central intelligence, with Admiral Roscoe Hillenkoetter presiding over the CIA's first few years but damaged by a controversy regarding whether the CIA had been surprised by the outbreak of the Korean War or by Chinese intervention in that conflict. Walter Bedell Smith, an army general, instituted important reforms, including strengthening CIA analytical capabilities with the Directorate of Intelligence and the Board of National Estimates.
It was Smith who began the practice of assembling the interagency National Intelligence Estimates. Under President Dwight D. Eisenhower, DCI Allen W. Dulles emphasized covert operations and began the U-2 and other scientific development programs. Dulles served on into the administration of President John F. Kennedy, but the CIA's spectacular failure at the Bay of Pigs invasion of Cuba, a covert operations disaster in April 1961, effectively bankrupted his leadership, and he left the CIA that fall.

During the 1950s the U.S. intelligence community as a whole assumed the basic shape it still retained at the beginning of the twenty-first century. Code-breaking branches of the army and navy had contributed greatly to the outcome of World War II, and each of the services had retained its unit subsequently; the air force and marines added their own radio intelligence branches as well. In search of better coordination, the joint Armed Forces Security Agency was created in 1949 but, beset by interservice rivalries, never achieved its intended effect. President Truman replaced this unit with the National Security Agency in 1952. President Eisenhower, concerned with the multiplication of satellite intelligence mechanisms, and with infighting over programs between the CIA and the air force, created the National Reconnaissance Office (NRO) in 1960 (although its existence remained a secret until 1992). President Kennedy, upset with the tendency of the armed services intelligence branches to promote views favoring their parent services, set up the Defense Intelligence Agency (DIA) in 1961. Armed forces intelligence regenerated over time, and the services always remained crucial in the NSA- and NRO-led activities. Not until 1995, when President William J. Clinton approved formation of the National Imagery and Mapping Agency, a merging of offices from the Pentagon, CIA, NRO, and the services, was any new national-level intelligence agency added to the community. All these units are agencies of the Department of Defense. These agencies also operate in some of the most highly technical—and expensive—areas of intelligence work. The result is that the secretary of defense controls the vast majority (85–95 percent) of the intelligence budget even while the director of central intelligence carries the official mantle of leadership in the community.

Beginning with John A. McCone, director of central intelligence from November 1961 to April 1964, DCIs have made a more intense effort to lead the community, often through procedures for coordinating among the various agencies, multiyear budget studies, or setting requirements for intelligence collection. These efforts have met with very limited success. The Pentagon's control of a large proportion of appropriated funds has been a key obstacle but not the only one. In the case of the FBI and the State Department's Bureau of Intelligence and Research, and certain other entities, small elements of large government departments participate in the intelligence community but are responsible to cabinet officials over whom the DCI has no authority. The actual degree to which a director of central intelligence can lead the intelligence community is a recurrent issue in American policy.

McCone and his successors, notably Richard Helms (1966–1973) and Williams E. Colby (1973–1975), faced the major task of integrating the new intelligence technologies into the old framework. Satellites, sophisticated electronic emissions receivers and recording devices, underwater receivers, airborne interception mechanisms, computer data handling and image interpretation, and many other innovations transformed the intelligence business during the 1960s and 1970s. In particular, the sheer volume of information collected that was deemed to have intelligence value grew astronomically. Finished intelligence reports that used all the new information were a great improvement over earlier products, as exemplified by the way the missile gap dispute was resolved through the advent of satellite photography. But management of the new mechanisms, scientific research and development for intelligence purposes, funding these expensive systems, and finding ways to use the information without compromising the security of intelligence collection all posed problems for community leaders. These issues recur as new generations of intelligence technology reach the hands of operators.

The opposite side of the same coin is the need for old-fashioned spies, "human intelligence." The machines gather vast amounts of information whose importance is difficult to gauge. The inside information given by agents is often a key to interpretation. This issue became salient during the 1970s, and virtually every policy review of intelligence since then has upheld the need for more human intelligence sources. In response to the felt need, the CIA redoubled efforts to recruit agents. During the Cold War the agency enjoyed considerable success; in the Viet-
nam War and against China spying proved more difficult. On terrorism and drug trafficking, key intelligence questions of the 1990s and the twenty-first century, the need for spies was still acute. At the same time evolving human rights and moral standards make unacceptable the recruitment of agents whose character would have been ignored in an earlier age. There will be continuing tension between different aspects of agency interest in human intelligence.

A thorny issue that has also recurred for U.S. policymakers is the degree to which intelligence does, or should, directly impact on U.S. foreign policy. The ideal concept has been that intelligence speaks truth to power; that is, secret information to policymakers informs decisions that are made on the basis of this private knowledge. In theory, the information is disinterested and devoid of private agendas; in practice this is often not the case, even for simple intelligence analysis. One reason alone justifies the existence of the CIA, despite the many objections made about it: this organization provides presidents and their top officials with a source of information independent of the government departments responsible for actions. Military intelligence traditionally takes the most dire view of the threat, thus justifying large defense budgets and weapons purchases to counter that threat. In war, military intelligence reports most optimistically on the results of operations. In the Vietnam War, the Gulf War, and the Kosovo War (1999), military intelligence estimates of the effectiveness of bombing in every case had to be revised downward after they were made. During the Vietnam War, there were notorious controversies between the military, both air force and DIA, and the CIA over the degree of success obtained in bombing North Vietnam. For its part, State Department intelligence sees possibilities for negotiation where none may exist. Here, too, the CIA can play a cautionary role.

However, the pure archetype of intelligence theory is difficult to achieve in fact. Directors of central intelligence can be, and have been, asked for their opinions on policy subjects. The mere act of a president putting his DCI on the spot by asking an opinion takes the CIA (and the intelligence community more broadly) out of the role of neutral arbiter and inserts it into the policy process as an interested player. Declassified records of the National Security Council, which are currently available for a period spanning the 1940s through the 1970s, show DCIs Allen Dulles, John A. McCon, Richard Helms, William Colby, and George H. W. Bush all commenting on policy, not merely intelligence matters. When more documents covering these and later periods become available, they will undoubtedly demonstrate the same pattern for other DCIs. It is the president’s prerogative to solicit advice from anyone, not excepting intelligence officials, but this adds to the difficulty of preserving separation between intelligence and policy roles.

Another facet of the problem of preserving a separation in roles arises from the DCIs responsibility to protect intelligence sources and methods. That statutory responsibility may conflict with policy in ways we are not aware of today. Desire to protect an intelligence source may lead a director to furnish disguised or watered-down information that presents less than a full picture. Conversely, full disclosure may result in compromise of sources. For example, it has been reported that during the Carter administration, a leak from an NSC staffer led the Soviet Union to arrest aircraft designer Adolf Tolkachev, who had been one of the CIA’s most valuable sources. Directors of central intelligence must be aware of the dangers that lie at the nexus of policy and intelligence.

A further aspect to the policy-intelligence conundrum is that the CIA, and the intelligence community more broadly, do have certain policy interests. In particular, these arise when intelligence engages in covert operations. Political action in western Europe during the Truman administration; paramilitary operations in the Far East, South Asia, and Latin America during the Eisenhower administration; and paramilitary actions in Nicaragua, Angola, Cambodia, Mozambique, and Afghanistan during the Reagan administration all represented real U.S. foreign policy initiatives in which the CIA was a principal player. To say that agency advice to a president can be divorced from policy interests in such cases is wishful thinking. It is also nugatory to argue that such covert operations are small items that can safely be ignored within the confines of a larger global policy. The Kennedy administration’s failure with the CIA invasion of Cuba at the Bay of Pigs in 1961 had major impact on Kennedy’s predispositions in many policy areas. The Iran-Contra affair during the Reagan administration triggered a near-constitutional crisis in the United States. Another Reagan-era covert operation, the CIA paramilitary action in Afghanistan, encouraged the development of, and provided weapons and training to, fundamentalist Islamic guerrillas.
who transformed themselves into anti-U.S. terrorists in the years after the war. As of 2001, Islamic terror was construed to be one of the top national security threats to the United States. Programmatic interests in supportive capabilities, such as military special forces, intelligence satellites and booster rockets, information and propaganda resources, and so on, are clearly also areas where intelligence has an actual policy stake. In short, the separation of intelligence from policy has always been imperfect and waxes and wanes depending on the president, his policy proclivities, and the constellation of senior officials surrounding the chief executive.

INTELLIGENCE ISSUES IN FOREIGN AND NATIONAL SECURITY POLICY

Intelligence can have great value in foreign policy and national security, but good intelligence is difficult to come by. Among the leading foreign policy dilemmas posed by intelligence is the need to frame relations with nations as affected by certain aspects of the spy business. The desire to maintain ground bases for certain technical collection means, or for covert operations, may drive decisions on economic and military assistance. General bilateral relations can be affected by nations’ spying against one another, particularly when major agents are caught and revealed or ships and aircraft crash or are captured. A desire to recruit agents may dictate waiver of human rights concerns that should be upheld, with the consequent danger of difficulties should such relationships surface. The desire to preserve a stream of intelligence sharing may be threatened by friendly nations spying on one another, or by fears of secret information leaking to third countries. In addition, bilateral relations can be directly affected by intelligence covert operations, while the general image of the United States in the world can be influenced by impressions of how ready the United States may be to resort to covert operations.

In theory, intelligence represents a disinterested purveyor of unbiased information to the president and other leaders. This ideal remains an ideal because presidents are people—they ask for help and advice, recommendations on anything from policy to politics. Directors of central intelligence can be pulled into the policy fray even if they would prefer to avoid it. In addition, the notion that intelligence does not have any real policy interests of its own is flawed, for directors of central intelligence may also be drawn into policy issues due to their responsibility to protect sources and methods. The policy versus intelligence question remains a live issue in America.

Finally, there are issues that may require policy decisions that are directly intelligence matters. Most obvious is the budget—how much should the nation pay for intelligence, and are the data worth the outlays? Related budgetary issues include the distribution of funds among technical collectors, agents, development programs, analysts, support functions, and the rest. Information issues include the emphasis to be placed upon current reporting versus that devoted to long-range prediction. Also vital is the packaging of intelligence—what kinds of reports of what types are the most useful? An information issue that persists is the relative emphasis to be given to secret, as opposed to open source, information. Then there is the technical issue of the tension between the need for high-security counterintelligence and the desire for the most efficient intelligence community. At the apex is the community role of the director of central intelligence—how much leadership can or should the director exercise, and can or should Department of Defense and other players in the intelligence field be brought under the director’s authority?

These are not the only recurring issues regarding intelligence and American foreign policy, but they are among the most salient. Each of the issues is relevant to structuring intelligence to best support American policy. All of the issues can confidently be expected to arise in the future, whatever their status may be in the present context. For this reason alone, they should be carefully considered.

Internationalism in American foreign policy has had different meanings for nearly every generation of citizens and diplomats. It has been associated with all forms of external contact with the world, the relationships becoming more extensive and political with the passage of time. As a foreign policy, it has usually been viewed as the antithesis of isolationism, and in that sense it has involved political commitments or “entanglements” through multinational treaties as well as membership in international organizations. In a broader context, it has also encompassed official and unofficial nonpolitical activities—economic, social, cultural, and scientific—usually evidenced through affiliation with specialized international societies or agencies. Some internationalists have thought in terms of a universal community, a broad brotherhood of people with common concerns, needs, and aspirations that exists as a reality beyond the confines of nation-states. In recent times, internationalism has taken on a new meaning under a doctrine of responsibility, with the United States assuming the burden of “policeman of the world,” both unilaterally and multilaterally.

THE EARLY YEARS
Long before isolationism became an established policy in the nineteenth century, citizens of the American colonies recognized that they could not live apart from the rest of the world. They existed within an imperial system that involved them in numerous crises and four world wars (Queen Anne’s War, King William’s War, King George’s War, and the French and Indian War), mostly related to trade and territories. Early Americans understood that international law applied to them as they redefined their relationships toward their neighbors and their mother country. William Penn reflected the cosmopolitan atmosphere when he drafted his Essay Towards the Present and Future Peace of Europe (1693), in which he called for a congress of states to promote stability. Evidence of a broad perspective also appeared in a colonial union, the New England Confederation of 1643, and in the suggestion for joint action embodied in the Albany Plan of 1754. Joseph Galloway’s proposal for an Anglo-American council in 1774 also expressed a cosmopolitan outlook. Such experiences, as well as an awareness of the Iroquois League of the Five Nations, may explain why revolutionary leaders like Benjamin Franklin and Thomas Paine spoke favorably of an international organization. Certainly, the Articles of Confederation and the Constitution of 1789 revealed a general awareness that sovereign states could combine to promote their interests.

Events during and after the Revolution related to the treaty of alliance with France, as well as difficulties arising over the neutrality policy pursued during the French revolutionary wars and the Napoleonic wars, encouraged another perspective. A desire for separateness and unilateral freedom of action merged with national pride and a sense of continental safety to foster the policy of isolation. Although the United States maintained diplomatic relations and economic contacts abroad, it sought to restrict these as narrowly as possible in order to retain its independence. The Department of State continually rejected proposals for joint cooperation, a policy made explicit in the Monroe Doctrine’s emphasis on unilateral action. Not until 1863 did an American delegate attend an international conference. Even so, Secretary of State William H. Seward reflected prevailing views by refusing to sign an 1864 multilateral treaty related to the Red Cross. The United States did not subscribe to such a convention until 1882. Thereafter, cooperation on economic and social matters seemed acceptable, but political issues, especially those involving Europe, were generally avoided until the end of the century.

241
THE BEGINNINGS OF ORGANIZED INTERNATIONALISM

Although most citizens accepted the principle of isolationism, scattered voices throughout the nineteenth century called for a more cooperative stance toward the world. As early as the 1830s the American Peace Society, under the direction of William Ladd, sponsored essay contests concerning international organization, and in 1840 Ladd utilized many of the ideas in drafting his well-known Essay on a Congress of Nations. His proposal for both a political body and a judicial agency gained considerable public notice through petition and educational campaigns during the ensuing years. After Ladd’s death in 1841, Elihu Burritt, a reformer known as “The Learned Blacksmith,” presented the congress of nations program to European pacifists with such regularity that they referred to it as the “American idea.”

The Civil War in America (1861–1865) and conflicts in Europe (1854–1856, 1870–1871) undermined the peace movement, but a developing interest in the law of nations kept alive the concept of global cooperation during the last third of the century. Several societies emerged to promote the codification of international rules of behavior and to encourage the settlement of disputes through arbitration by a third party. These were not new ideas, but leading citizens in many nations around the turn of the twentieth century seized upon the arbitration concept to guarantee a warless world.

This activity contributed substantially to the evolution of thought concerning an international organization. As countries signed arbitration accords, men—and a few women—began to think beyond such limited agreements. Agencies would be needed to implement the treaties; laws would have to be codified. As John Westlake, an English law professor, observed, “When we assert that there is such a thing as International Law, we assert that there is a society of States; when we recognize that there is a society of States, we recognize that there is International Law.”

The arbitration settlement in 1871–1872 of the Alabama Claims, an Anglo-American dispute over damages caused by Confederate cruisers, led to the signing of many other arbitration agreements during the next four decades. Most were disputes involving monetary and boundary claims and questions arising under treaty clauses; this discouraged pacifists, who hoped to see accords calling for all controversies to be arbitrated. They rallied to promote their goal, gaining public endorsement in the 1890s. The Lake Mohonk (New York) Conference on International Arbitration, which began in 1895 and met annually through 1916, united American civic, business, religious, and educational leaders in a quest to institutionalize arbitration. Proponents recognized that the Senate would not subscribe to unlimited agreements, so they agreed that matters involving national honor and vital interests be exempted. Their support resulted in the Olney-Pauncefote Treaty with Great Britain in 1897, which called for the arbitration of monetary and territorial differences. As expected, the Senate exempted disputes affecting national interest and honor, and then insisted that the Senate have authority to exempt from arbitration any dispute submitted for settlement. Even these safeguards did not satisfy the extreme isolationists. After adding yet other reservations, the Senate refused to ratify the treaty.

These developments had a lasting impact upon American internationalist thought. First, arbitration accords encouraged the exploration of cooperative methods of resolving disputes and breached barriers that had kept statesmen from previously examining such subjects. Second, these experiences warned internationalists that they must be cautious about proposals for a union of nations. It was quite clear by the time that the United States fought Spain in 1898 that Washington would not assume obligations that would weaken its sovereignty or jeopardize interests deemed vital to its welfare. Finally, the advances in arbitration influenced discussions at the first genuine international assembly of nations, the Hague Conference of 1899.

ARBITRATION AND LEGALISM

U.S. delegates at The Hague supported a convention to create the Permanent Court of Arbitration. Because the Court was little more than a list of names of persons who could be called upon to hear issues, because the convention exempted matters of national honor or interest, and because the submission of disputes was optional for governments, isolationists in the Senate put up little serious resistance. The convention proved popular, especially after the American delegates added a proviso that ratification would not mean abandoning traditional policies of nonentanglement or policies like those found in the Monroe Doctrine.
The convention fertilized the young internationalist movement. By 1900 a number of persons had presented plans that would move the world beyond courts of arbitration. Most of these called for a world federation that vaguely reflected the American political experience. Benjamin F Trueblood, secretary of the American Peace Society, advanced the idea in The Federation of the World (1899), in articles, and in lectures. The interdependence of men and nations, he argued, would lead inevitably to “a complete political union of the world, a great international world state, built up somewhat on the pattern of our union of States, with supreme legislative, judicial and executive functions touching those interests which the nations have in common.” Trueblood quickly cautioned that he envisioned no powerful agency. The union would operate primarily in a legislative and judicial capacity, without a formal executive, and it would possess no authority to compel its members to maintain peace. Between 1899 and 1914 a wide variety of proposals appeared, with a few internationalists devoting exceptional thought and time to the subject. Their suggestions unquestionably influenced the twentieth-century movement toward international organization, and their writings reflected a number of basic assumptions. First, they believed that an inexorable evolutionary process was at work. That process included the arbitration treaties, the willingness of governments to cooperate at The Hague in 1899, and the budding interest of governments in a court of justice. Secretary of State Elihu Root in 1907 enunciated this viewpoint when he declared that the importance of The Hague meeting of 1899 was that it made a follow-up meeting possible. Out of this he foresaw law, order, and peace. Said Root, “The world has entered upon an orderly process through which, step-by-step, in successive conferences, each taking the work of its predecessor as its point of departure, there may be continual progress toward making the practice of civilized nations conform to their peaceful professions.”

Raymond Bridgman, a Boston journalist, echoed Root in a volume of essays, World Organization (1905). He saw continued meetings as the foundation stone for an international body. It could begin with a legislature modeled after the U.S. Congress, and then be followed by a court and an executive agency. New York attorney Hayne Davis also reflected this philosophy in articles published between 1903 and 1912. A “United Nations” would emerge, said Davis in what appears to have been the first use of that term. Just as the United States had been forced to develop a more perfect government after the Revolution and the Confederation period, so would the world be compelled to build a better system to keep the peace.

This evolutionary concept appeared in nearly all of the internationalist proposals. Each began by calling for further development of the arbitral network through a series of treaties that would bind nations together. Then states could explore other ways to promote their common needs. Events seemed to confirm such logic. Between 1903 and 1914 governments concluded more than 162 arbitration accords, and in 1907 the Second Hague Conference convened. The State Department kept step by negotiating a series of treaties in 1904 and 1905 that respected the Senate’s concern for American rights, honor, and interests. Nevertheless, senators inserted into each agreement a clause giving the Senate the right to veto arbitration of a dispute. President Theodore Roosevelt reacted sharply. He considered the Senate action to be a violation of the constitutional authority of the chief executive and refused to exchange ratifications. In 1908, however, he relented, authorizing Root to negotiate other agreements that reflected the Senate’s wishes.

In 1910, President William Howard Taft decided to go further and seek agreements to arbitrate all disputes. Two such treaties in 1911 inevitably ran afoul of the Senate, which nullified his efforts and restricted the process in such a way that Taft abandoned his quest. In short, even before Woodrow Wilson became president, internationalists understood that the Senate would likely object to any meaningful proposal for American participation in a world organization.

This may explain why Wilson’s secretary of state, William Jennings Bryan, took a less controversial course by signing conciliation accords with many governments. Unlike arbitration agreements, these did not bind the signatories to the decisions of a third party. Bryan also introduced the “cooling-off” principle, whereby political leaders promised they would not resort to force while a case was pending. This concept was widely adopted after 1914.

Internationalists soon moved beyond their advocacy for an arbitration system and presented an even more important proposal. The world, they argued, needed a genuine court of justice. They viewed arbitration as limited because it contained no fixed principles that could be univer-
sally applied. With established laws and impartial judges, nations could submit disputes to a reliable and fair tribunal. With the U.S. Supreme Court as their (usually) unstated example, internationalists believed that an international system incorporating universally accepted rules (laws) might prompt governments to allow the court to hear even cases involving honor and independence.

The United States officially supported the goal of a court of justice at the Second Hague Conference, but the delegates had been unable to agree on a method of selecting judges. International lawyers and advocates of the evolutionary hypothesis continued to work for some type of judicial agency. The American Society of International Law, established in 1906, and the American Society for Judicial Settlement of International Disputes along with the Carnegie Endowment for International Peace, both formed in 1910, concentrated on this objective. Resolutions of peace congresses and other internationalist organizations reflected a popular desire for a judicial tribunal. President Taft’s secretary of state, former corporate lawyer Philander C. Knox, proposed in 1909 that a maritime prize court discussed at the Second Hague Conference be reconstituted as an international court of justice. The proposal went nowhere. The fears of nationalists continued to be more influential than the hopes of the internationalists.

Nevertheless, proposals concerning an international court of justice inevitably revived interest in the old scheme of a periodic congress. Evolutionists viewed it as a vital next step. Even more significantly, advocates of an international court saw it as an important development because, they argued, some agency had to establish the rules (the international law) that would guide the judges. The First Hague Conference had stimulated demands for additional meetings, and the congress theme became increasingly popular after 1900. Bridgman began a successful petition campaign to obtain the endorsement of the Massachusetts legislature, while the American Peace Society embarked upon an extensive propaganda campaign to reach religious and civic bodies. One writer breathlessly called the periodic congress idea “the demand of the hour.”

Such agitation prompted action that had a direct bearing upon calls for the Second Hague Conference. In 1904, representatives of the Interparliamentary Union, an association of legislators from congresses within nations, met at St. Louis, where they resolved to support the convening of a second Hague Conference. Under the leadership of U.S. Representative Richard Bartholdt of Missouri, they persuaded President Roosevelt to join them in calling on foreign chancellories to support the plan. The 1907 conference was the fruit of their labors.

Bartholdt had launched this project along with peace advocate Hayne Davis, and the two men proposed that “a regular Congress of Nations be created, to meet at stated periods, to discuss international questions and make recommendations to the governments.” By April 1906 the nearly two hundred congressmen who had joined the Interparliamentary Union agreed to endorse Bartholdt and Davis’s aims. The periodic congress proposal gained acceptance at The Hague in 1907 in the form of a resolution calling for further meetings. Internationalists hoped that a third session might convene in 1914 or 1915. The outbreak of war, however, frustrated their aims.

As the periodic congress idea gained in popularity, some planners began to focus on specifics, exploring, for instance, how an evolving organization would operate and the powers that it must have. Perhaps unsurprisingly, most of these planners thought in terms of a federation modeled after that of the United States, with legislative, judicial, and executive agencies. Such a structure would allow nations to divide their sovereignty. They would allocate certain responsibilities to the central body while retaining control over those affairs most important to themselves, an arrangement that many internationalists hoped, or perhaps assumed, would mollify nationalist members of the Senate. Hamilton Holt, managing editor of The Independent magazine, popularized this theme, with help from other prominent internationalists like Andrew Carnegie. The steel magnate repeatedly called for a “league of peace,” a proposal that may well have inspired Theodore Roosevelt to float his own version of a league of peace in 1910.

The most ambitious undertaking in the years from 1910 to 1912 was what Holt and his co-activist, Oscar Crosby, called a World-Federation League. Its intricacy may have owed much to Crosby’s background as an inventor and engineer. He and Holt had been energized by Roosevelt’s brand of skeptical idealism. They called for the creation of a U.S. commission authorized to draft for Congress “articles of Federation” for the “maintenance of peace, through the establishment of a court that could decide any dispute between nations.” This was revolutionary enough, but what especially distinguished their proposal was that the court would have the ability to enforce its
judgments by calling for the use of military force by members of the federation. The Holt-Crosby emphasis on legal procedures backed up by military force would become more common—and more controversial—during the next decade.

Although Congress failed to address their proposal, in 1910 it did unanimously pass a resolution sponsored by Representative William S. Bennet of New York. Perhaps the fact that the resolution passed unanimously signifies that it had little real importance, for it actually committed the United States to nothing that nationalists viewed as threatening the concept of sovereignty. What the resolution did do, however, was to call for a commission to explore the possibility of both arms reduction and the creation of an international naval force (composed of existing navies) that could police the oceans. In a sense, this may have been less radical than it appears. Former President Theodore Roosevelt had recently incorporated the policing idea into what historians call the Roosevelt Corollary of the Monroe Doctrine as well as his league of peace proposal. Although his motives were no less nationalist than internationalist, he more or less legitimized the concept sufficiently to elicit congressional approval of Bennet's 1910 resolution.

President Taft, however, never acted. Despite pressure from pacifists and federalists, Taft—who would later contribute a great deal to the movement for a league of nations—kept his own counsel. Yet it is worth noting that Taft, whom historians generally view as much more conservative than either his predecessor or his successor, reflected the progressive emphasis on settling international disputes peacefully. Taft was the most legalistic president of the twentieth century, even more so than Woodrow Wilson. His commitment to the so-called conciliation treaties, along with his dedication to international law, provided additional foundation work for the flowering of internationalism later in the century.

**ORGANIZATION FOR WORLD GOVERNMENT**

A few internationalists of the pre-1914 period went beyond federal principles to advocate a world government. Sixty years later, this kind of thinking would fuel a backlash against internationalism. Not so before World War I, when the idea was too novel to inspire great fear. Journalist Raymond Bridgman called for an internationalist agency that would coin money, regulate trade, control patents and copyrights, and (again reflecting a powerful current in turn-of-the-century progressivism) even supervise global monopolies. He and his followers also favored the establishment of an international executive with considerable authority, including the authority to use force to maintain peace. Roosevelt incorporated this latter idea in his Nobel Peace Prize address; Holt occasionally flirted with the idea; and Barthold's suggestions to the Interparliamentary Union in 1905, no less than the Bennet resolution of 1910, embodied this principle. Andrew Carnegie, too, endorsed the need for an international police force, as did Lucia Ames Mead, a prominent Boston reformer and peace advocate. Publisher Edwin Ginn favored an army to maintain order; and Cyrus Street, an eccentric realtor from San Francisco, presented some extreme views along this vein. He published a small journal, called *The United Nations*, in which he noted the need for a government “with power to make, judge, and execute laws; and to provide for the final disposal of all their armies and navies.” He meant by this that a United Nations would have the sole authority “to enforce peace and prevent war from ever occurring again” (italics in original). After 1919, of course, this would hardly seem so eccentric.

Representative James L. Slayden of Texas added another feature when he introduced House Joint Resolution 72 in April 1913. It called for all Western Hemisphere nations to unite in “the mutual guaranty of their sovereignty and territorial integrity.” Although the resolution never got out of committee, it again points to the degree to which traditional isolationism—or, more accurately, the unilateralism expressed by such things as the Roosevelt Corollary—was subject to challenge.

In truth, such suggestions represented a minority opinion among those who favored the creation of an international organization prior to 1914. The plans for periodic congresses (inspired by the Congress System that emerged from the Vienna Conference of 1815), for a federal approach to order that clearly limited a single organization's powers, and for a court of justice appealed to many more Americans. Even the court idea, however, was complicated by competing legal visions. American delegates had proposed the formation of a court of justice at the Second Hague Peace Conference in 1907. The court concept, however, stood in conflict with the arbitration ideal that emerged from both the First and Second Hague Conferences. The formation of
a Permanent Court of Arbitration appealed powerfully to some internationalists, but it contradicted the hopes of those, like legal scholar James Brown Scott, who hoped to see a court more committed to “adjudication” and less to arbitration. The differences between these concepts was not always clear, even among internationalists, but the former was usually viewed as more useful in legal disputes among nations, while the latter would presumably handle more “political” matters that involved the necessity for compromise.

While such debates monopolized the attention of lawyers, other internationalists gravitated toward more modest proposals. Historian George L. Beer advocated an English-speaking union, while Ellery C. Stowell, who taught law at Columbia University, believed that a general alignment of states along geographical lines would provide the basis of order. Stowell was among the first to use the term “internationalism,” a concept that he viewed as binding America and its allies along both political and economic lines.

Cultural and racial considerations, too, came into play. The new Rhodes Scholarship program appealed to Americans—many of them imperialists like Theodore Roosevelt—who believed that the United States indeed should share the white man’s burden. Internationalism and imperialism would part company in the United States after World War I, but there was yet no consensus about this in the prewar period, as the turn-of-the-century debate over the U.S. role in the Philippines had shown.

One thing, however, was becoming increasingly clear. The development of turbine-engine ocean liners and the telegraph had already compressed both time and space in ways that would profoundly influence the growth of internationalist thought. Since the end of the Civil War, Americans had participated in a growing number of meetings on an ever-widening variety of topics. “Functionalism,” modern writers call this theme, as if to emphasize that cooperation regarding such functions has powered the growth of internationalism generally. Subjects as varied as communications, health and sanitation, weights and measures, patents, copyrights, currency, and agriculture provided the basis for international conferences. And not just conferences. The late nineteenth and early twentieth centuries became an age of organizations such as the General Postal Union, founded in 1875, followed by a telegraphic union, a health organization, and many others. These bodies redefined the very context in which isolationism could survive and internationalism would thrive. Not only public officials, but private citizens, served as delegates to these organizations and attended these conferences. Such contacts engendered a growing awareness of global interdependence as the United States developed industrially and thrust outward economically and territorially.

The result was the development among some internationalists of a genuine sense of global community, promoting what is commonly called cultural internationalism at the beginning of the twenty-first century. Unlike the more typical internationalists who took the Darwinian system of sovereign states for granted and sought to tame interstate competition through legal restrictions and, occasionally, military cooperation to enforce the peace, the cultural internationalists approached their task in a very different frame of mind. They saw the process of unity advancing not through a political process involving institutions and agencies created by the nation-state, but through the relationships of people more or less transcending the state. They were precursors of those who, a century later, would describe the world as a global village, and they viewed international society as much more organic than the political and legal internationalists who emphasized individual rights rather than the rights of societies (whether national or international). If the political and legal internationalists tended to approach their task via the rule of law and military enforcement, the cultural internationalists more often appealed to common interests and a sense of common humanity.

WORLD WAR I

The First World War began in Europe in 1914, engulfing the United States nearly three years later. This was the war that Americans of a progressive generation had sought to avoid, isolationists by ignoring Europe, internationalists by erecting the machinery that might prevent a small dispute from becoming a larger conflict. At first, internationalists despaired. In 1915, however, the military carnage in Europe energized Americans who argued not that international cooperation was impossible, but that it had not been sufficiently tried. In short, they resolved to work harder, to construct peacekeeping machinery that might work much more effectively than the failed pre-1914 arbitration and conciliation treaties.
Although arbitration and conciliation had been discredited, few internationalists gave up on the quintessentially American faith in law. Led by former president Taft, many Americans joined what soon became the most important internationalist organization of the wartime years, the League to Enforce Peace. Such a league, argued its founders, would incorporate a judicial court to provide the basis for international stability. Formed in the spring of 1915, it aimed to prevent war, not to win a war once war broke out or to use force as a threat to prevent states from violating the peace in the first place. This point is important, because the League to Enforce Peace really had little inclination to enforce anything. Its program reflected the prewar faith in procedural machinery that could be used to resolve differences before they erupted in war. It would compel nations to submit their disputes to various agencies in order to guarantee that peaceful disputes did not turn violent. Sanctions, both economic and military, theoretically existed to compel a state (or states, as long as they were members of the organization) to resolve differences peacefully. Presumably, sanctions would be applied whenever a party to a dispute refused to follow prescribed procedures. But theory and practice were never reconciled, for the League to Enforce Peace recommended no use of force in the event that states rejected its recommendations or decisions. As one of its leaders, Harvard president A. Lawrence Lowell, put it, no international organization could be effective once war erupted; it had to succeed in preventing war, not ending war.

Other internationalists agreed. Few would endorse the potential use of force by any international organization. The World’s Court League, second only to the League to Enforce Peace as an internationalist organization with substantial national influence, called for a judicially centered body with no power to compel the submission of controversies or to uphold decisions. No power meant no effectiveness, but the noise of war ironically shrouded this reality in the context of World War I. The emphasis on judicial authority without enforcement provisions spoke to the aspirations of most Americans, who believed that it really made no sense to fight a war to prevent a war. Pacifists, of course, applauded such an approach. So did many lawyers who either neglected the need for enforcement to compel people (or states) to obey the law, or who were so enamored of the logic and sanctity of law that they ignored the fundamentally anarchic nature of the international system.

WILSON’S LEAGUE OF NATIONS

Despite the limitations of these plans, both organizations—the League to Enforce Peace and the World’s Court League—campaigned vigorously to promote not only their projects but the more general idea of a league. Even the critics of international organization did not doubt that a vast majority of citizens found the league idea attractive by 1919. President Wilson incorporated it into the famous Fourteen Points address, his most important speech regarding war aims. At the Paris Peace Conference, he then insisted that the final peace treaty contain the League of Nations proposal. Nevertheless, Wilson had done little to clarify his thinking about a league during the war. He consciously and consistently rejected suggestions to spell out a peace plan before the summer of 1918. Only after the British presented their own plan and the fortunes of war turned decisively in favor of the Allies did the American president encourage more detailed thinking about the subject.

In part because he believed the British plan, authored mainly by Lord Phillimore, to be toothless, he increasingly emphasized the importance of both economic and military sanctions to compel states to maintain the peace. This approach not only differed from that of the British but substantially deviated from that of the League to Enforce Peace. Wilson not only became increasingly sympathetic to sanctions, but veered away from the League to Enforce Peace plan in a number of other ways. These included his insistence on a guarantee of territorial integrity, his emphasis on disarmament, and his stress on the binding and compulsory nature of arbitration. Oddly, the president, who had written some serious history, ignored the main lines of prewar American internationalist thought. By calling for an organization with considerable authority that emphasized elements of power politics rather than legal principles, he virtually guaranteed that his plan would encounter stiff opposition at home.

Americans bided their time while Wilson in Paris, together with a handful of colleagues from the larger states, hammered out the League of Nations Covenant behind closed doors. French skepticism about a league and British fear of too strong a league gave way before Wilson’s influence. Moreover, the president’s willingness to compromise on territorial, imperial, and financial issues was contingent on European willingness to approve his version of the Covenant. At the heart of that Covenant were four articles that, Wilson
had come to believe, would make war a thing of the past. Article 10 guaranteed the territorial and political independence of every member state. Article 11 mandated that any threat to the peace was of concern to every member of the organization and authorized the league to take “any action that may be deemed wise and effectual to safeguard the peace of nations.” Article 15 established procedures to settle matters that could not be arbitrated or settled in court, and Article 16 provided the machinery for economic and military sanctions. For a nation schooled in isolationism and quite unprepared for the kind of commitments that Wilson had championed in Paris, the change in course was quite radical. Wilson gambled that the fear of another world war would persuade Americans to embrace his proposals. Nonetheless, by failing to prepare the public for such a radical change, and by ignoring the crassly political crosscurrents that the treaty fight unleashed, the president found himself on the defensive during the remainder of his term.

The story of the treaty fight of 1919–1920 has been recounted many times. Conventional interpretations emphasize the clash between isolationism and internationalism, and between the Democratic president and his chief Republican opponent, Senate Foreign Relations Committee chairman Henry Cabot Lodge. Isolationism, of course, was an extension of nationalism, and the next two years would witness a real clash between internationalism and nationalism. Even former president Theodore Roosevelt would repudiate his internationalist leanings by damming the league as pro-German. “We are not internationalists,” he said as he denounced the league, “we are American nationalists.” His own hatred of Wilson was reflected in his indictment of the league. Substituting internationalism for nationalism meant, he argued, the rejection of patriotism. “The professional pacifist and the professional internationalist are equally undesirable citizens,” said the still-popular ex-president.

This kind of demagoguery took its toll. Even though historians agree that most Americans favored a league of some kind, the public grew increasingly wary of a league that contained the kind of advance commitments regarding force embodied in Articles 10 and 16. To many Americans, fighting a war to prevent a war just did not make much sense, as the prewar internationalists in the World’s Court League had claimed. Perhaps Wilson really believed that the threat of using force against an aggressor state that violated the League of Nations Covenant would suffice to guarantee the peace. The American public was less sure. The result was that the Senate debated not membership itself, but the kind of league the United States might join. The slim Republican majority in the Senate, and even some Democrats, sought to whittle away the obligations of membership. Wilson remained uncompromising. The president’s supporters, therefore, failed to mobilize the two-thirds Senate majority needed to ratify the Treaty of Versailles. Sadly for Wilson, the first twenty-six articles of that treaty constituted the League Covenant.

INTERWAR ISOLATIONISM AND INTERNATIONALISM

The refusal of the Senate to ratify the Treaty of Versailles, followed by the victory in the 1920 presidential election of Warren G. Harding, who had rejected the league, claiming to favor a mythical “association of nations,” meant that the United States never joined the League of Nations. Neither would the Senate ratify a treaty to join the country to the Permanent Court of International Justice, organized in 1921 as an affiliated agency of the league. Did this in fact represent a repudiation of internationalism? Scholars are not of one mind. Almost surely the voting public in 1920 would have approved a somewhat scaled-down League of Nations that lacked the automatic territorial guarantee embodied in Article 10. And although the Harding administration refused even to answer mail from the League Secretariat in Geneva, there are few indicators that the public approved the administration’s rigid rejection of international cooperation. Indeed, by 1923 the State Department had begun to soften its anti-league policy by accepting invitations to league-sponsored meetings and sending unofficial observers (“something between a guest and a spy,” quipped one league proponent) to Geneva on a regular basis.

Another piece of evidence that many Americans remained sympathetic to internationalism was the Harding administration’s disarmament and foreign policy. State Department support for hosting the Washington Naval Conference—held from November 1921 to February 1922—stemmed at least in part from the fear that, with the League of Nations a going concern, America might find itself more isolated than was desirable. Certainly many isolationists favored the naval
Internationalism

limitation treaty that emerged from the conference, but the treaty garnered overwhelming support among internationalists, both of the idealist variety and those who would later be called realists, like Secretary of State Charles Evans Hughes and future Secretary of State Henry L. Stimson. The other agreements signed at Washington also spoke to the belief among internationalists that U.S. strategic and economic interests made isolationism obsolete. The Four-Power Pact guaranteeing the status quo in the western Pacific may not have contained enforcement provisions, but it did obligate the signatories to consult in the event of a threat to the peace. Internationalists likewise supported the Nine-Power Pact guaranteeing the “open door” and the status quo in China.

In short, the Harding administration forged a web of relationships that did not support overt intervention abroad but did contradict the fundamental basis of isolationism. These relationships were further supported by an economic policy that increasingly reflected the corporate side of American life. The post–Civil War Industrial Revolution tied American prosperity to a healthy global economy. The policymakers who promoted U.S. loans to China and Latin America were internationalists, not isolationists, as were their banker and industrialist friends. They may have differed among themselves over such issues as imperialism and even military intervention, but few still doubted that America needed to be involved in the global economy of the twentieth century. Some of these policymakers were themselves financiers and industrialists, like oil magnate Charles G. Dawes, who served as vice president during the Coolidge Administration (1925–1929), and banker Norman Davis, who served both Wilson and Franklin D. Roosevelt in various foreign policy posts. Their prominence gave substance to the belief that international cooperation had become an article of faith in post–World War I Washington.

No wonder, therefore, that even President Harding favored U.S. membership on the World Court, officially the Permanent Court of International Justice. The Advisory Committee of Jurists who met at The Hague in 1920 and drafted the court’s statute included the influential Elihu Root, a Republican Wall Street lawyer who had served Theodore Roosevelt as secretary first in the War Department and then in the State Department. Root typified many of the Republican internationalists during the 1920s. He had misgivings about President Wilson’s brand of enforcement internationalism, preferring the prewar legal approach that emphasized the importance of judicial processes and the codification of international law. His prestige, along with that of future World Court judges like Charles Evans Hughes and the legal scholar John Bassett Moore, helped to legitimize the court for most Americans. The unimaginative Calvin Coolidge, who succeeded Harding in the White House and has often (and too simplistically) been described as an isolationist, also called for membership on the court. So did every subsequent president and secretary of state during the interwar period. Enough isolationist opponents of the court remained in and out of Congress, however, to prevent ratification of court membership until after World War II. When the most important Senate vote on membership occurred in 1935, these isolationists capitalized on the insecurities generated by the Great Depression and the fear of an aggressive Germany and Japan to block ratification by a two-thirds vote. Americans favored international cooperation, but not to the extent of risking war. This may not have been full-blown internationalism, but neither was it isolationism.

It is important to remember that support for World Court membership during the interwar period did not always translate into support for league membership. Nevertheless, many internationalists continued their Wilsonian campaign into the early 1930s, believing (perhaps correctly) that the new organization could not succeed without U.S. participation. As with so much else regarding foreign policy between the wars, the results were mixed.

Pro-league spokesmen lobbied with some success for support in the political platforms of the two major parties, and they publicized the league’s work in order to generate renewed interest. Hamilton Holt, former Supreme Court justice John H. Clarke, and Theodore Roosevelt’s former attorney general, George W. Wickesham, founded in 1922 the most focused supportive organization, the League of Nations Non-Partisan Association, later renamed the League of Nations Association. Women’s and religious organizations, such as Jane Addams’s Women’s International League for Peace and Freedom, strongly endorsed the league, while pacifist groups and legal bodies supported World Court membership. The World Peace Foundation, the Carnegie Endowment for International Peace, and the American Society of International Law led the pro-Court parade.

Internationalist educational activity complemented these efforts. The establishment of organ-
izations like the Foreign Policy Association, with its many local chapters, publicized international affairs generally and cooperative international activity in and out of Geneva specifically. The Carnegie Endowment helped to sponsor international clubs in high schools, while a number of colleges and universities instituted major programs in international relations. A few, like Harvard, Princeton, and Johns Hopkins, founded graduate institutes to produce specialists who might find their way into the State Department or into teaching positions at other institutions.

Other organizations, too, warrant mention, including some that encouraged cultural internationalism. Of special importance was the establishment in 1919 of the Institute of International Education. The IIE promoted educational exchanges abroad for both students and teachers and, after World War II, administered the Fulbright scholarship program. It shared an assumption common among interwar internationalists: that familiarity with foreign cultures would promote understanding and therefore peace.

A few internationalist enthusiasts, such as the journalist Clarence Streit, who founded one of the more popular internationalist organizations, Federal Union, favored a plan to organize the world’s democracies into a world federation to ensure peace. Streit’s movement eventually included more than a quarter of a million Americans in local chapters and represented the most popular prointernationalist response before Pearl Harbor. Other internationalist organizations, like the Council on Foreign Relations, which first appeared in 1921, headed in a more traditional, or “realist,” direction. Founded by former cabinet members Elihu Root and Henry L. Stimson, the council capped its membership at about 550 prestigious individuals from government, business, journalism, and university life who met with domestic and foreign officials, hosted seminars on wide-ranging issues concerning foreign policy, and published the prestigious journal Foreign Affairs. The council’s influence was much greater than its actual membership would suggest. The degree to which it closed its doors to the general public led many isolationists, both then and later, to see it as the center of an internationalist conspiracy to involve the United States in foreign entanglements or wars. Unlike Streit’s organization, it remained committed to a very traditional model of state sovereignty, albeit one that rejected the assumptions undergirding American isolationism.

When by 1923 it was clear that the United States would not join the League of Nations, internationalists turned their attention to increasing American cooperation with the league and its agencies short of membership. But they also sought to influence American attitudes toward the outside world by creating a sense of collective “responsibility”—the world would soon achieve almost religious meaning—to support Covenant principles that advanced peace.

The first program succeeded reasonably well. By the mid-1920s the United States regularly participated in league commissions dealing with nonpolitical matters, notably health, social, and economic problems. It also cooperated in the disarmament area, though without much success. International cooperation, of course, was not pursued exclusively through the league or league-related agencies. Some Americans continued to work for pre-league internationalist objectives such as arbitration of interstate disputes and legal, not political, means to resolve problems. The arbitration ideal, discredited by World War I, bounced back among Americans with short memories and received additional support by the league itself with the establishment in 1927 of the Arbitration and Security Commission. Partly through the commission’s efforts, Washington would eventually negotiate twenty-seven arbitration treaties between 1928 and 1931, though these treaties, as earlier, usually excepted consideration of such important interests as the Monroe Doctrine.

Efforts to further strengthen international law as a bulwark against disorder led the Carnegie Endowment for International Peace in 1923 to establish and fund the Academy of International Law at The Hague. The Carnegie Endowment also funded efforts to continue the codification of international law, particularly in the Western Hemisphere. James Brown Scott, who founded and led the American Society of International Law, spearheaded this work. To the disappointment of Scott and his colleagues, little of it captured the public imagination as it had before World War I. At best, the limited agreements that resulted from these efforts allowed the United States to balance its economic interests and its legal ideals.

Those economic interests carried the U.S. government in both directions during the interwar period, sometimes at the same time. Internationalists applauded the involvement of Washington in forging the loan programs embod-
ied in the Dawes Plan (1924) and Young Plan (1929) to stabilize the European economy. They were silenced, however, by the economic nationalism expressed in 1930 when President Herbert Hoover signed the protectionist Smoot-Hawley Act. Nor did the Democrats who joined the Roosevelt administration offer consistent support to the economic internationalists. When Franklin Roosevelt's secretary of state, Cordell Hull, an orthodox Wilsonian, attended the London Economic Conference of 1933 to forge a global solution to the economic crisis, the president undermined his efforts by siding with economic nationalists who opposed Hull. Yet the following year, Roosevelt gave his blessing to Hull's internationalist program for reciprocal tariff agreements to lower rates.

**MANCHURIA AND COLLECTIVE SECURITY**

It was shortly before Franklin Roosevelt became president that Japan set in motion a series of challenges to the existing international order that eventually led to American involvement in World War II. These were the kind of affronts to the post–World War I treaties that the League of Nations had been created to prevent. For good or ill, American officials had shunned league considerations of such political controversies until the Manchurian crisis of 1931–1932. Secretary of State Henry L. Stimson, a staunch internationalist who believed powerfully in the sanctity of treaties, sent a delegate to the league council debates in October 1931 to consider Japan's violation of the Nine-Power Pact of 1922. Stimson's anger at Tokyo almost triggered a fundamental shift in Republican Party policy toward Geneva. The secretary, a proponent of what would soon be called collective security, gave serious consideration to embargoing American trade to Japan should the league invoke the sanctions authorized by the Covenant's Article 16. President Herbert Hoover demurred, however. He feared that economic sanctions would inevitably lead to military sanctions, which in his mind meant war. As a result, Stimson's initiatives, while heartening the battered internationalist movement at home, ultimately led nowhere.

Nor was the next president, Franklin D. Roosevelt, able to repair things. He had been a strong supporter of league membership when he ran for vice president in 1920. In 1932, however, he reversed his position, fearing that he might alienate isolationist progressives from the Midwest and West whose support he needed for the presidential nomination. Domestic political considerations overrode his internationalist instincts.

Nevertheless, by the time he became president in 1933, cooperation with Geneva concerning nonpolitical subjects had become so routine as to be hardly newsworthy. Internationalists had established extensive ties at Geneva. American citizens held league administrative posts and promoted both official and unofficial contact between Washington and Geneva. Arthur Sweetser, a Boston journalist who served in the league's Information Section, became the focus of such contacts. He worked closely with the Harvard law professor Manley Hudson, who established a study and research center at Geneva. Hudson even sought gifts from Americans to underwrite league programs, and those he obtained included a Rockefeller Foundation grant of $2 million to establish a library at the league's headquarters.

Until the late 1930s, however, little of this kind of activity made much difference. Even Roosevelt, privately sympathetic to international cooperation, remained publicly wary of pro-league enthusiasts who advocated outright membership or even just political cooperation with Geneva. Nevertheless, amid the indifference or even hostility of many depression-scarred Americans concerning international cooperation, a few well-known internationalists kept the faith. The historian James T. Shotwell became the leading advocate of the idea that the United States must reject doing business as usual with governments that broke treaties or defied the League Covenant. If this could not be done through league membership, then states should morally condemn violations of international law through such treaties as the Kellogg-Briand Pact (Pact of Paris) of 1928, which renounced war as an instrument of policy. Similar was internationalist support for Secretary Stimson's 1932 nonrecognition doctrine, enunciated to deprive Japan of legal sanction for its occupation of Manchuria. Internationalists also applauded Roosevelt's support for the Neutrality Act of 1935 because it permitted the United States to establish economic sanctions parallel to potential league sanctions against an aggressor by prohibiting American trade in war-related materials. But like so much other activity during the Great Depression, these measures were not unambiguously internationalist. Isolationists, too, generally
supported them—indeed, it was Senator Gerald Nye, an isolationist, who initially proposed neutrality legislation—because neutrality posed so little risk to the United States. The result was a foreign policy that veered erratically between internationalism and isolationism, leading critics to claim, with some justification, that the Roosevelt administration had no foreign policy at all.

**WAR IN EUROPE AND THE UNITED NATIONS**

This ambiguity dissipated after the European phase of World War II began in September 1939, ushering in what eventually became the most internationalist phase of American foreign policy. Between 1939 and the attack on Pearl Harbor, the country was sharply divided between internationalist advocates of aid to America's European allies and isolationists who feared such aid would lead to an unwanted and unnecessary American involvement in the war. The internationalists were themselves divided between outright interventionists and those who, led by William Allen White and his Committee to Defend America by Aiding the Allies, argued that sending military equipment and loans would make American participation in the war against Adolf Hitler unnecessary. All these internationalists called for the repeal or modification of neutrality legislation and other laws that hindered the free flow of materials to governments fighting the Axis Powers. By late 1941, Washington had lifted most restrictions against sending aid to Great Britain. Rejecting the charge of inconsistency, these same internationalists applauded the imposition of economic sanctions against Japan regarding oil and scrap iron.

The European war in 1939 and the attack on Pearl Harbor in 1941 seemed to confirm what internationalists had been saying for years about the need for an effective collective security organization. They also reinforced the argument in favor of American membership. Isolation, charged the internationalists, had not only failed but made world wars more rather than less likely. Even months before Pearl Harbor, 87 percent of Americans claimed they favored some kind of postwar organization. To most Americans, Hitler had made internationalism not only respectable but necessary.

The president of the League of Nations Association, James T. Shotwell, and his executive director, Clark M. Eichelberger, founded the somewhat pompously named Commission to Study the Organization of Peace, which cooperated with the State Department in formulating U.S. proposals for what eventually became the United Nations. (The League of Nations Association changed its name to the American Association for the United Nations in 1943.) Next in importance to the commission was the Federal Council of Churches to Study the Basis of a Just and Durable Peace, led by collective-security advocate and future secretary of state John Foster Dulles. Altogether, thirty-six private internationalist organizations joined this effort to create the UN, threatening to make the task chaotic.

The task of coordinating the planning for the UN fell mainly on an obscure State Department economist, Leo Pasvolsky, who headed the department's Division of Special Research (which had, at various times, other bland titles). No one worked more tirelessly or anonymously than he. At a time when American planning for the UN was hampered by rivalries between State Department officers, between Republicans and Democrats, and between congressional leaders and State Department officials, Pasvolsky managed to keep the project afloat. And because American officials had done much more planning than their counterparts in other countries, the final charter would reflect American thinking to a great extent.

The UN Charter was drafted primarily at three conferences: Dumbarton Oaks (August–October 1944), Yalta (February 1945), and the special UN conference at San Francisco (April to June 1945). Although the president had raised the issue of a postwar organization with the USSR's Joseph Stalin and Britain's Winston Churchill at various wartime conferences, the details—including the critical questions relating to membership and great power authority—were postponed until the latter stages of the war. A small group of officials, not the internationalist movement generally, resolved these matters, agreeing with Stalin's insistence that each of the great powers possess a permanent veto in the UN's Security Council. They also agreed that the Security Council, and not the larger General Assembly, would control the UN's enforcement machinery.

This time the president and his advisers, in contrast to President Wilson, did their political homework. They employed a broad spectrum of American internationalists to prepare the way for ratification of the UN Charter. Preceding the vote the administration launched the most ambitious
campaign to support a foreign policy objective of the entire twentieth century. It included parades, parties, lectures, and radio and school programs. UN supporters turned isolationism into a dirty word. Everyone, it seemed, had become an internationalist, which masked the real differences within the movement. Even many Republicans who had opposed League of Nations membership a quarter of a century earlier now promoted UN membership. Less than a month after the San Francisco Conference, the Senate ratified the UN Charter by 89 to 2.

The charter reflected much of the structure and many of the operational features of the League Covenant, including a basic reliance upon power politics and a response to crises only after a breach of the peace. Like Woodrow Wilson, Franklin Roosevelt believed that an alliance of nations, functioning through an organization, could best maintain stability (though Wilson thought more in terms of universality, Roosevelt more in terms of great power cooperation). The United Nations Charter called for states to sacrifice very little sovereignty. Even former American isolationists could call themselves internationalists, knowing that American interests were protected by the permanent veto.

**UN SKEPTICS**

Nevertheless, the nation had indeed shifted decisively toward a more internationalist position. Washington quickly and quietly joined UN-related agencies like the new International Court of Justice (which replaced the older Permanent Court of International Justice) and the International Labor Organization. (The United States had actually joined that organization in 1933, but only because ILO proponents emphasized its separation from the League of Nations itself.) Membership in both came with some of the usual nationalist protections, such as the Connally Amendment preventing the International Court from hearing cases that Congress considered within the “domestic jurisdiction” of the United States.

Not all Americans accepted the United Nations unquestioningly. A vocal isolationist remnant, led by Senator Robert Taft, challenged the new internationalist faith and its emphasis on sanctions and entanglement. A small but visible group of internationalists, too, raised concerns about the UN. They complained not that the UN had too much power, but that it had too little. Where isolationists and nationalists feared that the new organization would compromise American sovereignty, the internationalist critics mainly argued that the UN left its members with too much sovereignty. Many called for a world federation, more or less inspired by Clarence Streit’s *Union Now* (1939). UN proponents may have stolen much of Streit’s thunder, but his movement continued to promote the federation ideal, which emphasized the primacy of people rather than states. This became evident in 1958, when Grenville Clark and Louis B. Sohn published the most famous treatise on the subject of federalism, *World Peace Through World Law*. They proposed that the UN General Assembly become the foundation of the new system, with delegates elected by subject populations and not selected by sovereign governments. Law, not national interest, would be the driving force behind the federation, therefore ensuring the likelihood of permanent peace.

Considered utopian by most academic writers, this brand of internationalism never achieved real popularity. A diverse coalition of groups called Americans United for World Organization sought to mobilize support for this kind of federalism even before the end of the war, but internal disputes eventually rendered it impotent. In 1947 it merged with a few other federalist groups to form its better-known successor, United World Federalists. This organization, too, failed to dent the pro-UN consensus. In part, its timing was wrong. Federalism necessitated international cooperation, exactly the opposite of what occurred after 1947 as the Cold War became the dominant international reality. Ideological differences and military alliances rendered the federalists irrelevant.

**COLD WAR**

Ironically, the American love affair with the UN would mask some real changes to the organization. Not only did the Cold War make the federalists irrelevant, it stripped the Security Council of authority at the very moment that it most needed support. With the Soviet Union increasingly using its permanent veto to block enforcement action by the UN’s American-led majority, the UN could not live up to its promise. Only in Korea during 1950, and then solely because a Soviet boycott of the Security Council left the USSR unable to exercise its veto, did the UN come close to addressing its original purpose. As a rule, the veto shifted the
UN to the periphery of world politics. Americans increasingly came to associate collective security not with the UN but with the North Atlantic Treaty Organization, formed in 1949. But NATO was much closer to being a traditional military alliance than a universal collective security organization. As long as the UN would be hampered by the Soviet veto—which meant that so long as the UN would not serve as a convenient instrument of American foreign policy—Cold War internationalists like Dean Acheson, secretary of state from 1949 to 1953, would hold it in disdain.

The Great Depression, World War II, nuclear weapons, and the Cold War had discredited isolationism. But internationalists may have celebrated their victory too casually. If nearly everyone had become an internationalist, then the term was in danger of losing its meaning, which is exactly what happened during the next forty years. Indeed, many outspoken nationalists proclaimed themselves internationalists, promoting the projection of U.S. power throughout the world through the new system of alliances. Yes, they admitted, the world had shrunk. Economic interdependence and advances in communications and weaponry—including intercontinental bombers and missiles—made cooperation expedient. But it was anticommunism, not technology, that served as the glue holding their foreign policy worldview together, and anticommunism, as the McCarthy era proved, was often associated with xenophobia and unilateralism.

INTERNATIONALIST INCONSISTENCY
What did all this mean? Confusion, at least. Scholarly terms reflected the confusion: internationalism, interventionism, globalism, multilateralism, transnationalism, hegemonism. But some things are clear, including that for many members of the post–World War II generation of internationalists, U.S. involvement abroad, utilizing UN agencies or other institutions, lacked a commitment to equality that the pre–World War II internationalists had promoted. Prewar internationalists generally viewed internationalism as a way to create a warless world and a more just international society. Post–World War II internationalists proved more willing to ignore both. Justice played second fiddle to the national interest. Especially after 1970, as Third World countries became the UN majority, Washington rejected what it viewed as radical proposals to share the resources of the industrialized North with the developing and needy South. From 1972, when the State Department rejected Third World demands for a new international economic order, to 2000, when the Clinton administration ignored proposals to forgive the debts of sub-Saharan African nations, issues of economic justice have been greeted unsympathetically by official Washington.

Americans after World War II also proved more willing to entertain—and occasionally even promote—the use of military force, as they did in Korea and Vietnam, but also in less risky areas such as the Dominican Republic (1965), Grenada (1983), Panama (1989), the Persian Gulf (1991), and the former Yugoslavia (1999). Motives varied, ranging from anticommunism to regional hegemony to humanitarianism. So did the degree of international cooperation. In Korea, Cold War internationalists fought under a UN flag; during the Gulf War, under less formal UN authorization; in Yugoslavia, under NATO command. But in Latin America there was barely a pretense of cooperation. In fact, the Organization of American States formally condemned the U.S. intervention in Grenada.

The inconsistency concerning collective military activity also characterized the record of the United States in areas even more traditionally viewed as internationalist, such as support for international law and arms negotiations. Ever since the Hague Conferences, internationalist lawyers had promoted the creation of an international court to reduce the anarchy inherent in a system of sovereign states. They believed that the codification of international law would promote stability and peace, and that an international court would serve as a capstone of the legal system. Their dreams were partially fulfilled when, after both world wars, the victorious nations established international courts. But the court ideal never attained its promise, partly because of American policy. During the interwar period, Congress refused to ratify the statute of the Permanent Court of International Justice. Nearly forty years after World War II, American support for its successor, the International Court of Justice, would be dramatically reversed when the Reagan administration in 1984 rejected the court’s authority in a celebrated case brought against the United States by Nicaragua. To accentuate the retreat from internationalism, Washington then formally repudiated the court’s compulsory jurisdiction in all cases involving U.S. interests unless specifically mandated by treaty. Nevertheless, inconsistency tri-
umphed here, too, as the United States joined with other countries at the end of the century to create the International Criminal Court with authority to try defendants charged with genocide and other violations of the law of war.

Arms negotiations offered another version of the same story. The development of atomic weapons by the United States and the Soviet Union during and after World War II dramatized the need for arms reduction and limitation. Internationalists helped to negotiate and ratify a number of agreements, most notably the Nuclear Test Ban Treaty of 1963, the bilateral accords negotiated with the Soviet Union during the 1970s, 1980s, and early 1990s (SALT I, the 1972 ABM Treaty, the 1987 International Nuclear Forces Treaty, and the 1991 Strategic Arms Reduction Treaty, known as START). In 1997 the Clinton administration, with some support from Republican nationalists, persuaded the Senate to ratify a comprehensive chemical weapons ban. But other treaties, including SALT II, signed by the Carter administration in 1979, the Comprehensive Nuclear Test Ban Treaty of 1996, and a 1997 treaty prohibiting the use of land mines, failed to win Senate approval, the latter two supported by more than one hundred governments. Indeed, in 2001 the administration of George W. Bush not only ended efforts to have the Senate ratify the Comprehensive Nuclear Test Ban Treaty of 1996, but to terminate the 1972 ABM Treaty despite strong objections from America's European allies.

The theme of inconsistency also applied to the subject of international economic cooperation. During the late stages of World War II, the United States had initiated efforts to create international financial institutions that would economically stabilize the postwar world and prevent another Great Depression. The most important such institutions emerging from the war were the World Bank, to provide bank-sponsored development loans, and the International Monetary Fund, to grant government loans to stabilize currencies.

The last half of the twentieth century also witnessed tariff reduction, long applauded by internationalists. The General Agreement on Trade and Tariffs dates back to 1947; the agreement involved numerous conferences held over decades. GATT addressed the hopes of Wilsonians, who continued to argue that economic nationalism was a powerful cause of war. But here, too, internationalists met increasing resistance at home. Labor unions, fearful of losing jobs to low-wage workers abroad, joined forces with (generally) small businesses fearing foreign competition, nationalists, environmentalists, and neo-isolationists to pass measures like the 1988 Omnibus Trade and Competitiveness Act undermining the free-trade aims of internationally oriented businesses and banks. For the most part, the legislative record from 1962 to 2001 favored the free traders. The North American Free Trade Agreement of 1993, membership for the United States and its trading partners (most controversially, China) in the World Trade Organization (GATT’s successor), and the Clinton and George W. Bush administrations’ support for the Free Trade for the Americas Treaty (not yet finalized in 2001) exemplify this trend.

Inconsistency also characterized international cooperation regarding the environment. Internationalists successfully promoted modest environmental reform, such as the creation of a UN Environment Program that emerged out of the 113-member UN Stockholm Conference of 1972, and two agreements (Vienna in 1985 and Montreal in 1987) limiting the release of ozone into the atmosphere. However, the Senate refused to ratify the Law of the Sea Treaty negotiated between 1972 and 1982, the 1992 Convention on Biological Diversity negotiated at Rio de Janeiro, and the 1997 Kyoto Accords limiting carbon dioxide emissions negotiated at the UN Conference on Climate Change. Indeed, by the early twenty-first century, American environmentalists were themselves aligning in opposition to internationalism, fearing that looser environmental standards abroad would undermine environmental protections at home.

RETREAT

There is a larger issue here: the last third of the twentieth century witnessed a general deterioration of support for internationalism. The causes were many. They have included the upsurge of nationalism that accompanied the appearance of the evangelical religious right; disillusionment concerning foreign entanglements stemming from the American defeat in Vietnam; the decline of the industrial economy resulting from foreign competition in low-wage countries; the failure of the UN in highly publicized peacekeeping ventures (most importantly, Somalia and Bosnia during the early and mid-1990s); the increase in international terrorism; and the rise of anti-American policies at the UN (seen in programs like the New Interna-
tional Economic Order of 1972 and the New World Information and Communications Order of 1978). A former president of the Carnegie Endowment for International Peace described the late twentieth century as “the twilight of internationalism.”

He may have exaggerated the reaction against internationalism, but he was onto something important. Since 1994, the United States has sharply curtailed its support for UN peacekeeping missions. Facing criticism of U.S. peacekeeping activity in both Somalia and Bosnia, President William Jefferson Clinton sharply scaled down American support (including both military and financial support) for these missions. Some 74,000 peacekeeping troops from seventy-six countries served in 1994; by 2000 this number had shrunk to less than 20,000. Presidential Decision Directive 25, the most important State Department policy paper concerning peacekeeping since the Congo crisis of 1960, placed stringent criteria on peacekeeping, reversing calls for more U.S. involvement uttered just two years earlier by Bill Clinton as he campaigned for the presidency.

Nor was the disillusionment with internationalism confined to peacekeeping. After the 1970s it spread to the UN generally. During the mid-1980s, President Ronald Reagan began to withhold American dues to the UN, a process encouraged by Congress when it passed the 1983 Kassenbaum Amendment unilaterally cutting the American share of UN assessments. The growth of conservative nationalism during the 1990s intensified anti-UN sentiment, especially after the Republicans gained control of Congress in 1995. Dues and peacekeeping assessments went unpaid, threatening America with the loss of its vote. Congressional critics of the UN more or less blackmailed the Secretariat not only into bureaucratic reform (which was overdue), but into further reducing the percentage of revenues paid by the United States. Tellingly, few internationalist voices inside or outside Washington expressed strong objections.

Other important developments during the last third of the century also reflected the decline of internationalism. In 1977 the United States withdrew from the ILO for what turned into a three-year absence. A similar story was repeated at the International Atomic Energy Agency between 1981 and 1983. Washington withdrew from the UN Educational, Scientific, and Cultural Organization (UNESCO) in 1984 and from the UN Industrial Development Organization in 1995. American officials may have rightly deplored the politicization of these agencies. Nevertheless, Washington’s decisions to withdraw altogether symbolized the priority that Congress and the White House increasingly gave to national rather than international interests.

American internationalism, of course, ranges far beyond the subject of the UN. Regional organizations, most importantly the Organization of American States (OAS), which rests on three treaties ratified in 1947 and 1948, have also been a part of this story, but without the centrality or the visibility of the League of Nations or the UN. Indeed, Article 51 of the UN Charter sought to make room for regional collective defense, a matter that was central to some of the negotiations regarding the UN Charter during World War II. Moreover, American obligations under the OAS charter regarding nonintervention have occasionally clashed with U.S. Cold War objectives, a clash that led some Western Hemispheric countries to seek recourse at the UN. This was especially the case regarding crises in Guatemala (1954), Cuba (1962), and Grenada (1983). During each episode U.S. officials gave short shrift to UN and OAS objections regarding American intervention.

Washington also gave little heed to OAS demands to highlight the principle of collective economic security, which many in Washington viewed as a regional variation of the New International Economic Order. Although U.S. policymakers have never been sympathetic to resource transfers from rich nations to poor (with the possible exception of technology transfers), some of the Latin American demands for wealth sharing contributed to Washington’s willingness to negotiate the free trade agreements of the 1990s. This was an area in which internationalist sentiment coincided with what every presidential administration from Reagan to George W. Bush has viewed as U.S. economic interests.

**CULTURAL INTERNATIONALISM**

With the end of the Cold War, the subject of cultural internationalism returned to prominence as it had after World War I. Disillusionment with political internationalism has not yet affected the health of the Fulbright scholarship program, begun after World War II to promote among Americans knowledge of other cultures and to attract foreign scholars to the United States. Cultural, athletic, and scientific exchanges thrived
during the last third of the twentieth century. The degree to which Americans have taken up soccer, long considered a foreign sport, is a small sign of this, as is the internationalization of baseball, with American players in Japan and a great many Latin American players along with a growing number of Japanese players in the Major Leagues.

A similar story can be told about other sports, as with the internationalization of rock and roll and American films. More moviegoers saw Schindler's List (1993) and Titanic (1997) outside of the United States than inside. Michael Jordan T-shirts are worn by Asian teenagers who never saw a basketball game. The Internet, for good or ill, has connected people in different countries in ways that seemed unimaginable in 1990. This may not be exactly what the founders of the Carnegie Endowment for International Peace had in mind when they formed their organization in 1910. Neither is it likely to be what President George H. W. Bush meant when he called for a new world order in 1990. Nevertheless, it addresses the vitality of cultural internationalism even when disillusionment, pessimism, and cynicism have crippled the movement politically.

In short, the history of American internationalism has been the history of complexity and inconsistency. This remains as true at the beginning of the twenty-first century as it was one hundred years earlier.

**BIBLIOGRAPHY**

International law is the body of customs, principles, and rules recognized as effectively binding legal obligations by sovereign states and other international actors. International law stems from three main sources: treaties and international conventions, customs and customary usage, and the generally accepted principles of law and equity. Judicial decisions rendered by international tribunals and domestic courts are important elements of the lawmaking process of the international community. Resolutions of international organizations, the United Nations in particular, may also affect the growth of the so-called customary international law that is synonymous with general principles of international law. The present system of international legal rules is based on the premise of state sovereignty. It is within the discretion of each state to participate in the negotiation of, or to sign or ratify, any international treaty. Likewise, each member state of an international agency such as the United Nations is free to ratify any convention adopted by that agency.

American history confirms that the functions of international law and U.S. foreign policy are inextricably intertwined. The rules of modern international law are in great part products of negotiations in which U.S. diplomats played important roles, and U.S. foreign policy is in great part dependent on the rules of international law for its operation. The willingness of the U.S. government to employ international law as an instrument of foreign policy arises from the historical experience that shapes the political attitudes of the American people. Its vast size and abundant natural resources allowed the United States to grow into an economic power that rivaled its European peers. The United States was permitted to develop internally, in large measure without external distractions. Throughout the first half of the twentieth century, save for the interruption of World War I, the United States remained mainly on the sidelines, contributing little to expanding or modernizing the rules of international intercourse. After World War II, however, the United States emerged as a global superpower. Coincident with this newfound responsibility, and with the onset of Cold War rivalry with the Soviet Union, the United States asserted greater prominence in shaping the direction of international law—a role that became more salient over time.

To appreciate how international legal rules function in the making and performance of U.S. foreign policy, it must be understood that both tangible and intangible factors impose constraints on policymakers. The essence of these constraints lies within the nature of the international system.

CONSTRAINTS ON U.S. FOREIGN POLICY

The international system imposes structural constraints on the ability of American decision makers to create legal rules favorable to U.S. national interests. The enduring feature of the international system is its decentralization. There are no central institutions to legislate standards or to ensure their enforcement. Nor does a common political culture exist in which to anchor an agreed-upon body of norms for governing the behavior of states. The upshot for U.S. foreign policy is a highly competitive international system in which there is constant expectation of violence and conflict and little expectation that either international law or appeals to normative principles will significantly influence the resolution of contentious issues.

A decentralized international system does not mean that U.S. foreign policy operates in a legal vacuum or under conditions of global anarchy. While there is no world government, and universally enforceable laws and common values are lacking, rules affecting the conduct of U.S. foreign policy do matter, and such rules lend greater pre-
dictability and more certainty to international transactions. These legal rules indicate the limits of permissible behavior, the norms for interstate conduct, and the ways and means of settling disputes. To the extent that the U.S. government subscribes to these legal rules, it becomes obligated to perform certain duties to those ends. That is, the United States as a sovereign, independent state is affected by legal principles contained in fundamental legal constructs. For its foreign policy to function the United States must be diplomatically recognized by other governments. In its foreign affairs, the government must accept and exercise certain rights and duties under international law, which are motivated by pragmatism and reciprocity. These rights and duties ensure that governments can deal with one another in a systematic, orderly fashion. The United States has the rights, inter alia, to recognize other states and to secure its national territorial integrity, sovereignty, and independence, by forcible self-defense if necessary. The United States also has corresponding obligations, key among which are not to intervene militarily into the affairs of other states, not to pollute the air, water, or land such that it causes transboundary harm, and to abide by international agreements made with other states or international actors. Although constrained by the world system, the United States is able to perform critical legal functions that ensure its survival as a legal entity in interstate relations.

A second structural constraint flows from the fact that the world system is a self-help system. The United States, like all governments, ultimately relies upon itself to accomplish foreign policy objectives. To do otherwise risks being manipulated by other governments. Similarly, the self-help principle impresses upon U.S. officials the need to bring policy goals and national resources into balance. International law strives to facilitate that. The pursuit of excessive goals, without adequate resources to attain them, can enervate a government and diminish its ability to respond effectively to future challenges. For the United States the tragedy of the Vietnam War remains a constant reminder of that truth.

A third structural constraint rests in the hierarchical character of the international system. The equality of states implicit in the legal principle of sovereignty is a political fiction. The notion of sovereignty dates back to the Treaty of Westphalia in 1648 and the origins of modern states. As a political construct, the sovereignty principle affirms that no legal authority exists above the state except that which the government voluntarily accepts. The reality of twenty-first-century international relations is markedly different. Sovereignty remains more a matter of degree than an absolute condition. States are inherently unequal, and the resources they use to exercise power in their international dealings are distributed unequally around the world. As the lone superpower state in the early twenty-first century, the United States has access to more resources, possesses greater capabilities, and can exercise greater power than any other state. In this context international law defines permissible ways and means that the U.S. government may employ those resources and capabilities in its foreign relations.

Despite systemic constraints, an international society does exist. International legal rules do affect the structure of that society—its institutions, actors, and procedures for transnational activity; the assumptions on which the society was founded; the status, rights, responsibilities, and obligations of states within this society; and the various relations between those states. Through its foreign policy the United States maintains, establishes, changes, and terminates relationships with other international actors—all through international legal means. Although international law may be primitive, the United States employs it to formalize, regulate, and regularize interstate relationships. For the United States most of the time, its foreign policy is constructed in a way that preserves international order, so that government policymakers might pursue the best perceived course for U.S. national interests, both foreign and domestic. Such international order depends on a framework of agreed presumptions, customs, commitments, expectations, and sanctions that all states, including the United States, accept to regulate international society. International law furnishes the rules for relations between states, sets standards for the conduct of governments within this international system, and facilitates establishment of multilateral institutions toward these ends. In these regards the United States has become the chief state architect and purveyor of international legal rules in the twenty-first century.

LAW AND U.S. FOREIGN POLICY APPROACHES

Public attitudes in the United States toward the utility of international law have shifted with its
government’s perceptions of how the United States best fits into the world scene. At the same time, government officials do not agree to international legal rules in a political void—domestic political considerations and national interests figure prominently, and often preeminently, in negotiating legal instruments. Historically, the propensity of U.S. government officials for creating legal rules was caught in the tension between two opposing policy approaches—isolationism and internationalism. Up until 1940 these approaches were more or less cyclical throughout American history. Since then the East-West ideological rivalry of the Cold War, escalating international economic interdependence, and ever-increasing technological globalization have combined to render the internationalist approach politically, commercially, and legally imperative for the United States.

Isolationism reflects the belief that the United States should avoid getting involved in the political affairs of other states. This rejection of foreign political involvement was not meant to imply that the United States should ignore the rest of the world. Indeed, diplomatic and commercial contacts were critical for the United States as it developed throughout the nineteenth and early twentieth centuries. In these respects, international legal rules and multilateral instruments assumed cardinal importance in rendering American foreign policy practical and effective. Instead, from the isolationist perspective, American national interests are best served by withdrawing from the rest of the world, or at least remaining detached from events elsewhere. In this regard, international legal rules play only a minimal role. Less international involvement abroad results in less interest in world affairs and fosters the perception that the United States has little need to be bound by international law.

Isolationism draws its inspiration from George Washington’s Farewell Address of 1796, in which he admonished Americans to “steer clear of permanent alliance with any portion of the foreign world.” This tendency to avoid foreign involvement was fueled by the fact that, save for the War of 1812, the United States was never physically endangered by foreign military attack, and a sense of physical security from the threat of foreign intervention prevailed. Later, the horrors of the Civil War fostered a less militaristic attitude within the American political culture. When combined, these attitudes contributed to the isolationist impulse and a relative indifference to international legal concerns. Among the major isolationist foreign policy decisions that heavily impacted on principles of international law are the Monroe Doctrine (1823), the refusal to join the League of Nations (by the U.S. Senate’s rejection of the Treaty of Versailles in 1919), the neutrality laws of the 1930s, and the legacy of the Vietnam syndrome, that is, the reluctance to commit American troops abroad.

The internationalist perspective sees the protection and promotion of U.S. national interests through pursuit of a legally based, activist, global foreign policy. Internationalists argue that the United States cannot escape the world. Events in other places inevitably encroach upon U.S. interests, and policy rooted in the retreat from global involvement is self-defeating. Thus, the United States has a stake in the general nature of the international system, and its government must be willing to become actively involved in world affairs on a regular basis. To bolster this contention, internationalists point to the Great Depression of the 1930s, the rise of Hitler in Europe, the outbreak of World War II, and the expansion of communism in the war’s aftermath. Hence, the United States must be involved in world affairs. To this end, international law provides proven conduits for integrating U.S. national interests into constructive foreign policy opportunities. American national interests are best served by remaining active internationally and by negotiating legal rules that promote foreign policy goals as they foster international order. Evidence that internationalism best serves U.S. national interests is seen in the preeminent place of the United States since 1945 in establishing the United Nations, the North Atlantic Treaty Organization (NATO), and many other international organizations; in promoting the Marshall Plan and the Helsinki Human Rights Agreement; in U.S. involvement in armed conflicts in Korea, Vietnam, the Persian Gulf, Bosnia, and Kosovo; and in vigorous support of a massive expansion of U.S. international trade relations. In all of these areas, the ways in which the United States employed international legal rules proved critical for implementing its foreign policy in ways acceptable to international society.

The war in Vietnam frayed American confidence about internationalism in general and the containment doctrine in particular. The tremendous human, financial, and political costs traumatized the American people, gave rise to a domestic antiwar movement, and undermined the faith of Americans in their government. More
than 58,000 American lives were lost, and four million Vietnamese on both sides were killed or injured. Over eleven years the war cost the United States approximately $150 billion to fight and lose. Consequently, since 1975 American attitudes have been ambivalent toward activist internationalism. On the one hand, the realization persists that as the world’s only superpower, the United States retains a special responsibility for maintaining international peace and security. But, on the other hand, the American people are profoundly reluctant to support long-term commitments of American blood and treasure abroad to defend other states, especially those with little strategic value to the United States. American government officials therefore are wary about sending U.S. forces abroad and have done so only in selected cases. They are fully aware that a high political price can be incurred for American soldiers coming home in body bags—namely, defeat in the next general election.

Isolationism and internationalism have both shaped the course of American foreign policy and determined the relative degree of importance that international law has assumed in policy formulation. Both approaches are joined in the conviction that international law should be used to serve and protect the institutions and ideals of the American experience. The approaches differ, however, on how to achieve these national ambitions. Isolationism aims to insulate the American experience from the corruption of foreign influences and protect U.S. sovereignty from burdensome international commitments. The isolationist approach attributes little utility to international law, except insofar as it segregates the United States from extraterritorial commitments and facilitates the government’s foreign relations to secure needed resources and sustain trade relations. Conversely, internationalism works to attain U.S. policy goals by promoting a more stable global environment for the United States, which opens the door to foreign opportunities to fulfill American political, economic, and legal interests. To these internationalist ends, international law assumes a more fundamental, more comprehensive place in U.S. foreign policy. International legal rules become channels for closer, more regularized international contact as well as regulatory standards that encourage such cooperation. Regardless of the approach taken, consideration of and regard for international legal rules remain important in the process and formulation of American foreign policy.

AMERICAN POLITICAL CULTURE

American political culture determines how individual policymakers regard the place and authority of international law in U.S. foreign policy. Political culture, which embraces fundamental attitudes and practices of American society, draws from two main sources. One is historical experience. Americans are products of their past. The second is the national belief system, that is, the ideas and ideologies held by the American people. The relevance and status of international law in the making of U.S. foreign policy derive from the American people’s self-image, their norms and values, and the ways in which American political culture influences their perceptions of international relations. This national outlook, which might be called the American ideology, inculcates an American style in world affairs and helps to explain why and how international legal rules are integrated into U.S. foreign policy actions.

Understanding the sets of beliefs that comprise the American ideology is critical for appreciating why, where, and how much legal considerations figure into the process and patterns of American foreign policymaking. This national ideology emanates from four sets of core American self-perceptions and values, namely, the predispositions toward exceptionalism, legalism, liberalism, and pragmatism. When evaluating how these elements of American political culture affect policymakers, one must remember that each element influences personal attitudes, though in various ways and to differing degrees. A person’s attitudes toward some international event can invite struggle over the priority between these elements and engender conflicted feelings over which policy appears most appropriate for U.S. interests. Similarly, a person’s strength of convictions toward these elements can change over time, relative to perceptions, circumstances, and particular events.

EXCEPTIONALISM

A principal set of core elements in the American ideology that affects feelings about international law’s role in U.S. foreign policy originates from a sense of exceptionalism, often expressed as self-virtuosity. That is, Americans seem to be self-confident to the degree that they and their political culture are admired and thought special by the rest of the world. To early Americans the New
World was a gift from God, which settlers transformed out of wilderness into the most prosperous and advanced society in history. Traditional perceptions of history reinforce this conclusion: Americans conquered native, “uncivilized” peoples, survived a brutal civil war, moved westward and secured the continent, established a country founded on private, free-enterprise capitalism and democratic principles, rescued Europe from the evils of nazism in World War II, and saved the world from communist domination in the four decades thereafter. In the American mind, these profound accomplishments make the United States the envy of the world and correspondingly reinforce the sense of being uniquely special. Americans thus are prone to view the United States as having evolved into an exceptional country that is not merely different from, but actually superior to, all other states.

Exceptionalists admit that the United States has a certain moral responsibility for the fate of people living in other countries. As such, they advocate international activism and interventionism in a wide variety of global situations. They do not concede to any clear, universally accepted international code of foreign policy behavior. Their chief belief is that the United States should advance principally American values in its foreign policy.

Belief in American exceptionalism has sometimes bred U.S. unilateralism in foreign affairs. That is, integral to Americans’ belief that their country’s experience has produced the best social and political order in history is the predilection of the United States to act alone in addressing foreign concerns. This go-it-alone tendency in U.S. foreign policy represents the rejection of a balance-of-power approach for promoting national security in international relations. Given the geography and natural assets of the United States, national security was once largely assumed, making efforts at multilateral collaboration unnecessary. After World War II, the rise of the United States to superpower status exaggerated its self-perceived virtuosity in world affairs, which generated more acts of unilateralism in its foreign relations and international law attitudes.

Another facet of American self-virtuosity arises in the tendency to engage in messianism abroad. American foreign policy sometimes takes up crusadefulike causes for ends that are perceived as just and noble. U.S. policymakers conclude that they must bring the benefits of American ideals and institutions to other, less fortunate, peoples. Such feelings blend the traits of the American self-image of political, moral, and ideological superiority to produce within the American political culture a tendency to engage in messianic campaigns. There emerges a mission-like compulsion in U.S. foreign policy ambitions to recreate the world in the American image, to establish models of governance grounded in American values and democratic institutions, by force if necessary. Such attitudes can foster a sense of paternalism. More ominously, they breed resentment from other societies who see the United States as attempting to impose its cultural values and political lifestyle upon them. In the extreme, such a doctrine of internationalized manifest destiny can become the political rationalization for unlawful U.S. intervention. Witness, during the second half of the twentieth century, U.S. involvement in Iran (1953), Guatemala (1954), Cuba (1961), the Dominican Republic (1965), Chile (1973), Nicaragua (1981–1984), Grenada (1983), Panama (1989), and Serbia (Kosovo) (2000).

The clearest historical statement of American unilateralism remains the Monroe Doctrine in 1823. This declaration by President James Monroe came in reaction to U.S. concern over the possibility of European interference into affairs of newly independent Latin American countries. The doctrine proclaimed that the United States would not tolerate European intervention into the Western Hemisphere, and, in return, the United States pledged not to interfere in European affairs. The Roosevelt Corollary, articulated by President Theodore Roosevelt in his annual message to Congress on 6 December 1904, expanded the scope of the doctrine by making the United States the self-appointed policeman of the Western Hemisphere, thereby providing a unilateral justification for increased intervention into the affairs of Latin American countries.

Important to realize is that neither the Monroe Doctrine nor its Roosevelt Corollary drew validity from any U.S. legislative pronouncement, nor from any international treaty instrument. Nor was the reach of jurisdiction or application of either doctrine ever precisely defined by specific law or fiat. Indeed, both doctrines were applied historically on an ad hoc basis, in circumstances defined only by perceptions of U.S. policymakers, to explain the rationale for interventionist actions. From 1850 to 1935, both doctrines were held out as pillars of U.S. foreign policy and were invoked periodically to justify unilateral interventions taken in the name of defending the Ameri-
cas from European intrusions. For example, in the first three decades of the twentieth century, the United States intervened militarily on some sixty occasions in several small Caribbean and Central American states. In all these cases, little diplomatic consideration or formal concern was expressed by the U.S. government about the international legal implications of these interventions or the critical attitudes of other states.

Although largely repudiated with the rise of Pan Americanism during the administration of President Franklin Roosevelt during the 1930s, the legacy of the Monroe Doctrine persisted in modern times. Involvement of the Central Intelligence Agency in overthrowing the Arbenz government in Guatemala in 1954 and the Allende government in Chile in 1973, U.S. complicity in the 1961 Bay of Pigs invasion and in blockading Cuba during the missile crisis in 1962, the 1965 invasion of the Dominican Republic, the 1983 invasion of Grenada, and the 1989 invasion of Panama attest to the continued influence of U.S. unilateralist behavior in the Western Hemisphere.

LEGALISM

Legalism—the tendency to profess legal grounds for U.S. foreign policies—is a second core belief underpinning the American ideology. The inclination to embrace legalism springs from rejection of the balance-of-power approach as the means for preserving U.S. national security and from the liberal assumptions that people are rational human beings who loathe war and prefer the peaceful settlement of disputes. In modern times U.S. foreign policy clearly contributed to the creation of a global system of institutions and legal rules that allow states to settle their disputes without resource to use of force. This legalism perspective is well embodied in active U.S. participation in international rule-making and in the multitude of contemporary international institutions that the United States has joined and in great part has been responsible for establishing. Paramount among these is the United Nations, which was envisaged through the political initiative of the United States at Dumbarton Oaks in 1944 and San Francisco in 1945. The United States was also the main architect for designing and negotiating the International Bank for Reconstruction and Development (the World Bank) and the International Monetary Fund to reconstruct the post–World War II international economic order. From 1987 to 1994 the United States assumed the leading role in negotiating the World Trade Organization, which effectively rewrote the 1947 General Agreement on Tariffs and Trade in an effort to provide legal rules, inclusive of mandatory dispute settlement, for international commercial transactions. At the end of the twentieth century the United States assumed an intensely active internationalist role as it participated in more than one thousand intergovernmental organizations, most of which were conceived through U.S. political initiatives and were sustained with substantial U.S. financial support. In this regard it is critical to appreciate that nearly all of these international organizations were empowered to negotiate and create new legal rules, both for internal administration and as international regulations. As a global superpower with worldwide interests, the United States remained intimately involved in that norm-creating process through these global institutions.

For the United States, the rule-making facet of legalism rests in the critical legal principle of a government pledging its willingness to abide by international agreements to which it has voluntarily committed itself. This legal principle, known as pacta sunt servanda and drawn from the domestic practice of contract law, asserts that treaties made in good faith between governments are binding. While no meaningful police or judicial mechanisms are available to enforce international agreements, state practice clearly indicates that all governments, including the United States, overwhelmingly abide by their treaty obligations for two fundamental reasons: first, it is in their national interests to do so; second, abrogation of treaty commitments absent legitimate justification deprives a government of its political and legal credibility with the rest of the international community. The United States, like all states, honors its treaty obligations principally because those rules benefit American foreign policy interests. To spotlight this point, in 2001 the United States was party to more than five thousand international agreements, of which more than five hundred were prominent multilateral conventions. If treaty-based legal rules were nugatory for U.S. foreign policy, why pursue the painstaking political effort to negotiate, ratify, and consolidate such an impressive array of international instruments into legally binding obligations? The answer is plain: international legal agreements are not worthless. These rule-making documents well serve U.S. national interests, and upholding their obligations provides the United States with
greater constructive opportunities and legal latitude in its relations with other states.

Legalism places heavy burdens on U.S. foreign policy, especially when considerations are given to the use of military force internationally. By rejecting the power-politics approach, policymakers cannot assert national security self-interests as the only justification for engaging in armed conflict abroad. Instead, U.S. foreign policy actions may be dressed in legal principles to explain the bases for those decisions. Several examples demonstrate this pronounced tendency to justify the grounds for military action in legal terms, including resort to using the United Nations as an umbrella of legitimacy to prosecute the Korean War in 1950 and the Gulf War in 1991, citing a request by the Organization of Eastern Caribbean States as partial legal justification for the 1983 invasion of Grenada, and use of NATO to sanction the lawfulness of U.S. action in Bosnia in 1994–1995 and in Kosovo in 2000.

The American resort to legalism contains a proclivity toward moralism. Moralistic assertions may be used to explain how international legal rules and institutions are integrated into U.S. foreign policy outcomes. This American sense of morality in its international relations rests on two presumptions. First, the belief persists that the conduct of states can be judged by moral standards. Second, there is the assumption that American morality supplies the universal standard for making those judgments. By definition, American foreign policy actions are presumed morally right and legally justifiable. Thus, when flawed policy initiatives occur, they are not attributed to “American” values that guide the policy action. Rather, such fallacies are rationalized as resulting from leadership deficiencies, information failures, bureaucratic miscommunications, or organizational lapses.

Americans often justify political goals and foreign policy actions in moral terms and evaluate outcomes of events through a prism of moralistic values. This occurs when the government seeks to explain to the American public why foreign assistance for some state might be necessary. Numerous examples of such cases can be found during the Cold War, as the United States often asserted moral principles to justify aid to pro-democratic governments aimed at suppressing communist insurgencies in Greece in 1947, Lebanon in 1958, the Dominican Republic in 1965, El Salvador in 1981–1984, and Grenada in 1983. One might also add the decision to send military and food aid during the widespread famine in Somalia in late 1992. U.S. participation in massive refugee relief efforts similarly rests on pillars of moral values, well illustrated in the tragedies that gripped Bosnia (1992–1994), Burundi (1993), Rwanda (1994), and Kosovo (2000).

Idealism, or the vision that advocates that international peace is desirable and possible, also remains salient as a theme in American legalism. American idealists believe that violence and conflict represent human failures that can be overcome through education. Idealists find clear, accepted moral values in international agreements such as the United Nations Charter and the Universal Declaration of Human Rights. They are closely aware of moral claims by other governments and tend to advocate greater access for peoples in other countries to civil rights and liberties, health care, housing, and education. Idealists emphasize the importance of applying the principle of self-determination in U.S. foreign policy to peoples abroad and are more likely to advocate multilateral than unilateral action in world affairs. The integration of idealism with legalism’s proclivity for establishing institutional structures served as the catalyst for the United States—through President Woodrow Wilson—to assume the leading role in establishing the League of Nations in 1919 and for supporting the United Nations in 1945. Idealism also fostered the rapid promotion and acceptability of human rights law in U.S. foreign policy programs and treaty commitments.

U.S. foreign policy at times assumes an approach of idealistic legalism to seek means of attaining international peace and cooperation. Such ambitions are seen in the nation’s leadership in several disarmament conferences throughout the twentieth century, among them the Hague Peace Conferences of 1899 and 1907, Washington Naval Conference of 1922, Geneva Conference of 1922, London Conferences of 1930 and 1935, and Kellogg-Briand Pact of 1928, in which sixty-two contracting parties, including the United States, renounced the use of war as an instrument of national policy.

Idealism furnishes the bedrock of international humanitarian law, which governs the use of armed force and the treatment of individuals during armed conflict. International humanitarian law is designed to reduce and limit suffering of individuals in war. It thus extends the principles and protections of human rights to the rules governing armed conflict. In substantial part, such international humanitarian law is the product of U.S. for-
eign policy. In 1907, the Second Hague Peace Conference adopted Hague Convention IV, Respecting the Laws and Customs of War on Land, which remains the core legal statement on the law of war. These regulations originated in the code of principles set out in 1863 by Francis Leiber, a U.S. physician during the American Civil War, to provide Union troops with rules of conduct on the battlefield. In reacting to the horrors of World War I, the United States in 1929 played a pivotal part in drafting two Geneva conventions that codified protections for prisoners of war and ameliorated conditions of sick and wounded soldiers in the field. The experiences of World War II reaffirmed the need to broaden the 1929 accords, and in 1949 in Geneva four major conventions were adopted that codified more comprehensively legal rules for the protection of victims of war. Although drafted under the aegis of the International Committee of the Red Cross, the United States assumed the lead role in revising and developing these agreements, which dealt with the wounded and sick in the field and at sea, treatment of prisoners of war, and the protection of civilians. The four Geneva conventions of 1949 represent the most important codification of international humanitarian law protecting armed forces and civilian victims of armed conflict. As such they have been ratified by virtually every state in the world.

Idealism also underpins modern international criminal law, the main goal of which is to make accountable persons accused of committing atrocities and gross violations of human rights law. International criminal law descends substantially from American jurisprudential values and U.S. foreign policy initiatives. The trials in 1945 by the International Military Tribunal at Nuremberg, which prosecuted twenty-two German Nazi officials for committing acts of genocide, crimes against humanity, war crimes, and crimes against the peace during World War II, were innovations of and productions by American lawyers. So, too, were the Tokyo War Crimes Trials during 1947–1948 that prosecuted Japanese war leaders and industrialists. In reaction to “ethnic cleansing” in Bosnia during 1992–1993, the United States diplomatically steered the UN Security Council into the May 1993 establishment of the International Criminal Tribunal for the Former Yugoslavia (the Hague Tribunal). With U.S. diplomatic and financial support, this court emerged as a credible institution for investigating, prosecuting, and punishing persons accused of committing genocide, crimes against humanity, and war crimes against persons in the former Yugoslavia (mainly Bosnia). By 2001 the Hague Tribunal had publicly indicted one hundred persons for alleged atrocities, and nineteen had been convicted. Among those in custody and being tried was Slobodan Milosevic, former president of the Republic of Yugoslavia. In 1994 the United States again acted through the UN Security Council to create a special tribunal to try and prosecute persons accused of committing similar offenses in Rwanda. By 2001 the International Criminal Tribunal for Rwanda had indicted at least fifty-five persons, had fifty-one cases in progress, and found eight individuals guilty, including former Prime Minister Jean Kambanda, the first head of state ever convicted of such crimes. The United States also actively participated in the 1998 Rome negotiations that produced the Convention for the International Criminal Court. Ironically, while this instrument was the product of considerable American jurisprudential influence, the U.S. government continued to have strong reservations about the convention text. In particular, American objections centered on the fact that no provision existed for the United States to veto in the Security Council a particular case coming before the court and the possibility that U.S. troops abroad might be made subject to the court's jurisdiction on trumped-up charges.

Idealistic traits in U.S. foreign policy have generated support within the American public for humanitarian military intervention in situations where gross human rights atrocities or flagrant acts of genocide are perpetrated. Led by the Clinton administration, from 24 March to 10 June 1999, NATO conducted an air campaign against the Federal Republic of Yugoslavia. NATO aircraft flew more than 38,000 combat sorties against targets in Kosovo, Serbia, and Montenegro. Geostategic and Realpolitik concerns clearly motivated the United States to act, especially the belief that ethnic conflict within Kosovo could destabilize the Balkans and inflame tensions between Greece and Turkey. Criticisms leveled at the Clinton administration for sketchy legal rationales proffered to justify NATO's military attacks, which caused severe collateral damage and civilian deaths. Nevertheless, strong evidence suggests that Serbian forces were undertaking a wide range of human rights and humanitarian law violations throughout Kosovo under the guise of “ethnic cleansing.” An estimated six to ten thousand Kosovar Albanians were victims of mass murder, and more than 250,000 Kosovars were
displaced and forced to flee to Albania, Macedonia, and Montenegro. The Clinton administration contended that a cardinal objective of NATO in its military action was to deter Belgrade from launching an all-out offensive against its own civilians. In this sense, the NATO bombing campaign took on the character of a humanitarian intervention, motivated by both moral and idealistic concerns. Strictly speaking, the lawfulness of U.S.–NATO action remains suspect because it was taken neither in self-defense to a military attack by Serbia nor legitimized by the approval of the UN Security Council. Still, it is reasonable to infer that the U.S.–NATO action may have saved thousands of Kosovar Albanian lives and might be considered an act of anticipatory humanitarian intervention.

**LIBERALISM**

A third critical ingredient in American ideology is a belief in the political and economic values associated with liberalism. Dominant as an American political philosophy, liberalism stipulates that the rights of the individual superecede rights of the government, and as such, the individual must be protected by law. Such notions, which are enshrined in the Declaration of Independence and the Constitution's Bill of Rights, proclaim the Lockeian notions of protection of individual liberty, private property, and the rule of law.

Belief in principles of liberalism imbues Americans with antagonism toward authoritarian governments that suppress the civil and political rights of their citizens. This can be seen in Woodrow Wilson's principle of self-determination (1919); Jimmy Carter's human rights policy (1976–1980); the Clinton administration's efforts to restore democracy in Haiti and to use military force if necessary to overthrow the military junta (1994); and the anticommunist impulse, especially during the 1950s and 1960s, toward the Soviet Union and Eastern Europe, when communist governments were viewed as enslaving their populations under the control of a police state. Americans believe in individual rights and democratic principles, and the U.S. government often seeks to translate those beliefs into policies abroad.

During the 1990s these beliefs gave rise to the democratic peace theory, a notion of democratic idealism. Liberals argue that democratic states are less likely to wage war against each other, the fundamental proposition in the democratic peace theory. Democracies are more law-abiding and pacific because democratic norms and culture inhibit the leadership from taking actions that might precipitate war. Democratic leaders must listen to multiple voices that tend to restrain decision makers, and citizens of democracies share a certain kinship toward one other. All of these factors work together, the thinking goes, to diminish the possibilities of war. Promoting democracy fosters peace, political stability, and greater cooperation and collaboration in solving problems. Integrating this notion into its foreign policy, the Clinton administration successfully used economic and political incentives to promote democracy in Russia as well as states in Latin America, Eastern Europe, and Asia. By the beginning of the twenty-first century more states than ever before were nominally democracies.

Since revelations of the Holocaust in 1945, the protection of human rights has emerged as a major concern of international law. World attention to human rights has intensified because of television coverage of the horrors of gross violations, increasing efforts of nongovernmental organizations to promote concern for human rights abroad, and growing awareness that human rights violations are a major source of international instability. For the United States, the contemporary realm of human rights law flows directly from both the government's evolving experience in protecting the civil rights and liberties of its citizens and the goal of extending those protections to peoples everywhere. Many human rights norms are modeled after rights, liberties, and protections incorporated into U.S. constitutional law, American jurisprudence, and the national welfare system instituted during the mid-1930s under the administration of Franklin D. Roosevelt. Not surprisingly, the American people tend to support foreign policies that champion and enforce such human rights standards. To codify such standards, U.S. foreign policy has strives to create global human rights law through the adoption of prominent international legal agreements, to which most states have become lawfully obligated. As a consequence, the United States has assumed a leading role in promoting the negotiation and promulgation of human rights instruments. Yet a paradox persists here for U.S. foreign policy and international human rights law. On the one hand, the United States, more than any other government, is responsible for initiating, engineering, and bringing into force most of these agreements. On the other hand, the political concerns of some U.S. government officials that these treaties might
be used to interfere into domestic affairs have prompted partisan isolationist impulses that continue to preclude a number of them from being ratified into U.S. law. Even so, the United States can take credit for substantially contributing to the codification of global human rights law and became a contracting party to several core instruments: the 1948 Genocide Convention (132 contracting parties); the 1966 Convention on the Elimination of All Forms of Racial Discrimination (157 contracting parties); the 1966 International Covenant on Civil and Political Rights (147 contracting parties); and the 1984 Convention against Torture and Other Cruel, Inhuman, or Degrading Treatment or Punishment (124 contracting parties). Although actively participating in negotiations leading to their promulgation, at the turn of the century the United States remained outside legal obligations associated with a number of other important human rights treaties, including the 1951 Convention Relating to the Status of Refugees (137 contracting parties); the 1966 Covenant on Economic, Social, and Cultural Rights (147 contracting parties); the 1973 Convention on the Prevention and Punishment of the Crime of Apartheid (101 contracting parties); the 1979 Convention on the Elimination of All Forms of Discrimination Against Women (168 contracting parties); and the 1989 Convention on the Rights of the Child (191 contracting parties). Each of these treaties includes specific human rights protections that have generated ideological preferences in the U.S. Senate for isolationism, exceptionalism, and pragmatism—considerations that supersede that of codifying idealism and moralism into legal obligations binding American policy.

Even though democracy and respect for human rights have prominent stature as American political values, the application of such norms to U.S. foreign policy remains inconsistent. Throughout the Cold War years, a state's human rights record had little to do with whether it received foreign aid from the United States, which sought to aid anticommunist governments even if they were oppressive to their own people. Witness, for example, U.S. support for the Somoza regime in Nicaragua, the shah in Iran, the Marcos government in the Philippines, and the white minority government in South Africa even during the Carter administration, the strongest proponent of a U.S. foreign policy grounded in human rights considerations.

There likewise persists among Americans a strong aversion to military intervention into another state's affairs even to install a democratic regime or to protect principles of human rights. Americans appear quick to champion human rights rhetorically, but they abhor taking action to implement or guarantee them for peoples in other states. This penchant is a legacy of the Vietnam War and the manifest disinclination to send troops abroad. American policymakers usually rule out U.S. military intervention undertaken to protect the human rights of peoples elsewhere because of the high political costs that casualties would produce at home for the administration. This so-called Vietnam syndrome explains in large part the readiness of the Clinton administration to quit Somalia abruptly in 1993 and its unwillingness to send U.S. troops to suppress gross genocidal atrocities being perpetrated in Bosnia during 1991–1994, Rwanda in 1994, and Sierra Leone in 1999. In the same vein, the Clinton administration downplayed human rights abuses in the People's Republic of China in favor of consistently supporting renewal of its most-favored-nation trade status, as well as in supporting the admission of China into the World Trade Organization. Clearly the strategic implications for the United States of a secure economic relationship with China overrode moralistic concerns that advocate stronger protection for human rights for its population.

As instilled in the American political culture, liberalism also assumes an economic dimension. This aspect takes the form of laissez-faire capitalism, which, like liberal democracy, concentrates on the free will of the individual. Key values earmarking the U.S. brand of capitalism turn on the profit motive, private property, and the free market as a means of guaranteeing rewards for persons who earn their way. Sustained U.S. commitment to capitalism during the Cold War years worked to define socialism under the former Soviet Union and its communist satellites as dysfunctional and menacing to the world economy. Pursuit of capitalism by the United States also coalesced with American economic and political supremacy after World War II to facilitate its ability to assert the leading role in constructing the postwar world economic order. Critical was the U.S. capacity for proposing and legally assembling core international treaties and institutions, which have continued to regulate international economic relations. Put tersely, the American conviction in the liberal values of capitalism bolsters the U.S. emphasis on international trade and commerce and generates pronounced impacts for the role that international law must perform in U.S. foreign policy.
The United States emerged as the world’s economic superpower during the last half of the twentieth century. It did so by realizing that international legal rules play in making and carrying out U.S. policy objectives abroad. The future of U.S. foreign policy still turns on the costs and advantages of three persistent conflicting impulses: the choices between isolationism and internationalism, realism and idealism, and intervention and nonintervention. International legal issues and concerns lie at the heart of each debate, and American policymakers bear the burden of reconciling these divergent viewpoints in rapidly changing global circumstances. The challenges for American foreign policy are daunting, particularly given the economic, political, and military superpower roles in which the United States is cast. The threats to U.S. security are no less menacing, among them: the proliferation of weapons of mass destruction; the degradation of the planet’s environment through natural resource depletion; increased global warming, ozone depletion, and transnational pollution; pervasive poverty and overpopulation; terrorist violence; the rise of intrastate ethnic wars that produce genocidal atrocities and massive violations of human rights; accelerating forces of interdependence and globalization that make economic, technological, and electronic penetration of national borders increasingly facile; and the massive expansion in international commerce, which makes all states increasingly dependent on (and vulnerable to) others for needed goods and services.

The United States, despite its preponderant military, cultural, and economic power, cannot manage, much less mitigate, these global threats alone. Remedies lie in producing multilateral cooperation, collaboration, and commitment of mutual political wills among governments. The policy means for attaining these remedies come through active American diplomacy that strives to elaborate international legal strategies and agreements for meeting those ends. The conclusion is clear: international law is far from being an idealist pipe dream. International legal means are in fact realistic policy instruments that the United States must increasingly exercise if multilateral agreements are to be secured on common solutions and approaches for dealing with common global problems. In a world of intensifying interdependence and globalization, the United States needs international law to protect its fundamental national interests. Similarly, American foreign policy must be formulated in such a way that the United States accepts the norm of state responsibility to uphold its international legal obligations. To do otherwise is to ignore the lessons of U.S. diplomatic history and, more perturbing, to render the world an even more politically, economically, and ecologically complicated place in which to live.

The United States emerged as the world’s economic superpower during the last half of the twentieth century. It did so by realizing that international legal rules play in making and carrying out U.S. policy objectives abroad. The future of U.S. foreign policy still turns on the costs and advantages of three persistent conflicting impulses: the choices between isolationism and internationalism, realism and idealism, and intervention and nonintervention. The challenges for American foreign policy are daunting, particularly given the economic, political, and military superpower roles in which the United States is cast. The threats to U.S. security are no less menacing, among them: the proliferation of weapons of mass destruction; the degradation of the planet’s environment through natural resource depletion; increased global warming, ozone depletion, and transnational pollution; pervasive poverty and overpopulation; terrorist violence; the rise of intrastate ethnic wars that produce genocidal atrocities and massive violations of human rights; accelerating forces of interdependence and globalization that make economic, technological, and electronic penetration of national borders increasingly facile; and the massive expansion in international commerce, which makes all states increasingly dependent on (and vulnerable to) others for needed goods and services.

The United States, despite its preponderant military, cultural, and economic power, cannot manage, much less mitigate, these global threats alone. Remedies lie in producing multilateral cooperation, collaboration, and commitment of mutual political wills among governments. The policy means for attaining these remedies come through active American diplomacy that strives to elaborate international legal strategies and agreements for meeting those ends. The conclusion is clear: international law is far from being an idealist pipe dream. International legal means are in fact realistic policy instruments that the United States must increasingly exercise if multilateral agreements are to be secured on common solutions and approaches for dealing with common global problems. In a world of intensifying interdependence and globalization, the United States needs international law to protect its fundamental national interests. Similarly, American foreign policy must be formulated in such a way that the United States accepts the norm of state responsibility to uphold its international legal obligations. To do otherwise is to ignore the lessons of U.S. diplomatic history and, more perturbing, to render the world an even more politically, economically, and ecologically complicated place in which to live.
From 1947 to 1993 the United States played the pivotal role in the GATT's multilateral trade conference negotiations (called "rounds"). The 1986–1994 Uruguay Round produced the most ambitious trade liberalization policies yet, and led to creation of the World Trade Organization (WTO), an institution proposed and strongly supported by the United States in its foreign economic policy. On 1 January 1995 the GATT was replaced by the WTO. Charged with monitoring and regulating international commerce, in 2001 the WTO had 142 members, accounting for 90 percent of world trade. The organization serves as a forum for administering trade agreements, conducting negotiations, and settling trade disputes; it also has the power to enforce provisions of the GATT and to assess trade penalties against countries that violate the accord. WTO rules, which include trade in goods, trade in services, intellectual property rights, dispute settlement, and trade policy reviews, consist of sixty agreements that run thirty thousand pages in length. While critics might grumble about diminished sovereignty, U.S. foreign policy clearly benefits from the WTOs legal guarantees of nondiscriminatory free trade and the mandatory legal process created for settlement of disputes between member states. From 1995 through 2001 the United States brought fifty-seven complaints to the WTO and had to answer forty-nine complaints by other countries. In cases actually decided by the WTO litigation process, the United States prevailed sixteen times and lost sixteen times. In twenty-seven cases, disputes were resolved to U.S. satisfaction without litigation. Critical to appreciate is that the U.S. government complied with WTO juridical processes and its arbitral panels’ rulings, irrespective of the outcome. In these dispute situations, U.S. foreign policy allocates greater import to the rule of law than to pragmatic self-interest or belief in the virtues of America's economic might.

The GATT and the WTO strengthen and make more stable the international trading system that has fostered unprecedented global economic growth since the 1950s. More than any other government, the United States has been the architect of that system. While the lawfulness of its foreign trade policy might be tested at times through multilateral institutions, the United States is willing to accept that price to preserve economic order and support for the liberal principles of international commerce. To this end, U.S. foreign policymakers cede preference to the long-term benefits of international legalism and liberalism over the costs that would be incurred by national exceptionalism and isolationism.

The regional dimension of U.S. economic policy exists in the North American Free Trade Agreement (NAFTA), which entered into force for the United States, Canada, and Mexico on 1 January 1994. The agreement, which exceeds two thousand pages, established schedules for reducing tariff and nontariff barriers in nearly all of twenty thousand product categories. NAFTA also expanded foreign investment opportunities and other financial transactions among the three states. While many uncertainties persist over the economic impacts of NAFTA, one obvious reality is the much freer flow of goods, services, and investments among the three member countries. Once again, U.S. foreign policy operates through agreed-upon international legal conduits to attain liberal economic goals of freer, nondiscriminatory trade relations with its neighbors. In a world of accelerating globalism and economic interdependence, the creation, implementation, and respect for international economic law becomes increasingly necessary for the United States.

U.S. foreign policy sometimes uses economic instruments as sanctions against other states. Throughout the Cold War, strategic embargoes were levied against trade with communist bloc countries in Eastern Europe as well as the Soviet Union, China, Vietnam, North Korea, and Cambodia. With the end of the Cold War the United States continued to apply its own legislative sanctions against certain states, namely, Cuba, Iran, Iraq, and Libya, and cooperated with the UN Security Council in imposing economic sanctions against a number of other governments. The U.S. economic embargo of Cuba reflected a policy steeped in liberal, ideologically messianic ambitions to install democracy in that country. At the same time, the sanctions stood as a symbol of U.S. unilateralism, driven by forces of self-virtuosity. A number of measures, including the 1996 Helms-Burton Act, applied sanctions against Cuba and foreign companies doing business with the Castro government. These sanctions represented the effort by the United States to link trade relations to the nature of the Cuban government in order to pressure the Cuban people to overthrow Castro in favor of democracy. But this policy was condemned by the UN General Assembly, Organization of American States, Canada, and several European governments. While the goal of turning Cuba into a democracy may have seemed admirable, the means used appeared counterproductive.
PRAGMATISM

The fourth core belief set in the American national ideology is pragmatism, that is, resort to an applied practical approach to foreign policy decisions. It stems from the realization that Americans built a country out of the wilderness, created their own government institutions, and achieved more economic and ideological success than any other people in modern history. American pragmatism thus resembles an engineering approach to foreign policy problem solving. U.S. involvement is often viewed as working to make things politically stable and morally right. The assumption is that right answers do exist for world problems, and the U.S. response contains those right answers. Complications arise in international relations when other governments do not perceive these problems in the same way as the United States. As a consequence, the preferred American approach in seeking solutions for law-related foreign policy issues is to deconstruct the problem, much as an engineer would use a blueprint to break tasks down into sub-problems. A mechanical solution is then devised for each legal component of a problem, while all the time keeping in mind the political implications. It bears mentioning that in this process one runs the risk of losing sight of the problem's larger legal context in order to protect perceived political interests inherent in each sub-problem. When this occurs, the result can be the substitution of means for ends and the tendency to improvise solutions that are unlikely to lead to resolution of the greater problem.

Resort to pragmatism means that legal situations are dealt with on an individual basis, as opposed to long-term planning. Pragmatist policymakers tend to evaluate policies based on whether they solve the problem, rather than on what is legally permissible, ethically required, or even morally acceptable. In this regard, reliance on pragmatism invites U.S. decision makers to assert a strong realist approach in foreign policy. The theory of realism involves application of power politics to international relations. Realists are generally skeptical about human nature and are willing to accept that governments will inevitably act aggressively in their foreign policy. Hence, governments must pursue and protect their national interests, including use of force if deemed necessary. Realists advocate the prudent management of economic and military power. In sum, for U.S. foreign policy realists, the main objectives that the government should advance in its international relations are its military security and economic prosperity, that is, its national interests. Legal considerations are pushed aside, save insofar as they contribute to securing military security and economic objectives. Hence, when such realist tendencies occur, the likelihood arises that foreign policy decisions might compromise or circumvent international legal rules for the sake of obtaining perceived direct political gains. To attain greater short-term benefits for U.S. national interests, a strictly pragmatic approach might conclude that international legal commitments should be short-circuited or overridden. Unilateralist political ambitions are given higher value than multilateral legal obligations.

Resort to pragmatic foreign policies by the United States frequently occurs in situations involving the use of force abroad, which often produce fundamental conflicts with legalism, especially in terms of moral constraints and idealistic principles. When that occurs, historical experience suggests that pragmatism usually prevails. This can be seen in the American attitude toward policies of intervention abroad and government rationales devised to politically support those actions. To put this into legal perspective, international law holds that military intervention by one state into the territory of another state is flatly prohibited, except under four special circumstances: (1) if there is a treaty agreement permitting such intervention between the two states; (2) if the intervention comes at the genuine invitation of the legitimate government of a state; (3) if the intervention is undertaken as part of a collective security action involving an international organization; and, more controversially, (4) if the intervention is done for humanitarian purposes. Throughout most of its history, the United States chose not to rely on these legal justifications to substantiate the legitimacy of its intervention actions abroad.

Historically, the legal logic used by the United States to support foreign intervention is couched in the articulation of presidential doctrines. These policy proclamations, which significantly shape U.S. legal attitudes toward the permissibility of international intervention, are greatly influenced by pragmatic motivations but increasingly assume ideological traits irrespective of relevant legal considerations. The Monroe Doctrine and its Roosevelt Corollary were historically the most widely applied of these doctrines. The Cold War markedly affected U.S. policy attitudes and resurrected American willingness to engage in military intervention abroad. Consequently,
during the last half of the twentieth century the U.S. perception of aggression (that is, legally impermissible intervention) became framed in terms of evaluating and containing radical communist regimes throughout the Third World generally and the Western Hemisphere in particular. U.S. policymakers believed radical influence upon the domestic politics or governmental structure of a state produced regional instability and therefore plowed fertile ground for that country to become a victim of communist aggression. Concerns about the threat of communist expansion worldwide resurrected and reactivated the fundamental policy motive contained in the Monroe Doctrine—intervention for self-defense—and fostered its application through a number of post–World War II policy doctrines.

The first doctrine of the post–World War II era, the Truman Doctrine, was asserted in 1947 and committed the United States to a global policy aimed at stopping the spread of communism. The Truman Doctrine was designed specifically to send $400 million to help Greece and Turkey put down communist insurgencies that threatened those governments’ stability. The lawfulness of this aid was not at issue, nor did the United States intervene militarily. The scope of U.S. anticommunist assistance was expanded in January 1957 when President Dwight D. Eisenhower formally asked Congress to authorize the use of armed force to assist any country that requested help against communist aggression. In March 1957, Congress ratified the Eisenhower Doctrine, which became the legal rationale for U.S. intervention into the Middle East, where radical nationalism had sharpened in the aftermath of the Suez crisis of 1956. The Eisenhower Doctrine assumed Realpolitik policy objectives and affirmed U.S. determination to become the leading power in the region. The U.S. government invoked the Eisenhower Doctrine only twice, and in neither case was it in response to external aggression. In April 1957, Washington dispatched emergency aid to Jordan, which was threatened by an abortive coup. In January 1958, U.S. marines landed in Lebanon to support the Chamoun government, which was in the midst of a civil war. Importantly, in both cases, U.S. assistance had been formally invited by the legitimate government in power, making the action lawful notwithstanding the obvious Realpolitik ramifications.

The administration of President Lyndon B. Johnson produced a new intervention doctrine for U.S. foreign policy. The Johnson Doctrine derived from the episode in April 1965 when the United States sent 21,000 troops into the Dominican Republic to restore civil order on the pretext of preventing a “second Cuba” from emerging in the hemisphere. The principal legal rationale for the action was self-defense (more accurately, exaggerated national security concerns) against the perceived threat of communism being established in the Dominican Republic. Shortly thereafter, this doctrine was applied globally to shore up justification for U.S. military assistance to the government of South Vietnam in the face of the communist aggression of North Vietnam and China.

The Vietnam War imbroglio produced a new doctrine for U.S. foreign policy toward regions threatened by communist aggression. By the late 1960s, the enormous costs of the conflict in lives and dollars, coupled with the eruption of strong domestic antiwar sentiment, demonstrated to the Nixon administration the need to shift the American approach to military assistance. The new policy, articulated in 1969, aimed to transfer immediate self-defense responsibilities to the South Vietnamese indigenous forces. While the United States would continue to bear responsibility for deterring nuclear and conventional war, the burden for deterring localized conflicts would shift to the countries involved. This so-called Nixon Doctrine was later broadened to encompass the entire globe. As with other American doctrines, considerations of international law were largely omitted from the policy calculus. The change in military assistance policy was not done in response to international criticisms of U.S. military intervention into Vietnam or the widely reported American violations of the laws of war. Rather it was done to counter domestic public discontent and to produce more opportunity for an early withdrawal of U.S. forces from Southeast Asia. These were actions motivated by pragmatism and Realpolitik, not for reasons of legalism or moral commitment.

The administration of President Jimmy Carter revived the expansion of U.S. military commitment to the Middle East. On 29 December 1979 the Soviet Union invaded and seized control of Afghanistan. The Carter administration reacted by withdrawing the SALT II Treaty from Senate consideration, increasing aid to Pakistan, cutting off grain sales to the Soviet Union, and calling for a boycott of the 1980 summer Olympic Games in Moscow. More provocative was the president’s proclamation in January 1980 that warned the Soviets to halt their expansion into the Middle East. In effect, Carter declared that the Soviet invasion of Afghanistan threatened the Persian
Gulf and Indian Ocean oil supply pipelines and asserted that the United States would act alone if necessary to protect Middle East oil from Soviet takeover. Thus, the Carter Doctrine identified the continued flow of oil from the Persian Gulf as a paramount strategic interest of the United States, to be defended with U.S. military force if necessary. In so doing, it broke with the Nixon Doctrine, which called for partnership in preference to the unilateral approach in the Truman, Eisenhower, and Johnson doctrines. The United States in this case responded to an unlawful act of foreign intervention by asserting the strategic necessity—as opposed to the predicate of lawfulness—of military assistance to a victim state. Again, pre-eminence was given to motivations of American exceptionalism and pragmatism over normative elements found in policies of legalism, liberalism, and moralism.

Finally, during the 1980s, President Ronald Reagan articulated his own policy dictum to reinforce the central theme of halting the spread of communism. The Reagan administration expanded military and economic assistance to friendly Third World governments battling leftist insurgencies and actively supported guerrilla movements and other opposition forces in countries with leftist governments. This policy, which became known as the Reagan Doctrine, was applied with particular zeal in Latin America. Central to these efforts was supplying military and economic aid to the government of El Salvador in its civil war against the Farabundo Marti National Liberation Front and in organizing, funding, and training the contras, a guerrilla force of 15,000 who sought to overthrow the Marxist Sandinista government in neighboring Nicaragua. Support for such “freedom fighters” was also extended to Angola, Afghanistan, and Cambodia to assist those irregular forces in their struggles against totalitarian leftist regimes. In these ways the Reagan Doctrine can be viewed as a natural corollary of the Nixon Doctrine, albeit one whose permissibility under international law is seriously in question. Such assistance to rebel insurgents is generally viewed as unlawful intervention into the internal affairs of another state and is prohibited under international legal rules, irrespective of the ideological character of the ruling government.

Other U.S. policies highlight the salience of pragmatism over legalism. For example, even though the Reagan administration was adamant about not dealing with terrorists, in 1985 it agreed to sell weapons to Iran in the hope that this might persuade Islamic fundamentalists holding hostages in Lebanon to release them. Interestingly, the monies from the arms sales went to support of the contras in their war against the Nicaraguan Sandinistas. Similarly, the invasion of Grenada in 1983 (on the pretext of rescuing one thousand American medical students on the island) and the bombing of Libya in 1986 (on the pretext of acting in self-defense against Libya for its bombing of a West Berlin discotheque) further eroded the respect for law by the Reagan administration in its foreign policy. Although praised by Congress and the American public, these actions were widely condemned by the international community for their shaky legal underpinnings. Propelled by ideological concerns, U.S. foreign policy was characterized by American pragmatism, self-virtuosity, and unilateralism exercised at the expense of the legal, moral, and liberal considerations that embody the fundamental legal principle of noninterference in the internal affairs of other states. Throughout the Cold War years, presidential doctrines articulated policies in which international legal considerations were conspicuously omitted, as unilateralist ideology assumed paramount importance.

Since the end of the Cold War, pragmatism in U.S. foreign policy has remained ascendant over legal and moral considerations when issues of using armed force are involved. Even so moral, liberal, and legal considerations have been integrated more and more to explain and justify U.S. rationales for using armed force abroad. There has evolved the need to advocate normative arguments for American actions to foster greater international acceptance of the lawfulness of that policy.

For President George H. W. Bush, the invasion of Panama and the Gulf War were principal U.S. actions involving use of force. In December 1989, U.S. armed forces intervened militarily into Panama in Operation Just Cause. The Bush administration provided three pragmatic reasons, grounded in nationalist considerations, to justify the action: to keep the Panama Canal open; on grounds of self-defense, to protect the lives of U.S. citizens living there; and to apprehend the self-proclaimed “maximum leader,” General Manuel Noriega, so that he could be put on trial for alleged violations of U.S. narcotics laws. One liberal objective was given in support of the action: to restore democracy in Panama. None of these directly relate to international law, and, in fact, a joint communiqué of reservations and under-
standings appended to the Panama Canal Treaties of 1977 flatly renounces any right of the United States to intrude into the internal affairs of Panama. The legal rule of nonintervention into Panama was overridden for perceived pragmatic short-term objectives of U.S. policy interests, to protect the canal and to seize Noriega.

The Gulf War of 1991 was the first major military conflict involving U.S. intervention after the Cold War. Importantly, it came not as a unilateral U.S. response to Iraq's aggressive conquest of Kuwait in August 1990. Rather, American military action was taken as part of a collective responsibility, formally approved in seventeen resolutions by the UN Security Council in order to force Saddam Hussein's forces to quit their unlawful occupation of the Persian Gulf sheikdom. Sponsored by the United States, Security Council Resolution 678, adopted on 29 November 1990, asserted that unless Iraq unconditionally withdrew from Kuwait and released all foreigners by 15 January 1991, UN member states would be allowed to "use all necessary means to restore the international peace and security in the area." On 16 January, UN efforts to deal with Iraq culminated in a U.S.-led coalition of twenty-eight countries instigating an intense air attack against Iraq. On 23 February a massive ground assault was launched to eject Iraqi troops forcibly from Kuwait. Four days later the war ended.

While American motivations for prosecuting the war against Iraq were more strategic than moral—that is, to maintain secure access to oil resources in the Persian Gulf, to prevent Iraq from controlling nearly one-half of the world's known oil reserves, and to preclude Iraq from building up a military machine that included weapons of mass destruction—a strong case can be made for the lawfulness of its action. The United States might have acted unilaterally to oust Saddam Hussein, but it did not. Resort to the Security Council (and obtaining its concurrence) was essential for substantiating the legitimacy of the U.S. use of force. In this instance U.S. military intervention was implemented legitimately through multilateralism (through an international coalition) and attained the aims of moralism (to reverse aggression) as well as liberalism (to install greater respect for democracy and human rights) and legalism (to proceed through universally accepted UN procedures for dealing with aggressor states).

At the time, many analysts even agreed that the Gulf War served well the prospects for a "new world order." In the succeeding years, such an order did not come to pass, as violence between states became supplanted by the rise of violence between ethnic and tribal groups within states. To appreciate the tragedy of this point, one only has to think of the civil wars in Somalia (1992–1993), Burundi (1993), Rwanda (1994), Bosnia (1992–1995), Sierra Leone (1999–2000), Serbia-Kosovo (1999), and the Congo (2000–2001) that killed or displaced more than five million people over a decade.

Pragmatism affects U.S. foreign policy in several ways. It alleviates the requirement that American decision makers only make policy that is grounded in strict legal principles or ideological tenets. Policy is not wedded to philosophical or moral stricture. It can be decided with greater flexibility, based mainly on political perceptions as opposed to rigid normative considerations. Further, U.S. foreign policy tends to be reactive rather than proactive. In its international dealings the United States reacts to certain events as they occur rather than anticipating that they will occur. In this sense pragmatism contributes to the American tendency to prefer short-term national goals over long-term international solutions—an approach that invites inconsistency in foreign policy actions. Pragmatism can also blind policymakers to the more idealistic sides of liberalism, especially with regard to respect for human rights. One only has to recall that the United States has supported a number of governments that had egregious human rights records in the treatment of their own citizens, to wit, Anastasio Somoza in Nicaragua, Rafael Trujillo in the Dominican Republic, Fulgencio Batista in Cuba, the shah in Iran, Duarte in El Salvador, Ferdinand Marcos in the Philippines, and the minority white government in South Africa.

One can similarly conclude that when vital interests are perceived to be at stake, U.S. officials sometimes bend legal rules to justify their policies rather than conform their actions strictly to the letter of the law. In 1998 the Clinton administration fired cruise missiles against Iraq in retaliation for Saddam Hussein's refusal to permit UN inspections of suspected chemical and biological weapons facilities. More missiles were fired in 1998 against Sudan and Afghanistan in response to those governments' alleged complicity in the bombings of the U.S. embassies in Kenya and Tanzania. American claims that their actions were motivated by lawful considerations of self-defense are suspect, and the evidence of these govern-
ments’ complicity is not well founded. More likely, these attacks were acts of military reprisal against those states, acts that are impermissible under the rules of modern international law.

On certain national security issues, international law provides the preferred practical recourse in U.S. foreign policy. Two critical areas of intense U.S. involvement stand out: the threat of transnational terrorism and the preclusive strategy of arms control. Regarding international terrorism, such violence has become a regular event in modern times, with Americans and their property frequent targets. Between 1981 and 2000 the number of terrorist attacks worldwide remained relatively consistent, with 9,170 incidents, including 422 attacks in 2000. While domestic terrorism—such as the bombs that seriously damaged the World Trade Center in 1993 and destroyed the Alfred P. Murrah federal building in Oklahoma City in 1995—is a matter for American civil authorities, concern over transnational terrorism has escalated in U.S. foreign policy priorities. These worries not only pertain to conventional problems such as bombing and kidnapping but also to the possibility that terrorists might use chemical, biological, or nuclear weapons against a city in the United States.

Accordingly, the United States has assumed the leading role in establishing specific prohibitions against such violent acts through the negotiation of special international legal agreements. Chiefly toward this end, American negotiators, beginning in 1970, have proposed international legal instruments that stipulate not only the unlawful nature of terrorist acts but also the fundamental requirement for governments to prosecute persons who perpetrate such acts, or at least extradite accused offenders to those states who will. Outstanding among U.S.-inspired agreements to outlaw and prosecute criminal acts of transnational terrorism are the following instruments: the 1963 Tokyo Convention on Offenses and Certain Other Acts Committed on Board Aircraft (171 contracting states); the 1970 Hague Convention for the Suppression of Unlawful Seizure of Aircraft (173 contracting states); the 1971 Montreal Convention for the Suppression of Unlawful Acts Against the Safety of Civil Aviation (174 contracting states); the 1973 Convention on the Prevention and Punishment of Crimes Against Internationally Protected Persons, including Diplomatic Agents (107 contracting states); the 1979 International Convention Against the Taking of Hostages (75 contracting states); the 1980 Convention on the Physical Protection of Nuclear Materials (69 contracting states); the 1988 Convention for the Suppression of Unlawful Acts Against the Safety of Maritime Navigation (53 contracting states) and its protocol to suppress unlawful acts against the safety of fixed platforms on the continental shelf (49 contracting states); and the 1991 Convention on the Marking of Plastic Explosives for the Purpose of Detection (67 contracting states). Importantly, though, the United States by 2001 had yet to become a contracting party to the 1998 International Convention for the Suppression of Terrorist Bombings (24 contracting states) or the 1999 Convention for the Suppression of the Financing of Terrorism (3 contracting states). Through these legal means, U.S. foreign policy sought to integrate the moral aspiration of protecting innocent people with a pragmatic approach that provides diplomatically available international channels for political cooperation and legal prosecution of persons accused of such offenses.

To regulate the use of force and weapons systems in interstate relations, U.S. foreign policy has assumed a highly pragmatic approach. The end goal of policy might appear idealistic (to promote international peace and national security through disarmament), but the means taken are clearly more realistic in their intent and application (to negotiate instruments for arms control guided by President Reagan’s maxim of “trust but verify”). The United States has thus employed diplomacy to create legal rules so as to promote greater order and stability in interstate relations, thereby contributing to its own national security. Nowhere is this strategy more apparent than in efforts to control the use and spread of weapons of mass destruction globally and, more particularly, in its bilateral relationship with the former Soviet Union, now Russia. To assist in curbing proliferation of various weapons, the United States was instrumental in drafting, negotiating, and promoting numerous international agreements.

Through negotiation of international legal instruments, the U.S. government has put limitations on the types and power of weapons permissible in national arsenals. What makes the U.S.-led negotiation of these agreements even more impressive is that many states have become legally obligated to most of them, simply because they realize these limitations best serve their national interests. The United States is party and legally obligated to all of the following: The 1963 Limited Test Ban Treaty, which bans tests in the
atmosphere, outer space, and under water (124 contracting parties); the 1968 Nonproliferation Treaty, which prohibits selling, giving, or receiving nuclear weapons (189 contracting states); the 1971 Seabed Arms Control Treaty, which bans placement of nuclear weapons in or under the deep seabed (99 contracting states); the 1972 Biological and Toxin Weapons Convention, which bans the production and possession of biological weapons (143 contracting states); the 1972 Strategic Arms Limitation Talks Treaty (SALT I), which limits the number and types of U.S. and Soviet nuclear weapons; the 1972 Anti-Ballistic Missile Treaty, the pact between the United States and Soviet Union that sets limits on antiballistic missile testing and deployment; the 1976 Environmental Modification Convention, which bans modification of the environment as a form of warfare (66 contracting states); the 1979 SALT II Treaty, which limits the number and types of U.S. and Soviet strategic weapons; the 1987 Intermediate-Range Nuclear Forces (INF) Agreement, which eliminates all U.S. and Soviet missiles with ranges between 500 and 5,500 kilometers; the 1987 Missile Technology Control Regime, which limits transfer of missiles or missile technology (25 contracting states); the 1991 Strategic Arms Limitation Talks agreement (START I), which reduces strategic nuclear forces between the United States and the Soviet Union, Belarus, Kazakhstan, Russia, and the Ukraine; the 1992 Chemical Weapons Convention, which bans possession of chemical weapons after the year 2005 (143 contracting states); and the 1993 START II agreement that reduces U.S. and Russian strategic nuclear forces.

Notable exceptions cloud U.S. practice and highlight the force of pragmatic realism over multilateral legalism. The U.S. Senate in 1999 rejected the Comprehensive Nuclear Test Ban Treaty (77 contracting states), largely for reasons of partisan politics and to ensure that the ability to test nuclear weapons would be available to the United States so as to maintain nuclear parity with other states. Nor has the United States contracted to the Convention on the Prohibition of Anti-Personnel Mines (117 contracting states), because of the deterrent value of landmines for protecting U.S. troops in South Korea. Unilateral exceptionalism, ostensibly on pragmatic security grounds, reemerged in the presidency of George W. Bush. The Bush administration indicated that it would withdraw from the 1972 Anti-Ballistic Missile Treaty with Russia so that the United States may go forward with testing and deployment of a space-based missile system to protect America from an attack by a “rogue state” armed with nuclear missiles. Moreover, the Bush administration announced in 2001 that the United States opposed a UN treaty to limit the international sale of small arms, because the accord would constrain the legitimate weapons trade and infringe on the right of American citizens to bear arms. The fact that the United States is the leading exporter of such weapons, selling $1.2 billion of the estimated $6 billion worldwide total, seems a more pragmatic explanation of that policy decision.

Such international legal agreements demonstrate the American recourse to legalism, but they are steeped in motives of pragmatism and realism. A treaty in and of itself cannot prevent the use of any weapon by any party, no more than domestic laws can prevent a person from using a handgun to rob a bank or commit murder. Still, multilateral agreements articulate rules and norms that states are expected to follow in their conduct. If all contracting parties adhered to all these legal rules all of the time, the possibility of these weapons being used would be considerably reduced, and the prospects for obtaining international peace and security would be greatly enhanced. Once again, the motivations for U.S. foreign policy emerge as a national blend of realistic pragmatism and idealistic legalism, the success of which ultimately rests in the political will of the involved governments.

The blend of pragmatism with recourse to multilateral legalism is also well illustrated in issues concerning conservation of natural resources and protection of the biosphere. As the greatest industrial superpower in history, the United States consumes 35 percent of the world’s energy resources and emits nearly 25 percent of the world’s carbon dioxide. American economic consumption at home generates serious environmental repercussions abroad. Since 1960 the U.S. government, along with other states and international organizations, has grown more attuned to how burgeoning industrial output affects its own air, water, and land area, as well as how international legal agreements might best be fashioned to minimize the corrosive impacts of industrialization on the earth’s environment beyond the limits of national jurisdiction. To these ends more than five hundred multilateral agreements have been concluded on conservation and protection of the biosphere, many done with vigorous U.S. participation in UN-sponsored conferences. The obligatory presumption underpinning these instruments is that governments and individuals must use the bio-
sphere responsibly, on the theory that it belongs to no one individually and to everyone collectively. These views are crystallized in multilateral agreements negotiated as legal regimes to govern national activities in global common areas, that is, in those spaces such as the oceans, Antarctica, and the atmosphere. Importantly, the United States is formally obligated to most of these legal regimes.

The legal status of the world’s oceans has been a legal concern for four hundred years, though more recent attention has focused on how best to use them without causing pollution, resource depletion, or harm to living creatures. The first global effort to codify the oceans’ legal status came in 1958 with the promulgation of the four 1958 Geneva Conventions on the Law of the Sea. The United States assumed the pivotal role in drafting these agreements. When advances in technology overwhelmed the relevance of these instruments, the United Nations in 1973 convened a complex, protracted series of negotiations to recodify ocean law. Again, the United States assumed the central role in these negotiations, which in 1982 produced the UN Convention on the Law of the Sea. This framework convention seeks to regulate issues of offshore territorial jurisdiction, ownership of the continental shelf region, exploration and exploitation of living and nonliving resources in the ocean and on the deep seabed, as well as protection of the marine environment. The convention defines coastal zones, establishes an International Seabed Authority to regulate mining on the ocean floor beyond the limits of national jurisdiction, and provides for sharing revenues derived from such operations.

For modern ocean law, the 1982 convention rules the waves for most nations. Yet the United States has remained resistant to becoming a party to this agreement, principally because of the deep seabed issue. The United States possesses the most advanced seabed mining technology and would contribute the most dues to the authority’s operations, which would likely most benefit developing countries. On these grounds some U.S. senators argued vigorously during the 1980s against the treaty, although since the treaty entered into force in 1994, those objections have largely waned. In this respect the U.S. role in the modern law of the sea inculcates an ideological struggle in the American mind between the benefits of internationallegalism versus unilateral exceptionalism, as well as the virtues of economic liberalism versus international socialism. The irony is that, over the course of nearly a decade, the United States contributed more legal wherewithal and technical insights to the negotiation of this convention than any other government. In the end, the fundamental issue came down to that of sovereign self-interest versus international common interest, and in this case, sovereign self-interest appears to have won out.

Nevertheless, U.S. foreign policy was essential for forging many other treaties that contributed to more orderly use of ocean space. Among these were the 1946 International Convention for the Regulation of Whaling; the 1969 International Convention on Civil Liability for Oil Pollution Damage; the 1973 International Convention for the Prevention of Pollution from Ships, with its protocol of 1978 (MARPOL 73/78) and six annexes; the 1972 Convention on the Prevention of Marine Pollution by Dumping of Wastes and Other Matter, with its 1996 protocol; the 1966 Load Line Convention; the 1974 Safety of Life at Sea Convention; and the 1972 International Convention on the International Regulations for Preventing Collisions at Sea. In addition, the United States figured mightily in the negotiation of two other major ocean conservation documents, the 1993 UN Food and Agriculture Organization Agreement to Promote Compliance with International Conservation and Management Measures by Fishing Vessels on the High Seas; and the 1995 Agreement for the Conservation and Management of Straddling Fish Stocks and Highly Migratory Fish Stocks.

In the case of Antarctica, the United States remains key as the contributor to forming new rules for administering the legal regime there. The Treaty on Antarctica was largely an American inspiration and culminated on 1 December 1959 from a special negotiating conference of twelve states in Washington, D.C. The United States also emerged as the critical influence in producing three other agreements that comprise the modern Antarctic Treaty System. These are the 1972 Convention on the Conservation of Antarctic Seals, which protects Antarctic seals from being harvested; the 1980 Convention on the Conservation of Antarctic Marine Living Resources, designed to conserve krill, fish, birds, and other marine life in the Southern Ocean; and the 1991 Protocol to the Antarctic Treaty on the Protection of the Antarctic Environment, which establishes the norms, rules, and procedures that Antarctic Treaty contracting parties must apply to their activities in the region. Each instrument was negotiated and entered into force with full U.S. concurrence, because protection of the environment and conservation of
Antarctic resources are perceived as best serving long-term U.S. national interests. In this regard, elements of pragmatism stand out in U.S. policy. But what also stands out is the important proclivity toward multilateral legalism that is idealistically intended to secure environmental protection and resource conservation in the region. For U.S. interests to be best protected, other governments concerned with Antarctic matters must be likewise legally bound. Only multilateral agreements, as opposed to exceptionalist, unilateral initiatives, can suitably attain that purpose.

A quartet of instruments comprises the regime for regulating the protection of the atmosphere by eliminating or stabilizing anthropogenic emissions of substances that threaten its environment. The first of these, the 1985 Vienna Convention for the Protection of the Ozone Layer, was instigated and promoted mainly by the United States. This treaty aims to protect human health and the environment against the adverse effects of modification of the ozone layer. Its 1987 Montreal Protocol, which entered into force with strong support from the U.S. government, was negotiated to institute precautionary measures to control global emissions of substances that deplete the ozone layer. The UN Framework Convention on Climate Change, a product of the 1992 Earth Summit at Rio de Janeiro, seeks to regulate the level of greenhouse gases contaminating the atmosphere in order to avoid creating climate changes that impede economic development worldwide. Its companion instrument, the 1997 Kyoto Protocol, was negotiated as a means to implement the framework global warming convention. Even though U.S. industry is responsible for producing 25 percent of the world's greenhouse gas emissions, the administration of George W. Bush indicated in 2001 that it would not participate further in negotiations on the Kyoto Protocol, mainly because the economic price paid by U.S. industry was considered unfairly too high, especially given that India and China were not participating and developing countries were exempt from the protocol's restrictive terms.

By 2001 the United States had not accepted the 1992 Convention on Biological Diversity, which aims to conserve and promote sustainable use of biodiversity resources. Although 180 other states had ratified this accord, the United States rejected it on grounds that it encourages “equitable sharing of benefits” arising out of the use of genetic resources and “appropriate” transfer of technology, while taking into account rights over such resources. The legal logic here supposes that, as the largest developer of biotechnology industries, the United States stands to lose most from these obligations. These costs are seen as not worth the price of legal agreement. Nor had the United States contracted to the 1989 Basel Convention on the Control of Transboundary Movements of Hazardous Wastes and Their Disposal, ostensibly because critical terms in the agreement were left vague and open to interpretation. Rejection of the Basel Convention more likely came because U.S. industry is the world’s largest exporter and importer of precious-metal wastes and scrap and would be severely affected by the accord’s legal restrictions.

An attitude of exceptionalism for the world’s largest consumer and greatest polluter cannot produce benefits for the planet’s environment. To correct this, the United States has contracted to three important agreements: the 1973 Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES), which seeks to protect certain species from overexploitation by a system of import-export permits; the 1979 Geneva Convention on Long-Range Transboundary Air Pollution, which aims to limit the discharge of air pollutants, especially sulfur dioxide, that cause distant damage in other states; and the 1992 UN Convention to Combat Desertification, which strives to halt spreading desert lands.

CONCLUSION

U.S. foreign relations depend on legal order, operate within a legal framework, and require legal principles and concepts that influence policy and limit choices. To be sure, the United States derives benefits from international legal rules and agreements with other states. Legal rules keep international society functional, contribute to economic order and political stability, and provide a basis for common ventures and mutual intercourse. Given that international law serves to limit the actions of all governments, it therefore enhances the security and independence of the United States in its dealings with other states. International legal rules establish common standards where they are deemed by states to be desirable and make more predictable what behavior to expect from states in their relations with each other. That is no less true for the United States in this age of globalization and increasing interdependence.

But international law also limits the freedom of the United States to act in its foreign affairs. The
United States is obligated to certain restraints, irrespective of what its government might like to do when the time comes to act. Political arrangements legitimized by formal agreements are more difficult to unravel or modify. The predictability of state behavior established by international law means that the United States is not free to be disorderly or promote changes on its own whim. To foster the security and independence of its own territory and limit the conduct of other governments, the United States must accept corresponding limitations on its own behavior. To secure the confidence accrued from law, the United States must consent to being restricted in its ability to frustrate the expectations of other states. U.S. foreign policy therefore evolves in tandem with how international legal rules are regarded. Each successive administration builds its foreign policy on the legal framework constructed by its predecessors. Since World War II, U.S. foreign policy has moved slowly but perceptibly away from pragmatic, nationalist principles toward a more legalist, international doctrine. With the end of the Cold War, this tendency has accelerated. In the early twenty-first century, U.S. foreign policy was moving toward more universal values, bound by increasing legal commitments in formal multilateral agreements.

For American foreign policy, international law is most effective in regulating the rapidly expanding range of functional relations between the United States and other international actors. Such functional interstate relations are considered to be “low politics” (trade, communications, rules of diplomacy) and are motivated by a combination of idealism, moralism, and pragmatism. National security issues, however, retain their critical importance as pragmatic considerations, though increasingly the tendency has been to negotiate arms control agreements whenever possible, as opposed to seeking a straightforward balance of power amongst military adversaries. For the United States the restraint of legal rules appears least effective when applied to “high politics,” meaning its national security relations between sovereign states. Under these circumstances, realism and pragmatism are prone to fostering American unilateralism in foreign dealings. Yet the wide range of arms control agreements, environmental regulations, and rules for war negotiated through U.S. leadership suggests that recourse to international legal solutions to deal with “high politics” issues retains great sway for U.S. foreign policy as well.

The American experience demonstrates that international law best serves those who make it work over the long term. As the body of rules for the international relations game, international law provides the formal ways and means for communicating to U.S. policymakers the perceived international consensus on policy questions and legal issues. Thus, the United States employs international law in its foreign policy and contributes to its creation. This explains why, with few exceptions, the United States formally recognizes and agrees to respect fundamental rules and principles intended to guide its foreign policy behavior. For the preeminent actor in international relations at the dawn of the twenty-first century, it cannot be otherwise.

If the success of institutions were judged by the breadth and passion of their critics, then both the International Monetary Fund (IMF) and the International Bank for Reconstruction and Development (World Bank) would count among the most effective multilateral organizations in the world. Beginning in the late 1990s it became an annual ritual for tens of thousands of anti-globalization protesters to descend upon Washington, D.C., in late September to disrupt their annual meetings. But the left has had no monopoly on criticism of the IMF and World Bank. Republican U.S. congressmen and free-market economists have long derided both entities as misguided and even corrupt. Furthermore, these protests were nothing new: both the left and the right in the United States vehemently objected to the Bretton Woods agreements that created the IMF and World Bank near the end of World War II.

Do the arguments made against the Bretton Woods institutions, both now and in the past, have any merit? And why do these multilateral institutions, created for the noble goals of preventing international monetary turmoil and alleviating global poverty, incite such heated responses, both in the United States and abroad? Finally, are the IMF and World Bank near the end of War II.

In fact, in order to understand the influence and development of these organizations during their first few decades, it is more useful to talk about a “Bretton Woods system” rather than dissecting the specific institutional histories of the IMF and World Bank. The agencies themselves were both anemic and ineffective during their early years. For example, the World Bank was established in order to aid postwar European reconstruction but was quickly supplanted when the United States established the European Recovery Plan and the Marshall Plan. Only later did it embrace the mission of funding development, infrastructure, and anti-poverty programs in the underdeveloped countries of the world. The IMF was similarly pushed to the side during its early years, as bilateral negotiations, currency blocs (like those for sterling and the franc), or Marshall Plan institutions such as the European Payments Union drove postwar international monetary relations.

Still, while the IMF and World Bank were moribund for some time, and are not particularly influential in the early twenty-first century, the Bretton Woods agreements did set down certain “rules of the game” that, if not always enforced by the IMF and World Bank, certainly have animated much of the spirit of international economic activity since World War II. Furthermore, in spite of their weaknesses, it is important to remember that at the time of their inception, the idea of creating such multilateral economic institutions was truly revolutionary. The logic behind these organizations and their mission emerged from a powerful if sometimes flawed causal and historical logic. After the economic collapse of the 1930s and the destructive war of the 1940s, the conventional wisdom held that unfettered capitalism was unstable, prone to crisis, and unfair in its international distribution of wealth. Just as the U.S. federal government intervened in the domestic economy through the New Deal to eliminate the extremes of market capitalism
while maintaining the benefits, so too were the newly formed global organizations formed to regulate, but not stifle, the global economy.

Depression and war had ushered in a profound shift in the relationship between governments, national economies, and the global economic order by the time representatives of forty-four nations met at Bretton Woods, New Hampshire, in July 1944. Before World War I, international monetary relations were not considered the province of national governments. Rarely did any entity intervene in foreign exchange markets, and when one did, it was nongovernmental banks such as the House of Morgan or the still private Bank of England. There were several attempts at monetary cooperation and collaboration among international private bankers during the late nineteenth century, but it was sporadic. And while the idea of providing aid to rebuild the devastated, war-torn economies had been considered after World War I, the notion of a permanent international bank to guide global efforts to increase living standards and eliminate global poverty was truly remarkable.

One criticism is, however, quite justified. Both the World Bank and especially the IMF have often been tools for U.S. foreign policy and foreign economic goals. Part of this has to do with the nature of constituent power within these organizations. Unlike the United Nations, where each state has an equal vote, representation within the Bretton Woods institutions is established by the size of the financial contribution. Since the United States is by far the largest contributor, it has the principal voice in determining the policies and procedures of both institutions. Furthermore, the United States is able to pressure many of the other large contributors, like Japan, Germany, Saudi Arabia, and Kuwait, into following their policy preferences.

In fact, it is fair to say that America has dominated both of these institutions since their founding. To give just a few examples: in the 1940s, it was the United States bypassing these institutions through the Marshall Plan and regional aid schemes. In the 1950s and 1960s, the United States used the IMF to bail out sterling, the currency of its close ally Great Britain, and the World Bank to promote its modernization schemes. During the 1990s the relationship between the IMF and the Clinton administration’s Treasury Department was downright incestuous, as both institutions forged the now controversial “Washington consensus” in its aid and economic reform packages. Rarely has either Bretton Woods institution pursued policies at odds with U.S. foreign policy goals.

THE IMF BRETTON WOODS MONETARY SYSTEM

The Bretton Woods conference of 1944 produced the most ambitious and far-reaching international economic agreement between sovereign states in history. By far the most important aspect of these arrangements were the articles that created the International Monetary Fund and established the rules for global monetary relations. American and British financial officials, led by John Maynard Keynes and Harry Dexter White, hoped to establish a system that would maintain stable, fixed exchange rates, allow national currencies to be converted into an asset over which they had no issuing control (gold), and to provide an effective mechanism to adjust exchange rates in the hopefully rare event that a “fundamental” balance-of-payments disequilibrium emerged. In the event of nonfundamental deficits that normally arose in international transactions, the deficit country would pay with a reserve asset (gold or a key currency convertible into gold), or seek short-term financing from the International Monetary Fund, which would supply the currency needed. The IMF was also assigned the task of overseeing and enforcing these arrangements.

This IMF-guided system was much different from any previous international monetary system. It was not like a traditional gold standard, where the domestic money supply, and hence the domestic price level, was directly determined by the national gold stock. Under the gold standard, a balance-of-payments deficit would be paid for through the export of gold, resulting in a decrease in the domestic money base and a deflation of prices. The decreased purchasing power would lower that country’s imports, and the increased international demand for that country’s lower-priced goods would increase exports, naturally correcting the balance-of-payments deficit. Conversely, an influx of gold, by increasing the domestic monetary base and domestic prices, had the opposite effect of boosting imports and discouraging exports, thereby eliminating a payments surplus. According to standard market theory, any balance-of-payments disequilibrium would be adjusted more or less automatically, eliminating the need for government interference. But the cost of making payments balance could be
very high, and included deflation that caused widespread unemployment in deficit countries. In reality this system worked much better when capital flows from London, and to a lesser extent Paris, kept the system functioning smoothly.

The founders of the IMF explicitly rejected the gold standard as a model for future international monetary relations. White and especially Keynes believed that the interwar experience had demonstrated that a balance-of-payments adjustment process that relied on deflating the economy of a deficit country was draconian in an age when national governments promised full employment and a wide array of social spending. Decreasing the monetary base in a deficit country would lead to a fall in national income, unleashing unemployment and necessitating large cuts in government spending. To avoid such a politically unacceptable system, the Bretton Woods IMF regime allowed nations to import and export gold without penalty (that is, without having to change their domestic monetary base). If and when balance-of-payments deficits arose between countries, they would be corrected through short-term IMF financing and small, IMF-approved changes in the exchange rate. This points to an interesting fact about the Bretton Woods conference and agreement. Although Bretton Woods was hailed as the hallmark of international cooperation, in reality it provided national economic and political authorities an unprecedented amount of immunity from the international pressures of the global market. To a large degree, this was the policy preference of both the United States and Great Britain. Macroeconomic decisions were the sole province of national governments, which were quick to sacrifice measures that would bring about balance-of-payments equilibrium in order to achieve important domestic goals.

Because U.S. economic foreign policymakers worried that the existing gold stock was too small to sustain the growing demand for international liquidity, the Bretton Woods IMF regime was set up to be a two-tiered system in which certain key currencies—those convertible into gold, such as the dollar and (it was hoped) sterling—could be used in lieu of gold to settle international transactions. It was hoped that this would conserve the use of gold and dramatically increase the amount of liquidity available to finance international transactions. This meant that much of the world's reserve requirements would be supplied through the balance-of-payments deficits of the key currency economies. Why did the Bretton Woods planners allow such a thing? Keynes recognized that Great Britain would face postwar deficits, and he wanted a system that did not penalize sterling. Ironically the British economist also feared American surpluses and wanted to guarantee that the United States fulfilled international liquidity needs.

But it was unclear how large these deficits had to be to fulfill international reserve needs. If the key currency economies had no deficit, or too small a deficit, then the world would have to rely on gold alone to finance trade. Without key currency deficits, liquidity would dry up and international transactions disappear. But if the key currency country ran balance-of-payments deficits that were too large, the resulting inflation would test the value of the key currency and set off a large-scale conversion of the currency into gold. This would remove valuable liquidity from the system and set off a fierce competition for gold, with deflationary effects on the international economy. Capital controls, trade restrictions, and currency blocs might ensue. This made the meaning of British, and to a greater extent, American balance-of-payments deficits somewhat ambiguous. The system was designed to make deficits necessary, but it was never clear how large or how small a deficit was needed to supply liquidity without undermining confidence in the value of the dollar.

What were the larger motives of the founders of the IMF plan? U.S. and British foreign and economic policy goals were often at cross-purposes by 1944. It has often been noted how remarkable it was that Keynes and White, despite the vastly different economic priorities of the countries they represented, were able to come up with such an extraordinary compromise. Indeed, Keynes's original proposal envisioned a "currency union" in which countries would have had to pay a penalty on their surplus payment balances. Additionally debtor nations would have unrestricted and virtually unlimited access to the resources of the clearing fund without having to seek international approval or make domestic adjustments to correct payments disequilibria. Keynes's original plan had an enormous inflationary bias, and would have allowed Great Britain to tap the immense resources of the United States without having to go through the arduous and embarrassing process of asking for direct aid.

The IMF Bretton Woods system has often been portrayed as an attempt to move away from the vicious economic competition of the late nineteenth and early twentieth centuries. Ameri-
can policymakers were motivated, it has been suggested, “by a humanitarian desire to prevent the kind of financial stresses and economic dislocations that might lead to future wars.” The noted policy analyst Judy Shelton summed up the conventional wisdom when she argued in 1994 that “Keynes and White were convinced that international economic cooperation would provide a new foundation of hope for a world all too prone to violence. ‘If we can continue,’ Keynes observed, ‘this nightmare will be over. The brotherhood of man will have become more than a phrase.’”

Keynes’s own writings call this interpretation into doubt. Not only would his blueprint protect Great Britain’s planned full-employment policies from balance of payments pressures, it would also present a convenient and politically painless way to get money out of the United States in the guise of international banking and monetary reform:

It would also be a mistake to invite of our own motion, direct financial assistance after the war from the United States to ourselves. Whether as a gift or a loan without interest or a gratuitous redistribution of gold reserves. The U.S. will consider that we have had our whack in the shape of lend lease and a generous settlement of consideration. . . . We in particular, in a distressed & ruined continent, will not bear the guise of the most suitable claimant for a dole . . . On the contrary. If we are to attract the interest and enthusiasm of the Americans, we must come with an ambitious plan of an international complexion, suitable to serve the interests of others sides ourselves. . . . It is not with our problems of ways and means that idealistic and internationally minded Americans will be particularly concerned.

While the Americans rejected the currency union plan as too radical, the British came up with a substitute in the scarce-currency clause for the IMF, which permitted extensive capital controls and trade discrimination against major surplus countries. Roy F. Harrod, a U.S. Treasury official and Keynes protégé, even suggested that the scarce currency not be discussed in public, for fear that the U.S. Congress might figure out its true implications. Keynes agreed, stating, “the monetary fund, in particular, has the great advantage that to the average Congressman it is extremely boring.” But the heated debates in Congress over the IMF demonstrated that some Americans had a better understanding of the scarce-currency clause than Keynes assumed.

The controversial scarce-currency clause was eventually included as Article 7 in the IMF Bretton Woods agreement, but the Truman administration interpreted its provisions very narrowly. This angered many British policymakers, who in later years blamed many of Britain’s economic woes on the Americans’ narrow interpretation of the clause. During deliberations over whether or not to devalue sterling in 1949, the UK president of the Board of Trade bitterly lamented the American position:

In particular, United States policy in the Fund has been directed . . . to making the “scarce currency” clause a dead letter. We thought originally that this clause might give some real protection against a dollar shortage; indeed, Lord Keynes’s conviction that this was so was one of the main factors which led His Majesty’s Government and Parliament to accept the Loan Agreement. Once the clause comes into operation, it gives wide freedom for discriminatory exchange and trade controls against the scarce currency; and then there is real pressure on the country concerned to play its full part in putting the scarcity right, e.g., by drastic action such as we want the United States to take to stimulate imports.

In the end, the British had little to complain about. By the late 1940s the Truman administration’s foreign policy goal of promoting European reconstruction and eventual integration led the United States to permit extensive dollar discrimination while furnishing billions of dollars of aid through the Marshall Plan. Furthermore, to the surprise of many, the United States ran consistently large balance-of-payments deficits throughout the postwar period. The problem was not, as Keynes and White had feared, too little liquidity. The opposite was the case. By the late 1950s and early 1960s, there was a growing sense that the flood of postwar dollars had become too large, and that measures had to be taken to choke off the persistent American balance-of-payments deficit.

**A ROUGH START FOR BRETTON WOODS AND THE IMF**

The Bretton Woods blueprint for exchange-rate stability, hard convertibility, and international cooperation through the International Monetary Fund proved untenable from the start. In 1947, buoyed by an enormous stabilization loan given by the United States after the cessation of lend-lease, Great Britain attempted to make sterling convertible into gold and dollars, as stipulated by the Bretton Woods agreement. This first real test
of the agreement proved a dismal failure. There was an immediate run on the pound, and within months Britain used the entire proceeds of the loan. Current account convertibility of sterling was suspended, and no other major currency would attempt anything approaching hard convertibility until the end of 1958. The failed attempt to make sterling fully convertible was a major reason the United States decided to circumvent both the IMF and World Bank to provide direct aid to Great Britain and western Europe through the Marshall Plan. The sterling crisis also persuaded the Truman and Eisenhower administrations to accept widespread trade discrimination and monetary controls aimed at the dollar and dollar goods, in clear violation of the terms of the IMF's rules and regulations. Some of the monetary restrictions were lifted in 1958, but much of the trade discrimination against American goods continued for decades.

The pretense of IMF-monitored exchange-rate stability was abandoned in 1949, when Great Britain undertook a massive devaluation of sterling in order to make its exports more competitive and to write down wartime debts. Great Britain did not seek the approval of the IMF or any of its major non-Commonwealth trading partners. It did secretly consult with a small, high-level group of Truman administration officials led by Secretary of State Dean Acheson. The 1949 devaluation outraged officials from the IMF and the international community and threatened to undo the tentative movement toward European economic integration and the dismantling of worldwide trade and currency controls. The lesson learned by other nations was that there was no punishment for a unilateral devaluation if national interests warranted it. If one of the countries that helped design the IMF and the Bretton Woods system flouted its rules, how could other nations be expected to tow the line? The IMF was powerless to stop any transgression against its charter.

Perhaps the most shocking fact was that the International Monetary Fund, which was supposed to be both the source of liquidity for temporary payments imbalances and the enforcer of Keynes and White's international monetary rules, was almost entirely excluded from Great Britain's decision (which was made in close consultation with the Truman administration). In actuality, the IMF was emasculated in the 1940s and 1950s, with little authority or voice in international economics. Desperately needed liquidity was supplied to the world by direct American aid, through programs like the Marshall Plan, Point Four, and the Military Assistance Program. In fact, signatories of the Marshall Plan were strictly forbidden from using the IMF to correct payments imbalances. The Marshall Plan actually created a separate monetary system for western Europe, the European Payments Union, which had its own rules that flouted both the spirit and the letter of IMF regulations. The EPU allowed only extremely limited intra-European convertibility and permitted discrimination against dollar transactions. It was only much later that the IMF became a player in world monetary relations, a period that began when the United States used the IMF as a vehicle to make an enormous loan for Great Britain after the Suez crisis in 1956–1957.

"Disequilibrium" characterized the postwar IMF monetary system throughout the so-called Bretton Woods period. During the early postwar period, there were large payments imbalances between the devastated economies of western Europe and the United States. Large European deficits were to be expected, but they were made worse by the fact that currency par values were often established in an arbitrary manner. Although the IMF was supposed to approve initial par values and any subsequent changes, in actuality each country could pretty much establish whatever rate it wished. If exchange rates had “floated” on foreign exchange markets after the war, they might have found a sustainable rate that would have closed the payments gap with the United States more quickly and efficiently. But after rates were set, changes came in dramatic and disruptive devaluations, the direction of which was always known in advance. Extensive trade and capital controls that discriminated against dollar goods were established instead. In order to fill the large payments gap, the United States provided enormous amounts of aid (in fact, initially Marshall Plan disbursements by the United States were determined by the payments deficit of individual European countries). The adjustment process during the postwar period was not automatic but had to be managed by governmental policy and controls. This made the Bretton Woods period different from the gold standard and the free exchange-rate period in one important respect: because the adjustment process could only be accomplished by government intervention and policy, the system was highly politicized.
THE FLAWS OF THE IMF BRETTON WOODS SYSTEM

Why did the Nixon administration finally pull the plug on the IMF Bretton Woods system on 15 August 1971, after two decades of monetary chaos and instability? In fact the decision was to a large degree inevitable. In its final form the Bretton Woods Monetary Agreement that created the IMF was unworkable because it lacked a mechanism to adjust persistent payments imbalances between countries. Exchange-rate stability could only be maintained by providing ever-increasing amounts of “liquidity,” a process that created enormous political difficulties and ultimately undermined confidence in the IMF system.

Why were the fixed exchange rates unstable? The IMF plan, unlike a pure gold standard, affirmed the primacy of domestic economic goals, which included the maintenance of full-employment economies over strict balance-of-payments concerns. But exchange-rate stability can only be sustained when there is comparable price stability between countries, a near impossibility. If prices change markedly because of inflation or deflation in a given domestic economy, then currency exchange rates must shift accordingly or else their initial par rates will quickly be rendered obsolete. When exchange rates are not changed to reflect price shifts, balance-of-payments deficits and surpluses quickly emerge. Such a situation would be especially problematic if the initial par values were already out of line, which was often the case under the IMF Bretton Woods system, because nations were given wide discretion to establish their own rates.

The ensuing balance-of-payments disequilibria were a constant source of monetary instability in the IMF Bretton Woods system. For example, if Great Britain’s domestic economic goals produced a yearly inflation rate of 6 percent, and the United States pursued policies that resulted in 4 percent inflation, then the exchange rate would have to be adjusted if balance-of-payments disequilibrium was to be avoided. But this obviously contradicted the IMF’s goal of exchange-rate stability, and without market-determined rates there was no easy mechanism to adjust the exchange rate without creating havoc. Deflating the domestic economy to bring the balance-of-payments into balance was not politically realistic or desirable after World War II. Furthermore, the IMF system actually rewarded speculators, who knew the direction of any revaluation and could simply put pressure on a vulnerable currency until a nation exhausted its reserves or its will defending the old exchange rate. Speculators made a fortune forcing the devaluation of sterling in 1949 and 1967. The only option to avoid damaging devaluations was capital and trade controls. Every major country, including the United States, had to install capital controls in one form or another during the early years of the IMF Bretton Woods system in order to maintain their exchange rate, despite the fact they were forbidden (except in extreme cases) by the IMF.

A second flaw, less well recognized but equally serious, was the method of providing “liquidity” in the IMF Bretton Woods system. Liquidity is simply another word used to describe reserve assets that are transferred from debtor to surplus countries to cover their payments gap. In order to offset a negative payments balance and maintain a fixed exchange rate, governments had to supply some universally accepted asset over which they had no issuing control to cover. Until 1914 this asset was, at least in theory, gold. Because the IMF Bretton Woods planners believed that there was not enough gold to supply world liquidity (reserve) needs, key currencies, such as the dollar and sterling, should be used to supplement or replace gold to settle international transactions.

The failure to make sterling fully convertible in 1947 meant that the dollar alone would serve the reserve asset, or “liquidity,” function. As a result the dollar was demanded by foreign nations both as a reserve asset and to finance much of the world’s trade. These factors, in conjunction with the economic recovery of Europe, helped produce a sizable American balance-of-payments deficit. But it was not like the payments deficit of any other nation. Some of these excess dollars were actually desired by the rest of the world, not to purchase American goods and services but for reserve and international settlement purposes. In other words, the dollar’s unique role in world trade and reserve creation meant that a certain level of American balance-of-payments deficit was desirable and in fact necessary for the international economy. But how much of a payments deficit was needed to supply global liquidity was difficult, if not impossible, to determine. Initially most foreign central banks preferred to hold dollars because they earned interest and had lower transaction costs than gold. But as American dollar liabilities—created by the yearly payments deficits—increased, confidence in the gold convertibility of the dollar fell. After convertibility
was established by the major economies of western Europe at the end of 1958, central banks began to buy increasing amounts of gold from the United States with their excess dollars.

This brought up a larger question: how stable and cooperative could the IMF Bretton Woods system be if it only worked when the world’s largest economy, the United States, ran yearly balance-of-payments deficits? Much has been made of the advantages and disadvantages this system conferred on the American economy. When foreign central banks held dollars for reserve and transaction purposes, it enabled American consumers to receive foreign goods and services without having to give anything other than a promise to pay in return. It was like automatic credit, or, if the reserves built up indefinitely, like getting things for almost nothing. This arrangement, which is the benefit of seigniorage, could be maintained as long as the dollar was “as good as gold,” when holding dollars in the form of short-term interest-bearing securities was probably preferable to buying gold, which earned no interest income and had high transaction costs. The danger came when overseas holders of dollars worried that the dollar was not as good as gold or for noneconomic reasons preferred holding gold to dollars. This sentiment emerged in the late 1950s and 1960s.

Under the IMF Bretton Woods system, overseas central bankers could turn in their excess dollars for gold at any time. But at some point the ratio of dollar liabilities to American gold would increase to a level that might cause a loss of foreign confidence in the dollar and a run to the U.S. Treasury gold window. American policymakers saw this as a threat to the economic well-being and foreign policy of the United States. The loss of American gold was also seen as a threat to the world economy, because it was believed that a worldwide preference for gold over dollars would decrease the amount of liquidity needed to finance and balance ever-expanding world trade. A mass conversion to gold would force the United States to suspend convertibility, which would wipe out the dollar’s value as a reserve and transaction currency. It was feared that competition between central banks for scarce gold could subject the international economy to paralyzing deflation. Another fear was that the resulting collapse of liquidity would freeze world trade and investment, restoring the disastrous conditions that paralyzed the world during the 1930s and created depression and world war.

The IMF Bretton Woods monetary system did have certain disadvantages for the United States. The fact that overseas central bankers held dollars in their reserves meant that the United States could be pressured for political reasons by the countries within the IMF Bretton Woods system. While the United States accrued benefits from the system, its pledge to convert dollars into gold made it vulnerable in ways other countries were not, especially as the ratio of gold to dollars decreased over time. To some extent Great Britain ran a similar gold-exchange standard before 1914 with a very low gold to sterling ratio, but international monetary relations were far less politicized before World War I. If France held a large supply of dollars as reserves and wanted to express dissatisfaction with some aspect of American foreign or economic policy, it could convert those dollars into gold. Converting dollars into gold gave surplus countries an important source of political leverage. It was this scenario that caused President John F. Kennedy to exclaim that “the two things which scared him most were nuclear weapons and the payments deficit.”

The IMF Bretton Woods system trapped reserve countries in another way. If a nonreserve country ran a persistent balance-of-payments deficit, it had the option of devaluing its currency to improve the terms of trade of its exports. The dollar was priced in terms of gold, so if it was devalued, other currencies could simply shift the value of their currencies so that no real devaluation could take place. The only true devaluation option that the United States had was to suspend the convertibility of the dollar into gold. The rest of the world would be left with a choice. Overseas central bankers could support the exchange rate of the dollar by using their own reserves to maintain their exchange rates with the dollar. Or they could “float” their currencies in all the foreign-exchange markets to determine their true value. Suspending dollar-gold convertibility was an option few American policymakers wanted to consider during the 1950s and 1960s. For their part, most European surplus countries dreaded either option.

Why was there such a fear—both in the United States and abroad—of abandoning the IMF Bretton Woods fixed exchange rates and moving to a market-determined, free-floating exchange-rate regime? It is hard to underestimate the powerful influence of the received wisdom concerning the history of monetary relations between the wars. In the postwar period it was a
widely held belief that the economic collapse of the 1930s was caused by a failure of international monetary cooperation. In the minds of most post-war economists and policymakers, capital flight, which had its roots in free-market speculation, had ruined the gold exchange standard, which destroyed international liquidity and froze international trade and financial transactions. The collapse of the rules of the game unleashed a vicious competition whereby countries pursued beggar-thy-neighbor policies of competitive devaluations and trade restrictions. To most, the culprit behind the international economic collapse was a free market out of control, fueled by pernicious speculators who had no concern for the larger implications of their greed-driven actions. This economic collapse unleashed autarky and eventually war. A market-driven international monetary system was no longer compatible with stability and international cooperation. Any situation that remotely looked like a repeat of the 1930s was to be avoided at all costs. IMF planners and Western policymakers determined that in the postwar world the market had to be tamed and national interest replaced with international cooperation that would be fostered by enlightened rules and institutions. Strangely, few seemed to understand how chaotic and inefficient the IMF Bretton Woods system eventually became. Massive American aid and constant intervention tended to obscure the system’s failings. The intellectual framework that produced the IMF Bretton Woods blueprint, though deeply flawed, had a profound impact on the postwar planners in most Western countries, including the United States, and thrived well into the 1970s.

More than anything else, policymakers in America and western Europe were afraid of the unknown. While the system was inefficient and prone to crisis, monetary relations, no matter how strained, were far better than during the interwar period. Furthermore, Western monetary relations were interwoven into a complex fabric that included key political and military relationships, including U.S. troop commitments to West Germany and Japan. No one knew what would happen to this fabric if the IMF Bretton Woods system collapsed, and few were anxious to find out.

What eventually destroyed the original IMF Bretton Woods system was that it did not have an effective, consistent process to adjust payments imbalances between countries. In order to preserve or restore a balance in international payments, payments imbalances between a country and the rest of the world must be brought into equilibrium through an adjustment process. The adjustment process can take many different forms, depending upon the rules of the international monetary system in question. There are two monetary systems where the adjustment mechanism is automatic, at least in theory: a gold standard and a system of free exchange rates. The nineteenth-century gold standard eliminated payments deficits and surpluses automatically through changes in a country’s aggregate demand brought about by importing or exporting gold. The present system of free exchange rates eliminates prospective payments imbalances through market-driven shifts in exchange rates. In both systems, payments imbalances are brought into equilibrium through processes that are largely automatic and independent of any governmental interference. The adjustment process in gold standard and free exchange rate regimes tends to be less politicized.

But this is not how payments imbalances were adjusted in the IMF Bretton Woods system. Instead, domestic economies were protected from demand fluctuations produced by gold or other reserve movements, and the system of fixed exchange rates prevented the market from determining the equilibrium price for a nation’s currency. Since there were inevitably great differences among national monetary policies, some method was needed to adjust for the changes in the relative value of currencies produced by differential rates of inflation and savings. But exchange-rate variations were difficult because they unsettled foreign exchange markets, and it was impossible to get countries to agree to shifts because they feared the adverse effects on their terms of trade. Countries were equally reluctant to sacrifice full employment and social policy goals for balance-of-payments purposes. This left no effective means to close balance-of-payments gaps automatically. As the economist Robert Stern stated in 1973, “Since the functioning of the pegged rate system may appear to avoid rather than expedite adjustment, it might be more fitting to characterize this system . . . as the ‘international disequilibrium system.’”

Consider the lengths to which the Kennedy and Johnson administrations went to settle America’s balance-of-payments deficits in the early 1960s. After the Eisenhower administration went into a near panic over the loss of gold in the days immediately before and after the 1960 presidential election (Eisenhower even proposed using the more abundant uranium in place of gold to settle...
America's payments deficit), the new Democratic administration made solving the problem one of its key foreign policy goals. A whole series of complicated formal and informal arrangements ensued—some through the IMF; others bilaterally, and still others with the so-called Group of Ten, or industrialized nations. But none of these American policies dealt with the crucial issue of creating a more effective adjustment mechanism.

The liquidity issue was much discussed both within and outside of the IMF during the late 1950s, 1960s, and 1970s. Liquidity, which was merely a euphemism for reserves, was the vehicle for financing balance-of-payments deficits in the Bretton Woods system. The greater and more persistent the imbalances, the more reserves, or liquidity, are needed to make the system work. In a system of fixed exchange rates that does not have an automatic adjustment mechanism, differential inflation and savings rates will quickly produce large imbalances between countries. Government leaders, unwilling to adjust exchange rates or alter domestic priorities for balance-of-payments purposes, clamped for more liquidity to finance balance-of-payments deficits. But it was rarely pointed out that this liquidity would be unnecessary if there was an efficient, effective, and automatic process for adjusting imbalances.

During the late 1950s and 1960s, when both policymakers and academics recognized that the international monetary system was flawed, hardly a proposal for reform was produced that did not emphasize the need for more liquidity. Suggestions ranged from increasing the country subscriptions to the IMF to inventing a whole new form of liquidity. The most dramatic American proposal came during the summer of 1965, when the Johnson administration's secretary of the treasury, Henry Fowler, called for a “new Bretton Woods conference” to create new liquidity. When the major western European nations eased capital controls and allowed for convertibility of their currencies into dollars, trade and capital flows increased dramatically. This made liquidity a more important issue: larger trade and capital flows increased the payments imbalances that inevitably arose in a fixed exchange-rate regime. More reserve assets were needed by national foreign exchange authorities to defend their exchange rate in the face of increasingly large and sophisticated currency markets. If controls were to be avoided (and they were not), countries would have to cooperate to manage disequilibrium. This would require agreements and institutional arrangements, such as the IMF, the General Agreement to Borrow; the swap arrangements, the Group of Ten, and the gold pool. But in the end, all of these reforms and ad hoc measures were merely Band-Aids to cover the deep structural flaws within the IMF Bretton Woods monetary system.

**THE IMF AFTER THE COLLAPSE OF BRETTON WOODS**

Despite the strenuous efforts of U.S. foreign policymakers, the IMF Bretton Woods system suffered a slow, painful death in the 1960s and early 1970s. Institutionally the IMF was at the center of many of the attempts to keep the system on life support. The organization's deposits, and ability to loan, were increased substantially in the 1960s. The IMF was also at the center of a series of proposals to reform and recast international monetary relations. The most interesting was the American proposal to supplant the dollar's reserve and liquidity role with an instrument called “Special Drawing Rights,” or SDRs. The idea for the SDRs emerged from a 1963 G-10 study on the need for additional liquidity and was formally proposed by the United States in the summer of 1965. The French were vehemently against the SDR, or any instrument that increased the IMF's power, since they believed the organization was a vehicle for American hegemony. Tough and at times acrimonious negotiations finally produced an agreement that was signed in Rio de Janeiro in September 1967. The SDRs were hailed as a major accomplishment, a needed supplement to the IMF Bretton Woods system, but in fact they were never widely used.

Ironically the greatest beneficiary of the monetary disorder of the 1960s and 1970s might have been the IMF. Irrelevant during the late 1940s and 1950s, the organization became the focal point of efforts to fix a broken international monetary system. Increased capital and trade flows brought more balance of payments volatility, and the IMF was called upon repeatedly to bail countries out of foreign exchange crises. The British requested billions to stave off monetary crises in 1961, 1964, and 1966. None of this aid helped, as sterling was finally devalued in 1967, although unlike the 1949 devaluation, the IMF played a key role. Even the French were forced to ask the IMF for help to defend their currency after their currency collapsed in the wake of the May
1968 Paris street protests. The IMF also served as a convenient vehicle for U.S. foreign policy goals when direct aid was not politically feasible, especially in the case of the bailout of sterling.

The IMF’s power and influence as an organization increased even more after the collapse of the global monetary rules it was assigned to oversee. Nixon ended dollar-gold convertibility at Camp David on 15 August 1971 without consulting the IMF. But every American attempt to restructure the system during the ensuing sixteen months did so with the IMF as the centerpiece organization. Any attempt to maintain the Bretton Woods fixed exchange rate system collapsed, however, after February 1973, when the United States and the world abandoned the short-lived Smithsonian agreement. The world returned to market-determined free exchange rates, the very system the IMF was established to prevent.

Economic malaise, in the form of international recession and a fourfold increase in oil prices, combined with exchange-rate volatility to spread balance-of-payments chaos worldwide. After Camp David the IMF’s role, and even its customers, changed dramatically. After abandoning fixed exchange rates the large industrialized countries like Japan and the countries of western Europe were less concerned about balance-of-payments difficulties. Market-determined changes in cross exchange rates replaced the ineffective adjustment mechanism of the old IMF Bretton Woods system. Nor did these large countries need the liquidity provided by the IMF, unless they wanted to defend their exchange rates against the overwhelming forces of the market. But the countries of the developing world could not as easily ignore dramatic changes in their exchange rates, and the oil price surge left many unable to close their balance-of-payments gaps without outside help.

Thus in the 1970s the IMF acquired a new client—the developing world. The fund also had new subscribers—the states of the Middle East that had grown rich with profits from their oil. Countries like Kuwait and Saudi Arabia had vast amounts of money, some of which went to increased subscriptions to international organizations like the IMF, and most of which was “recy-
cled” through American banks and invested in the underdeveloped world. This massive recycling was both a response to and the reason for the Third World debt crisis of the late 1970s and 1980s. The IMF increasingly found itself providing balance-of-payments financing to poorer countries hit hard by the energy price spikes of the 1970s and the debt crisis of the 1980s.

One of the most controversial aspects of the IMF’s post–Bretton Woods lending program has been its requirement that funded countries undergo what is called “structural adjustment.” Since IMF funding is meant to fill a balance-of-payments deficit, stabilize the foreign exchange rate, and avoid devaluation, the institution demands fundamental macroeconomic and institutional reforms to remove the causes of the payments imbalance. Stabilizing a currency and halting massive capital flows usually require policies that deflate the domestic economy, such as raising interest rates and slashing the size of the state’s budget. Many critics contend that these measures hurt the weakest members of the affected society. The first programs cut are usually in much-needed social welfare, health care, and educational programs that help the poor. Higher interest rates deflate the economy and lead to increased unemployment. Furthermore, the poor do not have the option of transferring their assets and capital abroad, as the wealthy often do during currency crises in the underdeveloped world.

The harshness of the IMF’s structural adjustment program—and U.S. policymakers’ role in promoting these controversial plans—came into greater focus in the late twentieth century. Largely at the behest of the Clinton administration’s Treasury Department, the massive IMF bailout of Mexico in 1995 required an economic reform plan that led to large layoffs and sharp downward pressure on workers’ wages. Similar complaints have been voiced in East Asia, where Indonesia’s efforts to calm a currency crisis through “structural readjustment” led to political turmoil, domestic unrest, and economic collapse. The IMF’s reputation has been further damaged by the widespread misuse of its funds in Russia. Things got so bad that the IMF was publicly criticized by Joseph Stiglitz, the chief economist of its sister organization, the World Bank. Worse, the IMF was seen as a handmaiden for America’s foreign policy goal of privatizing, reforming, and opening overseas markets. The sharp criticism forced the IMF to reassess all of its lending procedures and requirements, including its structural adjustment programs.

THE WORLD BANK AND ITS OFFSHOOTS

The World Bank, though far less influential than the IMF, has certainly been no less controversial since its opening in 1946. The bank has actually gone through fundamental changes since accepting its original agenda to promote the postwar recovery of Europe and Japan—its first loan was for $250 million to France in 1947. As it has added to its mandate, it spawned several new organizations to the original International Bank of Reconstruction and Development (IBRD).

In 1956 the bank established the International Finance Corporation (IFC) to provide subsidized loans and guarantees to poor, underdeveloped countries. The IFC provides long-term financing at near-market rates. The IFC provides $4 to $5 billion in new loans annually. The International Development Association (IDA) is perhaps the most controversial additional arm of the World Bank. The IDA was created in 1960 to provide money to countries too poor to borrow from the World Bank’s primary institution, the International Bank of Reconstruction and Development. IDA loans carry no interest rate, are very long term (thirty-five to fifty years), a small yearly fee (.75 percent), and a ten-year grace period. The United States has been the largest contributor to the IDA, providing more than $20 billion between 1960 and 2000. The International Center for Settlement of Investment Disputes (ICSID) was established in 1966 to promote increased private investment to the underdeveloped world. Similarly, the Multilateral Investment Guarantee Agency (MIGA) was created in 1988 to reduce the risk faced by private global investors in poor countries. In addition to providing advice, MIGA insures and guarantees up to 90 percent of a project’s investment.

The bank gets its money from country contributions and its investments in financial markets. The membership has increased from the original 44 nations that met at Bretton Woods to 183 in 2001. The United States is by far the largest contributor, providing over $50 billion since 1944. Although its total share has decreased, the United States still provides more than 17 percent of total funds. Several bodies govern the bank, including a board of governors (with a member from each country), a twenty-five-member executive directorate (with the five largest donors—the United States, Japan, Germany, France, and Great Britain holding permanent seats), and a president, who is by tradition an American.
EXECUTIVE PERSONALITY AND THE WORLD BANK

Far more than the IMF, the World Bank's direction and policies have been established by the personality of the executive director. The director's authority came largely as the result of a power struggle in the bank's early years between the first president, Eugene Meyer, a seventy-year-old investment banker selected by the Truman administration, and the bank's management and executive board. This dispute over power sharing led to Meyer's resignation after only six months. The high-profile "wise man" John J. McCloy was brought in to succeed him and to place the tottering bank on a better footing. McCloy's first act was to get the bank's executive board to relinquish its activist position and allow the president to dictate the organization's policies and directions. Though McCloy only stayed two and a half years, he began the tradition of powerful American World Bank presidents who drove the multilateral organization's agenda.

The World Bank's original mission was to provide reconstruction loans to war-torn Europe and Japan. These loans were intended for basic infrastructure projects such as roads, bridges, electrical plants, and the like. But the bank's lending policies were very conservative at first, and the recipients both demanded more funds and resisted the conditions attached to financing. The European Recovery Program, or Marshall Plan, soon eclipsed the World Bank. This U.S.-financed program provided far more money and attached fewer strings. During its first four years the World Bank provided only $500 million to western Europe, a figure dwarfed by the Marshall Plan and even by private American investment.

The World Bank's conservative lending policies continued under the long-term leadership of Eugene Black (1949–1962). While Black, a former president of Chase Manhattan Bank, enjoyed a solid reputation in the financial world, he was wary of moving too quickly away from the bank's original mandate. But by the late 1950s and 1960s the World Bank decided to escape its international irrelevance by reinventing itself. Western Europe and Japan were well on their way to a robust economic recovery that the World Bank had little to do with. The key event was the creation of the International Development Association in 1960. The IDA was established to make subsidized loans to poor countries that were credit risks and could not afford private commercial loans.

In order to borrow from the IDA a country must meet four criteria. It must be very poor (less than $800 per capita GNP in 2001). It must have sufficient political and economic stability to warrant financing over the long term. The country must have extremely difficult balance-of-payments problems, with little opportunity to earn the needed foreign exchange. Finally, its national policies must reflect a real commitment to development. These goals and policies reflected a new passion within the U.S. academic and foreign policy community for using foreign aid to promote "modernization" in the so-called Third World.

The IDA did not start out well. In fact a whole series of regional institutions were developed in order to fill the perceived void created by the World Bank's stingy loan practices. In 1958 the European Development Bank was created, largely for the benefit of francophone Africa. The European Investment Bank was established to finance infrastructure projects within the European Economic Community. In 1958 the Inter-American Development Bank was set up in Washington, D.C., to spur growth in Latin America. The African Development Bank was created in 1964, and the very successful Asian Development Bank began operations in 1966. If imitation is the sincerest form of flattery, then the World Bank was successful indeed. But the proliferation of regional banks also signaled the failure of the Bretton Woods institution to fully embrace the enormous global development challenges that arose in the 1960s.

The World Bank began its real transformation under the controversial leadership of Robert S. McNamara (1968–1981). McNamara took over the bank after his resignation (or firing—he was never sure which) as President Lyndon B. Johnson's secretary of defense in 1968. McNamara became the father of a much-contested lending concept called "sustainable development." He dramatically increased the bank's lending portfolio, and by the time he left in 1981, lending had increased more than tenfold, from almost $900 million to $12 billion. McNamara succeeded in finally making the World Bank relevant to the global economy, particularly in the underdeveloped world. But he also left a legacy of continuing controversy that has fueled passionate anti–World Bank rhetoric from both the extreme left and right.

By the time McNamara had decided to leave the bank, there had been a sharp shift in orthodoxy within both the economics profession and policymaking community toward development...
aid. The election of Margaret Thatcher in England and Ronald Reagan in the United States signaled a move away from Keynesian demand management toward a more laissez-faire philosophy. This was bound to affect the bank. In fact, just as the last years of Jimmy Carter’s presidency witnessed a defense buildup and a spate of economic deregulation that foreshadowed the Reagan years, so too did the final period of the McNamara presidency bring a sea shift in World Bank policies. By the end of the 1970s there was a growing dissatisfaction with the results and perceived lack of accountability in World Bank lending. This led the bank to institute its own “structural adjustment” policies in the hope of encouraging macroeconomic reform among countries receiving funding.

McNamara’s successor, A. W. Claussen (1981–1986), faced mounting challenges: hostility from the new U.S. administration, a poorly performing portfolio, and increasing fears of a full-blown debt crisis in the developing world. Over time, Claussen replaced McNamara’s more progressive staff members with neoclassical economists like Anne Krueger. Claussen maintained a far more low-key style that served the bank well during this period of transition. Claussen’s successors Barber Conable (1986–1991) and Lewis Preston (1991–1995) did not fare as well. The World Bank was forced to suspend its lending to its largest (and in many ways most successful) client, the People’s Republic of China, after the June 1989 Tiananmen Square massacre. This set a precedent of sorts for the bank, as it had scrupulously tried to stay out of “borrower politics.” The Preston presidency faced growing questions about the bank’s effectiveness, detailed below, which continued to plague Preston’s successor, James Wolfensohn, who took over after Preston’s untimely death in 1995.

WORLD BANK CRITICS ON THE RIGHT AND LEFT

The World Bank and its lending practices have come under increasing scrutiny. The critique from the right contends that the World Bank has shifted from being a “lender of last resort” to an international welfare organization. In doing so the World Bank has become, according to critics, bloated, incompetent, and even corrupt. Worse, the bank’s lending policies often reward macroeconomic inefficiency in the underdeveloped world, allowing inefficient kleptocracies to avoid the types of fundamental reforms that would in the long run end poverty in their countries. These critics like to compare the fantastic growth in East Asia to the deplorable economic conditions of Africa. In 1950 the regions were alike—South Korea had a lower per capita GDP than Nigeria. But by pursuing macroeconomic reforms, high savings, investing in education and basic social services, and opening their economies to the global trading order, the “Pacific Tigers” have been able to lift themselves out of poverty and into wealth with very little help from the World Bank. Many countries in Africa, however, have relied primarily on multilateral assistance from organizations like the World Bank while avoiding fundamental macroeconomic reforms, with deplorable but predictable results.

Conservatives point out that the World Bank has lent more than $350 billion over a half-century, mostly to the underdeveloped world, with little to show for it. One study argued that of the sixty-six countries that received funding from the bank from 1975 to 2000, well over half were no better off than before, and twenty were actually worse off. The study pointed out that Niger received $637 million between 1965 and 1995, yet its per capita GNP had fallen, in real terms, more than 50 percent during that time. In the same period Singapore, which received one-seventh as much World Bank aid, had seen its per capita GNP increase by more than 6 percent a year.

The left has been no less harsh in its criticisms of the World Bank. They claim that World Bank loans privilege large infrastructure projects like building dams and electric plants over projects that would benefit the poor, such as education and basic health care. Worse, these projects often have wreaked havoc on the local environment. Forests, rivers, and fisheries have been devastated by World Bank–financed projects. Some projects even have led to the forced resettlement of indigenous communities. One estimate holds that more than two and a half million people have been displaced by projects made possible through World Bank loans.

Environmentalist and anti-globalization groups point to specific failed projects. The Sardar Sarovar dam on the Narmada River in India was expected to displace almost a quarter of a million people into squalid resettlement sites. The Polonoroeste Frontier Development scheme has led to large-scale deforestation in the Brazilian rain forest. In Thailand, the Pak Mun dam has destroyed the fisheries of the Mun River,
impoverishing thousands who had made their living fishing and forever altering the diet of the region.

In response to these accusations, the World Bank has attempted reforms, appointing its own inspection panel in 1993. But critics point out that the bank needs to be more responsive to outside forces and criticisms. The World Bank has never rejected a single project since 1944. The bank staff is very highly paid—the average compensation of a World Bank employee in 1994 was $134,000. The bank can’t even properly manage the construction of its own headquarters: the 1993–1994 project came in almost $100 million over budget. Perhaps most damning, the bank’s lax lending standards have led to a rapidly deteriorating loan portfolio.

CONCLUSION
The future of both Bretton Woods institutions remains uncertain. Both the IMF and World Bank escaped the efforts of the Republican U.S. Congress in the mid-1990s to sharply curtail and even eliminate both organizations. These agencies have been less successful in answering the charges from the left, as the IMF retains its demand for “structural adjustments” and the World Bank still favors funding for large, project-driven funding. While both the IMF and the World Bank have instituted some reforms, they have been unable to appease the concerns of outraged environmentalists, labor unionists, and nationalists and advocates of indigenous peoples in the developing world.

Still, as this essay has suggested, these two organizations are really the misguided target for the legitimate concerns people of all ideological stripes have had about the rapid pace of globalization in the past half century. It is likely this globalization would have occurred whether or not there had been a Bretton Woods conference, and it is all but certain it will continue in the future regardless of the policies pursued by the IMF and World Bank. While it is true that they have often been too driven by U.S. foreign policy concerns, in the end the influence of both institutions has been widely overstated. And despite their mistakes during the past half century, they have rarely been given credit for many of the little things they do well. For example, both institutions perform economic surveillance over most of the world’s economy, a valuable task that no other international or private organization could perform with such skill. Both agencies also serve as a store of expert knowledge and wisdom for countries throughout the world that lack trained specialists. While neither the IMF nor the World Bank has met the lofty goals of their founders or wielded the nefarious influence charged by their critics, they have and should continue to play a small but important role in promoting prosperity and economic stability worldwide.

International organizations (IOs) serve as crucial forces of coordination and cooperation on many political, economic, social, military and cultural issues. Aside from the traditional domination of international politics by established or recently codified nation-states, IOs are important participants of the international system. The growth of transnational IOs was greatly facilitated by the rise of an increasing number of tenuous networks of nation-states in political, economic, and financial affairs in early modern Europe. They began to proliferate in the course of the nineteenth century. As will be seen, the United States first participated in the development of IOs in a relatively minor way in the first two decades after the Civil War and in a more important way when American statesmen attended the Hague conferences of 1899 and 1907. For much of the twentieth century the United States remained a leading proponent of the formation and development of IOs. Washington was even instrumental in the creation of two of the most important IOs ever: the League of Nations founded in 1919 after World War I and the United Nations established in 1945 at the end of World War II.

The breakdown of the international system in the 1910s and late 1930s and the global bloodshed, devastation, and unsurpassed misery brought about by two world wars convinced the international community, led by the United States and Britain, of the urgency for the establishment of a new universal and cooperative order. In the course of World War II traditional American political isolationism was marginalized to a considerable degree. Beginning with the Atlantic Charter of 1941 and continuing with the 1944 Dumbarton Oaks and Breton Woods conferences, the establishment of the United Nations in 1945 and the formation of many other international political and economic institutions, the pillars for a new multilateral order were created. The Cold War soon added another dimension to this, which led to the shelving of the dream of a new cooperative world order for more than four decades: the politics and culture of bipolar containment. Genuine multilateralism was sidelined during much of the second half of the twentieth century. Instead international institutions, in particular the General Assembly of the United Nations, were frequently exploited as a mere talking shop and a forum for ventilating hostile rhetoric.

From the mid-1970s, however, a cautious revival of multilateralism, in the form of the Helsinki process inaugurated in 1975, may even have contributed to hastening the end of the Cold War in 1989–1991. The dangers of an ever-increasing nuclear arms race, as well as economic and financial globalization and, paradoxically, the simultaneous development of a politically and culturally ever more fragmented world, once again gave IOs a crucial role as a forum for consultation, mediation, and arbitration. In the late twentieth and early twenty-first centuries not only globalization and fragmentation but also the influence of more sophisticated means of transportation and communication and the increasingly transnational character of military, political, and environmental conflicts posed entirely new challenges. Despite recurrent bouts of political isolationism, the United States—like most other countries—recognized the impossibility of addressing contemporary problems merely on a nation-state basis. After the end of the East-West conflict and the gradual realignment of eastern and western Europe, this led to the formation of a host of new international organizations and institutions. Yet in the post–Cold War era the policies of the United States toward international organizations remained ambiguous; a widespread revival of both isolationism and unilaterality could be observed. However, the unprecedented terrorist attack on the World Trade Center and the Pentagon on 11 September 2001 had a fundamental impact on American political strategy. In the
immediate wake of the attack no one could say whether it would result in the abandonment of unilateralism, but many policy analysts believed that it might well lead to a much greater American reengagement with international organizations to fight global terrorism.

Intellectually the development of IOs was rooted in Immanuel Kant’s eighteenth-century insight that only the “pacification” of liberal democratic, interdependent, and lawful republics could overcome the inherent anarchy of the international system, as described by Thomas Hobbes, and therefore the permanent danger of the outbreak of war. While Hobbes believed that a strong authoritarian state and the balance of power among the world’s greatest powers could rectify this situation and provide lasting international security, Kant was not convinced. He was in favor of the establishment of peace-creating confederations and thus, in effect, of bringing about the interdependence of nation-states. Over time these insights developed into the contemporary conviction that interdependent democratic states will hardly ever embark on military action against one another. Democracy and cooperative multilateralism within (but also outside) international organizations were thus seen as the best vehicles for the creation of a more stable and peaceful world.

WHAT ARE INTERNATIONAL ORGANIZATIONS?

In general international organizations are based on multilateral treaties between at least two sovereign nation-states. The formation of an initially fairly loose bond among the participants is generally fortified by the development of more or less stringent institutional structures and organs to pursue certain more or less clearly defined common aims in the international arena. IOs can either have a global or a regional character, with the latter in general displaying a more centralized structure due to the limited number of regional state actors available. While many IOs are single-issue organizations, others focus their attention on a multitude of issues. IOs can either be open to new members or consist of a closed system. On occasion IOs are established for a certain duration as specified in their respective charters, but more often than not no time restriction is applied.

In some of the older literature IOs tend to be subdivided into political and apolitical organizations, the former referring to military and political alliances to further the power of their member states and the latter referring to organizations dealing with mere administrative and technical issues. However, in the last few decades of the twentieth century many of the allegedly technical and “apolitical” suborganizations of the United Nations (for example, the Atomic Energy Commission and the World Health Organization), as well as such wide-ranging entities as the International Olympic Committee, the International Monetary Fund, and even many large multinational corporations, developed into highly politicized organizations with a multitude of political aims. The differentiation between political and technical IOs is therefore unhelpful. It makes much more sense to differentiate between international governmental organizations (IGOs) like the United Nations, NATO, the IMF, and the World Bank, to name some of the best-known ones, and international nongovernmental organizations (INGOs) like Amnesty International and the International Red Cross. Although estimates differ profoundly, at the turn of the twenty-first century at least five hundred IGOs and eleven thousand INGOs were in existence. They were organized in the Union of International Organizations (founded 1907), which is based in Brussels and publishes the annual Yearbook of International Organizations.

While INGOs help to clarify international rules and regulations that enable at least two societal actors (parties, issue groups, unions, associations, international businesses, and corporations) to cooperate in the coordination of certain specified transnational and cross-border issues, IGOs, with which this essay is mostly concerned, are based on the cooperation of nation-states. An IGO is usually based on a multilateral treaty of two or more sovereign nation-states for the pursuit of certain common aims in the international arena. It is helpful to differentiate between supranational or semi-supranational IGOs, like the European Union, or looser confederations of states and nonsupranational IGOs, like the United Nations and NATO. While the former limit the sovereignty of the participating nations to a lesser or greater degree, the latter normally do not infringe on the sovereignty of their member states; they therefore tend to have only a limited degree of influence over their members. Despite the equality of recognized nation-states in international law, in fact a hierarchy of power and influence exists even within nonsupranational IGOs. The UN Security Council, dominated by its five permanent members, as well as the IMF, the
World Bank, and many other IOs, are all dominated by the established great powers, not least on account of their political and military influence and capabilities as well as their financial and economic clout. With the exception of China and Russia, the influential powers of the early twenty-first century all come from the ranks of the West.

There are some institutionalized meetings and conferences that can easily be mistaken as IGOs. Among these are the increasingly controversial G7/G8 meetings of developed nations and the meetings of the World Trade Organization as well as summit meetings between heads of states and, for example, the Conference on Security and Cooperation in Europe (CSCE), which played such an important role in overcoming the Cold War. In fact they are not IGOs; instead these loose organizational structures are only very temporary alliances of a hybrid nature. But they are increasingly important and, in addition to the IGOs and INGOs, must be characterized as a third—albeit no less ambiguous and still largely unexplored—actor in international diplomacy.

DEVELOPMENT OF IOS AND THE ROLE OF THE UNITED STATES

International organizations began to appear during the nineteenth century in the predominantly European state system. A considerable number of separate and limited-purpose agencies had accumulated by the outbreak of World War I. The organization-creating tendency of this period was stimulated primarily by the interdependencies engendered by the Industrial Revolution. New forms of production and new methods of transport and communication created problems and opportunities that necessitated more elaborate and systematic responses than those traditionally associated with bilateral diplomacy. International organization was an outgrowth of the multilateral consultation that came into vogue. It was a short step, and sometimes an almost imperceptible one, from convening a meeting of the several or many states whose interests were involved in a given problem and whose cooperation was essential to solving it, to establishing permanent machinery for collecting information, preparing studies and proposals, arranging recurrent consultations, and administering schemes agreed upon by the participating states.

The nineteenth-century concern with the challenge of developing rational multilateral responses to the changes wrought by steam and electricity in the economic and social spheres did not exclude concern with either the perennial or the newly developing problems of the “higher” sphere of international relations: war and peace, politics and security, law and order. Indeed it was clear that changes in the former spheres contributed to difficulties in the latter, and it was hoped that organized collaboration in the first might contribute to improvement in the second. Awareness of the increasing complexity of international politics, anxiety about the problems of preventing and limiting war, concern about the orderly balancing of stability and change, and hope for the strengthening of international law combined to inspire the idea of applying international organization to the politico-legal realm.

The effort to do this at the end of the Napoleonic wars had yielded meager results, but the idea of giving firm institutional shape to the Concert of Europe persisted and was supplemented during the nineteenth century by the ideal of developing judicial means for the resolution of international disputes. It remained for the Hague Conferences of 1899 and 1907 to stimulate the hope, and for World War I to demonstrate the necessity, of extending the concept of international organization into the “higher” sphere of international relations. The League of Nations embodied that extension, represented an effort to provide a central focus for the varied organizational activities that had emerged in the preceding century, and accelerated the growth of the organizing process among states. The collapse of the League and the outbreak of World War II gave rise to the establishment of the United Nations and a network of affiliated organizations. It also gave impetus to the institution-building disposition of statesmen, not least on the European continent, that has produced scores of agencies of almost every conceivable size and concern. If the nineteenth century was the period of the beginning of the movement toward international organization, the twentieth century has been the era of its multiplication. In the post–Cold War world the landscape is dotted with international agencies: global and regional, single-purpose and multipurpose, technical and political, regulatory and promotional, consultative and operational, modest and ambitious. And the habit of creating new ones and maintaining old ones remains well established among statesmen. By any test of quantity and variety, international organization has become a major phenomenon in international politics.
The beginning of the trend toward international organization in the nineteenth century and the proliferation of that trend in the next substantially involved the United States. The well-known isolationist tradition of the United States and the fact that it rejected membership in the League of Nations but joined the United Nations at its creation should not be taken as evidence that America is a latecomer to international organization. On the contrary, American participation in the nineteenth-century organizing process was at least as active as might reasonably have been expected given the country’s geographic remoteness from the European center of the movement and its modest standing among the powers. American initiative contributed to the formation of such multilateral agencies as the Universal Postal Union (1874) and, within the Western Hemisphere, the Pan American Union (1890). Although the determination of the dates of establishment of international organizations and of adherence by particular states is by no means an exact science, one can take it as approximately correct that by 1900 the United States was a member of ten international bodies, and that by the outbreak of World War I it participated in twenty-seven, as against twenty-eight for Great Britain and thirty-six for France.

This record would seem to substantiate Henry Reiff’s assertion that “The United States . . . is a veteran, if not an inveterate, joiner of unions or leagues of nations,” despite its failure to affiliate with the League of Nations and the Permanent Court of International Justice. America’s record of interest and involvement in international organization made it less surprising that President Woodrow Wilson took the lead in creating the League of Nations than that the United States refrained from joining it. The American rejection of the league, historically considered, was an aberration rather than a continuation of settled policy regarding international organization. Moreover, it did not presage a drastically altered policy. Although the United States never accepted membership, it gradually developed cooperative relationships with the league in many areas of activity and ultimately assumed a formal role in several of its component parts. In the final analysis the United States became a more active and more useful participant in the operation of the league than many of the states that were officially listed as members. In addition, between the world wars the United States continued to join organizations outside the league family to such an extent that by 1940 it held a greater number of organizational memberships than did Britain and France, the leading powers in the league. Following World War II the United States became the world’s unchallenged leader in promoting and supporting the development of international organizations of every sort.

**AMERICAN AMBIGUITY TOWARD IOS**

The attitude of the United States toward international organization, however, has been very ambivalent. Presumably the United States has gone along with, and has sometimes displayed enthusiasm for, the organizing process for essentially the same reasons that have moved other states: it has recognized the practical necessity, in its own interest, of developing and participating in systematic arrangements for dealing with the complex problems of the modern world. It has also shared the ideal of creating a global mechanism better adapted to promoting and maintaining peace and human welfare. Even when it has been skeptical of the utility or importance of particular multilateral institutions, the United States, like most other states, has generally inclined to the view that it can ill afford to be unrepresented in their functioning or to give the appearance of being indifferent to the ideals they purport to serve.

America’s limited and informal engagement in the operation of the League of Nations illustrated the first of these points. The United States could bring itself neither to join nor to abstain entirely from the League. Its enthusiastic adherence to the United Nations in 1945 can be interpreted as in part a symbolic act of repentance and reversal, a conscious repudiation of the American abandonment of the League. Moreover, already during World War II, American statesman had been very active in planning for the postwar world. Even though idealistic and quite unrealistic plans predominated—such as Franklin Roosevelt’s strong advocacy of a “one world” system including something approaching a world government, the abolition of the balance-of-power concept and of geographical spheres of influence, and Secretary of State Cordell Hull’s enthusiasm for uninhibited global free trade—this still compared favorably to the passivity of Britain, the nation that had hitherto dominated the international system. While the British hesitated to embark on any postwar planning exercises for
fear of undermining the war effort, Washington began planning for the postwar world before the country had even become a belligerent power. After Pearl Harbor, and once Hitler had declared war on the United States, it was unlikely that a return to the political isolationism of the interwar years would occur despite the continuation of a strong isolationist strand in American thinking.

Thus, America's joining the United Nations with New York as the new organization's headquarters and San Francisco as the venue for the ceremonial signing of the UN Charter was much more than a mere symbolic denial of indifference to the high ideals enunciated in the charter. It was, more positively, a declaration of resolve to accept a position of leadership in world affairs, an affirmation of the intention to play a role that this country had never before assumed in international relations. In this sense American ratification of the UN Charter was a unique act, a dramatization of an event of peculiar significance: the decision of the United States to transform its approach to world affairs. The country's subsequent role in the distribution of Marshall Plan aid to western Europe and, above all, its adherence to the North Atlantic Treaty Organization in April 1949, reaffirmed the same point and even strengthened it. After all, NATO membership carried more concrete obligations and more definite alliance commitments than did membership in the United Nations. Article 5 of the NATO treaty pledged all member states to regard an attack on a member state as an attack on itself. Although during the ratification process the U.S. Senate insisted that the last decision of how the United States would react to any such emergency had to be left to Congress, article 5 imposed a firm obligation of some form of assistance on NATO member states.

In most cases decisions by the United States to take part in international agencies can be assumed to be motivated in much the same way and can be assigned essentially the same meaning as such decisions by other states. Neither in the case of the United States nor in other instances does it make sense to regard acceptance or support of international organizations as in itself a demonstration of virtue comparable with the virtue sometimes attributed to the individual because he goes to church and pays his tithe. International agencies are not embodiments of a sacred cause but, rather, instruments of the purposes of their members, susceptible of use to promote both noble and ignoble causes. States join them for mixed reasons, and the mere act of affiliation typically provides no solid information about the constructiveness, willingness to cooperate, or the peacefulness of the intentions of the state concerned.

America's inhibitions and reservations concerning international organization are a blend of the typical and the peculiar. Despite the vogue of creating new international organizations since the 1990s and the strong trend toward economic and financial globalization, it is clear that all states maintain some measure of reluctance to become too encompassed, circumscribed, and absorbed by international bodies. It is perhaps unfair to accuse them of harboring the illogical desire to have their cake and eat it too, for in the relations between organization and sovereignty, just as in the relations between national society and individualism, the real question is not which to choose but how much of each to include in the package. In either the domestic or the international case, however, the perennial tension between control and autonomy remains, and it becomes especially acute when circumstances require reconsideration of the necessary and proper balance between them. The fact that states need and want international organizations does not eliminate their desire to retain as much as possible of the autonomy that the traditionally decentralized international system affords them. The tension between the desire for effective and useful international organization and the urge to continue to enjoy and exploit the freewheeling possibilities of a simpler era profoundly affects the behavior of states in creating, joining, and operating multilateral agencies. In the Western world both NATO and in particular the European Union are prime examples of this.

SOVEREIGNTY AND AUTONOMY

Although sovereignty may figure as an abstract concept with definable meaning in legal and political scholarship, in the real world of states and peoples it is a symbol and slogan no less powerful for its having indistinct and highly variable meaning. "Sovereigntyism" as a subjective phenomenon is a more important factor in international relations than sovereignty as an objective fact. Concern about sovereignty has pervaded America's policy with respect to international institutions from the earliest days to the present. While it has rarely prevented the joining of organizations, it has always affected American contri-
utions to their design and the style of participation in their functioning. The fear that organizational involvements might cut more deeply into national autonomy than originally intended or agreed has never been far beneath the surface of American politics.

American "sovereigntyism" was originally linked with isolationism, which was based upon the fact that the new state was substantially isolated from the European cockpit of world affairs; it was distant, separate, and different. Moreover, it was weak and vulnerable to exploitation in any intimate association with European powers. Fixation on sovereignty reflected the conviction that prudence required the fledgling state to go its own way, capitalizing upon its peculiar situation to maintain political distance between itself and the leading states of the day. Isolationist doctrine related to political and military embroilments, not to economic and commercial ties, and for that reason it did not significantly inhibit American participation in the public international unions that began to emerge in the nineteenth century.

It was when international organization turned political, with the formation of the League of Nations, that jealous regard for sovereignty, nurtured in the era of isolationism, came to the fore as an impediment to American involvement. President Wilson's leading contribution to the formulation of the covenant made the league largely an American enterprise, but it was nevertheless profoundly un-American in certain fundamental respects. The league promised or threatened to involve the United States deeply and systematically in the political and security problems of a world that was still fundamentally Europe-centered. The covenant prescribed commitments that seemed to restrict America's freedom to keep its distance, to stand aside. By this time the United States had lost its isolation and the cogency of much of the rationale for isolationism had faded. However, Americans continued to value the freedom to decide, unilaterally and ad hoc, whether, when, and how to become involved in the quarrels of other states. The right to be unpredictable constituted a major part of the substance of the American idea of sovereignty, and membership in the league was regarded as involving the drastic curtailment of that right.

Wilson lost his battle for American affiliation with the league not to nineteenth-century isolationists who believed that their country was safely encapsulated by the huge continent it had ruthlessly conquered and now inhabited without challenge but to proponents of the idea that the United States should continue its recently espoused auxiliary role in world affairs, the central feature of which was untrammeled discretion concerning engagement and disengagement. Wilson's successor, Warren G. Harding, expressed this idea succinctly: "If our people are ever to decide upon war they will choose to decide according to our own national conscience at the time and in the constitutional manner without advance commitment, or the advice and consent of any other power." When the league actually dealt with political and military crises, the United States was sometimes willing and eager to take an active role, but it was never willing to accept an obligation to do so.

Sovereignty, interpreted as the retention of a free hand, continues to have a major impact upon American policy regarding international organization. World War II convinced most Americans that the advance and well-understood commitment of the United States to throw its weight onto the scales was essential to the preservation of world peace, and the United States made the shift from the policy of the free hand to the policy of commitment that it had rejected when Wilson proposed it. Nevertheless the urge to keep options open has not been displaced by recognition of the value of clear and credible commitments. The strength of that urge was demonstrated in American insistence upon having the power to veto substantive decisions in the UN Security Council. It could also be observed in the careful hedging of obligations under the various bilateral and multilateral security treaties concluded during the Cold War. The United States has wanted to put the world on notice as to its future strategy while retaining the possibility of deciding its policy ad hoc. It has wanted to enjoy the benefits of being committed without paying the price of losing the national freedom to choose its course of action.

THE ROLE OF DOMESTIC JURISDICTION

The American conception of sovereignty has traditionally included another element: the right to national privacy, the capacity to fend off external intrusions into domestic affairs. This concern was rooted in the original American sense of separateness and differentiation from Europe. The New World had broken off from the Old World, and maintaining the sharpness of the break was
deemed essential to retaining the valued newness of the qualities of American political society. The isolationist tradition combined cautions against being drawn into European affairs and against Europe’s poking into American affairs.

The latter concern is typically expressed with reference to international organization by the concept of domestic jurisdiction. Participation in multilateral agencies necessarily involves exposure as well as commitment; nothing can be done with the collaboration of, or for the benefit of, a member state without something being done to that state. American enthusiasm for international organization has always been qualified by fear of expanding the national vulnerability to external interference, a concern that was manifested in the drafting of both the League Covenant and the UN Charter by vigorous insistence upon provisions protecting domestic jurisdiction. The campaign that defeated American affiliation with the league concentrated as heavily upon what might be done to this country by and through the organization as upon what the United States might be required to do on behalf of the league. Similarly, misgivings about the United Nations and the specialized agencies have often expressed the belief that the United States has been, or the fear that it might be, improperly penetrated by foreign influences flowing through those institutional channels.

This concern for sovereignty, translated as domestic jurisdiction, is shared by all states. It has received peculiar emphasis in American policy for reasons that go beyond the attitudes that were initially associated with an isolated position and an isolationist doctrine. It seems probable that, perhaps until very recently, the United States never shared the keen need for international organization to serve its particular interests—as distinguished from its broader interest in a stable and peaceful world—that most other states have felt. As a big country, a continental state, the United States appeared not to require the relief of difficulties posed by cramped territorial area that many other states have been compelled to seek through international organizations. It did not fully share the need of European states, now matched by states on other continents with numerous national divisions, for mechanisms of coordination to facilitate interchange across state boundaries. In this respect the American situation was analogous to that of a great rural landowner, in contrast with that of residents in congested urban areas.

Throughout the twentieth century the United States perceived itself as a powerful, wealthy, and highly developed state, not dependent upon others for protection or for economic and technical assistance. This feeling of independence and omnipotence even increased at the end of the Cold War. Given these characteristics it is perhaps understandable that the United States tended to conceive of participation in international agencies as a matter more of giving than of receiving, and that it insisted upon limiting both what it gave and what it received. The United States could afford to resist having undesired things done to it by international organizations because it had little stake in having essential things done for it by those bodies. With regard to the impact of multilateral programs and activities upon and within national societies, the United States accepted the biblical proposition that it was more blessed to give than to receive. America, more than most other states, could plausibly consider its engagement in organized international activities as predominantly a means of contributing to the general welfare of the global body politic rather than as a means of acquiring particular benefits for itself. Perhaps for this reason Americans appeared especially prone to believe that international organizations were, or should be, expressions of collective idealism and altruism. The sudden awareness of the exposure of the hitherto invulnerable American continent to international terrorism, however, changed this attitude dramatically at the beginning of the twenty-first century.

Another set of difficulties and inhibitions that affected American participation in international organization in the twentieth century might be said to derive from the reverse of the attitude toward national sovereignty discussed above. International organizations inevitably cut into the sovereignty of participating states in the sense that they require them to accept commitments—thereby restricting in some measure their freedom to decide what they will and will not do—and in the sense that states’ domestic exposure to external impacts is enhanced, thereby diminishing their sense of national privacy. Yet the development of so-called international rogue states like Iraq and North Korea in the 1990s, and in particular the increasing vulnerability of the United States to international terrorism, led to a much greater sense of the inevitability of American involvement with the rest of the world. A wide spectrum of U.S. policymakers began to
embrace the idea that even the territory of such a vast and powerful and geographically protected country like the United States could not do without the support of the international community to safeguard its physical security.

DEMOCRATIC CONSTITUTIONALISM VERSUS INTERNATIONAL COMMITMENTS

One should not conclude that the relationship between national sovereignty and international organization is in all respects a competitive one. International agencies are not engaged in a zero-sum game with states, a situation in which the weakening of the latter is the condition of the strengthening of the former. On the contrary, effective international organization requires the participation of broadly competent states—states that are able as well as willing to meet their obligations, that are capable of formulating responsible positions and reaching meaningful decisions, and that can manage their resources, people, and territories to the degree required for dependable cooperation in multilateral activities. States deficient in these respects are frequently pressed by involvement in international organization to remedy their deficiencies, and the agencies of the United Nations system have attempted to give attention to building up the capabilities of particularly deficient member states to increasing, rather than diminishing, the meaningfulness and effectiveness of their sovereignty.

America’s engagement in international organizations has always been handicapped by limited possession of the kind of national sovereignty essential for effective and reliable participation. Its collaboration in multilateral enterprises has been restrained by reluctance to bend to pressure for strengthening the national capabilities in question. When Americans worry about the implications of membership in international bodies, they are at least as likely to exhibit concern about the enlargement as about the diminution of the sovereign competence of the U.S. government.

The essence of the matter is that the United States is a political society dedicated to the ideal of constitutional democracy, a state whose central government is designed to operate within a framework of limitations derived from the principles of democracy and constitutionalism. Democracy implies that government must be responsive to the majority will more than, and in case of conflict, instead of, the exigencies of the international situation, the rules or decisions or pressures of the organs of international agencies, or the obligations prescribed either by general international law or by treaties. The problem posed by the tension between international commitment to order and domestic commitment to democracy is a real one for the United States; and the more the country becomes involved in multilateral agencies and activities the more intense it becomes.

Unfortunately for international organizations, the democratic principle is not exhausted by the proposition that national commitment requires popular consent. Consent theory implies the right of a nation to change its mind and the obligation of a government to accept the implications of the withdrawal of popular consent. The international legal sanctity of national commitments is challenged by the democratic legitimacy of popularly inspired decisions to violate or repudiate such commitments. The government of the United States came face to face with this problem in the 1960s and 1970s, when the popular consensus that had supported the acceptance of commitments in the two preceding decades began to dissolve. So long as the United States undertakes to combine international responsibility with domestic democracy, its leaders will confront serious dilemmas, and uncertainty will prevail in international organizations as to what can be expected from the United States. Democracy coexists uncomfortably with international law and organization.

Constitutionalism, no less than democracy, creates difficulties for the United States as a participant in international agencies. The president’s responsibility for the conduct of American foreign relations, including the management of American participation in international organizations, is not fully matched by his legal authority or his political power to exercise this responsibility. He must compete and cooperate with the Congress, which shares in the control of foreign policy. The division of powers associated with American federalism limits the capacity of the federal government to accept and carry out obligations, or to engage in cooperative arrangements, under the auspices of international bodies. The national commitments to preserve a significant degree of autonomy for the private sector of the economy, to maintain the freedom of a press that zealously guards the right to self-definition of its responsibility, and to respect individual rights enshrined in a written constitution and interpreted by an
independent judiciary, establish further limitations upon the capacity of those who speak and act officially for the United States to engage the country fully and reliably in the work of international organizations.

To say that the United States is a constitutional democracy is to say that the body politic has not conferred upon its central government the full powers, usually associated with the concept of sovereignty, that may be required for loyal and effective performance in foreign relations, including the country's effective performance in international organizations. To say that the American public is dedicated to the preservation of the system of constitutional democracy is to emphasize its reluctance to enlarge, or to countenance the enlargement of, governmental capacities relevant to involvement in multilateral enterprises, capacities to make and carry out commitments, to act decisively, and to exercise the degree of control over a variety of internal matters that may be entailed by acceptance of international schemes of regulation or cooperation.

There is a constitutional doctrine, derived from the Supreme Court opinion in *Missouri v. Holland* (1920), supporting the view that the valid acceptance of international obligations carries with it the enhancement of federal powers to the extent required for meeting those obligations. Moreover, early enthusiasm for membership in the United Nations was reflected in a widespread tendency to acquiesce in a broad interpretation of executive authority to act as might be required for effective collaboration with the organization. This acquiescence proved to be short-lived. In the 1950s the Bricker amendment campaign argued—at least according to President Eisenhower—in favor of curtailing presidential power and empowering Congress with the obligation to ratify all treaties negotiated by the executive. Yet the campaign revealed the high regard for the U.S. Constitution. The doctrine of *Missouri v. Holland* was more generally feared as a threat to the integrity of the American constitutional system than valued as a promise of the adaptability of that system to the requirements of the age of international organization. The formal constitutional renunciation of the doctrine was obviated by assurances that it would not be exploited. Less than two decades later there emerged a political mood dominated by insistence that the competence of the president to commit the country in international affairs should be significantly reduced. In 1973, in view of the lost war in Vietnam and the Watergate crisis, this led a Democratic Congress to pass the War Powers Act, which compelled the president to consult with Congress about sending American troops into combat abroad and required him to withdraw these troops within sixty days unless Congress gave its approval for a longer mission abroad.

Generally, however, it appeared that Americans were more concerned about preventing involvement in international organization from impinging upon the distribution of authority within their political system than about preventing the peculiarities of their domestic arrangements from handicapping the nation’s performance in international organization. The dominance of this concern had a great deal to do with American rejection of the League of Nations. Acceptance of the United Nations clearly has not eliminated this element from the American attitude toward involvement in world affairs.

Nineteenth-century isolationist doctrine, with its emphasis upon aloofness from European political entanglements and intrigues, expressed not only a pragmatic judgment concerning the best way for the United States to survive in a dangerous world but also a moral aspiration, an ideal of national virtue defined as innocent abstention from the evils of power politics. This heritage of moral distaste for international politics colored early American thinking about international organization to promote world peace and order. Nineteenth-century Americans, ranging from spokesmen for the various peace societies that sprang up after 1815 to leaders in government, tended to conceive organization for peace in essentially apolitical terms, emphasizing legal formulas and arbitral or judicial settlement of disputes. World courts figured more prominently than diplomatic forums or international armies in favored formulations, and the ground was prepared for the perennial popularity of the “rule of law” in American internationalist thought. In particular the vision of the future did not include the involvement of the United States in the international political arena or the burdening of the United States with weighty political responsibilities. It certainly did not refer to the obligation to participate in military sanctions against disturbers of the peace. America was not to be contaminated by being dragged into power politics; rather, the world was to be purified by being persuaded to rise above politics, to the realm of law. Global salvation was to be achieved by formula and gadget, not by American commitment to share in the
hard, dangerous, and dirty work of an organized political system.

The scheme, set forth during World War I by the League to Enforce Peace and by similar organizations in Europe, then formulated in the League of Nations Covenant under the leadership of President Wilson, was not in accord with this American vision. Calling for an essentially political approach to world order supported ultimately by national obligation to engage in military sanctions, it violated the basic tenets of the traditional American creed. It offered a painful, not a painless, solution to the problem of order. The American peace movement had hoped for the appointment of a judge; it was confronted by the demand that the United States serve as a policeman. The league promised not reliance upon predictable legal process but involvement in the uncertainties of political and military activity. True, the new machinery included the World Court, and there was massive American support throughout the life of the league for membership in that body. The movement to join the court was ultimately frustrated, however, by the fear of involvement in the political league through adherence to its judicial annex. The American legalistic tradition demanded acceptance of a court, but it did not permit acceptance of that particular court.

**IOS IN THE COLD WAR AND THE POST–COLD WAR WORLD**

During the Cold War the role of the United States in creating, supporting, and operating the United Nations reflected the official abandonment of preoccupation with legal system-building and of aversion to engagement in the political and military aspects of international affairs. Nevertheless the Cold War record contains numerous indications of the survival of these sentiments. The mood engendered by the Vietnam War was characterized by the revival of the tendency to conceive national virtue in terms of innocence rather than of responsibility. Fighting for peace, the central motif of the twentieth-century ideal of collective security, tended to be regarded not as paradoxical but as inconsistent at best and hypocritical at worst. Self-critical Americans are inclined to interpret the performance of the United States in the early years of the United Nations as a record of shameful manipulation and abuse of the organization, not of constructive leadership and loyal support.

The image of the responsible defender of international order was overshadowed by the image of the irresponsible adventurer and imperialist. In the eyes of self-pitying Americans, the national image was that of an overloaded and insufficiently appreciated bearer of international burdens. Those who put the matter as the abdication of a discredited tyrant and those who put it as the retirement of a weary servant were advocating the same thing: the diminution of the American role in world affairs. The appeal of this prescription was strengthened by the rise to dominance in the United Nations of political forces and factions that the United States could neither lead nor control; America's opportunity to exercise leadership declined as much as its inclination to do so.

Traditional American misgivings about involvement in international political organization was thus confirmed. Discounting the excesses of guilt and self-pity, it must nevertheless be concluded that participation in the United Nations entailed the disappointment of national hopes, the frustration of national efforts, and the dirtying of national hands. It required that the luxury of pure adherence to principle be sacrificed in favor of the more ambiguous and less satisfying morality of responsibility. The glamour of sharing in the formulation of a grand design gave way to the never-finished work of international housekeeping and the never-solved problem of managing the affairs of an almost unmanageable international system. It was not surprising that the United States failed to find this work inspiring or pleasant.

From the late 1960s to the 1980s—strongly influenced by the disastrous involvement in Vietnam, the country's subsequent severe economic problems, and, due to East-West détente, the diminishing Soviet threat—the shift from isolationism to international engagement that occurred during World War II was temporarily reversed. Instead attention was focused once more upon the dangers of overcommitment and the advantages of unilateralism. The pursuit of the national right to make foreign policy decisions unfettered by promises to, or participation by, other states was vigorously asserted by the Nixon, Carter, and Reagan administrations. But widespread talk of "American decline" and the loss of will to preserve the standing of the United States as one of two superpowers proved premature. Instead the crisis situation brought about by the end of the Cold War and the subsequent Gulf War of 1990–1991 to liberate Kuwait from the
Iraqi invasion saw impressive American leadership and the country’s constructive reengagement with IOs like NATO, the European Union, and the United Nations. Above all, leading U.S. involvement in the “two-plus-four” negotiations (the two German states and the United States, Soviet Union, Britain, and France) for bringing about German unification within the NATO, European Union, and United Nations framework, along with constructive American engagement with the Conference on Security and Cooperation in Europe, did much to achieve a relatively peaceful and stable transition to the post–Cold War era.

After the end of the Cold War and the collapse and disappearance of the Soviet Union in December 1991, with the United States remaining the only global superpower and by far the most powerful nation on earth, once again American suspicion of restrictive international commitments and American preference for unilateral activities increased dramatically. The symbolic significance of American membership in the United Nations and its many suborganizations was drastically reduced. Washington’s reluctance to pay its full dues to the United Nations was indicative of the United States’s ambiguous position toward its involvement and responsibilities in international affairs. While the American superpower was unwilling to pay its dues to the United Nations, the UN itself was in debt to some poor countries such as Bangladesh, owing it $15 million. Between 1994 and 1999 the United States built up a bill of $2.3 billion, arguing that it was asked to pay too much to the United Nations. By late 2001 Washington still owed a substantial amount to the world organization; it was committed to pay the outstanding amount of $382 million in 2001 and the remainder of $244 million in 2002. In 1999 and 2000, after passage of the Helms-Biden act, the United States paid some of the $1 billion it had promised to contribute belatedly to the UN coffers. In return the United States had asked for and obtained various UN reforms and the elimination of the rest of the American debt and a reduction of its future annual dues. (Instead of 25 percent, the United States would now finance only 22 percent of the UN’s regular budget; it would also reduce its contributions for UN peacekeeping missions from 31 to 27 percent of the overall costs.) While the Senate accepted this, the repayment of the remaining debt was controversial among Republican leaders in the House of Representatives who wished to impose further conditions and asked for greater UN reforms. The attitude of the House of Representatives was partially also a reaction to the fact that the United States was voted off the UN Human Rights Commission in May 2001 by some UN members (including some of America’s European allies) who were running out of patience with Washington’s less than constructive role in the human rights body and the administration’s general lack of support for the United Nations.

Washington’s manifold policy of suspicion toward the United Nations, Franklin Roosevelt’s harbinger of hope, must serve as just one example for the claim that an increasing concentration on domestic affairs and a neglect of American involvement in IOs was indeed the dominant feature of American policy in the 1990s. The few years of renewed international activism at the end of the Cold War—President George H. W. Bush’s somewhat rash announcement of a “new world order” in 1990 and the occasional brief burst of peacemaking activities that characterized the foreign policy of the Clinton administration after 1993—must be regarded as exceptions rather than the rule. Senate majority leader and 1996 Republican presidential candidate Robert Dole’s assessment in the mid-1990s reflected the deep and widespread American unease about IOs. Dole believed that frequently IOs either “reflect a consensus that opposes American interests or do not reflect American principles and ideas.”

Yet as G. John Ikenberry wrote in 1996, while the bipolar order of the Cold War years came to an end in 1989–1991, the dense economic and political “web of multilateralist institutions” and thus the “world order created in the 1940s is still with us.” Despite a tendency to focus on the domestic enjoyment of the prosperity and rising share values of the multiplying “dot com” companies of the Clinton years, the United States was unable and indeed unwilling to abdicate its global leadership. In fact globalization demanded the opposite, and the administration made sure that the United States would continue to dominate the World Bank and the increasingly important International Monetary Fund. The efforts the Clinton administration made for the full implementation and expansion of the North American Free Trade Agreement (NAFTA) and for enabling China to become a member of the World Trade Organization, allowing it to enjoy most-favored-nation status, are further examples that indicate that the Clinton administration had no intention to revert to economic isolationism.
The same applied to the political sphere. The Clinton administration was careful to denounce any talk of a new isolationism in the post–Cold War world, including alleged American disinterest in Europe in favor of a Pacific-first policy. In fact, despite the administration's ambiguous if not outright negative attitude to the United Nations and the many petty trade wars with the European Union, the post–Cold War world at times saw a vigorous and often constructive reengagement of the United States in many parts of the world. However, this became frequently mixed with a strong dose of American unilateralism. Clinton called this “assertive multilateralism.” For example, despite much international pressure, for largely domestic reasons the Clinton administration insisted on preventing a UN treaty controlling the trade in small arms. The administration's ambiguity toward the United Nations had disastrous consequences in the East Timor crisis of 1999–2000, when the lack of U.S. support induced a withdrawal of UN troops, which in turn led to the wholesale slaughter of many East Timorese people in the Indonesian civil war. Clinton's unsuccessful and unilateral bombing raids on buildings in Sudan and elsewhere in response to terrorist attacks on American diplomatic and military targets abroad also turned out to be ill-advised; they may well have contributed to inflaming even more hatred of the United States in the Islamic world.

Still, American peacemaking efforts in cooperation with IOs during the Clinton era often added a constructive element to the frequently chaotic and very violent developments in such embattled regions as the Middle East and the Balkans. It is unlikely that the successful NATO pursuit of the 1999 Kosovo war and the ousting and subsequent handover of Serbian president Slobodan Milosevic to the International War Crimes Tribunal in The Hague in 2001 would have been achieved without strong American involvement. The Clinton administration's attempts to act as a neutral arbiter in the “Troubles” in Northern Ireland and in the reconciliation between South and North Korea were also relatively successful. This explained the regret voiced in many parts of the world of Clinton's departure in January 2001. Paradoxically, despite Clinton's contempt for the United Nations and his many other unilateral activities, the president's reputation as an international peacemaker far surpassed his embattled and scandal-ridden standing within the United States. Yet his years in office may well be primarily remembered for his administration's ability to maintain and increase America's prosperity and the achievement of a substantial budget surplus rather than for a far-sighted foreign policy.

After the drama of the presidential election of 2000, which was only narrowly decided by the Supreme Court in December, it was not Vice President Al Gore but Texas governor George W. Bush who moved into the White House. The new president immediately surrounded himself with many right-wing and unilateralist if not isolationist advisers. Many of these people were very experienced policymakers who had already served under Bush's father in the early 1990s and even under Presidents Ford and Reagan in the 1970s and 1980s. Yet his administration did not appear to consist of a vigorous modernizing team prepared to tackle the international problems of globalization and fragmentation. In a 1999 article in Foreign Affairs, Condoleezza Rice, who became Bush's national security adviser in January 2001, tellingly talked at length about the importance of the pursuit of America's “national interest” but rather less about American international involvement and engagement in IOs. She wrote that a Republican administration would “proceed from the firm ground of the national interest, not from the interest of an illusory international community.” Indeed, the Bush administration treated the United Nations with even greater disdain and suspicion than Clinton had done. During its first eight months in office the new administration walked out of five international treaties (and withdrew from the conference on racism in protest at anti-Israel passages in the draft communique in South Africa in early September 2001). Among the treaties the United States opposed were the Kyoto Protocol on climate change supported by much of the rest of the world and a treaty for the enforcement of the important Biological and Toxin Weapons Convention of 1972. The administration also withheld support from the establishment of the World Court to be based in The Hague. Although Washington agreed with the principle of establishing such a court, it did not wish any of its nationals ever to appear before it. The Bush administration also threatened to abandon several other contractual pillars of the postwar world, notably the 1972 Anti-Ballistic Missile (ABM) Treaty concluded between Nixon and Leonid Brezhnev to contain the nuclear arms race.

Above all, Bush's insistence on implementing a national missile defense (NMD) to protect
the United States (and perhaps its NATO allies) from nuclear attacks from rogue states like North Korea and Iraq caused great unease in the Western world. Not even Britain, traditionally America’s closest ally, was able to show much enthusiasm for a missile plan that had not been tested successfully and would cost billions of dollars and resembled Reagan’s ill-fated Strategic Defense Initiative (“Star Wars”), a plan that had not been tested successfully and would cost billions of dollars. America’s allies reasoned that not least for financial reasons the implementation of Bush’s missile shield scheme would in all likelihood prevent the United States from giving equal attention to the development of other defensive and military schemes that deserved greater priority. Moreover, the Bush administration showed scant regard for international institutions like NATO by making clear that the missile shield decision had already been made. While America’s allies would be consulted and informed and would hopefully participate in the project, any allied advice to abandon the project would not be heeded. Unilateralism was triumphing. Multilateralism and constructive open-minded engagement with IOs had been abandoned for good.

Or so it seemed. Then, in September 2001, the terrorist attacks on the World Trade Center and the Pentagon occurred. This was not only a severe shock to the American people, who for so long had felt secure on a continent that was geographically very distant from most of the world’s battlegrounds, it also shook the Bush administration to its core. Alexis de Tocqueville’s statement in his famous Democracy in America (1835) that the United States was a nation without neighbors, securely enveloped in a huge continent and thus separate from the problems of the rest of the world, became out of date within a matter of hours. Despite its superpower status, and probably even because of it, it was recognized that America was no longer invulnerable. The Economist wrote presciently that the United States and the entire world realized that America was “not merely vulnerable to terrorism, but more vulnerable than others. It is the most open and technologically dependent country in the world, and its power attracts the hatred of enemies of freedom everywhere. The attacks have shattered the illusions of post-cold war peace and replaced them with an uncertain world of asymmetric threats.”

The value of American reengagement with IOs was recognized in many quarters almost immediately. Suddenly the United States was not merely the provider of benefits to the international community but could also greatly benefit itself from a close cooperative engagement with IOs. Within a matter of days the Security Council of the United Nations had unanimously condemned the attack in the strongest terms and pledged its support to the American intention to embark on a prolonged war against international terrorism. The European Union and many other IOs followed suit. NATO went even further. For the first time in its history the North Atlantic Alliance invoked article 5 of its charter, which obliged each member to take “such action as it deems necessary, including the use of armed force” if a member state was attacked from abroad. The terrorist attacks in New York and Washington were interpreted as a military attack on a NATO member state, which obliged all NATO members to come to the common defense of NATO territory. This was unprecedented; above all, it demonstrated the value of IOs to the hitherto unilateral Bush administration.

While it was unlikely that the Bush administration would not resort to unilateralist activities in the fight against international terrorism, it was equally improbable that even a state as powerful as the United States could win this fight by itself. Engagement with international organizations like NATO and the United Nations and cooperative multilateralism appeared to be decisive. Thus the occasional bouts of American neo-isolationism that could frequently be observed in the 1990s were thought by many to be largely a thing of the past. This, however, would also depend on whether or not the unity of NATO and its member states could be upheld for a prolonged period of time. Quite understandably, both the American people and the Bush administration were sufficiently enrag ed by the appalling attacks that cost the lives of more than six thousand people and caused damage in excess of $30 billion to “go it alone” if Western and indeed international unity could not be preserved. While the danger existed that the attacks might have the opposite effect and induce America to withdraw from international engagement altogether, this is unlikely; after all even an entirely isolationist America would continue to be exposed to the threats posed by international terrorism. Multilateralist engagement with international organizations and acting in concert with its allies appeared to be the best chance of reestablishing a degree of national and international security. However, it was thought abroad, at least, that this could well take the form of the controversial American “assertive
multilateralism” that the world had to put up with during the Clinton years.

Still, after 11 September it appeared that unilateralism and isolationism were no longer regarded as viable political concepts. In view of the Bush administration’s active engagement with the international community to fight the “war against international terrorism,” the Financial Times concluded that multilateralism was “no longer a dirty word.” Similarly, British Prime Minister Tony Blair expressed the belief that the answer to the unprecedented challenge confronting the world was “not isolationism but the world coming together with America as a community.” It was generally recognized that the world had to look beyond bombing Afghanistan, the country that hosted the terrorist network responsible for planning the attacks, and other military options. An American correspondent put it succinctly in a letter to the International Herald Tribune in early October 2001: “The Bush administration’s unilateralism has been revealed as hollow. Rather than infringe our sovereignty, international institutions enhance our ability to perform the functions of national government, including the ability to fight international crime.”

Analysis of the intervention and nonintervention theories and practices of the United States requires examination of four distinct facets of the issue. They are the theory underlying the use of intervention in international relations, the policy doctrines proclaimed by the United States regarding intervention, the international law regarding the legality of intervention, and the actual practice of intervention adopted by the United States.

THE THEORY
The theory of intervention is based on the concept of state sovereignty, which was incorporated into the 1648 Treaty of Westphalia that ended the Thirty Years' War to prevent rulers from meddling in the affairs of their neighbors at the risk of provoking wars. Sovereignty of a state means that it is entitled to exercise absolute control over its territory and people and can choose to govern its realm as it chooses. In a world of sovereign states, where no overarching governmental unit exists, nobody has the right to interfere with the state's activities unless the interference has been explicitly authorized by the state. In other words, by virtue of its sovereignty, every state, no matter how small and weak or large and powerful, has the legal right to be free from intervention by other states.

The problem with this theory is that it is based on an unrealistic assumption: namely, that all states are completely independent actors who are not affected by what other states do and whose activities do not affect other states. Nonintervention is an impossibility for political units sharing the same world, particularly when they exist in close physical proximity. National borders, which demarcate the state's sphere of control, have become increasingly porous, especially in the modern age of surveillance satellites and the Internet. The fact that international law acknowledges that states have the right of self-defense to protect their sovereignty has always been an implicit acknowledgment that intrusions on state sovereignty should be expected.

THE POLICY DOCTRINES
Throughout modern history, the principle of nonintervention, tempered by the right of self-defense, has been cherished, especially by small and weak nations that lacked the strength to resist intrusions by stronger rivals. The United States, which started its political life as a small and weak nation, was no exception. Its vocal support of the principles of nonintervention—the nonintervention doctrine—has served three major purposes throughout the years, aside from its use as a guideline for policy. First, it was meant to deter European interventions directed against the United States and its neighbors. President George Washington, in his Farewell Address to the nation, repeated a mantra common to the Founders. The United States would not intervene in Europe's affairs in return for reciprocity by European powers. Accordingly, it would object to interventions by other powers because it considered nonintervention as the normal rule to be applied by the world community.

Second, the doctrine was intended to inform the American people that pressures on their government for a policy of intervention were likely to be rejected on principle, even when Americans were eager to help European colonies in Latin America to become independent states. Expectations were that repeated proclamations of the nonintervention policy would deter interventions that the country could ill afford to undertake.

Third, once the principle had become venerable and established as right and moral conduct, it became useful as a psychological tool of politics. Many undesirable international activities
could be readily condemned by labeling them as “intervention.” Desired interventions could be excused by denying that they constituted interventions. Alternatively, the United States could claim that a particular intervention was within the scope of interventions permitted under the hallowed nonintervention doctrine. Putting policies within a framework of “moral” and “immoral” actions is particularly important for a democratic country where political leaders depend on the support of elected government officials and public opinion. It is easier to secure support when policies can be defended as moral principles, rather than as complex bargaining schemes or maneuvers in political power games.

All three purposes appeared to be particularly well served during the early years of the nation. It is therefore not surprising that American presidents, starting with George Washington, almost routinely advocated nonintervention. During the decades when the country was most vulnerable to foreign intervention and ill-equipped to intervene individually or collectively in faraway Europe, the doctrine was credited with keeping European powers from intervening in the affairs of the United States as a reward for American nonintervention in Europe’s liberation struggles. The doctrine permitted American leaders to refuse most requests for political as well as humanitarian interventions. The successes claimed for the doctrine strengthened faith in its value.

At first, the doctrine was generally expressed in absolute terms to give it the strongest possible impact. This formulation was never viewed as a renunciation of the presumably inalienable right of every country to use intervention to protect its vital interests. Rather, the doctrine was avowed for its practical usefulness for American policy needs. That the nonintervention doctrine involved legal considerations under international law was not stressed until 1842, when Secretary of State Daniel Webster alluded to its grounding in the legal doctrine of sovereign rights.

Because the absolute formulation of the doctrine was literally interpreted by many people, it grew embarrassing when the United States engaged in numerous interventions in the Western Hemisphere. Therefore, American statesmen reformulated the doctrine so that it would specify the exceptional conditions under which intervention would be permitted. The ebb and flow of efforts to spell out the limits of nonintervention, without abandoning the nonintervention doctrine as a general principle, constitute the major aspects of doctrinal developments over the ensuing decades.

President James Buchanan’s inaugural address in 1857 is an early example of reformulation. He declared it to be the nation’s policy never to interfere in the domestic concerns of other nations “unless this shall be imperatively required by the great law of self-preservation.” He did not specify the occasions when the law of self-preservation might apply and the ways in which such occasions could be identified. Buchanan also contended that the nonintervention doctrine did not preclude the duty of preventive intervention. When, as happened in Mexico in 1859, a Western Hemisphere country was afflicted by internal unrest that spilled over its borders, it was the duty of the United States to intervene to stop the unrest and thereby prevent intervention by other powers. Congress did not accept this argument at that time. But when the argument was revived and amplified during the closing decades of the nineteenth century, it became an accepted clarification of the scope of the nonintervention doctrine.

Officially, a number of major clarifications were labeled corollaries to the Monroe Doctrine, which had become an icon for the nonintervention principle. Linking interventionist policies to this icon served to maintain the aura that the nonintervention doctrine remained absolute. For example, the Olney Corollary of 1895 asserted the right of the United States to intervene in any conflict between an American and non-American power that endangered the security of the United States. Under the Roosevelt Corollary of 1904, the United States claimed an even broader right and duty to act as policeman of the Western Hemisphere. If any nation in the hemisphere permitted conditions on its territory that might invite intervention by another country, then it was incumbent on the United States to intervene to remedy these conditions and forestall intervention by others. The United States must assume this obligation because the Monroe Doctrine prevented other powers from exercising their right of intervention in troubled Western Hemisphere countries.

Many American political leaders were dissatisfied with the doctrinal and practical consequences of the Roosevelt Corollary. In an attempt to adhere more closely to the spirit of nonintervention, President William Howard Taft sought to control internal political affairs in other nations through economic, rather than military, pressures. Since the nonintervention doctrine did not prohibit intervention for the protection of nationals,
his administration encouraged American business interests to settle in potentially unstable neighboring countries. Presumably, they would help the country to stabilize its economy and prevent political turmoil. If the presence of American businesses failed to prevent unrest, the United States could then send protective missions as part of its right to protect its citizens abroad. In this manner it could control the politics of unstable countries without violating restraints commanded by the nonintervention doctrine.

During the presidency of Woodrow Wilson, the nonintervention doctrine received yet another interpretation. Wilson’s claim that the United States must discourage dictatorships or unconstitutional governments in Latin America by refusing to recognize them was accompanied by strong professions that such interventions accorded with the principles embodied in the established doctrine of nonintervention. Destruction of unpopular governments, Wilson argued, freed foreign nations from undue restraints on their sovereign right to opt for democratic rulers. Rather than serving as a tool for coercing these nations into unwanted action, intervention thus became a tool to enable their people to exercise their will. While Wilson expanded the scope of the right of intervention on one hand, he also laid the groundwork for subsequent contractions of the right. His stress on the sovereign rights of states to determine their own fates, regardless of size, led to a series of international agreements that proclaimed the nonintervention principle as a prescription of international law except for individual or collective self-defense. Such agreements became part of the Covenant of the League of Nations (1918) and later the United Nations Charter (1945).

Nations of the Western Hemisphere went even further than the rest of the international community. Through a series of agreements and declarations springing from successive inter-American conferences in the 1930s, Western Hemisphere countries, including the United States, adopted a principle of absolute nonintervention by individual countries within the Western Hemisphere. Individual countries retained the right to protect the personal security of their citizens. Beyond that, only collective intervention by the combined forces of Western Hemisphere countries would remain lawful.

The United States was willing to bind itself to such absolute declarations of nonintervention because it believed that the collective intervention arrangements made in the Western Hemisphere and on the broader international scene provided a viable alternative to intervention by individual countries. At the same time, a series of presidential declarations emphasized more strongly than had been done in the early years that nonintervention pledges did not mean an abandonment of the right of self-defense when there was no effective collective action. Whenever possible, the United States also tried to conclude mutual defense and economic assistance treaties to provide a legal basis for coming to the aid of selected countries when counterintervention was needed to resist a communist takeover.

In addition, the United States explicitly asserted a right of counterintervention against illegal interventions by other powers. Protection from intervention was a privilege earned by deserving countries; it was not an absolute right. Secretary of State Cordell Hull, during the administration of President Franklin D. Roosevelt, declared that the nonintervention principle applied only to nations that respected the rights of others. The United States, as a powerful member of the community of nations, had a right and duty to intervene in order to prevent or stop illegal interventions directed against countries that lacked the power or will to resist such interventions.

The dangers that would give rise to interventions were identified explicitly but broadly in the 1930s and 1940s. During that period, American political leaders believed that the efforts of the Axis powers to expand their control over Europe and Asia endangered peace and warranted intervention. American leaders sought—sometimes successfully and sometimes unsuccessfully—to have these concerns incorporated into multinational declarations to indicate that nonintervention pledges did not apply to power plays by the Axis powers. The idea that mutual nonintervention pledges by the United States and the Axis powers might be a better way to protect the United States was rejected by the administration of Franklin D. Roosevelt.

Following the defeat of the Axis powers in World War II, communism was viewed as the main danger to the national integrity and security of the United States and the world. In the Truman Doctrine, proclaimed in 1947, the United States declared broadly that either unilateral or collective intervention was justified to protect any country in the world from falling under communist rule. The peace and security of the United States and the world were at stake. The Eisenhower Doctrine, proclaimed in 1957, pinpointed...
some of the areas where intervention might be expected. Specifically, the political integrity of Middle Eastern nations was declared to be vital to world peace and American interests. If nations in the Middle East were threatened by overt armed aggression by communist forces, the United States would come to their aid if they requested help.

The 1970s saw a retrenchment in overt interventions against communist expansion. Accordingly, it seemed appropriate once more to redefine the scope of the nonintervention doctrine to conform to the prevailing official interpretation of the limits set by the policy. The Nixon Doctrine of 1970 expressed the principle that the United States did not consider it an obligation to protect other countries against communist intervention unless it had determined, in specific cases, that American security interests were involved. Even then, intervention was not the sole duty of the United States but was an obligation shared by all countries opposed to the overthrow of noncommunist governments by communist contenders. President Jimmy Carter deemed the Soviet Union’s invasion of Afghanistan in 1979 a major threat to the West’s oil lifeline. He responded in 1980 with the Carter Doctrine, declaring with unusual specificity that attempts by any foreign power to gain control over the Persian Gulf region would be considered a threat to the vital interests of the United States. It would be repell, using military force if necessary. Five years later, in 1985, President Ronald Reagan once more pledged support for a policy of unilateral armed intervention in Third World countries if this became necessary to overthrow Marxist-Leninist regimes. The policy was to be applied selectively anywhere in the world where people were fighting against communism. In practice, it was implemented mostly in Central America.

The Truman, Eisenhower, Nixon, and Reagan doctrines did not pinpoint the conditions that might trigger a specific intervention. However, high-level military leaders often laid out the policy in somewhat more detail. For instance, General Colin Powell, who was chairman of the Joint Chiefs of Staff during the administration of George H. W. Bush (1989–1993), declared that military interventions should be undertaken only when a number of conditions were met. Most importantly, the political objectives of the intervention had to be clearly defined and the gains and risks and likely outcomes had to be adequately assessed. Based on these assessments, it should be clear that the objectives of the intervention could be reached through military means at a defensible cost. Finally, nonviolent alternative policies, if suitable, had been tried first and failed.

Many observers argued that the various and sundry doctrines and statements by military leaders should not be viewed as blueprints for action. Rather, like the previously proclaimed nonintervention principles, they were tailored primarily for psychological impact. They were intended to discourage intervention-minded leaders and to give moral support to nations fearing communist attacks. It was hoped that policy pronouncements would obviate the need for remedial action. If action became necessary, the pronouncements could be characterized as prior warnings that legitimized subsequent actions.

Thus, the nonintervention doctrine has ebbed and flowed in its more than 200-year history. It has gone from an absolute expression, tempered by the implicit exception that interventions for vital purposes were permissible, to an emphasis on a broad range of exceptions to the doctrine, which left it little more than an empty shell. Then it was reformulated in absolute terms, tempered by statements of exceptions stressing that collective or unilateral intervention would still be used by the United States to protect vital security interests. But the absolutism abated again in the wake of major international threats posed by upheavals in Europe and Asia and evidence that collective interventions were difficult to orchestrate.

By the early twenty-first century, the policy implications of the doctrine were that the United States, like all sovereign states, claimed the right to protect its security by all means within its power—including intervention—whenever its leaders believed that this security was seriously endangered. Despite American capacity to intervene freely in the politics of most small nations, however, intervention would be used sparingly, primarily when conditions existed that potentially threatened the security of the United States and its allies and when all other means to resolve the problems failed. The pledges of nonintervention made in the twentieth century indicated the areas where intervention was most likely to occur and the conditions most likely to provoke it. They served as a rough guide to the government in its choice of policy options.

INTERNATIONAL LAW

Definition and General Rules As defined by international lawyers, intervention is unsolicited
interference by one state in the affairs of another; nonintervention is the avoidance of such interference. Intervention may be directed against a single state or factions within it, or it may involve interference with the interactions among a group of states. It may take the form of military action or economic or political pressures. These pressures force states to act in a manner prescribed or foreordained by the intervening state. Alternatively, the intervening state may use its own agents to carry out the policies that it desires. States yield because they fear military coercion or nonmilitary punitive actions or because they cannot stop the intervening state’s agents or activities.

Although the elements of intervention can be readily outlined, they are hard to identify in specific political situations. Most relations among states contain elements of coercion whenever interacting parties feel constrained to make some concessions to each others’ wishes. It is difficult to determine at what point pressure becomes coercive enough to be considered an intervention because consent was unwilling and therefore deemed void. For instance, when a country desperately needs economic aid from the United States or international agencies whose policies the U.S. controls, is it intervention to make aid contingent on privatizing that country’s banking system? Normal intercourse among states merges almost imperceptibly into interventionist practices. In a community of nations that is comprised of states of varying powers and degrees of interdependence, nations lacking in economic and political resources are most likely to experience interventionist pressures. The world community has not yet agreed on the borderline between the right of the stronger power to insist on its terms, and the right of the weaker power to conduct its affairs free from coercion. At the other end of the spectrum of coercion, it has at times been difficult to determine when interventions become outright warfare.

A second problem arises from the interdependence of nations in the community of nations, which makes the complete independence envisaged by the concept of sovereignty a legal fiction, rather than a viable reality. In a community of interdependent nations, the domestic or foreign policies of state A frequently have a direct effect on the affairs of state B. When the United States closes its borders to Mexican farm laborers hired for seasonal work in the United States, the Mexican economy suffers. There is disagreement about whether intervention has taken place when the actions of A—and even inactions—seriously affect B but have not been primarily designed to affect B. If, as many international lawyers contend, intent to intervene is essential to establish the fact of intervention, the difficulty of proving intent seriously impedes accurate findings. For instance, the United States stopped the exportation of scrap metal to Japan prior to World War II, giving U.S. national defense needs as the reason. Japan claimed that the measure was intended to force a change in its military policies. It was difficult to prove at the time which claim was correct.

A third problem is tied to the question of responsibility of a state for the actions of its nationals. Citizens of country A, enraged about the treatment of religious minorities, revolutionaries, or foreign business establishments in country B, may openly or covertly interfere in the politics of country B to change policies that they think are offensive. It remains unsettled whether and under what circumstances their government becomes implicated by their activities. For example, Americans who were outraged by the racial policies of a South African government controlled by whites who were an ethnic minority pressured various American enterprises in the 1980s and 1990s to withdraw their investments from South Africa unless racial policies were changed. The withdrawals caused major economic dislocations and contributed to the ultimate fall of the minority government.

The problem of accurate identification of interventionist actions was of minor significance in the eighteenth and nineteenth centuries, because most interventions by the major European powers in the affairs of weak states were then deemed permissible self-defense actions under international law. In fact, rulers in Europe considered intervention a moral duty to uphold their common culture and to protect the political status quo. When the status quo was threatened by the French Revolution, the major European powers pledged support of interventions that would uphold the existing balance of power and maintain established governments.

Numerous interventions took place for these causes. For example, Prussia, Austria, and Russia intervened in Spain, Naples, and Piedmont in 1820 to suppress revolution against the established governments. Similarly, from 1827 to 1832, during the Greek war of independence, Britain, France, and Russia repeatedly intervened in the internal affairs of Greece and Turkey to maintain the balance of power in the Middle East. Other interventions...
were designed to protect religious groups and minorities, especially when they had ties to the intervening country. Despite high regard for the principle of state sovereignty, international law and practice in the nineteenth century sanctioned a broad right of intervention to protect the interests of nations strong enough to exercise this right to maintain the political status quo.

In the twentieth century, international developments changed the concept of unquestioned legality of all interventions, raising the problem of defining the nature of legal and illegal interventions. The decline of autocratic monarchies and the rise of democratically controlled nations in the wake of the French Revolution had weakened the idea of a community of nations jointly responsible for preserving the existing political landscape. Democratic and autocratic governments had little in common except the reciprocal fear that one was determined to destroy the other. They did not share the sense of kinship and personal moral obligation that had united the crowned heads of Europe. Nor did they agree about the most advantageous policies for Europe and the aims worthy of individual or collective intervention.

Fearing each other, European states wanted to make sure that they would be able to conduct their affairs unhindered by other nations. They therefore looked to the theory of state sovereignty and to claims of an inherent freedom of self-determination as foundations for legal restraints that would protect them from unbridled interventionism by other members of the international community. Gradually, the efforts of small nations, supported by larger countries opposed to interventions to sustain absolute governments in Europe, undermined the concept of an unlimited right of intervention. The notion of a duty of intervention to prevent politically harmful changes was replaced by the concept of a duty of nonintervention subject only to a small number of exceptions.

By the middle of the twentieth century, changing legal philosophies, buttressed by a number of specific resolutions and multilateral treaties, including the Montevideo Convention on the Rights and Duties of States (1933) and the United Nations Charter (1945), had made it a general rule of international law that states may not interfere in matters customarily deemed to be the exclusive purview of another state. A state's internal affairs and its relations with third parties are inviolable. Article 2, paragraph 7 of the UN Charter states that "Nothing contained in the present Charter shall authorize the United Nations to intervene in matters which are essentially within the domestic jurisdiction of any state."

While nonintervention is the general rule, it is still limited by a right of intervention in cases where the current or imminent actions of one state endanger vital concerns of another state or of the community of nations. The clamor of small states for a total prohibition of all interventions has never been heeded. Accordingly, Article 2, paragraph 7 of the charter also provides that the nonintervention principle "shall not prejudice the application of enforcement measures under Chapter VII." Under Chapter VII, states retain the right of coercive action, including the use of military force, to protect international peace and security.

In fact, there has been a partial swing back to the notion that intervention may be a duty to assure the right of people everywhere to be governed democratically and to be protected from violations of their basic rights as human beings. The Universal Declaration of Human Rights, adopted by the United Nations General Assembly in 1948, laid out the scope of these rights. They include bans on genocide and war crimes. The declaration urges member nations to secure "universal and effective recognition and observance" of these rights. Subsequently, the 1951 Convention on the Prevention and Punishment of the Crime of Genocide spelled out in detail that actions such as killing members of national, ethnic, racial, or religious groups, or harming them bodily or mentally, or preventing them from having children, constitutes genocide. The Nuremberg Tribunal, set up to try German war criminals after World War II, established the principle that political leaders and their minions are personally responsible for atrocities they commit as part of their official duties. In the 1990s, international criminal tribunals were set up to try individuals accused of crimes against humanity in Rwanda and the former Yugoslavia. The activities of these tribunals demonstrate that individual responsibility for crimes against humanity can be enforced to some degree under existing international laws. The 1998 Rome Statute for creating an International Criminal Court, which was signed by 120 countries within two years of its adoption, is further evidence that the world community concurs that human rights should be protected under international law.

In 1999, United Nations Secretary-General Kofi Annan urged UN members to devise and pursue more effective policies to stop egregious human rights violations. He acknowledged that
some nations might oppose humanitarian interventions as violations of state sovereignty. He countered this contention by arguing that the moral duty of the world community to stop human rights violations trumped an offending state’s rights to sovereignty. In line with such widespread sentiments, which nonetheless lack the force of law, the United States has been criticized by political leaders at home and abroad for neglecting its “duty” to prevent or stop genocide, irrespective of its own interests. The issue arose in the Balkans, in Uganda, and in Indonesia when civil strife led to “ethnic cleansing” policies because ruling factions in these states or regions committed atrocities designed to kill or otherwise eliminate undesired minorities from their lands.

**Application Problems** The general rule that states may intervene in the affairs of other states to protect their own vital interests has been difficult to apply because there is no agreement on the definition of “vital interests.” Are the interests that may be protected limited to matters of military security, or do they include major economic and social stakes? Must the danger be imminent or is there a right of preventive intervention? Is it a vital right to protect the property of one’s citizens from physical harm in states where effective government has collapsed? Who determines that vital interests are endangered and that intervention is needed to protect them? What is an equitable balance between the safeguarding of vital interests of the intervening state and those of the state subject to intervention? If a state violates the human or political rights of individuals within its borders, or if its actions endanger international peace, do members of the international community have the duty to interfere to enforce the norms of the international community? May they intervene on behalf of established governments under attack by revolutionary forces within their own borders? The answers to these questions remain highly controversial.

These problems are further clouded by vociferous statements of political activists who invoke moral and ethical norms. They claim that interventions on behalf of “good” causes, as they define them, are legal and a moral duty, while interventions for “bad” causes are illegal, unethical, and immoral. Good causes range from aiding persecuted individuals to the duty to provide peoples with good governments to the obligation to stop civil wars or bring about the victory of the allegedly more virtuous side.

A second area of controversy concerns the means of intervention. There is substantial consensus that illegal intervention has occurred when a state dispatches armed forces to the territory of another. The Covenant of the League of Nations (1918), the Kellogg-Briand Pact (1928), and the United Nations Charter (1945) are examples of international agreements outlawing such armed interventions. There is far less agreement about the legality of the vast array of nonmilitary pressures by which states can affect the affairs of other states. These include economic pressures, such as an offer or withdrawal of loans, trade, or aid, including military supplies; political pressures, such as granting recognition to an acceptable government to bolster its power, and withholding of recognition from an unacceptable government in hopes of toppling it; and psychological pressures, such as expressing support for one side in a revolution, denouncing the policies of another state, or excluding it from international meetings. There is a good deal of disagreement about which of such economic, political, and psychological pressures are legitimate exercises of a state’s right to conduct its affairs with others as it pleases or undue interferences in the affairs of another state.

A third area of dispute involves the validity of consent to intervention. Many legal experts contend that intervention is legal if it is carried out pursuant to treaty rights or in response to an invitation by an incumbent government. Others dispute the legality of such interventions because treaties granting the right to intervention and requests for intervention frequently spring from duress or are initiated by unrepresentative governments eager to keep themselves in power. Whether these factors invalidate the consent expressed in the treaty or invitation is a controversial legal question. For example, when Colombia refused the request of President Theodore Roosevelt’s administration to allow the United States to build a canal in Panama, then a part of Colombia, an uprising leading to Panama’s independence was engineered with U.S. support. The pro-independence forces then requested U.S. aid in resisting Colombia’s efforts to prevent the secession. The United States complied, ignoring Colombia’s objections that the rebels lacked legitimacy and the right to request foreign aid. Once independent, Panama granted the United States the canal rights that its parent state had refused.

A related problem involves the right of collective intervention. For example, member states...
of the United Nations have agreed in principle to collective interventions. Is this tantamount to automatic approval of interventions by the United Nations in a member country that has violated UN rules and demands? Can a nonmember of the United Nations validly argue that collective intervention directed against it is illegal because it has not given prior consent? For example, could Iraq contend that the UN coalition cobbled together by the Bush administration in 1990–1991 amounted to illegal intervention when Iraq claimed that its incursions into neighboring Kuwait were legitimate because part of the region legally belonged to Iraq? Moreover, Iraq claimed that the government of Kuwait was ruling the country against the objections of the Kuwaiti population.

The official position of the United States on legality and illegality of interventions has generally leaned toward a fairly broad construction of the right of intervention. Presidents and secretaries of state have argued since the end of World War I that international law permits states to retain the right to determine which of their national interests may be protected through intervention and the occasions when intervention is required. Likewise, the United States contends that states retain the right to intervene individually when collective intervention machinery fails to operate efficiently. At the same time, the United States has narrowed the scope of American interests defined as vital enough to justify protection through intervention. Examples of circumstances claimed as justifying intervention include the establishment of Soviet missile sites in Cuba in 1962 and aid to the corrupt but noncommunist government of Vietnam in the 1960s when communist forces attempted to wrest power from the regime of President Ngo Dinh Diem.

The determination of what constitutes legal intervention has been further complicated by the fact that it is deemed derogatory to charge a government with the practice of intervention. For many of the world’s governments and people, interventions are policies pursued by international bullies and oppressors, while nonintervention is the hallmark of virtuous nations. These evaluative connotations tempt intervening governments to avoid the label of “intervention” even when their actions are lawful. Instead, they use deceptive names, such as “interposition” or “police action.” Similarly, they may misrepresent illegal interventions as legal activities by using deceptive names or spurious legal justifications. The countries that are the targets of interventions may give the false taint of illegality to them by attaching the intervention label to them. Such misuses of political terms make it difficult to ascertain prevailing views within the community of nations on the precise nature of intervention and the criteria by which one can judge whether intervention has occurred and is legal or illegal.

THE PRACTICE OF INTERVENTION

If one were to draw a curve charting the number of American interventions over a 200-year span, it would begin at a fairly low point, reach a peak roughly at the center, then move sharply downward and rebound after World War II. The curve would show several lesser fluctuations during the years of ascent and descent. The major rationale for this ebb and flow of interventionism is the change in perceptions about the security of U.S. hegemony in the Western Hemisphere.

The United States has intervened in the affairs of other nations, or seriously considered intervening, primarily to prevent or foil anticipated attempts by powers on other continents to gain a foothold in the Western Hemisphere from which they might mount an attack on the United States. It has also intervened to maintain power balances among nations in Europe and Asia so that no single nation or combination of nations might become strong enough in these regions to launch an assault on the Western Hemisphere from abroad. Occasionally, the United States has also intervened to establish American strategic and economic bases abroad in order to protect its vital connecting routes to other parts of the world.

When challenges to hegemony were deemed minor, or when interventions were urged for goals not clearly involving the protection of hegemonic interests, the United States has generally shunned intervention. A major exception has been the policy of intervening on behalf of U.S. citizens abroad whenever their lives and property were threatened by political events in a weak foreign country. American statesmen have generally viewed the protective aspects of such actions as paramount and the interventionist aspects as strictly subordinate. Protective interventions, if limited to safeguard Americans, were ordinarily not counted in the record of interventions, at least not by American officials. Of course, the target country often viewed the matter differently.

Humanitarian interventions are another exception. They are viewed primarily as attempts
to help suffering human beings whose lives are endangered, rather than as attempts to challenge or interfere with the political situation in the states where these individuals happen to live. In fact, the United States has resisted protecting people from violation of many of their economic and social rights stipulated in human rights conventions, claiming that such interventions would constitute illegal interference.

The argument that infringements of state sovereignty to achieve humanitarian goals are nonpolitical becomes more difficult to sustain when humanitarian crises are precipitated by political events, as was true in the 1990s for starvation relief in Somalia or rescue of Muslims in Bosnia and Kosovo from annihilation. States where humanitarian interventions are taking place generally condemn them. They consider all actions taken by a foreign power on their soil against their expressed wishes as intervention, regardless of the motivation for the action. This is why intervening states, including the United States, often supplement the humanitarian argument by claiming that the action is also undertaken because their vital interests are at stake or because extreme human suffering brings instability that endangers international peace.

While protection of the security of the United States has been the major reason for considering interventions as policy options, additional concerns have influenced specific policy decisions. Foremost, particularly in the early years of the country, was the question of capability to intervene effectively. Intervention usually requires substantial military, economic, and political resources. When the United States lacked such resources or was already using them to their fullest extent, it could not spare them for interventions.

The balance between political gains and political disadvantages derived from the intervention is also important. Intervention by one state may spur counterintervention by another. It may alienate the government and people of the state against which it is undertaken. It may antagonize other members of the community of nations. The chances that it will accomplish the objectives for which it was undertaken may be slim. All these factors are weighed in determining whether a particular intervention is advisable.

Policies of intervention, like other foreign policies, also tend to become entangled with events on the domestic political scene. Political competition for the allocation of human and material resources for various goals may lead to strong opposition to spending resources for a particular intervention. In the years before the Civil War, many interventions were appraised within the context of the proslavery-antislavery dispute. Later, the intervention policy became entangled in the debate over the merits of imperialist expansion. Differences in the appraisal of individual situations also are important. Political leaders often disagreed about whether hegemonic interests were really involved in a particular situation and whether intervention was likely to produce the anticipated results. Considering the high economic and political stakes involved in most decisions to intervene or to abstain, heated debates have been the rule. Political partisanship has also played a part in opposing or supporting particular interventions even though the policy of intervention and nonintervention has never carried a party label. Periods of plentiful and of scarce interventions have been unrelated to the partisan orientation of the government.

Public opinion within the United States has also had a discernible impact on foreign policy choices. When the public mood leaned toward isolationism and concentration on domestic problems, interventions were chosen less frequently than when the public mood was expansionist or imbued with the idea that the United States, as a world power, must involve itself fully with external affairs. Such swings in public opinion have been common, often based on reactions to the success or failure of the most recent foreign policies and on the country’s economic strength.

The history of U.S. intervention and nonintervention policies can be divided into four periods. The first, in which the stress on nonintervention was greatest, encompasses roughly the first century of the nation’s existence. Then followed an interlude of unabashed interventionism during the closing decades of the nineteenth century and the beginning of the twentieth century. This period ended with the Great Depression years of the 1930s. Third, there were the frustrating decades leading up to World War II, followed by the Cold War era of confrontation between communist and noncommunist power blocs. Hopes for meeting dangers to the national interest through collective interventions turned to dust in the Cold War era. Despite a desire to abandon unilateral interventions, the United States felt compelled to intervene repeatedly to safeguard its national security when American leaders deemed it endangered by the policies of authoritarian governments in various parts of the world. Finally,
the end of the Cold War and collapse of the Soviet Union ushered in a new era. Humanitarian interventions in ethnic conflicts and interventions to aid countries in creating democratic governments became fairly common interventionalist activities, usually after prolonged and heated verbal battles in the halls of government.

**The First Century** During the first century of the nation's history, numerous interventions were undertaken to consolidate control over the American mainland and adjacent regions. Territories held by European countries or in danger of being taken over by a European country were acquired or kept from passing under the control of a European rival or changing hands from a weaker to a stronger European ruler. Several major interventions to acquire Spanish Florida and minor meddling in Texas and California are examples. However, while the country was still weak compared to strong European powers, and during the turmoil of the Civil War and Reconstruction, interventions were undertaken only if the outcome seemed highly promising and few dire consequences appeared in the offing. For instance, intervention to acquire Canada was ruled out because of fear that it might bring war with Britain. Diplomatic activities to acquire Cuba were kept short of intervention lest they embroil the country in war with Spain and its allies. Likewise, intervention to annex the Dominican Republic was scotched by Congress.

Intervention was also considered repeatedly during this period in order to keep European powers from intervening in the affairs of independent Western Hemisphere states. But few of these plans bore fruit. Internal weakness kept the United States from pursuing its policies through intervention on a number of occasions when, at a later period, it would have intervened. For example, the United States did not stop interventions by France in Mexico and Haiti to collect debts, nor did it halt incursions by Britain into Guatemala, Nicaragua, and Argentina. Verbal protests were made repeatedly. The United States objected to France's intervention in Mexico to support a monarchy, to Spain's intervention in Peru and annexation of the Dominican Republic, and to Britain's acquisition of parts of Honduras.

The United States also attempted to strengthen American influence in areas threatened by European intervention by expressing a strong interest in the fate of these regions. But the United States could do little more. Powerful influences in Congress and among the public opposed preventive interventions that various presidents had suggested to restore public order in Mexico and the Caribbean area or to overturn military dictatorships and thereby forestall corrective measures by European powers. The United States even kept largely aloof from the efforts of European colonies in the Western Hemisphere to free themselves from control by their mother countries.

Interventions by the United States in revolutions outside the Western Hemisphere were also kept to a minimum, although many revolutions were taking place in Europe to replace absolute monarchies with democratic governments. Two centuries later, the support of democratic factions and countries against absolute governments of a different sort would be deemed sound reason for intervention by the United States, but that time had not yet arrived.

The United States did intervene in China, Japan, and Korea to coerce them to grant trade privileges to American merchants, beginning with a government trade mission in 1844 headed by Commissioner Caleb Cushing. At the time, such missions were the usual practice when foreign nations wanted to trade with Asian countries. The eagerness of the United States to have its citizens participate in the spoils of trade in the Far East was explained as much by strategic as by economic considerations. American leaders feared that the European powers would divide the Far East, particularly China, into spheres of influence from which other powers would be excluded. Land bases in China would give them control over the shipping lanes of the Pacific Ocean. The United States, unless it supported retention of control by the weak Asiatic powers or secured spheres of interest of its own, would be deprived of Pacific outposts to protect its access routes to Asia. The United States therefore pursued a two-pronged policy in the area: it protested against increased domination by European powers, and it intervened to acquire trade privileges for itself and to lay the foundations for ultimate acquisition of a number of naval bases in the Pacific.

**The Imperial Period** The heady philosophy of the interventionist phase of American foreign policy is epitomized by Secretary of State Richard Olney's claim in 1895 that the United States had become master of the American continent "practically invulnerable as against any or all other powers." Consequently, "its fiat is law upon the sub-
jects to which it confines its interposition." Within the next decade the United States would satisfy all its remaining territorial ambitions, largely through interventions and war with Spain. Puerto Rico, the Philippines, and Guam came under its control, as well as Hawaii and Samoa. Nonetheless, even during this period, reluctance to intervene did not disappear entirely. For instance, President Grover Cleveland's administration resisted pleas for intervention in Cuba although intermittent civil strife on the island was deemed hazardous to American security.

From the standpoint of intervention policy, the most crucial territorial acquisition during this period was the Panama Canal Zone. It was acquired through interventionist policies that assured that the Panama region would break away successfully from Colombia and would grant ample concessions to the United States for construction and protection of an isthmian canal. The United States regarded the canal as a lifeline permitting its naval units to shuttle rapidly between the East and West coasts to guard against dangers emanating from Europe or Asia. To protect this vital route, the United States appointed itself policeman of the Western Hemisphere who must and did intervene frequently to restore political order in the small countries near the canal. American political leaders assumed that political unrest automatically spelled danger to the canal area, warranting intervention. No specific proof was required in a particular situation that an attack on the canal was imminent. In a number of Caribbean countries, the United States even secured treaty rights of automatic intervention in case of unrest. The most famous advance authorization for intervention was the Platt Amendment to the Cuban constitution, which was in force for more than thirty years.

In areas farther from the canal, interventions were undertaken with more restraint. During this period, Mexico was a source of great concern to American policymakers because of constant internal turmoil, a succession of brutal dictatorial governments, and serious attacks on American citizens and their property in Mexico. The United States used a number of pressures, particularly economic sanctions and arms embargoes, to control turmoil in Mexico, but refrained from full-scale military intervention despite domestic pressures.

During the interventionist period the United States protested more strongly than ever before against European incursions into the affairs of the hemisphere. Boundary difficulties between Venezuela and Britain in the 1880s provide a good example. The United States intervened in the dispute, contending that it had a general right to interpose in any conflict in which the political or territorial integrity of an American state was threatened by a non-American power. It claimed that it could insist on arbitration and the enforcement of the arbitration award, even if one of the parties opposed the award.

By nonrecognition of an undesirable government, the United States also intervened repeatedly, although not consistently, to overthrow authoritarian regimes, particularly military dictatorships that had come to power in Latin America. Regimes that had ascended through unconstitutional means and represented authoritarian philosophies were deemed potential sources of instability. They might produce internal unrest, encouraging foreign intervention that would threaten the hegemonic interests of the United States. It was hoped that nonrecognition would make it so difficult for the unrecognized government to conduct its political and economic affairs that it would be weakened and overthrown by democratic forces. While potential danger to the security of the Western Hemisphere usually was the motivating force for nonrecognition, at times the policy was used on purely ideological grounds. Several instances occurred during the Woodrow Wilson administration because President Wilson was loathe to recognize governments that had come to power by force or ruled undemocratically.

Major challenges to the international balance of power continued in Asia during this period. European nations and Japan were establishing spheres of interest at the expense of China. More assiduously than before, the United States aimed to prevent this by means of an Open Door policy for China. This involved securing pledges by European nations and Japan to refrain from closing any part of China to access by other powers. The United States protested whenever other powers violated the policy, which it regarded as a guarantee of China's territorial integrity and independence. When protests failed, the United States did not usually attempt stronger pressures for fear that they might lead to war.

The United States did intervene in the Russo-Japanese War (1904–1905) to prevent Russia and Japan from encroaching on China's sovereignty. Later it refused to recognize damaging concessions extorted by Japan from China in the vain hope that this would produce a policy...
change on Japan’s part. The United States also continued to engage in intervention designed to strengthen China economically and politically and to assure an American presence in the area to checkmate European power plays.

The peak of interventionism, if one judges by the frequency of interventions and the number of countries involved, was reached during the first two decades of the twentieth century. Besides numerous interventions in the Western Hemisphere and Asia, this phase included U.S. intervention in World War I on behalf of the anti-German coalition. Ultimately, intervention led to full-scale American participation in the war.

In the postwar years, the number of interventions declined. The weakness of European powers after World War I was one major factor. They no longer presented a real threat to the hegemony of the United States in the Western Hemisphere. No European power was strong enough to assume control over Europe or the tottering Chinese empire. Another major factor was the realization that many goals that the United States had tried to accomplish in the course of interventions in the Western Hemisphere could not be achieved through intervention. For instance, it had been impossible to lay the groundwork for politically stable, economically sound, and democratically governed states in the Caribbean area, despite lengthy U.S. military interventions. Attempts to establish economic influence abroad and to use it for political purposes (known as dollar diplomacy) had also largely failed.

Lastly, interventions had aroused a great deal of opposition from other countries, particularly the nations of the Western Hemisphere, and from groups within the United States. The policy was attacked on legal, moral, and practical grounds as improper coercion of the weak by the strong for the selfish aims of the strong. Behind such charges lay a changing climate of world opinion that placed greater emphasis on the sovereign rights of small nations and condemned coercive diplomacy, particularly the use of military force, to achieve national objectives.

The Collective Security Phase The dominant feature of American intervention and nonintervention policies after the end of the openly interventionist years was the desire to make interventions—particularly those involving the use of military force—collective enterprises of the world community or regional groupings. Dangers to the vital interests of the international community that would justify protection through intervention were to be carefully defined in advance. The United States hoped that they would encompass all the circumstances that had hitherto tempted it into individual interventions. In addition, the United States expected to influence the policies of other countries through conditions attached to its economic and military aid policies. It did not consider such conditions interventionist. Rather, they were deemed the right of the donor to dictate the terms of a grant.

Unfortunately, the goals set for conditional aid policies were rarely achieved. The stipulated conditions often proved impossible to implement or failed to produce the desired results because of unstable internal conditions in the recipient nations. Fraud and corruption were major problems worldwide. In many cases, the conditions attached to the aid were flouted. Occasionally, the prospective recipient refused the aid because the conditions were deemed interventionist, destabilizing, or insulting.

The goals set for collective interventions fared somewhat better, but also fell short on many occasions. Prolonged negotiations over many years made it possible to organize a moderately effective collective intervention system in the Western Hemisphere. Spurred on by the United States and its supporters, the system was activated repeatedly to curb Axis and communist influence in Latin America. Strong objections by countries such as pro-Axis Argentina and Chile and pro-communist Cuba, Guatemala, and their supporters were overruled. But efforts to use the system failed frequently when the goal was to control major political problems endemic to Western Hemisphere countries.

On the wider international level, the League of Nations Covenant, and the United Nations Charter and interpretive resolutions thereafter, also contained provisions for collective intervention to protect the vital interests of members of the community of nations. But agreement could rarely be reached on the kinds of menaces to which this machinery should respond. Nations could not even agree during international gatherings or when faced with specific situations on what sets of circumstances should be considered threats to world peace.

The weaknesses of the collective intervention machinery encouraged the United States to continue to determine unilaterally whether its security was menaced by particular international developments. When protective interventions
seemed necessary, it would then try to initiate collective action. If this failed, or if the collective machinery could not be put into operation quickly and decisively enough to halt the danger, the United States claimed and continued to exercise a right of unilateral intervention.

Two major dangers, similar in nature, roused the United States to a large number of verbal, economic, political, and military interventions during this and the preceding period. The first was the attempt of right-wing authoritarian regimes in Europe, and later in the Far East as well, to destroy the balance of power in Europe and Asia and to establish their own hegemony. The United States first intervened in World War II in Europe and Asia by verbal attacks and warnings directed against the dictators. It tried to engender and support policies by neutral powers that would be harmful to the dictators’ aims, and it gave economic and military aid to the dictators’ enemies. Along with other countries in the Western Hemisphere, it interfered with the rights of belligerent powers to conduct hostilities on the high seas surrounding the Americas in a band 300 to 1,000 miles wide. To protect the hemisphere from Axis footholds, the territorial status of European possessions in the Americas was declared frozen in 1940. Inter-American machinery was established to administer the possessions of subjugated European countries. All of these verbal, political, and economic interventions failed to halt Axis advances. The United States then entered the war in 1941 in response to Axis war declarations and attacks on U.S. territories.

The victory of the Allied powers in World War II ended the menace to American security created by rightist totalitarian imperialism in Europe and Japanese empire building in Asia. New challenges to hemispheric safety soon arose from attempts by the Soviet Union and other communist powers to spread their ideology and political and even territorial control over a widening circle of countries in Europe, Asia, and other parts of the world. American leaders believed that the United States had a legal right to intervene to halt communist advances because its own survival as a democratic country was deemed at stake. Every addition to the communist coalition diminished the potential of the United States to defend itself successfully against communist subversion and military aggression.

Interventions by the United States to halt or prevent the spread of communist control throughout the world explain most of its far-flung operations during the latter four-fifths of the twentieth century. In almost every case in which the United States had identified a situation as potential or actual communist intervention, it tried to work through collective action. These efforts failed frequently because other countries disagreed that communist intervention was imminent or because they feared the consequences of the spread of communism less. Moreover, struggles by national liberation movements to free their countries from foreign control or domestic tyranny and corruption had often become so entwined with insurgency by procommunist forces that it was hard to fight communism without destroying liberation and reform movements. When the United States intervened unilaterally, claiming to act in the name of collectively approved principles to maintain established governments in power, its reputation as a champion of popular, honest government often suffered serious damage at home and abroad.

The United States intervened to prevent the ascendance of communist governments in Eastern Europe by means of a policy of nonrecognition and economic pressures. It tried to checkmate Soviet influence in places like Iran, Turkey, and Greece. It aided anticomunist nations in the Middle East, particularly the new state of Israel, as well as pro-Western Jordan and Lebanon in their struggles against covert and overt attacks by Soviet-supported Arab nations. The United States sent aid and rescue missions to assist anticomunist forces in the Congo and, to a lesser extent, Angola. It used a number of interventionist tactics to bring about black majority rule in Rhodesia (now Zimbabwe), South Africa, and Namibia, in hopes of preventing racial warfare in southern Africa that might provide a cover for further expansion of Soviet influence in the area. It also used such tactics to keep Soviet influence in the Mediterranean and the Persian Gulf at bay.

To strengthen noncommunist governments faced with strong domestic opposition from communist parties, and to support governments fighting against communist insurgents, the United States intervened in widely scattered parts of the globe, such as Central and Western Europe, the Far East, and Latin America. In the Far East, intervention was used to prevent the expansion of communist control over much of Southeast Asia, particularly South Vietnam, Laos, Cambodia, and Thailand, and over South Korea. In Korea, the United States intervened unilaterally in 1950 until a United Nations force could take over. The
bulk of military power that was made available to the United Nations for collective intervention had to be furnished by the United States because other powers gave only verbal support. The Korean intervention and other interventions undertaken to stop the advances of communism made it clear that gains won on the battlefield could not be maintained without permanently stationing non-communist military forces in areas coveted by communist powers.

The most protracted and costly intervention to halt the advance of communist-controlled forces occurred in Vietnam. There the United States and a number of its allies attempted to support noncommunist governments against attacks by procommunist forces eager to reunite North Vietnam and South Vietnam under a communist government. The fierce controversy over the legality and wisdom of the Vietnam intervention led to serious political cleavages within the United States and within the international community. Opponents of the intervention claimed that the situation involved a domestic struggle between pro-communist and anticommunist Vietnamese that did not seriously involve U.S. security interests. Proponents disagreed and their views prevailed. The United States finally withdrew its military forces from Vietnam in 1973. Economic and military aid to the South Vietnamese government was discontinued in 1975. By that time, communist forces had assumed full control of the country and further resistance to the spread of communism in Southeast Asia appeared hopeless.

In many instances, it is easy to refute charges of illegal interventionism by the United States because American policymakers based their actions on treaty rights providing for joint defense against communist attacks or on requests for help by anticommunist governments in various nations. But, as indicated earlier, the moral and even legal validity of these arrangements is often challenged when the agreements were concluded under circumstances that made it practically impossible for one party to decline or when the moral authority of the government to agree to intervention is questionable. A more solid, legal defense for anticommunist interventions is the claim to a right of counterintervention. The United States acted in most instances in response to proved, presumed, or anticipated interventions by communist forces that were intervening around the world to guide politics to their advantage. It can be argued that, akin to the right of self-defense, there exists a right of preventive or curative counterintervention.

While it may seem at first glance that the United States missed no opportunity to intervene against the spread of communism, this was not the case. Many possibilities for intervention were bypassed because the threat of advancing communist influence was comparatively limited, because the costs of intervention, including likely counterinterventions, seemed too high, or because the United States realized that it could not muster sufficient strength in faraway places to engage in effective intervention.

A situation involving all three of these contingencies occurred on mainland China. The United States had initially given some aid to the forces of General Chiang Kai-shek to assist him in wresting control of North China from the communist forces in that country. When it became clear that only massive military involvement would save the Chinese mainland from communist control, U.S. policymakers in the period following World War II, in a highly contested policy judgment, decided against such a major commitment. But limited aid to Chiang Kai-shek, who had retreated to the island of Formosa, continued. Similarly, despite explicit declarations and implicit threats, interventions on behalf of non-communist factions in Eastern European countries to help them shed communist control never materialized. Insurgents in East Germany in 1953, Poland and Hungary in 1956, and Czechoslovakia in 1968 received no official help.

Nor did the United States intervene in most instances when left- or right-wing dictatorships came to power in Latin America in the period after World War II, or when governments expropriated the assets of large American businesses without adequate compensation. For example, it failed to intervene in Bolivia in 1952 when a coup d'état supported by Argentina’s pro-fascist Juan Perón regime put a radical regime into power. It nationalized the tin mines that supplied tin to the United States and failed to compensate U.S. business interests for losses suffered through expropriations. Major exceptions to this hands-off policy occurred generally only in areas close to the American mainland and the access routes to the Panama Canal. For instance, the United States intervened to topple a left-wing anti-American government in Guatemala in 1954 by aiding exile forces attempting military invasion of their homeland.

The United States also helped to plan and execute an invasion by anti-Castro Cuban refugees in 1961 who wanted to overthrow the communist government of Premier Fidel Castro in Cuba. The
attack failed and the tactics of the United States were widely condemned as illegal. Few such charges were made a year later when the United States intervened in Cuban-Soviet relations by demanding removal of Soviet missiles stationed in Cuba. In the Cuban missile crisis, most Latin American states and most noncommunist members of the world community concurred that the security of the United States was sufficiently endangered by Soviet missiles ninety miles from its territory to justify intervention. Subsequently, the inter-American community acted jointly to exclude Cuba from the inter-American system and to embargo the shipment of arms and other goods to Cuba. This fell short of the collective break in diplomatic relations favored by the United States in response to Cuba’s publicized plans to subvert other Latin American governments, if necessary by guerrilla violence and civil war. Venezuela, Colombia, and Bolivia had been singled out as primary targets. When the dominance of the United States over hemispheric relations declined in the 1970s, restrictions against Cuba were lifted one by one.

Another major intervention against a Latin American government was the attempt to forestall a leftist takeover in the Dominican Republic. More than 30,000 U.S. troops were dispatched in 1965 to stop fighting between forces that President Lyndon Johnson deemed procommunist and anticommu

nist. Ultimately, a right-wing regime prevailed. Although the United States managed to involve the inter-American collective intervention machinery, participation by the Organization of American States did little to erase the bitterness within the United States, Latin America, and other parts of the globe about the initial failure of the United States to abide by its pledge to abstain from unilateral military intervention. Many observers doubted that the Dominican situation had presented a sufficiently serious threat to the security of the United States to warrant major preventive measures.

After costly, often fruitless interventions had soured American policymakers on benefits to be reaped from intervention, a renewed retreat from overt interventionism began in 1969. It was hastened by a policy of detente and bargaining between the United States, the Soviet Union, and mainland China that helped to reduce the climate of mutual fear that had spawned interventions earlier. The ascent of communist-controlled or communist-influenced governments was no longer deemed an ipso facto threat to the security of the noncommunist world. The United States reduced its interventions and military commitments in Asia. It tried to lessen occasions for intervention in the Middle East by pacifying the area and resuming more normal relations with countries that had drawn their support from the Soviet Union. It also took a more aloof stance toward the tumultuous politics of Latin America. Moreover, to avoid the onus of charges of interventionism, a number of interventions were conducted as covert enterprises. The activities of the Central Intelligence Agency, which contributed to the overthrow of the Marxist government of President Salvador Allende Gossens in Chile in 1973, are examples of the types of actions that were undertaken covertly to weaken governments and policies deemed hostile and dangerous to the United States.

However, increased reluctance to engage in interventions and decreased concern about the dangers posed by the ascendancy of Marxist governments in various parts of the world should not be construed as a complete retreat from the use of collective or unilateral intervention to protect the security of the United States from damage caused by attempts to spread communism. For instance, the United States invaded Grenada, a Caribbean island, in 1983 on the grounds that the Fidel Castro’s communist government in nearby Cuba had designs on the island.

Overall, the more restrained approach to anticommmunist interventionism was gradually counterbalanced by increased interventionism on behalf of humanitarian and civil rights causes. President Jimmy Carter, following policies reminiscent of the Woodrow Wilson presidency, proclaimed in 1977 that the United States would intervene on behalf of persecuted peoples anywhere in the world where states were denying human or civil rights to their citizens on account of race, religion, or political persuasion. Numerous such interventions took place. However, they were neither prompt nor consistent. In a haphazard pattern, influenced by a multiplicity of political and logistical factors, humanitarian interventions were carried out promptly or sluggishly in some situations but forgone in others involving equal or greater human catastrophes.

The Post–Cold War Decades During the Cold War era, most interventions could be defended as counterinterventions that were needed to implement the policy of containment designed to stop the spread of communism. Following the collapse of communism in the Soviet Union in 1991, different rationales came to the fore. The new potential dangers to U.S. interests came primarily from an
epidemic of violent internal conflicts and human rights violations in formerly communist nations and in developing countries throughout the globe. To justify intervention under these circumstances, U.S. presidents used three major rationales. Most commonly, presidents contended that these upheavals endangered world peace and security in general and hence the security of the United States. This argument served two purposes. It was useful in justifying collective interventions under the United Nations Charter and it weakened complaints by domestic critics in the United States, especially in the Senate, who denied that the country’s national security was imperiled and therefore charged that the United States had no business undertaking these foreign interventions.

The second major rationale was the evolving consensus that humanitarian interventions are a moral duty as well as a requirement in the wake of the various human rights declarations. However, this argument has never been considered strong enough to silence influential critics of intervention. Hence, it is usually accompanied by claims that the human rights violations, besides endangering vulnerable populations, also constitute a threat to peace.

The final major rationale—also usually buttressed by individual or collective self-defense arguments—is the claim that the United States is a world power that must protect the world from major misbehavior by members of the international community. The argument was clearly articulated by President Bill Clinton in his Farewell Address to the nation in 2001. He declared that “America cannot and must not disengage itself from the world. If we want the world to embody our shared values, then we must assume shared responsibility.” Clinton’s plea resembles to a surprising extent the claims made by President Theodore Roosevelt a century earlier. The Roosevelt Corollary that pictured the United States as the world’s policeman was never accepted by the rest of the international community. Its modern version is likely to be equally unpopular, especially among small nations that are the most likely targets of intervention.

The argument that international peace and security are endangered by political unrest in a foreign country was used by Clinton’s predecessor, President George H. W. Bush, to displace General Manuel Noriega, who headed the government of Panama in 1990 when the country was in turmoil and there were rampant violations of the human rights of Noriega’s enemies. Economic sanctions, such as freezing Panamanian assets in the United States and revoking Panama’s most-favored-nation trade status, had failed to drive the general from office. As in so many other interventions, the brunt of the suffering produced by these economic sanctions was borne by the poorest segments of the population while the leaders of the country continued to prosper and lead lives of luxury.

On 17 December 1989, President Bush ordered Operation Just Cause to replace Noriega by military force. American troops landed on 20 December. The officially stated “just causes” for the intervention were protection of American lives and property in Panama at a time of internal political unrest, restoration of democracy, the security of the Panama Canal, and brutalities and illegal drug trafficking ascribed to Noriega and his cronies. It remains a matter of controversy whether these were the actual motives or merely cover-ups for more mundane political objectives of the Bush administration. Among other reasons, President Bush, like many of his predecessors and like his successor, President Clinton, may have felt that the “leader of the free world” could not risk his international image by allowing a tin-pot dictator in a tiny country to defy his demands.

The argument that internal domestic conditions in a small country threatened world peace seemed spurious to devotees of nonintervention in the United States and abroad. Accordingly, the Panama intervention led to charges of unlawful intervention by the United States. On 29 December 1989, the UN General Assembly condemned the intervention by a vote of 75 to 20 and demanded that the United States remove its troops from Panama. Likewise, the Organization of American States condemned the intervention unanimously, even though many members detested Noriega and his actions. In defense of its actions, the United States cited the self-defense provisions of the UN and OAS charters, without specifying in what way Panama constituted a major threat to U.S. security. U.S. representatives also argued that the survival of democratic nations was at stake and that all available peaceful means of displacing Noriega had been tried and failed. There was no solid proof for these claims or for the claim that American citizens or the Panama Canal were in imminent danger of suffering major harm. However, public opinion polls by the CBS television network indicated that most Panamanians approved of the intervention and were happy that it had led to the removal of Noriega from government power and from the country.
A less political, and initially less controversial, intervention took place in Somalia in 1992. It began as a purely humanitarian venture to provide starvation relief and stop human rights abuses in that African country. No strategic, economic, or drug trafficking issues were involved, and Somali leaders had not seized territory illegally. However, the country was in the throes of a civil war without an effective government in place. Propponents of the intervention argued therefore that it made no sense for foreign powers to ask anyone’s permission to enter the country. The United Nations, with strong member support, had approved the mission after it had become impossible for relief agencies to function in the war-torn country. The United States then dispatched 37,000 troops to Somalia to keep food relief supplies out of the reach of the feuding warlords and distribute it to the starving population. The initial plans called for completing the mission within five months.

But, as often happens in unstable areas, the various UN forces involved in the mission, including the American contingents, soon became embroiled in the civil war, changing the nature of the venture in unforeseen and unplanned ways. It had become obvious that effective delivery of aid to the people required bringing about at least some semblance of political order. In the wake of political efforts to pacify the country—which turned out to be futile—Somali soldiers attacked the relief teams, inflicting heavy casualties. Eighteen U.S. soldiers were among the dead. After some hesitation, President Clinton withdrew U.S. forces in October 1993, in the wake of the killings. Pictures of the corpse of an American soldier dragged along the streets of Somalia’s capital city had outraged the American public and led to angry recriminations in Congress about the wisdom of undertaking the mission.

The Somalia intervention, besides souring the U.S. government’s taste for humanitarian interventions, gave rise to the belief that ample television coverage of human disasters throughout the world can arouse the anger and compassion of the American public. In turn, the public may then pressure the national government to intervene to stop human suffering. This putative phenomenon was dubbed “the CNN effect.” As evidence that such an effect had spawned the initial intervention in Somalia, scholars pointed out that graphic pictures and reports about atrocities, starvation, and devastation in Somalia had been widely aired on CNN television. Pressure groups, so it was alleged, had then forced the government, against its better judgment, to airlift relief supplies and later send U.S. troops to Somalia. Other scholars denied this sequence of events and contended that relief plans...
for Somalia antedated the CNN publicity by more than a year. They claimed that government officials, including members of Congress who had visited Somalia, had inspired the action.

It is impossible to prove that the pressure by government officials would have been sufficient to lead to the decision to intervene—and to withdraw when the bodies of dead soldiers were shown—if the decision had not been supported by media-induced public pressure. Hence, media buffs continue to believe that the CNN effect exists. They argue that graphic coverage of human suffering is an important determinant of whether or not a particular disaster will generate U.S. intervention. In general, public-opinion polls show that the American public supports purely humanitarian interventions by a substantial margin, especially if there are no American casualties. The same holds true when the public becomes convinced that the intervention seeks to subdue an aggressor eager to attack the United States, injure its vital interests, or damage its citizens. The public is far less supportive of interventions that seem designed to change another country’s politics when there appears to be no immediate threat to vital U.S. interests.

Many interventions that involve important humanitarian concerns serve multiple purposes, of course. For example, the intervention in Haiti in 1994 combined humanitarian and democracy-building objectives with an exceptionally strong emphasis on restoring democracy to a country where a democratic election had been aborted. Because of Haiti’s proximity to the U.S. mainland, large refugee flows into Florida were quite likely. Rumors suggested that more than 300,000 Haitians were eager to leave their country; most of them heading for the United States. Similarly, the 1989–1990 Panama intervention, besides stopping humanitarian outrages and supporting democracy in Panama, became a cog in U.S. efforts to stop the inflow of dangerous recreational drugs into the United States.

The policy of intervention to support democratic governments was originally part of the policy of containment of communism. If a country had a strong democratic government, presumably it would not succumb to an authoritarian ideology. After the Cold War ended, supporting or even creating democracies was viewed as an aid to international peace on the dubious assumption that democratic countries rarely go to war with other democratically governed states. Hence, the United States could argue that its intervention in Haiti was justified under the UN Charter to maintain world peace. The claim was bolstered by the fact that the United Nations had officially sanctioned the intervention.

As if to underline the importance of sponsoring the growth of democratic institutions worldwide, the U.S. State Department created a Bureau of Democracy, Human Rights, and Labor Affairs during the Clinton years. The bureau’s mission was defined as promotion of democracy throughout the world and formulation of human rights policies, including those relating to labor issues. In addition, the Clinton administration, like several of its predecessors, used the granting or withholding of economic resources as a weapon in the fight to democratize the nations of the world.

It has always been easier to claim concerns about the security of the United States as reasons for intervention when the location of the trouble is close to America’s shores. This is the U.S. “sphere of influence,” designated as its prime concern and fief since the days of the Monroe Doctrine. Reluctance to become entangled in conflicts outside of the Western Hemisphere, especially when international organizations are available with authority to handle such situations, explains why the United States initially tried to avoid intervention in the civil strife in Bosnia that entailed major human rights violations. But the combined pull of a number of motives—humanitarian concerns, the importance of U.S. support for NATO involvement in the Balkan situation, and the desire to maintain U.S. influence in European affairs—finally persuaded the Clinton administration in 1995 to join its NATO partners in air strikes to try to end ground fighting in Bosnia.

Overall, when U.S. policymakers weigh the options in situations where intervention is under consideration in the post–Cold War world, several factors seem to weigh especially heavily in favor of becoming involved. They are the location of the trouble spot, the relative size and power of the country in question, the degree of defiance of U.S. requests displayed by the local rulers, and the chances of a successful outcome. Given these criteria, Western Hemisphere locations, especially if they are close to the United States, are most likely to elicit intervention, provided the country is small and headed by an arrogant, democracy-defying ruler, and provided the United States is ready and willing to commit sufficient resources to carry the intervention through to a successful conclusion.

Other important factors are the magnitude and viciousness of human rights violations, the
effectiveness of mass media in depicting them to large audiences, the impact of unrest on American citizens in the country in question, and the likelihood that an exodus of refugees will seek asylum in the United States or allied nations. While absence of most of these conditions explains why the United States abstained from intervention in numerous major human rights tragedies in the post–Cold War era, U.S. policies have not been entirely consistent. The complex international and domestic environment that surrounds foreign policy decisions has always made it impossible to predict specific political actions with certainty.

A number of the interventions mentioned thus far are examples of cooperation between the United Nations and the United States. When interventions have been undertaken under UN auspices, the organization has repeatedly encouraged one nation to take charge of a collective intervention enterprise. For example, it entrusted the United States with major responsibilities for the conduct of UN interventions in the Persian Gulf War, in Somalia, and in Haiti. In such cases, the leading country is expected to take control of the operation and to foot most of its expenses. Other UN members contribute personnel and material resources.

The Gulf War of 1991 is the best example of the United States working effectively with the United Nations to implement a policy that seemed in its own as well as in the collective interest. When Saddam Hussein invaded Kuwait in 1990, destabilizing the balance of power in the Middle East and threatening the uninterrupted flow of oil, the UN Security Council condemned the aggression and imposed economic sanctions. When these measures failed to persuade Hussein to withdraw his troops, President George H. W. Bush threatened U.S. military intervention. The U.S. position was legitimized and strengthened by a Security Council resolution that authorized “all necessary means,” including the use of military force, to get Saddam out of Kuwait. Operation Desert Storm, which was launched in 1991 with full control by the U.S. military, thus became a UN operation supported by a coalition of twenty-seven nations. The drawback to the collaborative arrangement was that U.S. freedom of action in the military operations and the peace settlement that followed the brief span of hostilities was limited by political pressures to include coalition members in decision making and make concessions to their wishes.

Initially, the U.S. foreign policy establishment was bullish about the usefulness of interventions conducted within the UN framework. But the euphoria about collective action was short-lived. Disillusionment set in during subsequent crises in Somalia and Bosnia when disagreements between U.S. and UN policymakers hampered the United States in structuring and executing the missions. It was difficult, for example, to make threats of military intervention credible when the United States could not act without first securing UN approval.

Problems incurred in orchestrating interventions in the Balkans with the help of members of both the United Nations and the North Atlantic Treaty Association (NATO) were blamed for delaying subsequent U.S. intervention until after massive killing and ethnic cleansing had already occurred. Similarly, the failure of the Somalia intervention allegedly scotched all plans for intervention in the Rwanda genocides, which were the next major humanitarian crisis in Africa. Observers of U.S. diplomacy therefore believe that Americans have little patience with policies, especially when they involve military force, when these policies do not produce quick successes. Failed policies become a barrier to future action in the same vein. Like most generalizations, this is only partly true. The slogan “No More Vietnams” after the failed Vietnam War presumably precluded future military interventions but only for a while.

Still, in light of these policies of self-restraint whenever obstacles occur, it seems unlikely that the United States will make ample use of its proclaimed duty to act as the world’s chief law enforcement power. This is especially true because the experiences of the Bush and Clinton administrations with a number of interventions have made it clear that interventions carry high personnel costs. Airpower alone, even if massively deployed, will not generally displace violent governments or end brutal civil wars. But fighting on the ground risks large numbers of casualties. Such losses are both humanly and politically extraordinarily painful. Many members of Congress are very unwilling to become mired in interventions and resist them with all of the means at their disposal. Their opposition, often via claims that the 1973 War Powers Act has been violated, is a potent political deterrent to interventions, especially when they seem problematic for other reasons as well. High on the list of deterrents is the difficulty of coordinating multinational ventures that involve widely diverse nations and public- as well as private-sector organizations.

Opponents of policies involving military intervention often recommend economic sanc-
tions as an alternative to constrain international troublemakers. Unfortunately, the occasions when such policies have worked are few. The breakdown of apartheid policies in South Africa is often cited as a most conspicuous success. However, even in that situation, it remains controversial what the precise influence of economic sanctions was, compared to other factors in the breakdown of apartheid. Unfortunately, failures of even prolonged sanctions are easier to demonstrate, such as the defiance of sanctions by Fidel Castro's Cuba and by the despotic rulers of Haiti, Panama, Somalia, and Bosnia, where interventions followed failed sanctions. Another galling example of the impotence of sanctions was the political survival and prospering of Iraq's Saddam Hussein in the face of massive sanctions imposed by the international community and maintained for more than a decade.

DOCTRINE VERSUS PRACTICE

How does this record of numerous American interventions over two hundred years of national history square with the claim that the United States has always upheld the principle of nonintervention? How does it accord with the frequent declarations that nonintervention is the official policy of the United States? The answers require putting intervention policies into the perspective of available options, and also discussing the role that political doctrines play in the conduct of foreign affairs. Countries, like individuals, rarely act with total consistency. Champions of peace do go to war; a preference for free trade may yield to protectionism when circumstances make protectionism highly advantageous. One generally characterizes a country's policies by prevailing trends within the policy and within the international community. As discussed, in the case of American intervention policies, the large numbers of interventions are matched by an even larger number of occasions when the United States eschewed intervention, although it was a viable and potentially beneficial policy alternative. This was particularly true during the first century of the nation's existence when it first proclaimed that nonintervention would be its preferred policy. Whether it will again become true in the twenty-first century remains an open question in the wake of many disappointing results of intervention policies, the high costs of such ventures, and competing domestic claims on available national resources. One thing is clear however: choices of intervention and nonintervention in particular situations will always be controversial. Proponents will claim that they are necessary and legal while opponents will argue the reverse.

Throughout American history, whenever intervention was the preferred policy choice, it has always been pictured as a last, undesired option. Nonintervention has been hailed even when the country's practices were clearly interventions. One may call this hypocrisy and denounce it. Or one may recognize that the belief in a country's right to freedom and independence from outside interference runs strong. After all, that was the legacy left to Americans in 1796 when President George Washington warned that “History and experience prove that foreign influence is one of the most baneful foes of republican government.” Therefore, “it must be unwise for us to implicate ourselves . . . in the ordinary vicissitudes of [other nations'] . . . politics.”

The term “isolationism” has been used—most often in derogation—to designate the attitudes and policies of those Americans who have urged the continued adherence in the twentieth century to what they conceived to have been the key element of American foreign policy in the nineteenth century, that is, the avoidance of political and military commitments to or alliances with foreign powers, particularly those of Europe. It was most nearly applicable to American policy between the two world wars, especially after 1935, when the U.S. Congress attempted to insulate the country from an increasingly dangerous world situation through the enactment of so-called neutrality laws. Since World War II, efforts to limit or reduce the vastly increased American commitments abroad have sometimes been called neo-isolationism.

The word “isolationist” was listed for the first time in the 1901 edition of the Oxford English Dictionary, although without any indication as to when or where it had been used in its political sense. Standard American dictionaries did not incorporate the word until 1922, and the 1933 supplement to the Oxford English Dictionary cites no political use of it before 21 April 1921, when it appeared in the Glasgow Herald. Mitford M. Matthews, in A Dictionary of Americanisms on Historical Principles (Chicago, 1951), makes a logical but erroneous inference from the listing in the 1901 edition of the Oxford English Dictionary (it remains unchanged in the current edition) and traces “isolationist” in a political sense to an article in the Philadelphia Press of 25 March 1899. This article, however, uses the word in a medical sense in connection with a smallpox epidemic in Laredo, Texas.

The scholarly literature on isolationism began in 1924 with J. Fred Rippy and Angie Debo's essay “The Historical Background of the American Policy of Isolation” (Smith College Studies in History 9). The term was not prominently used, however, until 1935, when Albert K. Weinberg offered a provocative interpretation of it in Manifest Destiny. World War II and its immediate aftermath, when the United States for the first time actively sought to assume the mantle of a major power, provided the major impetus for its serious study.

American policy during the interwar years, which frequently was described as isolationist, came then to be regarded as an anomalous one that required explanation and analysis. Isolation, it was argued, had generally been imposed on major powers only against their will, as in the case of France after the Franco-Prussian War (1870–1871) or of Great Britain in the 1890s. Although the speech by George Eulas Foster in the Canadian House of Commons on 16 January 1896 led to a flurry of oratory concerning Britain’s “splendid isolation,” it was clear that the term had been used ironically more often than not and that British policy had been designed to help the empire emerge from that apparently undesirable state. Voluntary isolation had been sought only by
some smaller nations, such as Switzerland, as a way to avoid falling victim to more powerful neighbors, and by culturally threatened ones, such as China and Japan, as a defense against Western incursions.

The United States was the only major Western industrialized nation that had apparently displayed a positive interest in some form of isolation, and that phenomenon attracted the attention of scholars in the late 1940s, and with increasing frequency in the two decades that followed. Ray Allen Billington sought to give isolationism a geographic base in his “The Origins of Middle Western Isolationism” (Political Science Quarterly, March 1945); Henry Nash Smith examined its relationship to “the myth of the garden” (Virgin Land, 1950); Samuel Lubell exposed what he took to be its “ethnic and emotional roots” (The Future of American Politics, 1952); and Wayne S. Cole explained it as an expression of the “needs, desires, and value systems” of American agricultural society (Senator Gerald P. Nye and American Foreign Policy, 1962).

Extended analyses of isolationism were also published by Robert E. Osgood, who defined it as a form of “passive egoism” in his Ideals and Self-Interest in American Foreign Relations (1953); by Selig Adler, who stressed economic self-sufficiency, the illusion of security, and ethnic prejudices as causative factors (The Isolationist Impulse, 1957); by Arthur A. Ekirch, Jr., who explained isolationism as a policy designed to assure de facto independence after the American Revolution had been won (Ideas, Ideals, and American Diplomacy, 1966); and by Manfred Jonas, whose Isolationism in America, 1935–1941 (1966) analyzed the assumptions underlying the isolationist position prior to World War II and suggested that these indicated a survival of unilateralism bolstered by a fear of war. John Milton Cooper, Jr., sought to define isolationism as “a political position with programmatic and ideological dimensions” somewhat akin to a political movement (The Vanity of Power, 1969), and a host of other scholars—historians, political scientists, sociologists, and even psychologists—have investigated the subject from the perspective of their respective disciplines.

THE MYTH OF THE FOUNDERS

While controversy continues about the precise meaning of the term “isolationism” and about the relative importance of various factors that might explain the phenomenon, some areas of agreement emerged from the research. It became clear, for example, that isolationists of whatever stripe always regarded themselves as traditionalists with respect to American foreign policy and regularly invoked the Founders, particularly George Washington and Thomas Jefferson, in support of their position.

Washington was the father of the first American neutrality act (1794), which incorporated both the principle of his Proclamation of Neutrality (1793)—that the United States should pursue “a conduct friendly and impartial towards the Belligerent Powers”—and the subsequently developed Rules Governing Belligerents. The neutral stance of the United States was noteworthy primarily because of its obvious incompatibility with the French alliance that had been concluded despite strong misgivings in 1778. Since France chose not to invoke the alliance in the 1790s, American neutrality remained unchallenged, and could thus develop into a tradition that was reasserted, at least initially, with respect to every major international conflict up to World War II.

In his Farewell Address in 1796, Washington supplied the rationale for this policy and urged its continuance. He pointed out that “Europe has a set of primary interests which to us have none or a very remote relation, and advised his countrymen “to steer clear of permanent Alliances” and involvement “by artificial ties in the ordinary vicissitudes of her politics and the ordinary combinations and collisions of her friendships and enmities.” Less than five years later, Jefferson put substantially the same advice into even more enduring phraseology in his first inaugural address, where he insisted that American policy should continue to be based on the principle of “peace, commerce and honest friendship with all nations, entangling alliances with none.”

Neither Washington nor Jefferson, however, regarded themselves as advocates of a policy of isolation and, indeed, that word had not yet migrated to the English language from the French at the time they expressed their views. Both men actually sought to increase American contacts with the outside world. Washington vigorously espoused the expansion of foreign trade and promoted a series of commercial agreements on the model of the one negotiated with Prussia in 1785. Jefferson, although he would, in moments of great frustration, have preferred the United States “to practise neither commerce nor navigation, but to
stand, with respect to Europe, precisely on the footing of China," clearly recognized after he had become president the necessity of fostering commerce and other forms of international intercourse. Indeed, he sent the U.S. marines to the shores of Tripoli to protect American commerce and acquired the whole Louisiana Territory from France in order to keep the mouth of the Mississippi open to the new nation’s trade. Both presidents welcomed continued immigration and, Jefferson in particular, the influx of European ideas and culture.

The two did not even categorically rule out alliances. Washington indicated in his Farewell Address that the new nation might “safely trust to temporary alliances for extraordinary emergen-cies.” Jefferson advised President James Monroe in 1823 to accept Foreign Secretary George Canning’s invitation to joint action with Great Britain against the threat posed to Latin America by the Holy Alliance. While reasserting that the “first and fundamental maxim [of the United States] should be never to entangle ourselves in the broils of Europe” and the second maxim, “never to suffer Europe to meddle with cis-Atlantic affairs,” Jefferson nevertheless concluded that “the war in which the present proposition might engage us, should that be its consequence, is not her war, but ours,” and that if “we can effect a division in the body of the European powers, and draw over to our side its most powerful member, surely we should do it.”

The basic aim of both Washington and Jefferson was to safeguard the independence of a new and weak nation by avoiding, whenever possible, involvement in the military and political affairs of the major powers while at the same time expanding trade and commerce as a means of fostering national development. But both men were fully aware that economic and political matters could not be separated as neatly as their phraseology suggested, and neither can be regarded in any meaningful way as an isolationist. Together with many of the other Founders, they merely followed the logic of the American Revolution and its consequences.

Thomas Paine had pointed out in Common Sense (1776) that one of the advantages of breaking the connection with Great Britain lay in the possibility of assuming a position of neutrality with respect to a Europe “too thickly planted with Kingdoms to be long at peace” and thus promoting and protecting trade with all nations even in wartime. John Adams urged the Continental Congress to enter only into treaties of commerce and “to lay it down, as a first principle and a maxim never to be forgotten, to maintain an entire neutrality in all future European wars.” Were the fledgling United States to do otherwise, Adams feared, “we should be little better than puppets, danced on the wires of the cabinets of Europe.” The Congress that he addressed had earlier established a committee to draft a declaration of independence and, at the very same time, one to devise a model treaty for regulating relations with foreign nations. The model treaty, Adams declared, was to be only commercial and have neither political nor military clauses. Such a treaty proved impossible to conclude, however, and foreign aid was needed if independence were to become a reality. Less than six months after adopting the Declaration of Independence, therefore, Congress dispatched John Jay to Spain, Benjamin Franklin to France, and John Adams himself to Holland to seek both money and full-fledged alliances. Isolating the United States from the rest of the world was the last thing they had in mind.

The United States was involved almost from the beginning in the first world crisis after independence was achieved: the quarter century of wars spawned by the French Revolution. That was due in part to the fact that the new nation could not be indifferent to the outcome of these wars, and that Jefferson and the Republicans generally favored the cause of France, while Washington, Hamilton, and the Federalists favored Great Britain. Washington’s Neutrality Proclamation of 1793 was not intended primarily to insulate the United States against foreign conflicts, but was rather an anti-French measure for evading America’s obligations under the Treaty of Amity and Commerce of 1778 and thereby helping the British cause. Both Jefferson and James Madison denounced it on that account, particularly after the Washington administration negotiated a new treaty, this one with Great Britain, shortly thereafter. Alexander J. Dallas, the future secretary of the Treasury who would have been much happier to have the French alliance continue, in 1795 denounced the treaty that John Jay had negotiated in London as a scheme for “wantonly involving ourselves in the political intrigues and squabbles of the European nations.”

After Napoleon came to power in France, Jefferson played a role in the ongoing struggles by buying Louisiana from the financially strapped emperor and by a series of manipulative trade measures including the Embargo Act of 1807
and the Nonintercourse Act of the following year. Over the protests of staunchly Federalist New England, the United States even went to war in 1812 with Great Britain and attempted to conquer Canada, thereby becoming in effect an ally of Napoleon. The Boston Gazette promptly lamented the shedding of American “blood for Bonaparte” and, after the French occupied Moscow, Czar Alexander I offered his services as mediator in the conflict between his British ally and the United States.

The nation was thus, in its early years, neither isolated nor isolationist. It consistently recognized its involvement with the world but sought to pursue its international interests unilaterally without making long-term commitments or entering formal alliances. Secretary of State John Quincy Adams correctly assured the assembled multitude on 4 July 1821 that the United States “does not go forth in search of monsters to destroy” because “by once enlisting under banners other than her own” it would become party to “all the wars of interest and intrigue, of individual avarice, envy and ambition.” But Adams had already served as minister to the Netherlands, Prussia, Russia, and Great Britain and had been one of America’s negotiators of the Treaty of Ghent ending the War of 1812. As secretary of state, he was to conclude formal treaties with Spain and Great Britain and to protect the newly independent states of Latin America with the Monroe Doctrine.

**AMERICA’S FOREIGN POLICY IN THE NINETEENTH CENTURY**

The unilateralist foreign policy that Adams pursued—the actual legacy of the Founders—proved serviceable and was followed with reasonable consistency until the end of the nineteenth century. It was a policy peculiar to the United States not in its motivation but only in the circumstances that allowed it to work. Americans had deliberately shaken off their major tie with Europe during the Revolution and understandably had little interest in replacing it with other ties. Moreover, in 1776 Americans had acted partly out of a sense of uniqueness and of superiority to the Old World and its institutions, and they regarded it as essential to the success of the mission of the United States that its policies remain uncontaminated and free from foreign influence. The development of the traditional American foreign policy was thus coeval with the first flowering of an assertive American nationalism.

The freedom of action that the United States sought for itself during the nineteenth century is, however, the ideal of all nation-states. Alliances, however desirable or even necessary under certain circumstances, inevitably circumscribe that freedom, and the avoidance of alliances and the maintenance of neutrality in the quarrels of others are, therefore, a universally appealing policy.

For most nations, however, the policy is also self-defeating and dangerous, since it is often incompatible with the continuance and further development of commercial and cultural ties, largely rules out assistance from others when that may be necessary, and invites attack by stronger neighbors. For the United States in the early nineteenth century, as a country of little economic and no military importance, without strong neighbors, protected by wide expanses of ocean and the polar ice cap, and favored by a world balance of power that tended in most instances to safeguard its interest, the policy was not only appealing, however, but also practicable. Unallied and uncommitted, threatened neither by invasion nor loss of territory, and possessed of a vast, rich, and sparsely developed hinterland, the United States was able to act independently and at its own discretion in those cases in which events elsewhere in the world seemed to affect the nation's interests.

Over the course of the century, the United States was able to expand its trade and commercial relations to an extraordinary degree, absorbed European immigrants in unparalleled numbers, and engaged freely in the process of cultural exchange. Moreover, it quite consistently displayed strong interest in political and military matters outside its borders.

It encouraged the revolutions in Spain’s American colonies and sought to protect their newly won independence with the Monroe Doctrine. It followed the Greek Revolution and the European revolutions of 1830 and 1848 with sympathetic interest, and treated at least one of their leaders, the Hungarian Lajos Kossuth, to a hero’s welcome. It vied with the British for control of the Oregon Territory in the 1840s and tried to buy Cuba in the 1850s. It went to war with Mexico in order to acquire not only Texas but California as well, and was instrumental in bringing Japan, a truly isolated country, into contact with the world at large. At the close of the Civil War, it helped effect the withdrawal of French troops
from Mexico and acquired Alaska, its first non-contiguous territory, from Russia.

At the same time, the United States consistently sought to avoid “entanglements” by either acting alone or, when that proved impossible, refraining from action. Not only did it take part in the Napoleonic Wars without entering into an alliance with France, it never made certain the support of the British fleet by formal treaty even though that fleet was essential to the effectiveness of the Monroe Doctrine. Despite some strong sentiments to the contrary, the United States consistently refused to commit itself to active support of the European revolutionaries, and limited its treaty making during the entire nineteenth century to the settlement of specific disputes concerning boundaries, immigration, and fishing and sealing rights. The only treaty to carry even the suggestion of joint action with another power, the Clayton-Bulwer Treaty of 1850 with Great Britain, which limited action by the United States with regard to the building of a trans-isthmian canal, has been called by the historian Thomas A. Bailey “the most persistently unpopular pact ever concluded by the United States.”

By the middle of the nineteenth century, America’s traditional policy had become so firmly established that it was above serious challenge. In rejecting, on 11 May 1863, an invitation to join with France, Great Britain, and Austria in an attempt to persuade Czar Alexander II to modify his designs on Poland, Secretary of State William H. Seward cited Washington’s Farewell Address as the basis for his action, and applauded the hitherto successful resistance to “seductions from what, superficially viewed, seemed a course of isolation and indifference.” It was the first known official use of the term “isolation” in connection with the traditional American policy, and it was used, of course, only to be rejected as inapplicable. “Our policy of nonintervention, straight, absolute, and peculiar as it may seem to other nations,” concluded Seward, “has . . . become a traditional one, which could not be abandoned without the most urgent occasion, amounting to manifest necessity.”

TRYING THE ROLE OF WORLD POWER

As long as this policy was regarded as natural and obvious, it provided no basis for factional disputes and required, therefore, neither ideological nor programmatic definition nor a specific label. Isolationism emerged as a distinctive and definable political position only when the foreign policy consensus derived from the teachings of Washington and Jefferson began to break down, a development that found its basis in the conditions of the late nineteenth century but full expression only in the period of World War I.

By the end of the nineteenth century, virtually all of the circumstances that had made the traditional policy of the United States possible had either been greatly modified or disappeared altogether. With rapid industrialization and the opening of vast new lands to agriculture, the United States had become a serious factor in the world economy and was converting itself from an importer into an exporter of capital. The need for the protection of trade and investments, as well as the chauvinistic search for the sinews and symbols of power that infected all Western nations in these years, led the United States to follow the teachings of Alfred Thayer Mahan, who in his lectures at the newly established Naval War College—subsequently published as The Influence of Sea Power on History, 1660—1783 (1890)—argued that great countries were built by great navies. Even as the United States thus embarked on the road to military power, advances in technology and communications continued to shrink the oceans and thereby to move the country from the periphery of power to a place closer to the center. And the nineteenth-century balance of power, which, for all the abuse that had been heaped on it by American statesmen, had served the nation well, was upset by the simultaneous rise to international prominence of two ambitious newcomers, Germany and Japan.

The United States responded to these changes with a more active foreign policy and greater international involvement. In 1884 it joined the International Red Cross and participated in the Berlin Conference that was intended to solve the problems in the Congo. Three years later, it hosted the first international conference of its own, the Washington Conference on Samoa, and in 1889 the first Pan-American Conference. These expanded international contacts soon led to further involvement. The Venezuela Crisis of 1895 was followed by the War with Spain, the acquisition of Hawaii, Puerto Rico, and the Philippines, and the enunciation of the Open Door policy designed to assure equal international access to the markets of China. The United States sent delegates to the First International Peace Conference at The Hague in 1899, and the
following year contributed 5,000 troops to an international expeditionary force that put down the Boxer Rebellion in China.

The pace of America's involvement with the world quickened during the presidency of Theodore Roosevelt, who hugely enjoyed asserting America's growing power. In 1902, after Great Britain, Germany, and Italy had blockaded Venezuela and brought its dictator, Cipriano Castro, to his knees, he facilitated an arbitration of the dispute that protected America's long-standing interests in Latin America. In 1903 he encouraged rebellion in Colombia, promptly recognized the new country of Panama that emerged, and acquired territory from it on which to build a trans-isthmian canal. In 1904 his corollary to the Monroe Doctrine arrogated to the United States the exercise of an international police power in the Caribbean, and for the next twenty years U.S. marines landed periodically in Cuba, the Dominican Republic, Nicaragua, Haiti, and, on occasion, even Mexico. In 1905 he mediated the peace treaty between Russia and Japan that was concluded at a conference in Portsmouth, New Hampshire. For his efforts he became the first of three Americans who were to win the Nobel Peace Prize before 1920.

All of this activism in international affairs was deemed to be compatible with the foreign policy of the Founders, and the traditional American consensus therefore remained largely intact. Even the anti-imperialists at the turn of the century, while opposing the acquisition of colonies on the grounds that this would fundamentally change the character of the American Republic, made surprisingly little of the fact that it would inevitably lead to involvement in the great power rivalries against which President Washington had warned, and that the Open Door policy would have the same effect if attempts were made to enforce it. When the Senate ratified the Algeciras Agreement of 1906, an international compact dealing with the future of Morocco, and the Hague Convention of 1908 that established the rights of neutrals and of noncombatants—both clearly “entangling” in nature—it simply added the proviso that agreeing to them was “without purpose to depart from the traditional American foreign policy.”

Less than three months before the outbreak of World War I, Woodrow Wilson, who still insisted that “we need not and we should not form alliances with any nation in the world,” reasserted the traditional policy: “Those who are right, those who study their consciences in determining their policies, those who hold their honor higher than their advantages, do not need alliances.” Consequently, the onset of hostilities in Europe produced the traditional American response: a declaration of neutrality and a reassertion of the policy of friendship with all and entanglements with none, which, as an editorial in the magazine World's Work put it, “was made for us by wise men a hundred years ago.”

INTERVENTIONISM AND ISOLATIONISM

World War I nevertheless proved to be the first clear indicator that the United States, would, by virtue of its new power position, find it difficult, and perhaps also undesirable, to remain “unentangled.” Since the conflict pitted many ideological friends and major trading partners of the United States against a group of European autocracies—most particularly after the March Revolution of 1917 in Russia—it proved extraordinarily difficult, even for the president himself, to heed Wilson's admonition to be “impartial in thought as well as in action.” The wartime increase in trade flowed naturally into previously developed channels, and loans and credits largely followed the route of established business connections, thus not only favoring one set of belligerents and arousing the ire of the other but giving the United States a tangible stake in the outcome of the war.

Even aside from such specific considerations, the possibility that nations with political systems and economic aims different from those of the United States might dominate the world after the war could be ignored only with difficulty. For all of his original devotion to neutrality, Wilson himself was moved to his desire for a negotiated “peace without victory” at least in part because he found one of the other alternatives—the victory of the Central Powers—to be wholly incompatible with American interests. “The world,” he was to say in his declaration of war, “must be made safe for democracy.”

The situation of the United States during World War I brought respectability for the first time to the proposition that, given its changed world position, the United States might best protect its interests by more active cooperation with other nations, even through commitments and alliances not in keeping with the traditional policy. Wilson's espousal of such ideas led him to propose a League of Nations, which required full-
fledged American participation in a system of collective security. Others with similar views joined together in June 1915 to found the League to Enforce Peace, an American counterpart to the Netherlands-based Organisation Centrale pour une Paix Durable. Among the leaders of the new organization were former president William Howard Taft, President A. Lawrence Lowell of Harvard, and Hamilton Holt, the influential editor of the Independent.

This initial articulation of an approach to foreign policy that differed from the traditional one chiefly in its espousal of collective action as a necessary element in the defense of the national interest produced, in its turn, the defensive position generally called isolationism. In the context of the time, it amounted to an assertion, implicit or explicit, that changed world conditions had not made a departure from traditional policies either necessary or desirable and that entanglement in what continued to be regarded as the affairs of other nations was more dangerous to the United States than any conceivable result of continued noninvolvement. Among the early isolationists, in this sense, were Secretary of State William Jennings Bryan, Senators William E. Borah of Idaho and George W. Norris of Nebraska, and the pacifist-intellectual Randolph S. Bourne. On a popular level, such sentiments found support in the Hearst press beginning in early 1917.

Although the occasion for this development of an isolationist position was the debate over American entry into World War I, the actual declaration of war did not prove to be the really divisive issue. If the United States entered the war on its own volition and in defense of its own interests, such a step did not necessarily violate traditional policy, particularly not if it fought, as it did, not in formal alliance with other nations, but simply as an “associated power.” Accordingly, a number of confirmed isolationists in the Senate voted for war. Among these were not only Democrats like Charles S. Thomas of Colorado and Thomas P. Gore of Oklahoma, who might be considered to have put partisanship ahead of conviction, but also Republicans Joseph I. France of Maryland, Hiram Johnson of California, and Borah.

Wilson soon realized, however, that any serious effort to make the world safe for democracy required that the United States enter into de facto alliance with the European powers, under whatever label, so that he himself would be able to exert the leadership necessary to the attainment of that objective. In his Fourteen Points address of 18 January 1918 he in effect supplied all of the Allies with a set of war aims that included the removal of economic barriers among nations, the adjustment of competing colonial claims, the freedom of the seas, and a “general association of nations” to secure “mutual guarantees of political independence and territorial integrity to great and small states alike.” Less than a year later, he went to Paris in an effort to have these objectives, especially the establishment of a League of Nations, incorporated in the Treaty of Versailles that ended the war.

America’s entry into the League of Nations would have been an obvious violation of the traditional policy. The league was clearly an alliance, an open-ended commitment of the very sort against which the Founders had warned. Wilson in fact promoted U.S. participation in the international organization as “an entirely new course of action” made necessary by the fact that the isolation of the United States was at an end, “not because we chose to go into the politics of the world, but because by the sheer genius of this people and the growth of our power we have become a determining factor in the history of mankind and after you have become a determining factor you cannot remain isolated, whether you want to or not.”

The isolationists would have none of that. They generally agreed with the contention that isolation was no longer a realistic aim, if indeed it had ever been one, but took sharp issue with the proposed policy reversal. “We may set aside all this empty talk about isolation,” Henry Cabot Lodge of Massachusetts, the chairman of the Senate’s Committee on Foreign Relations, told his colleagues in 1919. “Nobody expects to isolate the United States or make it a hermit Nation, which is sheer absurdity.” At the same time, however, he warned against the injury the United States would do itself by “meddling in all the differences which may arise among any portion or fragment of humankind” and urged continued adherence to “the policy of Washington and Hamilton, of Jefferson and Monroe, under which we have risen to our present greatness and prosperity.” The Senate debate over ratification of the Treaty of Versailles sharpened and clarified the isolationist position. It turned entirely on the question of America’s so-called meddling, and set the course of American foreign policy for the next two decades.
THE TRIUMPH OF ISOLATIONISM

The rejection of the Treaty of Versailles by the Senate and the overwhelming popular ratification of that action in the election of 1920 can be regarded as a triumph of American isolationism. It was not, as has sometimes been argued, a return to an earlier policy. The world had changed too much to allow that. But it was a reassertion of that policy in the face of the first fundamental challenge it had ever faced. The isolationism of the 1920s was real, despite the continuing commercial expansion of the United States and despite the greater influence on world affairs that the country enjoyed. The traditional policy, which the isolationists thought they were preserving, had always, after all, emphasized trade and commerce even while shrinking from political commitments, and American influence and the desire for it had traditionally been a component of the “mission” of the United States.

Nevertheless, the American position during the 1920s was in some ways an ambiguous one. The experience of World War I had greatly increased the role of the United States as an economic, political, and even military factor in world affairs, and made some degree of coordination with other nations all the more crucial. At the same time, the war had served as an object lesson on the danger of international commitments. The success of the Bolshevik Revolution in Russia was only the most threatening of the postwar events that persuaded most Americans that their intervention had clearly failed to make the world safe for democracy. It thus appeared to demonstrate the wisdom of the contention that meddling in the affairs of others was useless and self-defeating. The reflexive logic that this intervention had almost led to a total abandonment of the policy of the Founders only served as a further warning.

On the basis of such perceptions, the United States set out on an isolationist course that could best be described as one of cooperation without commitment. The United States, for the first time in its history, sharply curtailed immigration. It took the lead in negotiations on naval disarmament that would make war less likely and took pains to clarify the purely hortatory character of the Open Door policy. The Four-Power Treaty of 1921 changed any commitments the United States might once have assumed with respect to the openness or territorial integrity of China into a commitment, proposed by Senator Lodge, “to communicate . . . fully and frankly in order to arrive at an understanding as to the most efficient measures to be taken, jointly or separately, to meet the exigencies of the particular situation.” Even then, the Senate ratified the treaty only after adding a further disclaimer: “The United States understands that under the statement in the preambles or under the terms of this treaty there is no

THE SWANSON RESOLUTION (1926)

Resolved (two thirds of the Senate present concurring). That the Senate advise and consent to the adherence on the part of the United States to . . . the Permanent Court of International Justice . . . subject to the following reservations and understandings, which are hereby made a part and condition of this resolution, namely:

1. That such adherence shall not be taken to involve any legal relation on the part of the United States to the League of Nations or the assumption of any obligations by the United States under the Treaty of Versailles . . .

4. That the United States may at any time withdraw its adherence to the said protocol and that the statute for the Permanent Court of International Justice adjoined to the protocol shall not be amended without the consent of the United States.

5. That the court shall not . . . without the consent of the United States, entertain any request for an advisory opinion touching any dispute or question in which the United States has or claims an interest . . .

Resolved further, That adherence to the said protocol and statute hereby approved shall not be so construed as to require the United States to depart from its traditional policy of not intruding upon, interfering with, or entangling itself in the political questions of policy or internal administration of any foreign state; nor shall adherence to the said protocol and statute be construed to imply a relinquishment by the United States of its traditional attitude towards purely American questions.

— From Congressional Record 67 (1926): 2306 —
commitment to armed force, no alliance, no obligation to join in any defense.”

During these years the most heralded diplomatic achievement by the United States, the Kellogg-Briand Pact (1928), was in its origins simply a way of gracefully denying France the security guarantees it had sought to obtain. Although generally regarded at the time as a positive contribution to the maintenance of world peace and order, it formally committed the United States to no action of any kind and was strongly supported by many of the most prominent isolationists, including the new chairman of the Senate Foreign Relations Committee, Senator Borah.

By the beginning of the 1930s, the United States was retreating from military intervention in Latin America by adopting the so-called Good Neighbor Policy, and Secretary of State Henry L. Stimson reacted to the Japanese conquest of Manchuria with a unilateral action that threatened nothing more serious than nonrecognition. President Herbert Hoover restated the isolationist consensus in 1931. Although recognizing a greater interdependence among nations in the modern world, Hoover nonetheless distinguished between the path of the United States and that of other nations. “We should cooperate with the rest of the world;” he told his cabinet, “we should do so as long as that cooperation remains in the field of moral pressures. . . . But that is the limit.” There were few dissenters.

**ISOLATIONISM AT HIGH TIDE**

During the remainder of the 1930s, America’s isolationism was most clearly defined and most ardently defended, and it reigned triumphant until fatally undermined by the very world events that had helped to promote it. The isolationism of the 1930s emanated clearly from a world situation in which the totalitarian states—most notably Germany, Japan, and Italy—challenged the status quo and with it the power position and security of the United States. Traditional American foreign policy had always rested on the assumption that the United States was safe from attack and that American trade and ideas would continue to find acceptance regardless of developments elsewhere. As that assurance diminished, it seemed more important than ever before to try and seal off the United States from threats from abroad, especially the threat of war. It was not until the end of the decade that most Americans faced up to the question then raised rhetorically by the formerly isolationist *Progressive* of Madison, Wisconsin: “If Hitler defeats England and the British fleet is destroyed, what becomes of our splendid isolation, with Hitler on the Atlantic side and Japan and Russia on the Pacific side?”

Until that time, the Great Depression provided a new and for a time persuasive rationale for the isolationist position. Confronted by urgent domestic problems, the immediate impulse of the United States was to turn inward and to regard events outside its borders as distractions tending to impede the solution of problems at home. Even President Franklin D. Roosevelt, who, as a disciple of Woodrow Wilson was anything but an isolationist, spurned international cooperation to alleviate the crisis in favor of unilateral American action and, in effect, torpedoed the London Economic Conference in 1933.

The depression also deflated confidence in the strength of the United States and in its ability to influence events elsewhere. Faced with evidence that much was wrong at home, many Americans abandoned the traditional belief that their institutions should serve as a model for the rest of the world. Others reasoned that the economic crisis had so sapped the nation’s strength that it would be futile to intervene in international affairs. Both lines of thought led to essentially isolationist conclusions. Finally, the depression increased popular distrust of bankers and businessmen and thus the willingness to sacrifice even trade and commerce, if necessary, to maintain political and military noninvolvement. Because the reputation of the American businessman reached its nadir in the 1930s, the attempt was made to resolve the increasingly apparent dichotomy between “commerce and honest friendship with all nations” and “entangling alliances with none” not by increasing American political involvement but by circumscribing the then suspect commercial contacts.

The high-water mark of American isolationism was therefore reached in the years from 1934 to 1937, in the depth of the Great Depression. Beginning with the Johnson Act, which in 1934 prohibited loans to countries in default on previous debts—only Finland could qualify for a loan under that provision—Congress took a series of actions designed to prohibit activities of the sort that were presumed to have involved the United States in World War I. The Senate established a committee headed by the isolationist Gerald P. Nye of North Dakota to investigate the American munitions
industry and its ties to European arms makers. In 1935, 1936, and 1937, by means of so-called neutrality acts, the United States banned loans and the export of arms and ammunition to countries at war, prohibited Americans from traveling on belligerent vessels, forbade the arming of American merchant ships trading with countries at war, and prohibited the sale on credit of war materials other than arms and ammunitions as well as transportation of such materials on U.S. vessels. A substantial majority of the members of Congress believed that such measures could insulate the country against increasingly threatening world events.

The rationale behind these acts provides us with the clearest expression of isolationist assumptions. Their purpose was simply to make possible in the twentieth century the stance first adopted by the United States in 1794. Although the recognition that legislation was necessary to achieve this implied an acknowledgment that the world had changed since the eighteenth century, it also suggested that the United States might accommodate itself to these changes and maintain its traditional position of neutrality by simply taking certain relatively minor precautions. This assumption required a continuing belief that the vital interests of the United States were not substantially affected by events elsewhere; that Europe still had a set of interests “which to us have none or a very remote relation”; and that the country had become involved in other international quarrels, particularly in World War I, for reasons having little to do with genuine national interest.

The last of these beliefs was given powerful support not only by the conclusions of the Nye Committee that the greed of America’s “merchants of death” had led the nation into war in 1917, but also by the work of so-called revisionist historians who, at least since the appearance of Harry Elmer Barnes’s The Genesis of the World War (1926), had been hammering away at the theme that the entry of the United States into the world war had been brought about, contrary to the true interests of the United States, by direct and indirect Allied pressure and by the machinations of bankers, brokers, and businessmen who had unwisely tied American prosperity to the cause of Great Britain and France. In the mid-1930s, Charles A. Beard and Charles C. Tansill were the most prominent of the historians who repeated this theme and alleged the existence of a “deadly parallel” to the situation twenty years before. Walter Millis repeated these arguments in his best-selling Road to War (1935).

The neutrality legislation of the 1930s clearly reflected the isolationist contention that the United States went to war in 1917, and might do so again, not because its interests were threatened, but merely because its activities, particularly those relating to trade, produced incidents that blurred judgment and inflamed passions. By prohibiting loans and the trade in arms, by keeping Americans off belligerent vessels, and by insisting that title to all war material had passed to the purchaser and that such material be carried only in non-American ships, the United States expected to avoid such incidents and thereby involvement in war.

**ISOLATIONISM IN RETREAT**

The isolationist’s beliefs, however, no longer reflected the realities of the world situation. The United States had acquired a far greater stake in the international power balance and exerted far more influence on it than the isolationists were prepared to admit. Neutrality legislation did not reduce this influence but simply redirected it, not necessarily into desirable channels.

In general, the American policy gave aid and comfort to would-be aggressors since it offered tacit assurance that this country would not actively oppose their actions as long as they did not directly threaten the United States. More specifically, the neutrality legislation in effect aided the Fascist dictators—Italy’s Benito Mussolini when applied to the Italo-Ethiopian War and Spain’s Francisco Franco when applied to the Spanish Civil War. The legislation also tended, at least in the first of these cases, to undercut possible peacekeeping actions by the League of Nations.

Since even most isolationists agreed that the victories of the Italian and Spanish fascists were less desirable from the American viewpoint than were other possible outcomes, the wisdom of a policy that contributed to such a result came increasingly to be questioned. “In the long run,” the Socialist Party leader Norman Thomas, a staunch isolationist and an original proponent of neutrality legislation, told President Roosevelt in December 1936, “it is not peace for the world, even for America which will be served by applying to the Spanish rebellion a general principle which should be asserted more rigorously than is yet the case in Congressional legislation concerning neutrality in international law.” As a
socialist who supported the elected government of Spain and abhorred Franco, Thomas was caught in a dilemma that could not be resolved in isolationist terms.

The two events that destroyed the rationale for American isolationism altogether were the fall of France in June 1940 and the attack on Pearl Harbor in December of the following year. The defeat of France by a seemingly invincible Germany created a profound sense of insecurity in the United States. It raised fears not only of an Axis victory but also of a direct attack on this country in the event, now deemed possible, that the British fleet would either be destroyed or captured. The founding of the Committee to Defend America by Aiding the Allies, the first influential interventionist organization, was a direct result of this fear, and the success of that organization produced the establishment of the America First Committee, the last stronghold of the embattled and soon outnumbered isolationists.

The attack on Pearl Harbor, in its turn, graphically demonstrated the vulnerability of American territory to foreign aggressors. Under these circumstances cooperation and even alliance with others to forestall further danger seemed dictated by prudence and common sense. “In my own mind,” one of the most outspoken and influential of the congressional isolationists, Senator Arthur H. Vandenberg of Michigan, confided in his diary some time after the event, “my convictions regarding international cooperation and collective security for peace took firm form on the afternoon of the Pearl Harbor attack. That day ended isolationism for any realist.”

THE END OF AMERICA'S ISOLATIONISM

Vandenberg was essentially right. Both the traditional American foreign policy, based on the precepts of Washington and Jefferson, and isolationism, regarded by its proponents as an adaptation of that policy to the conditions of the twentieth century, had rested on the assumption that Europe's interests were sufficiently different from those of the United States and that the United States was sufficiently safe from attack to make political or military involvement with Europe unnecessary. If unnecessary, such involvement was undesirable by definition, since it could only limit the country’s freedom of action and thereby its sovereignty without bringing any compensating benefits. Although these assumptions had been challenged by world events since the end of the nineteenth century, they had never before been clearly disproved. When the assumptions were disproved, the isolationist structure was no longer a viable one, and the United States moved rapidly not only into tacit alliance with Great Britain and into war as a formal ally of the anti-Axis powers but also very consciously into a commitment to collective security.

Even before World War II had ended, the world economy and the political structure of the new league of nations, the United Nations, would be laid out under American leadership at international conferences at the Bretton Woods resort in New Hampshire and the Dumbarton Oaks estate in Washington, D.C. The United States not only joined the United Nations without serious opposition, but also symbolized its change of course by welcoming that organization's headquarters to New York City.

What had been destroyed, of course, had only been the practicality of the isolationist position. Its emotional appeal remained largely intact, as it had in nations for whom isolationism had never been a realistic position. Isolationist rhetoric, therefore, continued to be used by some opponents of American postwar policies. In the debate over military aid to Europe, which began late in 1950, Joseph P. Kennedy, the isolationist former ambassador to Great Britain, spoke of “unwise commitments” in Berlin and Korea and scoffed at the idea that the United States had any interest in or responsibility for the defense of Western Europe. Herbert Hoover argued that the Americas were still "surrounded by a great moat," and referred once again to “the eternal malign forces of Europe” with which this country should have as little as possible to do. Senator Robert A. Taft of Ohio, a leading prewar isolationist, minimized the danger that this country faced from the Soviet Union in terms virtually identical to those in which he had discussed the threat emanating from Nazi Germany.

Although some observers promptly labeled this outburst “the new isolationism,” it bore little practical relation to true isolationism. Hoover, in fact, strongly favored an American commitment to the defense of a “Western Hemisphere Gibraltar,” the outlying bastions of which were the British Isles, Japan, Taiwan, the Philippines, and, possibly, Australia and New Zealand. Taft recognized that an effective international organization would give the best assurance of world peace and, therefore, of American peace, and stated flatly
that "nobody is an isolationist today." The whole discussion centered largely on the extent of American military and economic aid to other nations, and not on the necessity for such assistance. It turned on the question of how the cooperation among allies of the United States might best be secured, not how American alliances could be terminated most rapidly.

Isolationism was simply no longer viable in a world in which neutrality for the United States was impossible, if for no other reason than that the Soviet Union regarded the United States as its primary foe; in which the United States could clearly not be indifferent to wars in Europe or Asia that affected the world power balance; and in which the development of nuclear weapons and intercontinental missiles had eliminated the margin of safety that geography had once provided. In short, isolationism was made practically impossible when the United States emerged as the dominant world power in an unstable world. Just as "splendid isolation" had emotional appeal but dangerous practical implications for Great Britain at the close of the nineteenth century, so isolation in any form posed a threat to the position of the United States in the postwar world.

For a brief period, even the traces of the isolationist strain in American foreign policy seemed to disappear. The United States embraced its world leadership role at a time when it was, by a considerable margin, the strongest power on earth. It thus could expect to control whatever alliances it entered and saw no necessary conflict between such alliances and the traditional insistence on unilateral action. The refusal of the Soviet Union to recognize a Pax Americana did not shatter that expectation, but initially strengthened the belief that America's security required cooperation with and commitments to like-minded nations. In the Cold War that resulted, the United States laid claim, without having to consult anyone, to the leadership of what it chose to define as the free world. That leadership produced the Marshall Plan, a massive program to rebuild war-devastated Western Europe, in 1948 and, in 1949, the North Atlantic Treaty Organization, a permanent formal, military alliance—its first in 171 years—with Canada and a group of ten Western European nations. It was manifested again the following year, when the United States was able to use the UN to muster an international force to serve under American command in Korea. A powerful United States controlling its allies fully met the test of unilateralism.

**ISOLATIONISM RECONFIGURED?**

Over time, however, American control of the UN and of its allies declined even as its worldwide commitments multiplied. As a result, U.S. foreign policy became both less effective and more costly, and domestic criticism of it increased. The Vietnam War, in particular, spawned critics who argued that there were limits to America's power and that, in consequence, the United States should withdraw from some of its more exposed positions and reduce its international commitments. These critics were often referred to as "neo-isolationists" and sometimes even applied that label to themselves. A leading scholar of American foreign policy, Robert W. Tucker, applauded their position in his book *A New Isolationism: Threat or Promise?* (New York, 1972).

Yet major spokesmen for this point of view, such as Senators Wayne Morse of Oregon, Ernest Gruening of Alaska, J. William Fulbright of Arkansas, George McGovern of South Dakota, and Eugene McCarthy of Minnesota, or George F. Kennan, who as a foreign service officer had been the first to advocate “containment” of the Soviet Union, were not isolationists in any meaningful sense. All favored increasing the role of the United Nations, the maintenance of key alliances, and new attempts to reach agreements with the Soviet Union and the People's Republic of China. None suggested, even remotely, that the cure for current problems might be found in a return to the foreign policies of the 1920s or 1930s.

The Vietnam War, to be sure, had a traumatic effect on both American policymakers and the American public. It caused President Lyndon Johnson to withdraw as a candidate for reelection, assured the defeat of his vice-president, Hubert Humphrey, in the 1968 election, and produced major reassessments of American military and strategic policies. But the lessons that were drawn from the failure in Vietnam did not seriously question America's international commitments. They concentrated instead on the clearer and perhaps more limited definition of American goals, the avoidance, where possible, of no-win situations, and, above all, the avoidance of American casualties in future conflicts.

The internationalist consensus thus remained largely intact, and all subsequent presidents vigorously exercised their presumed prerogative of world leadership. Richard Nixon traveled to China in 1972 to definitively change that nation's relationship to the Soviet Union as well as to the United States. President Jimmy Carter tried
policies based on the ideas of the Trilateral Commission, a private group of American, Western European, and Japanese businessmen, and in 1979 negotiated a peace treaty between Egypt and Israel at Camp David in Maryland.

Ronald Reagan outdid even Woodrow Wilson in what Frank Ninkovich has defined as crisis internationalism (The Wilsonian Century, Chicago and London, 1999). “Our mission is to nourish and defend freedom and democracy” runs the so-called Reagan Doctrine he enunciated in his State of the Union message in 1985. “We must stand by all of our democratic allies. And we must not break faith with those who are risking their lives—on every continent . . . —to defend Soviet-supported aggression.” Reagan’s successor, George H. W. Bush, launched the Gulf War against Iraq in 1991 and brought a number of European and Middle Eastern allies into it. President Clinton, throughout the 1990s, played a direct role in conflicts throughout the world, from Ireland to Israel to Yugoslavia and even beyond.

Throughout these years, isolationism has, to be sure, remained in the area of public discourse. But it has remained there largely as a bogeyman. All presidents since Nixon have defended their policies by labeling their opponents isolationists, and they continue to do so. On 8 December 2000, President Clinton traveled to Kearney, Nebraska, for a foreign policy speech in which he warned his listeners against “isolationist sentiment,” and at his confirmation hearing on 17 January 2001, incoming Secretary of State Colin L. Powell found it necessary to assure the Senate that under his guidance the United States would not become “an island of isolationism.”

Political commentators continued to treat such allegations with great seriousness. The American Enterprise Institute as recently as 1996 found good cause to publish Joshua Muravchik’s The Imperative of American Leadership: A Challenge to Neo-Isolationism, and publications on both sides of the question abound. Yet isolationism is no longer a serious prescription for American policy. With the possible exceptions of the pseudo-populist industrialist Ross Perot, an independent candidate for president in 1992, and Patrick Buchanan, a disgruntled Republican who ran on the Reform Party ticket in 2000, no responsible leader has proposed withdrawal from NATO or the UN or urged the United States to go it alone in a world still considered dangerous, even after the end of the Cold War and the relative triumph of both democracy and free-market capitalism. Ironically, even Buchanan’s A Republic Not An Empire (Washington, D.C., 1999) contains a section entitled “The Myth of American Isolationism.”

The persistence of isolationism as a talking point half a century after its effective demise led some scholars, particularly in the field of security policy, to redefine the term, sometimes in quite sophisticated ways. Eric Nordlinger’s Isolationism Reconfigured (Princeton, N.J., 1995), for example, sees isolationism essentially as the unilateralist component of the traditional American foreign policy that is wary of entangling alliances and, therefore, as a permanent counterweight to the traditional policy’s internationalist component that has carried the day since World War II. In somewhat similar fashion, Frank Ninkovich has defined isolationism as the “normal internationalism” he attributes to the Founders. The Wilsonian counterpart to that which has dominated U.S. foreign policy for the past half century he calls “crisis internationalism.”

Either redefinition does away with the need to explain isolationism or to account for its appearance, especially in the 1920s. For that reason, both lend themselves to the development of ingenious and highly persuasive analyses with substantial postmodernist appeal. They do so, however, by dealing scarcely, if at all, with the objective reality of that isolationism that was an important phase in the development of American foreign policy. That phase has now been superseded, and reentry into it seems no longer possible, even if a nostalgic longing for it survives.

Born of the universal aspiration for unrestricted national sovereignty and the peculiar relation of the United States to the rest of the world in the nineteenth century, isolationism was staunchly defended and raised to the level of dogma when world events in the twentieth century threatened America’s traditional foreign policy consensus. In a shrinking world with an increasingly global economy and ever more deadly weapons that can be delivered anywhere, however, it is an untenable position for a country that has gone to great expense to develop and maintain a fully global military reach, dominates virtually every international institution or agency to which it belongs, and labors ceaselessly to remain the center of global finance and of world trade.

The words “foreign policy” and “foreign affairs” do not appear in the U.S. Constitution, and there is nothing in the document to suggest that the three branches of government should treat this policy area any differently than others. Yet with a few notable exceptions, the judiciary branch has played a limited role in foreign policy. The courts have preferred to refrain from influencing foreign policy, often regarding disputes between the executive and legislative branches in this area to be political, rather than legal, questions. Indeed, Article 3, Section 2 states that “judicial Power shall extend to all Cases, in Law and Equity, arising under this Constitution, the Laws of the United States, and Treaties made, or which shall be made, under their Authority.” This judicial deference is controversial, particularly among those who feel that foreign policy has no special claim to be treated differently than other policy areas.

JUDICIAL REVIEW AND POLITICAL QUESTIONS
The judiciary’s traditional refusal to be drawn into foreign policy matters has its origins in the Constitution, which established responsibility for exercising foreign policy with the executive and the legislature. The president as commander in chief is responsible for conducting war, but Congress is empowered to declare war and raise and maintain military forces. The president may negotiate treaties, but the Senate must ratify them. Congress appropriates funds for the president to use for international diplomacy. While Article 3, Section 2 of the Constitution extends judicial power to cases related to treaties, ambassadors, and the admiralty, and to controversies to which the United States is a party, there is no explicit constitutional role or responsibility for the judiciary in foreign affairs.

The lack of an enumerated constitutional power for the judiciary has not kept foreign policy questions out of the courts. The case of *Marbury v. Madison* (1803) established the Supreme Court’s power of judicial review. This power has come to mean that the Court can determine whether legislative and executive branch actions are permitted within the powers outlined for these branches in the Constitution. Although the case details of *Marbury* were clearly domestic in nature, judicial review is applicable to all policy areas, including foreign policy.

Despite this power, the Supreme Court has often refused to review cases related to foreign affairs on the grounds that they are “political questions,” which are solvable only by the political branches of government, Congress and the president. The Court first adopted this stance in *Foster & Elam v. Neilson* (1829), which involved an international dispute over title to part of the Louisiana Territory. In those cases it has heard, the Court generally has upheld exercise of the power in question—a power usually delegated by Congress to the president during a foreign affairs crisis.

Judicial abstention in questions involving foreign affairs is controversial. On the one hand, the Constitution provides no expressed powers for the judiciary in foreign affairs. The general foreign affairs powers distributed to the legislative and executive branches are clearly enumerated, although the specifics are vague and contradictory. Given the emotional nature of war, the absence of tools for the judiciary to apply its own foreign policy preferences, and its reliance on the executive to carry out a decision, deference is the only responsible approach for the courts to take. On the other hand is the argument that deference on political questions is an abdication of the judiciary’s constitutional responsibilities. Article 3, Section 2 seems to bestow responsibility on the judiciary to review all cases under the laws and treaties of the United States. There is no exclusion
for foreign policy, and treaties certainly are elements of foreign affairs. There is little in the Constitution to suggest that the framers regarded foreign affairs as privileged and beyond the safeguards established by the separation of powers. Yet at various times the Court has ruled the following to be political questions: matters of sovereignty of either the United States or another country; boundaries and territorial authority; the determination of U.S. neutrality; the existence of peace and war; the length of a military occupation; the recognition of the independence or belligerency of a foreign state or government; the acknowledgment of diplomatic immunity; the status of aliens; and the validity or breach of a treaty. The doctrine of political questions, then, must be seen as a product of judicial self-restraint.

The other side of the self-restraint coin is a willingness to let stand legislation that increases the authority of the other two branches, especially the executive, to shape foreign affairs. The courts often have used the “necessary and proper” clause of the Constitution (Article 1, Section 8) to permit congressional actions. Sometimes known as the “elastic clause,” the necessary and proper clause has been interpreted broadly by the courts, beginning with McCulloch v. Maryland (1819), to give considerable discretion to the ways that the federal government, and in particular Congress, utilizes its expressed powers. In Missouri v. Holland (1920), the Supreme Court ruled that the necessary and proper clause could justify the supremacy of international treaties. Upset that lower courts had ruled a congressional act to protect migratory birds from hunters unconstitutional as a violation of state sovereignty, the federal government negotiated a treaty with Canada to protect the birds. Following Senate ratification of the treaty, Congress passed another law prohibiting hunting of the birds, using compliance with the U.S.–Canada treaty as its justification. In affirming the constitutionality of the second law under the necessary and proper clause, the Court opened itself to the criticism that the excuse to implement legislation to comply with international treaties circumvented constitutional restrictions on federal government power, thereby expanding federal authority.

Judicial deference is controversial on other grounds. In Harisiades v. Shaughnessy (1952), the Supreme Court heard an appeal brought by an alien being deported because of his membership in the Communist Party earlier in his life. The opinion of the Court was that policy toward aliens is a component of foreign relations, and that such matters “are so exclusively entrusted to the political branches of government as to be largely immune from judicial inquiry or interference.” The decision was contentious because it did not appear that the Court had considered how restraint in reviewing political questions related to national security and foreign policy conflicts with other constitutional values and civil liberties.

Another justification for deference is that courts are not equipped with the expertise to rule on complicated foreign policy issues or treaties based on international law. It may be more expedient for domestic judges to rely upon the views of the executive branch. However, even in foreign policy cases, attorneys provide the necessary information in their roles as advocates. While deference may be the norm in cases with a foreign policy dimension, the judiciary has weighed in with important opinions at critical times in the country’s history. Many of these moments occurred while the country was at war.

WAR AND THE COURTS

While it is generally accepted that the Constitution grants war powers to the federal government, and the courts have never seriously questioned this, the source and division of war powers has been much disputed. Reasons for judicial acceptance of federal war powers include: that the power to declare war carries with it the power to conduct war (McCulloch v. Maryland); that the power to wage war derives from a country’s sovereignty and is not dependent on the enumerated powers of the Constitution (United States v. Curtiss-Wright Export Corporations, 1936); and that the power to wage war comes from the expressed powers as well as the necessary and proper clause. With such acceptance of the federal government’s central role in war (and foreign policy generally), the Supreme Court has been reluctant to place any limits on the powers Congress or the president devise to conduct it. The courts have declared some statutes created during wartime unconstitutional, but in nearly every case it has been done on grounds that the law abused a power other than war power, and the decision has been rendered only after combat has ceased.

It is perhaps surprising that Congress has declared war on only five occasions: the War of 1812; the Mexican War; the Spanish-American War, World War I, and World War II. When U.S.
involvement in other international conflicts was challenged in the courts, the judiciary has ruled that declaration is not required. For example, in Bas v. Tingy (1800), the Supreme Court held that Congress need not declare full-scale war and could engage in a limited naval conflict with France. During the latter half of the twentieth century the United States engaged in numerous military conflicts without declaring war, the most controversial being the Vietnam War. Lower courts ruled that the absence of a formal declaration of war in Vietnam raised political questions not resolvable in the courts. The Supreme Court refused all appeals to review the lower court rulings, although not all its denials were unanimously agreed (for example, Mora v. McNamara, 1967).

The courts have also rebuffed state challenges to federal government war-related actions. In 1990 the Supreme Court upheld a law in which Congress eliminated the requirement that governors consent before their states’ National Guard units are called up for deployment (Perpich v. Department of Defense, 1990). Specifically, Minnesota objected to National Guard units being sent to Honduras for joint exercises with that country’s military. The issue was between states’ control over the National Guard under the Constitution’s militia clauses and congressional authority to provide trained forces. The unanimous decision in Perpich further strengthened the power of the federal government in military affairs.

While there has been little disagreement on the federal government’s authority to go to war, the appropriate roles of Congress and the president have sparked considerable debate. Article 2, Section 2 of the Constitution begins: “The President shall be Commander in Chief of the Army and Navy of the United States, and of the Militia of the several States, when called into the actual Service of the United States.” This sentence has been the source of controversy between the three branches of government. Of particular concern are the circumstances under which the president can authorize the use of force abroad and how and whether Congress should be involved in making such decisions. The role of the judiciary in such matters seems crucial, but the courts have been unwilling participants in these debates.

While such abandonment of judicial review is questionable, there are a series of historical precedents to support the courts’ approach. In 1795, Congress authorized the president to call out the militia of any state to quell resistance to the law. The Court sanctioned the president’s discretion to determine when an emergency existed and subsequent calling of state militia. Several New England states challenged that law during the War of 1812, but the Supreme Court upheld the delegation of congressional authority as a limited power in Martin v. Mott (1827). In subsequent decades the Court and Congress regarded

**UNITED STATES V. CURTISS-WRIGHT EXPORT CORPORATION**

The majority opinion in this Supreme Court case, 299 U.S. 304 (1936), upheld an embargo on arms destined for Paraguay and Bolivia, two nations at war. Justice George Sutherland’s majority opinion included the following statements:

> It will contribute to the elucidation of the question if we first consider the differences between the powers of the federal government in respect of foreign or external affairs and those in respect of domestic or internal affairs. That there are differences between them, and that these differences are fundamental, may not be doubted. The two classes of powers are different, both in respect of their origin and their nature. The broad statement that the federal government can exercise no powers except those specifically enumerated in the Constitution, and such implied powers as are necessary and proper to carry into effect the enumerated powers, is categorically true only in respect of our internal affairs.

> It results that the investment of the federal government with the powers of external sovereignty did not depend upon the affirmative grants of the Constitution. The powers to declare and wage war, to conclude peace, to make treaties, to maintain diplomatic relations with other sovereignties, if they had never been mentioned in the Constitution, would have vested in the federal government as necessary concomitants of nationality.

> Not only, as we have shown, is the federal power over external affairs in origin and essential character different from that over internal affairs, but participation in the exercise of the power is significantly limited. In this vast external realm, with its important, complicated, delicate and manifold problems, the President alone has the power to speak or listen as a representative of the nation.

> It is important to bear in mind that we are here dealing not alone with an authority vested in the President by an exertion of legislative power, but with such an authority plus the very delicate, plenary and exclusive power of the President as the sole organ of the federal government in the field of international relations.
the president's war power as primarily military in nature. The Supreme Court has never opposed the president's authority as commander in chief to deploy forces abroad. However, during most of the nineteenth century Congress provided the initiative in foreign policy. When presidents in peacetime sought expansionist policies that threatened war, Congress stopped them.

Supreme Court decisions during the Civil War played a central role in shaping the courts' approach to war powers. Congress was in recess when hostilities broke out, so President Abraham Lincoln declared a blockade of Confederate ports, issued a proclamation increasing the size of the army and navy, ordered new naval ships, and requested funds from the Treasury to cover military expenditures. When Congress returned it adopted a resolution that approved the president's actions. However, owners of vessels seized during the blockade and sold as prizes brought suit, arguing that no war had been declared between the North and the South. The Supreme Court ruled in the *Prize Cases* (1863) that President Lincoln's actions in the early weeks of the war were constitutional, because the threat to the nation justified the broadest range of authority in the commander in chief.

Despite a narrow 5–4 ruling, the *Prize Cases* bolstered the powers of the presidency and shaped the tendency of the judiciary to abstain from rulings that would curb war powers. The Supreme Court's decisions, which interpreted broadly the powers of the president as commander in chief, marked the beginning of expansionary presidential actions during war. The national emergency of civil war required that the executive be able to exercise powers that might not be permitted during peacetime. Thus, Lincoln's decisions to declare the existence of a rebellion, call out state militia to suppress it, blockade southern ports, increase the size of the army and navy, and spend federal money on the war effort were not rebuked by the courts. Even the Emancipation Proclamation was issued under Lincoln's authority as commander in chief. Only Lincoln's suspension of habeas corpus in certain parts of the country earned a censure from the Supreme Court.

The world wars of the twentieth century provided opportunities for Presidents Woodrow Wilson and Franklin Roosevelt to push the constitutional envelope. As the United States entered World War I in 1917, President Wilson sought and obtained from Congress broad delegations of power to prepare for war and to mobilize the country. He used these powers to manage the country's economy, creating war management and production boards (coordinated by the Council of National Defense) to coordinate production and supply. His actions included taking over mines and factories, fixing prices, taking over the transportation and communications networks, and managing the production and distribution of food. Because the president had obtained prior congressional approval for these actions, there were no legal challenges to Wilson's authority during the war.

In a novel interpretation of the economic turmoil of the 1930s, President Roosevelt equated the challenge of the Great Depression to war. He sought wide executive-branch powers to address the economic crisis, but the Supreme Court was reluctant to sanction such authority during peacetime. However, once the United States entered World War II, Roosevelt was on more solid footing. Congress again delegated vast federal powers to the president to help win the war, and Roosevelt created many new administrative agencies to aid in the effort. There were very few objections on constitutional grounds, largely because the three branches assumed that the use of war powers by Lincoln and Wilson applied to the current conflict. The Supreme Court never upheld challenges to the authority of wartime agencies or to the authority of the 101 governmental corporations created by Roosevelt to engage in production, insurance, transportation, banking, housing, and other lines of business designed to aid the war effort. The Court also upheld the power of the president to apply sanctions to individuals, labor unions, and industries that refused to comply with wartime guidelines. Even the case of the removal and relocation of Japanese Americans was considered by the Supreme Court, which ruled that, because Congress had ratified Roosevelt's executive order as an emergency war measure, this joint action was permitted.

The assertion of broad emergency powers by Presidents Wilson and Roosevelt obfuscated the constitutional separation between Congress's authority to declare war and the president's power to wage it. As long as Congress delegated authority to the president and appropriated funds (through its "power of the purse") to support such powers, the judiciary would interpret this as congressional sanction of the president's decision. The courts would not challenge this "fusion" of the two branches' warmaking powers.
The onset of the Cold War did not result in a curb in executive war powers. In 1950, President Harry Truman decided to commit U.S. forces to help South Korea without a declaration of war from Congress. He based the authority for his actions on the United Nations Security Council vote to condemn North Korea’s invasion and urge member countries to assist South Korea. However, the Supreme Court ruled that President Truman went too far when he ordered the secretary of commerce to seize and operate most of the country’s steel mills to prevent a nationwide strike of steelworkers. The president justified his actions by arguing that the strike would interrupt military production and cripple the war effort in Korea and by claiming authority as commander in chief. In *Youngstown Sheet and Tube Company v. Sawyer* (1952), also known as the Steel Seizure Case, the Court agreed that the president had overstepped constitutional bounds, but it did not rule out the possibility that such seizures might be legal if done with the consent of Congress. Nonetheless, the Steel Seizure Case is significant as the strongest rebuke by the Court of unilateral presidential national security authority. The country was at war when Truman acted, and Congress had not expressly denied him the authority to act. It was extraordinary for the Court to find that the president lacked authority under those circumstances.

Thus, the Cold War environment did little to curb the gradual expansion of presidential authority during war. In 1955, Congress authorized President Dwight D. Eisenhower to use force if necessary to defend Taiwan if China attacked the island. In 1962, President John F. Kennedy obtained a joint congressional resolution authorizing him to use force if necessary to prevent the spread of communism in the Western Hemisphere. Two years later, Congress passed the Gulf of Tonkin Resolution, which empowered President Lyndon B. Johnson to take all necessary steps, including the use of armed force, to assist in the defense of members of the Southeast Asia Collective Defense Treaty. President Johnson relied on this resolution to wage the war in Vietnam instead of asking Congress to declare war on North Vietnam. Federal courts were asked repeatedly during the late 1960s and early 1970s to rule on the constitutionality of the war. The Supreme Court declined to hear such cases on the view that war was a political question. Although opponents of the war contended that U.S. involvement was unconstitutional because Congress had never declared war, the legislative body continued to appropriate funds for defense, thus implying support for Johnson’s, and then Richard Nixon’s, policies in Southeast Asia.

**THE WAR POWERS RESOLUTION**

While the commander in chief role of the president has stirred little debate in those instances when the United States was attacked by another country, the president’s authority to send forces into hostile situations abroad without a declaration of war or congressional authorization has generated much controversy. The tension reached a head during the latter years of the Vietnam War. Beginning in 1969, President Richard Nixon authorized secret bombing raids on neutral Cambodia without informing Congress. The following year he ordered U.S. forces on “search and destroy” missions in that country. In 1972 he directed the mining of North Vietnamese ports, which risked collisions with Russian and Chinese vessels, and one year later ordered the carpet-bombing of Hanoi. The president neither sought nor obtained explicit congressional approval for any of these policies, and he negotiated the 1973 Paris treaty ending the Vietnam War without congressional participation. Nixon defended his actions by arguing that the constitutional distinction between Congress’s war power and the president’s commander in chief role had become blurred.

For Congress, this was the last straw. The perception that presidents had assumed more authority to commit forces than the Constitution’s framers had intended led Congress in 1973 to pass the War Powers Resolution (also known as the War Powers Act) over President Nixon’s veto. The main purpose of the resolution was to assure that both the executive and legislative branches participate in decisions that might get the United States involved in war. Congress wanted to circumscribe the president’s authority to use armed forces abroad without a declaration of war or other congressional authorization, yet provide enough flexibility to permit the president to respond to attack or other emergencies. Specifically, the War Powers Resolution requires the president to provide written notification to Congress of the introduction of U.S. armed forces into hostilities within forty-eight hours of such action. The president must explain the reasons forces were inserted in a hostile situation, the executive’s
authority for doing so, and the scope and duration of the military action. In addition, the president is required to terminate the use of military forces after sixty days unless Congress has declared war, extended the period by law, or cannot meet the sixty-day deadline as a result of an armed attack on the United States. The sixty days can be extended for thirty days by the president if the safety of armed forces would be jeopardized by immediate removal. The president is also required to remove forces at any time if Congress so demands by concurrent resolutions (known as a legislative veto). In essence, most members of Congress supported the notion that the president, as commander in chief, is empowered by the Constitution to lead U.S. forces once the decision to wage war is made or an attack on the United States has commenced. What Congress sought with the War Powers Resolution was participation in the decision to commit armed forces at the beginning of hostilities.

Critics of the resolution argue that Congress has always held the power to forbid or terminate military action by statute or refusal of appropriations, and that without the clear will to act the resolution is ineffective. The sixty-day termination requirement is a major reason why presidents do not report force deployments to Congress, thereby undermining the objective of the resolution. The imposition of a deadline, some critics contend, would signal a divided country to the enemy, which might then seek to prolong the conflict to at least sixty days, thereby forcing the president to either seek a congressional declaration of war or withdraw U.S. forces. Alternatively, the resolution could be seen as a blank check to commit troops anywhere and for any purpose, subject only to the time limitations, thereby defeating the intended goal of restricting the president’s war-making ability. A more fundamental problem is defining presidential consultation of Congress.

Does the War Powers Resolution require the president to seek congressional opinion prior to making a decision to commit armed forces, or simply to notify Congress after a decision to deploy troops has been made but before their actual introduction to the area of hostility? Such wide differences in interpretation of the War Powers Resolution would suggest a clear role for the judiciary.

Surprisingly, the courts have not ruled on the constitutionality of the War Powers Resolution. The first legal challenge to noncompliance with the resolution, Crockett v. Reagan (1982), was filed by eleven members of Congress who contended that President Ronald Reagan’s decision to send military advisers to El Salvador must be reported to Congress. A district court ruled that Congress, not the court, must resolve the question of whether U.S. forces in El Salvador were involved in a hostile or potentially hostile situation. The Supreme Court declined consideration of a later appeal. In Lowry v. Reagan (1987), the courts refused to decide whether President Reagan had failed to comply with the War Powers Resolution when he dispatched naval forces to the Persian Gulf. A suit was brought by 110 members of Congress, arguing that sending forces close to the Iran-Iraq war zone required congressional approval. The district court held that it was a political dispute to be dismissed “as a prudential matter under the political question doctrine.”

An important question in the post–Cold War world is whether the War Powers Resolution applies to U.S. participation in United Nations military actions. During the 1990s the United Nations sent multinational forces to trouble spots around the world, usually for peacekeeping and humanitarian purposes. However, after Iraq invaded Kuwait in August 1990, the United Nations contemplated and approved military force against Iraq. The United States took a leading role in this effort. Between August and December 1990, President George H. W. Bush deployed 350,000 troops to the Persian Gulf in response to Iraq’s invasion of Kuwait. Although the president sent reports to Congress describing the buildup, he did not seek the legislative body’s approval. Forty-five Democratic members of Congress sought a judicial order enjoining the president from offensive military operations in connection with Operation Desert Shield unless he consulted with and obtained an authorization from Congress. However, a federal district court denied the injunction, holding that the controversy was not
ripe for judicial resolution because a majority of Congress had not sought relief and the executive branch had not shown sufficient commitment to a definitive course of action (Dellums v. Bush, 1990). On the same day, another federal judge issued a decision in Ange v. Bush (1990), holding that the courts could not decide whether President Bush needed congressional permission to go to war because it was a political question.

Bush claimed that he did not need a congressional declaration of war to use military force against Iraq. However, to bolster political support for the commencement of hostilities with Iraq, and to obtain legislative legitimacy for the participation of U.S. troops in a multinational coalition, the president requested a congressional resolution supporting the implementation of the UN Security Council resolution authorizing member states to use “all necessary means” to restore peace to the region. The Senate (in a 52–47 vote) and House (302–131) passed the Authorization for Use of Military Force Against Iraq Resolution, stating that it was intended to constitute authorization within the meaning of the War Powers Resolution. Bush’s action during the Gulf War was not unique. The deployment of U.S. troops to Somalia, the former Yugoslavia, and Haiti by Presidents Bush and William Jefferson Clinton did not fully comply with the War Powers Resolution either.

The main point here is that the courts have provided no guidance in how to interpret the War Powers Resolution, or in whether the resolution is constitutional at all. Only Immigration and Naturalization Service v. Chadha (1983), which ruled unconstitutional a one-house legislative veto, has implications for the legality of the concurrent resolutions section of the War Powers Resolution. This is because a concurrent resolution is adopted by both legislative chambers but is not presented to the president for signature or veto. The larger question of the appropriate amount of congressional participation in presidential decisions to commit U.S. troops abroad, a question that the War Powers Resolution tried to address, remained unanswered by the judiciary.

THE COURTS AND FOREIGN POLICY

While war can be viewed as a specific component of foreign relations, foreign relations in general suffer from the same constitutional ambiguities as war. In addition to the president’s commander in chief powers, the Constitution grants the president the power to make treaties and to receive and appoint ambassadors. Together, these grants of power are the source of the president’s authority to conduct foreign policy. The Constitution’s framers did not want the president to be as powerful as European monarchs in international matters, so Congress was given a voice too. While the president is free to negotiate treaties, they must be ratified by two-thirds of the Senate. Congress’s only other constitutional authorizations over foreign policy derive from the powers mentioned earlier: the power to declare war, raise a military, and appropriate funds.

The judiciary has provided little guidance in more clearly demarcating executive and legislative branch powers in foreign policy, often invoking the political question doctrine. The result is that Court rulings either supported the actions of the political branches or refused to judge them. Baker v. Carr (1962) is the principle case outlining the Supreme Court’s position on political questions. Although Baker v. Carr concerned the malapportionment of election districts in Tennessee, the Court’s comments on political questions apply to domestic and foreign policy issues. Writing for the majority, Justice William Brennan outlined the circumstances under which a case involved a political question and the obligation of federal courts to abstain from ruling. Among other instances, Justice Brennan opined that judicial abstention would be appropriate whenever a case raised foreign policy questions that “uniquely demand single-voiced statement of the Government’s views.” Despite this attempt at clarification, Baker v. Carr continued to confuse constitutional scholars and lower courts because the guidelines set forth by Justice Brennan did little to clarify the definition of political questions, the circumstances under which an issue is nonjusticiable, or the approach the courts should take when confronted by cases that appear political and nonjusticiable.

For several reasons, then—an explicit constitutional role for Congress confined to treaties, the exclusion of individual states from traditional foreign policy, and judicial deference to the political branches in such matters—the president and executive branch have been the principle beneficiaries of Court rulings in foreign policy matters. United States v. Curtiss-Wright Export Corporation (1936) was a landmark case that confirmed the president’s lead role in foreign affairs. In this case, Congress approved a joint resolution authorizing President Roosevelt to embargo arms shipments
to Paraguay and Bolivia, if doing so might contribute to ending the war. After Roosevelt declared an embargo in effect, Curtiss-Wright was subsequently convicted of selling weapons to Bolivia in violation of the embargo. The company challenged the constitutionality of the resolution, arguing that it was an improper delegation of congressional power to the president.

Given that the Court had already struck down major New Deal programs, there was some expectation that it would do the same with respect to arms embargoes. However, in his 7–1 majority opinion, Justice George Sutherland presented an original and controversial defense of presidential authority in foreign affairs. Sutherland argued that independence from Britain fused the thirteen original colonies into a sovereign nation. He also distinguished between internal (domestic policy) and external (foreign policy) powers of the federal government. Internal powers, he argued, lay with the individual states and are conferred upon the federal government by the Constitution. External powers, however, derive the sovereignty that all countries enjoy, and sovereignty was passed from Britain to the union of states upon independence. Since the powers of the United States to conduct its foreign relations do not derive from, nor are enumerated in, the Constitution, it is impossible to identify or infer them from constitutional language. As a result, the Court’s view was that delegation of power to the president in foreign affairs was not to be judged by the same standards as delegation of power over domestic matters. Consequently, the “president alone has the power to speak as a representative of the nation.”

Sutherland’s opinion is open to criticism from several angles. If the federal government derives powers from sources other than the Constitution, neither the Constitution nor the courts provide guidance in the distribution of such powers between the branches. The implication that foreign affairs powers of the federal government are extra-constitutional goes beyond previous Court opinions that, less controversially, found foreign affairs powers to be vested in the federal government by the Constitution. Further, the notion that the federal government was to have major powers outside the Constitution is not insinuated in the document itself, the records of the Constitutional Convention, the Federalist Papers, or contemporary debates. Sutherland’s opinion is grounded in sovereignty, but it is also possible to interpret the Declaration of Independence as creating thirteen sovereign states, and many did conduct their own foreign relations until the Articles of Confederation. Sutherland’s reliance on political philosophy and international law, rather than constitutional interpretation, as a basis for foreign policy powers is also controversial. Finally, drawing a clear distinction between foreign and domestic policy is becoming increasingly difficult to do, and an approach that derives different sources of power for each is bound to generate legal challenges. Sutherland’s position holds up best if one takes the view that the Constitution is a document whose principle objective is to distribute power between the states and federal government, and among the branches of the federal government. Despite the criticisms, Curtiss-Wright is a landmark case in the broadening of federal and, in particular, presidential authority in foreign affairs.

Presidents have found additional means to increase their foreign policy powers. One is to use executive agreements, since they do not require Senate ratification but have been upheld by the Court to have the same legal status as treaties (United States v. Pink, 1942). Executive agreements are of two forms: those authorized by Congress and those made on presidential initiative. Authorized executive agreements have provided authority for presidents to negotiate the lowering of tariff barriers and trade agreements. The Lend-Lease Act (1941) granted President Roosevelt the power to enter into executive agreements that would provide war material to “any country deemed vital to the defense of the United States.” Numerous executive agreements have been negotiated regarding the stationing of U.S. military forces in other countries. Executive agreements made on presidential initiative have often been obtained during international conflict, including the ending of the Spanish-American War and the deployment of troops during China’s Boxer Rebellion. The Supreme Court, in United States v. Belmont (1937), upheld Roosevelt’s use of an executive agreement to formalize his decision to recognize the Soviet Union, noting that it had the effect of a treaty and overruled conflicting state laws. Roosevelt used executive agreements extensively in the years leading up to World War II and to negotiate agreements at the Cairo, Tehran, and Yalta conferences. President Lyndon Johnson made many secret agreements with Asian countries during the 1960s, and President Jimmy Carter used executive agreements that constituted the financial arrangement necessary to free Amer-
ican hostages in Iran. In Dames & Moore v. Regan (1981), the Supreme Court ruled that Presidents Carter and Reagan had acted consistently with emergency powers granted by statute to use executive agreements to suspend the financial claims of Americans against Iran, in return for the safe release of the hostages seized during the 1979 Iranian revolution.

While the treaty approval process is described in the Constitution and has raised few problems, the relationship between treaties, domestic laws, and the Constitution is less clear. One area of confusion was whether treaties were superior to national legislation. In Foster & Elam v. Neilson (1829), Chief Justice John Marshall distinguished between a self-executing treaty and a non-self-executing treaty. The former requires no legislation to put it into effect, while the latter does not take effect until implemented through legislation approved by the Congress and president. The superiority of a treaty or statute is determined by whichever is most recent. However, in the case of a non-self-executing treaty, congressional acts take precedence (Head Money Cases, 1884). In Missouri v. Holland (1920), the Court's ruling illustrated how treaties could increase the power of the federal government vis-à-vis the states. The Court upheld the national law protecting migratory birds on the grounds that it was necessary to carry the provisions of this non-self-executing treaty into effect.

The Court has also considered the termination of treaties. It has held that termination requires an act of Congress. If international obligations are violated as a result of the termination, the matter will need to be renegotiated with the international parties. However, the Court has also ruled that treaties may be terminated by agreement between the contracting parties, by treaty provisions, by congressional repeal, by the president, and by the president and Senate acting jointly. When President Carter decided to officially recognize the government of the People's Republic of China, he unilaterally terminated a mutual defense treaty between the United States and Taiwan. The Supreme Court refused to hear a case brought by Senator Barry Goldwater and nineteen other senators (Goldwater v. Carter, 1979) asking the Court to require the president to first obtain congressional authorization.

It is clear that, for two centuries, the courts have played an important role in resolving foreign policy disputes between the executive and legislative branches. But this is only one of the two principle divisions of power established by the Constitution. The other principle is dividing power between the states and federal government. Along this division, too, the courts have been required to resolve disputes over foreign policy powers.

**FEDERALISM AND FOREIGN POLICY**

It is widely believed that the Constitution's framers sought to place control of the new country's foreign relations in the hands of the federal government rather than the states. To ensure that the country spoke with one voice in international matters, the Constitution granted the federal courts power to hear all cases between a state or its citizens and a foreign state or its citizens, and all cases involving ambassadors, public ministers, or consuls. To the framers of the Constitution, foreign policy was first and foremost the arena for waging war and making treaties. However, they also understood that the federal government must have power over some economic issues like setting tariffs and duties and issuing currency, all of which affect international trade and investment. Article 1, Section 10 of the Constitution lists the activities that states are prohibited from doing, most of which are related to foreign policy. However, the Tenth Amendment reserves powers not delegated to the federal government, or prohibited by the Constitution to the states, to the states or to the people.

The ambiguity of this notion of “dual federalism” has been a source of confusion from the start. The role of states in foreign policy was one of the first controversies addressed by the Court in the years following the writing of the Constitution. In Penhallow v. Doane (1795) and Ware v. Hylton (1796), the Supreme Court denied to the states any role in foreign policy matters, ruling that treaty-making power was not affected by the doctrine of dual federalism. It helped to minimize disputes in this area because, for most of the country's history, it was easy to distinguish between domestic and foreign matters. In the later years of the twentieth century, however, the lines blurred. This was particularly true in international economic matters. States and cities routinely sent trade missions abroad to help local firms export and to encourage foreign companies to invest locally. Local government forays into foreign policy accelerated in the 1980s. Many localities enacted boycott legislation to pressure South Africa to end apartheid. Others passed resolutions criticizing nuclear weapons, supporting a freeze in the arms race, and banning
nuclear testing. Some formed linkages with Nicaragua and, along with grassroots organizations, provided more humanitarian aid to the Nicaraguan people than all the military aid Congress authorized for the contras, the anticommunist forces supported by the Reagan administration. Still others welcomed Guatemalan and Salvadoran refugees, established “sister city” relationships with communities in other countries (including the Soviet Union), and passed ordinances phasing out ozone-depleting chemicals.

Opponents of local government involvement in foreign policy proposed three arguments. The first was that U.S. foreign policy is most effective when the country speaks with one voice. The second was that foreign affairs, like all public policies, should be shaped democratically by all who would be affected. It would be unfair for some states and cities to make decisions that affect the entire country. The third proposition was that only the federal government has the expertise to make foreign policy. The president, through the National Security Council, Central Intelligence Agency, Departments of State and Defense, and other executive branch organizations, has far more resources and information (much of it secret or sensitive) than governors and mayors. These arguments were countered by the fact that U.S. foreign policy is rarely of one voice. Members of Congress, different departments within the executive branch, multinational corporations, and special interest groups have all expressed views at odds with the president or State Department. In addition, local government foreign policies may be viewed as an extension of the democratic process, since local governments concerned about an international issue can develop policies specific to their citizens’ needs, as well as accountability, since there is no national security apparatus for local officials to hide behind. Finally, while the federal government may have access to more information in traditional foreign policy areas (like war and security), local governments are perhaps more knowledgeable in economic policy and have more tools at their disposal (such as tax and other incentives to attract foreign direct investment).

There have been few cases challenging local government foreign policies, and the Constitution helps to explain why. Under the Articles of Confederation, the states engaged in trade wars, pursued their own military campaigns, and carried out independent diplomacy. The Constitution’s framers sought to correct this. First, it is broadly understood that the framers sought to place foreign policy firmly at the national level. Second, the Constitution clearly prohibits states from some foreign activities, including making treaties or engaging in war. Third, Article 6 of the Constitution provides that laws and treaties of the United States are “the supreme law of the land” and prevail (or preempt) state law. Fourth, states may not levy taxes or duties on imports or exports, or enact regulations that unduly inhibit interstate or foreign commerce. Consequently, until the late twentieth century there were relatively few foreign policies enacted by local government, and only a handful that posed a serious threat to the ability of the United States to speak with one voice in international relations.

An alternative reading of the Constitution suggests that the framers could have taken all foreign policy activities away from state and local governments but chose not to do so. Instead, they enumerated a small number of limitations on state power. In those instances when local government has become involved in foreign policy, the executive and legislative branches usually have done little to discourage such activity. During the Reagan administration, conservatives in the Justice Department were reluctant to file suit against municipal foreign policies because of their support for the principle of states’ rights. Thus, local government foreign policies bring two constitutional principles, states’ rights and a national-level foreign policy, into conflict.

Many of the local government activities of the 1980s and 1990s do not fall neatly into constitutional categories (like war, treaties, and duties). For example, the Comprehensive Anti-Apartheid Act of 1986 made it clear that state and local divestment and antiapartheid legislation could remain in effect. In such cases, the judiciary resorted to other interpretations. In Zschernig v. Miller (1968), the Supreme Court ruled against Oregon. That state’s government had enacted a law requiring reciprocal treatment of property inherited by a resident alien in Oregon and in the alien’s home country. The Court announced that it would now strike down any municipal foreign policies having more than “some incidental or indirect effect” on U.S. foreign relations. The fact that such an effect could vary in importance over time creates an opening for the judiciary to increase its influence in foreign policy matters.

One increasingly popular type of nontraditional foreign policy of local governments is economic sanctions. In 1996, Massachusetts passed a
The constitutional law expert Louis Henkin summarized the judiciary's role in foreign affairs nicely when he wrote:

The fuzzy area of the constitutionality of state actions in the international realm was underlined by the ways in which federal courts ruled as this case made its way through the judicial system. A federal judge ruled that the Massachusetts law "unconstitutionally impinges on the federal government's exclusive authority to regulate foreign affairs," since the objective of the legislation was to change Myanmar's domestic politics (specifically, to force the military junta to recognize the results of a 1990 election). The appeals court's 1999 ruling was much more sweeping, as it found the Burma law unconstitutional on all three grounds presented by the NFTC. The Supreme Court agreed to hear the case (Crosby v. National Foreign Trade Council, 2000) and ruled against Massachusetts— but for yet a different reason. The Clinton administration avoided taking sides in this dispute, but revealed its support for the NFTC during the Supreme Court hearing. In a unanimous ruling, the Supreme Court concluded that the federal statute banning investment in Burma (enacted shortly after the Massachusetts law) preempted the Massachusetts law on procurement. In other words, the law passed by Congress prevented states from having their own sanctions laws aimed at Burma. The Court has taken a similar approach in other cases, whereby it has nullified a state or local foreign policy because it contradicted a specific federal statute, treaty, executive agreement, or constitutional clause.

Unfortunately, the narrow ruling in the Massachusetts case left the door open for other state and local government actions in the foreign policy area. For example, it was not clear whether a state sanctions law is constitutional when no national law exists aimed at the same country. Nor did the ruling prohibit other measures, such as divestment by state pension funds of stock held in firms doing business in undesirable places. Most importantly, this case presented the courts with the opportunity to clearly demarcate the limits of states' actions in the foreign realm, but the Supreme Court was unwilling to make such a bold statement. The conflicting constitutional principles that thus arose were difficult to resolve. One solution to controversies of this type was for the courts to treat local government involvement in foreign policy in the same way that they usually treat disputes over war powers. By holding that these are political questions, the courts could leave it to the legislative and executive branches to create laws permitting or barring various activities. For example, if Congress did not want states like Massachusetts enacting selective purchasing laws, it could pass a law prohibiting them from doing so. In this line of thinking, the courts should uphold all local government foreign policies, unless such activities are specifically barred by national legislation or the Constitution.

CONCLUSION

The constitutional law expert Louis Henkin summarized the judiciary's role in foreign affairs nicely when he wrote:
Overall, the contribution of the courts to foreign policy and their impact on foreign relations are significant but not large. The Supreme Court in particular intervenes only infrequently and its foreign affairs cases are few and haphazard. The Court does not build and refine steadily case by case, it develops no expertise or experts; the Justices have no matured or clear philosophies; the precedents are flimsy and often reflect the spirit of another day. But though the courts have only a supporting part, it is indispensable and inevitable, and if their competence and equipment for making foreign policy are uncertain, they can be improved by stronger, continuing guidance by Congress and, perhaps, by the President.

In examining the power and practice of the judiciary in foreign affairs, one is struck by the potential power of this branch but the rare use of it in practice. In general, the judiciary has tended to regard foreign affairs as fundamentally different from other areas of power. In so doing, it has been more willing (either through actual rulings or the dismissal of cases as political questions) to permit the federal power under consideration, and to give the president the benefit of the doubt in disputes over executive and legislative branch authority. The blurring of the domestic and international, the increasing activism of state and local governments in foreign affairs, and the form and timing of U.S. military intervention abroad will be major factors in coming years that will determine whether the judiciary’s restraint in foreign affairs continues.

Problems arising from unpaid debts owed by foreign governments to private bankers and, later, to international agencies, troubled American policymakers during the twentieth century. Initial concerns arose regarding the political motives of European governments who sought to employ their military forces to enforce repayment of financial debts incurred by South American and Central American countries. When its World War I allies stopped paying on wartime loans during the 1920s and 1930s, U.S. officials were faced with a series of unpleasant choices. To avoid this problem during World War II, President Franklin D. Roosevelt established the lend-lease program that provided economic and military aid to America’s allies yet left no substantial postwar debt.

During the Cold War years, the United States employed foreign aid packages that consisted largely of grants with occasional loans to aid its allies. Initially, the new International Monetary Fund and the World Bank provided developing countries with economic assistance; later, in the 1970s, commercial agents—individual banks and consortiums—extended loans to the same clients. This subsequent surge of credit resulted in greatly increasing Third World debt and, after 1981, increasing concern with possible defaults and debt rescheduling.

CARIBBEAN PROTECTORATES

In the early twentieth century, debt repayment emerged as a significant U.S. foreign policy issue when dictatorships in several Caribbean republics—regimes that had managed to live on loans granted by European banking and speculative interests—demonstrated an incapacity or plain unwillingness to pay that brought threats of armed intervention from European powers. The classic instance was that of Venezuela, whose reckless behavior had aroused the anger and contempt of the great powers, including the United States. In 1902 the British and German governments, joined nominally by Italy, blockaded Venezuela and seized the country’s customs, the revenues from which would then be utilized toward redemption of the debts. This method, which proved effective but also aroused American susceptibilities over the Monroe Doctrine (1823), soon brought from the administration of Theodore Roosevelt (1901–1909) an important policy shift, namely, that the United States would henceforth be responsible for the behavior of the Latin American republics toward Europe. In due course, then, the United States assumed fiscal supervision over several Caribbean countries.

The principal recipients of American “protection” were Cuba, Panama, the Dominican Republic, Nicaragua, and Haiti. The special relations of the United States to these republics were embodied in treaties, no two of which were exactly alike. To only one such state—the Republic of Panama—did the United States actually promise “protection,” in the declaration that “the United States guarantees and will maintain the independence of the Republic of Panama.” Other treaties, such as those with Cuba and Haiti, contained engagements on the part of the “protected” states not to impair their independence or cede any of their territory to a third party; and the same two treaties permitted intervention by the United States for the maintenance of independence or of orderly government. Since careless public finance was likely to lead to foreign intervention and possible loss of independence, a number of the treaties—those with Cuba, Haiti, and the Dominican Republic—contained restrictions upon, or gave the United States supervision over, financial policy.

American investments existed in all the countries of this Caribbean semicircle of protectorates. These no doubt benefited from the increased stability and financial responsibility
induced by governmental policy. In the Dominican Republic, Haiti, and Nicaragua that policy resulted in a transfer of the ownership of government obligations from European to American bankers. Yet in none of the five republics save Cuba were American financial interests especially large or important. The dominant motive was clearly political and strategic rather than economic. The acquisition of the Canal Zone and the building of the Panama Canal made the isthmian area a crucial concern in the American defense system.

CUBA AND THE PLATT AMENDMENT (1901)

The end of the war with Spain in 1898 left Cuba occupied by the armed forces of the United States but with the future status of the island not clearly defined. Spain had relinquished sovereignty over Cuba, and the United States had renounced any thought of annexing it. But that renunciation did not absolve the United States, in its own eyes, from responsibility for Cuba’s future. President William McKinley remarked in his annual message of 5 December 1899 that the United States had assumed “a grave responsibility for the future good government of Cuba.” The island, he continued, “must needs be bound to us by ties of singular intimacy and strength of its enduring welfare is to be assured.”

What those ties were to be was defined by Elihu Root, McKinley’s secretary of war. General Leonard Wood, America’s military governor of Cuba, convoked a constitutional convention, which sat in Havana from November 1900 to February 1901. It completed a constitution for independent Cuba but failed to carry out a directive of the governor to provide for relations between the Cuban government and the government of the United States. Secretary Root outlined his concept of what those relations should be in a set of proposals that were introduced in the U.S. Senate by Senator Orville H. Platt of Connecticut and were known henceforth as the Platt Amendment. This was actually an amendment to the Army Appropriation Bill of 2 March 1901; the amendment authorized the president to terminate the military occupation of Cuba as soon as a Cuban government was established under a constitution that provided, among other things, that Cuba should never permit any “foreign power” to gain a foothold in its territory or contract any debt beyond the capacity of its ordinary revenues to pay; and that Cuba should consent that the United States might intervene in its affairs for the preservation of Cuba’s independence.

The new Cuban government was inaugurated on 20 May 1902. The Platt Amendment took its place as an annex to the Cuban constitution and was embodied in the permanent treaty of 1903 between Cuba and the United States. It remained in force until 1934, when all of the treaty except the naval base article was abrogated. Under that article the United States enjoyed the use of Guantánamo Bay, on the south coast near Santiago, as a naval station. Under Article 3 the United States exercised the right of intervention from time to time, notably in 1906–1909, following a breakdown of the Cuban government, but more frequently in subsequent years.

THE ROOSEVELT COROLLARY OF THE MONROE DOCTRINE

Secretary Root spoke of the Platt Amendment as supplying a basis in international law for intervention by the United States under the Monroe Doctrine to protect the independence of Cuba. But with how much justice or logic could the United States enforce the Monroe Doctrine against European intervention in turbulent Western Hemisphere republics if it took no responsibility for the behavior of such republics or for the fulfillment of their obligations to Europe? The Platt Amendment, by restricting the debt-contracting power of Cuba and permitting the United States to intervene for the preservation of orderly government, hinted that the Monroe Doctrine involved certain policing responsibilities for the United States. That idea, though previously suggested from time to time, was now for the first time written into law. Need for such a principle was emphasized by events in Venezuela in 1902–1903.

In 1901, when the German and British governments were contemplating the use of force to collect debts from the Venezuelan dictator, Cipriano Castro, Theodore Roosevelt (then vice president) wrote to a German friend: “If any South American country misbehaves toward any European country spank it.” In his first annual message as president a few months later he declared that the Monroe Doctrine gave no guarantee to any state in the Americas against punishment for misconduct, provided that punishment did not take the form of acquisition of territory. When, however, in the winter of 1902–1903, Germany
and Great Britain actually undertook to bring Castro to terms by a “pacific blockade,” anti-German sentiment flared up in the United States, and Roosevelt became alarmed over the possibility that such a situation might produce a serious quarrel between the United States and some European power. The Venezuelan crisis was settled when Castro agreed to submit the question of his debts to arbitration, but no one knew when Venezuela or one of its neighbors might present a new invitation to coercion. It seemed to Roosevelt desirable to find a formula by which all excuses for European intervention in the New World might be removed.

The formula was announced by Roosevelt in 1904, first in May in a letter to Secretary Root, then, in almost identical language, in his annual message of 6 December 1904. As stated in the annual message:

Any country whose people conduct themselves well can count upon our hearty friendship. If a nation shows that it knows how to act with reasonable efficiency and decency in social and political matters, if it keeps order and pays its obligations, it need fear no interference from the United States. Chronic wrongdoing, or an impotence which results in a general loosening of the ties of civilized society, may in America, as elsewhere, ultimately require intervention of some civilized nation, and in the Western Hemisphere, the adherence of the United States to the Monroe Doctrine may force the United States, however reluctantly, in flagrant cases of such wrongdoing or impotence, to the exercise of an international police power.

THE DOMINICAN RECEIVERSHIP

The Roosevelt Corollary of the Monroe Doctrine—so called because it was assumed to follow as a necessary consequence of the doctrine—was to serve, whether expressly mentioned or not, as the theoretical basis for the subsequent establishment of protectorates in the Caribbean. The United States now assumed the role of international policeman—kindly to the law-abiding but apt to lay a stern hand upon little nations that fell into disorder or defaulted on their obligations, since disorder or default, if allowed to continue, might invite intervention from outside the hemisphere. The first application of the new doctrine was in the Dominican Republic.

The government of the Dominican Republic, or Santo Domingo, after that state won its independence from Haiti in 1844, had been a dictatorship generously tempered by revolution. Revolutions were costly, and by 1904 the Dominican debt had grown to a figure—some $32 million—which the national revenues, as administered by native collectors of taxes and customs, were incapable of servicing. The foreign debt was widely distributed. Portions of it were held in France, Belgium, Italy, and Germany. The largest single creditor, representing both American and British capital, was the U.S.-based San Domingo Improvement Company. From time to time, the Dominican government pledged the customs duties at various ports as security for its debts, and the pledges sometimes conflicted. Intervention by the United States on the company’s behalf resulted, in 1903 and 1904, in the San Domingo Improvement Company being placed in charge of the collection of customs at Puerto Plata and Monte Cristi on the north coast. This action brought protests from the European creditors, who claimed that those same revenues had previously been pledged to them. An international scramble for control of the Dominican customhouses threatened, with the possible development of a situation resembling the one in Venezuela that had alarmed Roosevelt a scant two years earlier.
