It was under these circumstances that Roosevelt formulated his famous corollary, which was without doubt intended as a forecast of coming events. With the encouragement of Thomas C. Dawson, U.S. minister to the Dominican Republic, President Morales invited the United States to take charge of the nation’s customhouses and administer the collection of import duties for the purpose of satisfying the creditors of the republic and providing its government with revenue. An executive agreement to this effect was signed on 20 January 1905, but this attempt of Roosevelt to bypass the Senate excited so much criticism that Dawson was instructed to put the agreement into the form of a treaty, subject to ratification in the constitutional manner. The treaty was duly signed and its approval urged upon the Senate by President Roosevelt with reasoning based, like his corollary message, upon the Monroe Doctrine.

Democratic opposition prevented action upon the treaty, but the president, with characteristic determination, put the essence of the arrangement into effect by a new executive agreement, referred to as a modus vivendi, signed 1 April 1905. The Dominican government agreed to appoint as receiver of customs a citizen of the United States nominated by the U.S. president. As
in the proposed treaty, 45 percent of the receipts were to be turned over to the Dominican government; the remainder, less costs of collection, was to be deposited in a New York bank, to be apportioned among the creditors of the republic if the Senate approved the treaty, or returned to the Dominican government if the treaty was finally rejected.

The modus vivendi remained operative for more than two years. During that period the creditors of the Dominican government agreed to a downward adjustment of the debt from over $30 million to $17 million. A new $20 million bond issue was floated in the United States, and the proceeds were applied to the paying off of the adjusted debt and to the execution of needful public works on the island. In February 1907 a new treaty was signed, which the Senate promptly approved through the switch of a few Democratic votes to its support. The treaty, proclaimed 25 July 1907, perpetuated the arrangement under the modus vivendi, with minor modifications. A general receiver of Dominican customs, named by the president of the United States, was to have full control of the collection of customs duties until the $20 million bond issue was liquidated.

The Dominican receivership, under the modus vivendi and the subsequent treaty, produced results. For some four years after the conclusion of the treaty, the republic experienced the unaccustomed blessings of financial solvency and political stability. Then began a new series of revolutionary disturbances that led to a more drastic form of intervention by the United States.

**DOLLAR DIPLOMACY IN NICARAGUA**

The next Caribbean country to receive the “protection” of the United States was Nicaragua. Intervention in Nicaragua, initiated under President William H. Taft and Secretary of State Philander C. Knox in 1912, was a prominent example of the so-called dollar diplomacy usually associated with that administration. Dollar diplomacy had a dual character. On one side, it was the use of diplomacy to advance and protect American business abroad; on the other side, it was the use of dollars abroad to promote the needs of American diplomacy. In the first sense, it was practiced by many an administration before Taft and since.

The employment of American dollars to advance the political and strategic aims of diplomacy was a less familiar technique. There was a hint of it in the Platt Amendment. It was plainly seen in the refunding of the debt and the instituting of the receivership in the Dominican Republic under Theodore Roosevelt. Invoking, as Roosevelt had done, the Monroe Doctrine as their justification, Taft and Knox made a similar arrangement with Nicaragua and sought unsuccessfully to do the same with Honduras and Guatemala.

The setting up of the Nicaraguan customs receivership came at the conclusion of some years of turmoil in Central America, largely the work of the Nicaraguan dictator, José Santos Zelaya. Having lent support to the ousting of Zelaya, Taft and Knox were anxious to bring peace and order to Central America by applying in Nicaragua the same remedy that had some success in the Dominican Republic. They found a cooperative leader in Nicaragua in the person of Adolfo Díaz, who succeeded Zelaya as president in 1911. A businessman who despised militarism and craved order and good government, Díaz was willing to compromise his country’s independence by granting to the United States broad powers of intervention. In 1912, when he was faced with insurrection, the United States, at his request, sent 2,000 U.S. marines to Nicaragua, suppressed the rebellion, deported its leaders, and left a legation guard of one hundred marines that—until 1925—“stabilized” the Nicaraguan government under Díaz and his successors.

Secretary Knox’s attempt, with the aid of Díaz, to set up a customs receivership in Nicaragua by treaty was blocked in the U.S. Senate, but a receivership was established nevertheless by agreement between Nicaragua, certain American banks, and the State Department. A mixed claims commission reduced claims against Nicaragua from $13.75 million to a mere $1.75 million. Another mixed commission was given limited control over Nicaragua’s spending policy. The policy of Taft and Knox was continued by their successors, President Woodrow Wilson and his first secretary of state, William Jennings Bryan. To meet Nicaragua’s urgent need for funds and at the same time to provide for the future canal needs of the United States, the Bryan-Chamorro Treaty, signed 5 August 1914 and approved nearly two years later, provided for a payment of $3 million to Nicaragua in return for the grant of certain concessions to the United States. These included the perpetual and exclusive right to construct a canal through Nicaragua and the right for ninety-nine years to establish
naval bases at either end of the route, in the Corn Islands in the Caribbean and on the Gulf of Fonseca on the Pacific.

The United States also succeeded, not by treaty but by informal agreement with Nicaragua and the bankers, in reducing and simplifying the Nicaraguan debt and in setting up a customs receivership that would see to it that a suitable portion of the national revenue was applied on the debt. Application of the Roosevelt Corollary, implemented by dollar diplomacy and the landing of a few marines, had made Nicaragua secure against any violation of the Monroe Doctrine.

WILSONIAN INTERVENTION

It is ironic that the treaty that consummated the success of dollar diplomacy in Nicaragua bore the name of William Jennings Bryan, for Bryan, out of office, had been a severe critic of dollar diplomacy. Other inconsistencies were to follow. The anti-imperialist Wilson administration (1913–1921), with first Bryan and later Robert Lansing as secretary of state, although promoting independence for the Philippines and self-government for Puerto Rico, imposed upon Haiti a protectorate treaty of unprecedented severity and set up a regime of pure force in the Dominican Republic.

There is perhaps less of a contradiction than at first appears between the new administration's policy in the Philippines and Puerto Rico and its policy toward the independent republics of the Caribbean. The Philippines and Puerto Rico, under American tutelage, had been learning the lessons of democracy and conducting orderly elections in which ballots, not bullets, determined the outcome. Perhaps a few years of American tutelage would suffice to complete the political education of the natives of Haiti and the Dominican Republic, who hitherto had found the bullet a more congenial instrument than the ballot. At the very beginning of his administration, Wilson made it clear that he would frown upon revolutions in the neighboring republics. "I am going to teach the South American republics to elect good men," he remarked with optimism to a British visitor.

Such remarks foreshadowed a new turn in American interventionist policy in which the promotion of democracy would take its place as an objective beside the preservation of the Monroe Doctrine and the protection of the economic and strategic interests of the United States. Unfortu-
and the National Assembly to accept a treaty embodying all the American demands.

The Treaty of 1915 with Haiti went further in establishing U.S. control and supervision than the Platt Amendment treaty with Cuba or the Dominican treaty of 1907 combined. It provided that the top officials should be appointed by the president of Haiti upon nomination by the president of the United States. Moreover, all Haitian governmental debts were to be classified, arranged, and serviced from funds collected by the general receiver, and Haiti was not to increase its debt without the consent of the United States, nor do anything to alienate any of its territory or impair its independence. The treaty was to remain in force for ten years, but a clause permitting its extension for another ten-year period upon either party's showing sufficient cause was invoked by the United States in 1917, thus prolonging to 1936 the prospective life of the treaty.

THE NAVY GOVERNS THE DOMINICAN REPUBLIC

Until 1911, the customs receivership of 1905 and 1907 in the Dominican Republic worked admirably. Under the presidency of Ramón Cáceres (1906–1911), stable government and orderly finance had been the rule: constitutional reforms had been adopted, and surplus revenues had been applied to port improvements, highway and railroad construction, and education. Such a novel employment of the powers and resources of government was displeasing to many Dominican politicians, and on 19 November 1911, Cáceres fell victim to an assassin's bullet. At once the republic reverted to its seemingly normal condition of factional turmoil and civil war, and the necessities incident to the conducting and suppressing of revolutions resulted in the contraction of a large floating debt, contrary to the spirit, if not the letter, of the 1907 treaty with the United States.

Thus, the Wilson administration found in the Dominican Republic a situation as difficult as that in Haiti. Under a plan drafted by Wilson himself and accepted by the Dominican leaders, the United States supervised the 1914 elections. From the new leadership, the United States demanded a treaty providing for the appointment of a financial adviser with control over disbursements, for the extension of the authority of the general receiver to cover internal revenue as well as customs, and for the organization of a constabulary. These demands were rejected as violative of Dominican sovereignty, and in the spring of 1916 the situation went from bad to worse when the Dominican secretary of war, Desiderio Arias, launched a new revolution and seized the capital. On 15 May, U.S. marines landed in Santo Domingo and the country was soon placed under military government. This arrangement lasted six years.

ECONOMIC FOREIGN POLICY DURING THE INTERWAR PERIOD

A consequence of World War I, the significance of which was little recognized save the wartime flow of gold across the Atlantic, was the sudden transformation of the United States from a debtor to a creditor nation. Like other new countries, the United States hitherto had been consistently a borrower. Its canals, railroads, and industry had been built in large measure with capital borrowed in Europe, which it had been enabled to service by an excess of exports over imports. By the end of the century, the United States was also lending or investing money abroad, but in 1914 it was still on balance a debtor, owing Europe from $4.5 to $5 billion against $2.5 billion invested abroad, chiefly in Canada, Mexico, and Cuba.

Early in the war, large quantities of U.S. securities held abroad were sold in New York in order to finance purchases of American war materials by the Allied governments. By the fall of 1915, those governments found it necessary to float a bond issue of $500 million in the United States through the agency of J. P. Morgan and Company, and such borrowings continued until the United States entered the war (1917). The role of lender was then assumed by the U.S. government, which advanced to friendly governments more than $7 billion before the armistice of 11 November 1918, and $3.75 billion in subsequent months. Without counting interest, therefore, the U.S. government at the close of World War I was a creditor to its wartime associates to the extent of $10.35 billion. Although the war impoverished Europe, it brought great wealth to the United States and thereby created a large fund of surplus capital ready to seek investment abroad. By 1928 private investments in foreign lands totaled between $11.5 and $13.5 billion. Acceptance of the new creditor role should have entailed changes in policy, especially tariff policy, which American statesmanship proved incapable of making.
The $10 billion advanced by the United States to friendly governments during and immediately after the war had unquestionably been regarded as loans by both lender and receivers. In the U.S. Congress, a few voices were raised in support of the thesis that the advances should be viewed simply as part of America’s contribution to the war, as a means of enabling others to do what, for the moment, the United States could not do with its own army and navy. There were warnings, too, of the ill will that might result from an American effort to collect the debts from governments that the war left close to bankruptcy. But such pleas and warnings went almost unnoticed, and President Wilson and his advisers rebuffed all proposals for cancellation of the debts or for discussing them at the Paris Peace Conference.

In June 1921, President Warren G. Harding proposed that Congress empower the secretary of the Treasury to negotiate with the debtor governments adjustments of the war debts as to terms, interest rates, and dates of maturity. Congress responded by an act (9 February 1922) creating the World War Foreign Debt Commission, with the secretary of the Treasury as chairman and authorizing it to negotiate settlements on terms defined by the act. No portion of any debt might be canceled; the interest rate must not be less than 4.5 percent, nor the date of maturity later than 1947. The commission found no debtor government willing to settle on these difficult terms. The procedure it adopted, therefore, was to make with each debtor the best terms possible (taking into account in the later settlements “capacity to pay”) and then to ask Congress in each case to approve the departure from the formula originally prescribed.

In this way, between May 1923 and May 1926, the World War Foreign Debt Commission negotiated settlements with thirteen governments. Settlements with Austria and Greece were later made by the Treasury Department. With the exception of Austria, which received special treatment, all the settlements provided for initial payments over sixty-two years. No part of the principal was canceled in practice, and the rates of interest were so adjusted downward that varying portions of the debts were actually forgiven. Comparing the total amounts to be paid under the settlements with the amounts that would have been paid at the interest rate of 4.5 percent originally prescribed by Congress, one finds effective cancellations ranging from 19.3 percent for Finland and 19.7 percent for Great Britain to 52.8 percent for Austria.

THE REPARATIONS PROBLEM

Throughout the debt-settlement negotiations, the European debtor governments argued that payments on the debts should be dependent upon the collection of reparations from Germany. The United States refused consistently to recognize any relation between the two transactions. In American eyes, the Allied governments that had borrowed from the United States—had “hired the money,” as President Calvin Coolidge put it—were under obligation to repay their borrowings regardless of what they might be able to collect from Germany. In actual fact, however, it was obvious that the ability of the Allied governments to pay their debts would be affected by their success or failure in collecting reparations, and it is for this reason the United States took a sympathetic attitude toward efforts to solve the reparations problem.

The peace conference had left to the Reparations Commission the determination of the amount to be paid by Germany. In May 1921 the commission set the figure at 132 billion marks, or approximately $33 billion. Germany accepted the figure under threat of occupation of additional German territory. Annual payments of a minimum of 2 billion marks were to begin at once, with later payments to be adjusted in the light of estimates of capacity to pay and evaluation of payments in kind already made.

Within just fifteen months of the settlement, Germany was in default on the required payments, whether willfully or through inability to meet the schedules. Over British objection (backed by that of the American observer), the Reparations Commission authorized occupation of the great German industrial area of the Ruhr Valley. French and Belgian armies carried out the mandate in January 1923 and held the Ruhr until September 1924. Germany met the occupation with passive resistance, and its economy suffered a prolonged and disastrous inflation. Reparations payments stopped entirely.

In the meantime, Secretary of State Charles Evans Hughes had proposed that a committee of experts study Germany’s capacity to pay and devise a plan to facilitate payments. Late in 1923, all the governments concerned agreed to the suggestion, and the Reparations Commission appointed two committees to study different aspects of the problem. One of the committees was headed by the Chicago banker Charles G. Dawes. The Dawes Plan, which went into effect on 1 September 1924, was admittedly a temporary expedient, providing a rising scale of reparations payments over a period in which it was hoped the German economic and monetary system could be restored to a healthy condition. Germany received an international loan of $200 million. It agreed to make reparations payments beginning at 1 billion gold marks the first year, rising to 2.5 billion in the fifth year and thereafter. Payments would be made in German currency to an agent general for reparations. Thereupon Germany’s responsibility would cease. The problem of converting the marks into foreign currencies would be the responsibility of the Inter-Allied Transfer Committee. No attempt was made to reassess the total or to set a date for the termination of payments.

During the prosperous years 1924 to 1928 the Dawes Plan worked satisfactorily, and by the latter year, the time appeared ripe for an attempt at a final settlement. A new committee headed by another American, the New York financier Owen D. Young, proposed the Young Plan, which was agreed to by Germany and its creditors in January 1930. By the new arrangement, which was intended to make a final disposition of the reparations problem, Germany agreed to make thirty-seven annual payments averaging a little over $500 million, followed by twenty-two annual payments averaging slightly under $400 million. By the end of the fifty-nine years, Germany would have paid altogether about $9 billion of principal and $17 billion of interest—a drastic reduction from the $33 billion of principal at first demanded by the Reparations Commission. Furthermore, the Young Plan clearly recognized the relationship between reparations and war debts through a concurrent agreement (not participated in by the United States) that any scaling down of the debts would bring about a corresponding reduction in reparations. The annuities to be distributed under the plan were so proportioned as to cover the war debt payments to be made by the recipients. As long as Germany continued to pay the Young Plan annuities, the debtor governments would have the wherewithal to satisfy their creditors, of whom the chief was the United States. If general prosperity had continued, the plan would have been workable.
MAKING THE CONNECTION

None of the presidents from Wilson to Franklin D. Roosevelt or the high officials under them evinced any economic enlightenment on the subject. Herbert Hoover stuck to his rigid belief in the sanctity of contracts, and in October 1930 his secretary of state, Henry L. Stimson, rejected the idea of a connection between the Allied war debts and German reparations. But by this time the Great Depression had entered its serious stage, and voices were being raised at home and abroad for a drastic reduction of the debts just as German reparations had been twice reduced. Senator Alben W. Barkley of Kentucky returned from a trip to Europe to announce publicly that the American tariff was a handicap—that there was no possibility that Britain could continue to pay, that “in every circle with which I came in contact, official and unofficial, there was a profound feeling bordering on despair and even bitterness.” Europeans could not understand “our demand that they pay us what they owed us and buy the goods we send them while at the same time denying them the ability to do either by preventing them from selling anything to us.” Barkley’s reference was to the new Smoot-Hawley Act (June 1930), the effect of which was to reduce foreign trade to a trickle. President Hoover had brushed aside warnings of the evil consequences of the bill. Senator Reed Smoot, the principal author, had been a member of the World War Foreign Debt Funding Commission, but to his mind no “good American” would advocate cancellation of the debts or oppose his tariff bill.

The basic economic consequence of the war was to advance the United States to a position of supremacy. Despite the difficulties surrounding the war debt settlements, dollar loans poured from private American banks and investment syndicates on a vast scale, accelerating after 1924 but coming to an almost complete stop in 1930. European governments, municipalities, and private corporations sought and received these loans, paying high interest rates (in dollars) and meeting their war debt installments from the proceeds of these loans. Germany was a leading recipient of American loans and was thus able to pay reparations to the Allies, who in turn were able to pay their American creditors. The source of these extraordinary loans was the profits of American industry in the sale of its products both at home and abroad, and in the abundance of speculative capital-seeking outlets. An open door—or rather, open doors—appeared as if by magic to dazzle the American investor. Latin America, Australasia, Africa, and East Asia obtained dollar loans. The lending process was a continuation of the Open Door policy pursued in China; an attempt by means of loans to capture the world’s markets, but without serious consideration as to how these loans were to be repaid. Actually interest was being paid out of principal, not out of returns on the investment. As secretary of commerce under Coolidge, Herbert Hoover encouraged loans of this type, particularly to South American countries. Criticism, scrutiny, and hints to the naive individual investor to exercise caution were alien to Hoover’s peculiar laissez-faire cast of mind.

When the bubble burst in 1930, total U.S. private long-term foreign investments stood at $15.17 billion, triple the figure in 1919. Germany still routinely made payments on its reparations account, and at least some of the Allied governments were forwarding their installments to Washington. But the principal of the war debts (including the postwar loans) carried on the books of the U.S. Treasury stood at $11.64 billion, which was $120 million more than the total shown at the time the thirteen governments signed the settlement agreements. Supposing that all thirteen had continued to pay principal and interest through the entire sixty-two-year period, the grand total would have exceeded $22 billion. Meanwhile, the fascist dictatorship under Benito Mussolini had installed itself in Italy; and in Germany, the Nazis, now on the high road to power in that country, had promised to repudiate all further reparations payments. Bolshevik Russia had long ago repudiated czarist Russia’s war debts.

By June 1931, Germany, the greatest of the world’s debtors, was near collapse; and while continuing to maintain that debts and reparations were unconnected, Hoover, after assuring himself of sufficient congressional support, proposed a year’s moratorium on all intergovernmental debts. Hoover was at last ready to admit that debt redemption on the part of any country depended upon its capacity to pay, although probably as a political gesture, he again declared his disapproval of cancellation. Hoover’s opponent, Franklin D. Roosevelt, declined to take a position but did not miss his opportunity to ridicule the Republicans for their absurd policy “of demanding payment and at the same time making payment impossible.”

Meanwhile, the Lausanne Agreement (1932) between Germany and its creditors put an end, for
In a speech to the Reichstag on 17 May 1933, Adolf Hitler denounced the Treaty of Versailles because, in part, it had imposed such large reparations payments as to leave Germany in economic shambles.

“All the problems which are causing such unrest today lie in the deficiencies of the Treaty of Peace which did not succeed in solving in a clear and reasonable way the questions of the most decisive importance for the future. Neither national nor economic—to say nothing of legal—problems and demands of the nations were settled by this treaty in such a way as to stand the criticism of reason in the future. It is therefore natural that the idea of revision is not only one of the constant accompaniments of the effects of this treaty, but that it was actually foreseen as necessary by the authors of the Treaty and therefore given a legal foundation in the Treaty itself. . . .

“It is not wise to deprive a people of the economic resources necessary for its existence without taking into consideration the fact that the population dependent on them are bound to the soil and will have to be fed. The idea that the economic extermination of a nation of sixty-five millions would be of service to other nations is absurd. Any people inclined to follow such a line of thought would, under the law of cause and effect, soon experience that the doom which they were preparing for another nation would swiftly overtake them. The very idea of reparations and the way in which they were enforced will become a classic example in the history of the nations of how seriously international welfare can be damaged by hasty and unconsidered action.

“As a matter of fact, the policy of reparations could only be financed by German exports. To the same extent as Germany, for the sake of reparations, was regarded in the light of an international exporting concern, the export of the creditor nations was bound to suffer. The economic benefit accruing from the reparation payments could therefore never make good the damage which the system of reparations inflicted upon the individual economic systems.

“The attempt to prevent such a development by compensating for a limitation of German exports by the grant of credits, in order to render payments possible, was no less short-sighted and mistaken in the end. For the conversion of political debts into private obligations led to an interest service which was bound to have the same results. The worst feature, however, was that the development of internal economic life was artificially hindered and ruined. The struggle to gain the world markets by constant underselling led to excessive rationalization measures in the economic field.

“The millions of German unemployed are the final result of this development. If it was desired, however, to restrict reparation obligations to deliveries in kind, this must naturally cause equally serious damage to the internal production of the nations receiving them. For deliveries in kind to the amount involved are unthinkable without most seriously endangering the production of the individual nations.

“The Treaty of Versailles is to blame for having inaugurated a period in which financial calculations appear to destroy economic reason.

“Germany has faithfully fulfilled the obligations imposed upon her, in spite of their intrinsic lack of reason and the obviously suicidal consequences of this fulfilment.

“The international economic crisis is the indisputable proof of the correctness of this statement.”

ment in default on its debts. Although this is what Johnson intended to do in the bill, the act as passed applied only to World War I debts owed to the U.S. Treasury. As Harry Dexter White pointed out to Treasury Secretary Henry Morgenthau, this left open the door to public lending to Latin American states and others that defaulted on private debts only. And the act did not apply to Export-Import Bank loans, though members of Congress frowned on lending the bank’s funds to governments in default on their private debt. The Johnson Act had no practical effect; no foreign nation offered to resume payments, and none of those at whom the act was pointed was in the market for further American credits.

LEND-LEASE

The reparations experience had a marked affect on the way in which the United States provided the bulk of its aid to nations fighting the Axis powers in World War II. Under the provisions of the Lend-Lease Act (1941) and in lieu of credits and loans, the United States supplied to more than thirty-eight nations whatever goods were certified by President Franklin D. Roosevelt as “in the interests of national defense.”

After reelection in 1940, the president received from Prime Minister Winston Churchill a long letter setting forth Great Britain’s financial straits. That nation was scraping the bottom of the barrel to pay for goods already ordered and would need “ten times as much” for the extension of the war. Churchill hoped that Roosevelt would regard his letter “not as an appeal for aid, but as a statement of the minimum action necessary to achieve our common purpose.” The problem, as Roosevelt saw it, was how to aid England in the common cause without incurring such a breeder of ill-will as the war debt problem after World War I. After brooding over the matter for days during a Caribbean cruise on the cruiser Tuscaloosa, he came up with the ingenious idea of lending goods instead of money. He wanted, as he told a press conference, to get away from that “silly, foolish old dollar sign,” and he compared what he proposed to do to lending a garden hose to a neighbor to put out a fire that might otherwise spread to one’s own house.

In his “fireside chat” radio broadcast on 29 December 1940, Roosevelt depicted the United States as the “arsenal of democracy,” and in his message to Congress a few days later, he made official the proposal that resulted in the Lend-Lease Act of 11 March 1941. The act, the complete negation of traditional neutrality, empowered the president to make available to “the government of any country whose defense the President deems vital to the defense of the United States” any “defense article,” any service, or any “defense information.” “Defense articles” might be manufactured expressly for the government that was to receive them, or they might be taken from existing stocks in the possession of the United States. Launched on a modest scale, the lend-lease program eventually conveyed goods and services valued at more than $50 billion to the friends and allies of the United States in World War II, and it left in its wake no such exasperating war debt problem as that of the 1920s.

Against the $50 billion of lend-lease aid furnished by the United States, it received approximately $10 billion in so-called reverse lend-lease from its allies. After the war the United States negotiated settlement agreements with most of the recipients. In general, the agreements stipulated that lend-lease materials not used in the war should be returned or paid for, but the settlements were also shaped by the proviso written into the original lend-lease agreements, that final settlement terms should “be such as not to burden commerce but to promote mutually advantageous economic relations . . . and the betterment of worldwide economic relations.” Within a decade of the war’s end, settlement agreements totaling more than $1.5 billion had been negotiated, on which $477 million had been paid. The Soviet Union, which had received $11 billion, did not settle its account until 1990, in the glow of glasnost and the end of the Cold War, eager to qualify for U.S. credits.

UNILATERAL FOREIGN ASSISTANCE: AID, GRANTS, AND LOANS

The first notice of a new American foreign economic policy that recognized aid as an integral part of its overall approach to the world came on 12 March 1947, when President Harry Truman went before Congress to ask for $400 million in military and economic aid for Greece and Turkey. Since 1945 the royal government of Greece had been struggling against communist forces within, aided by heavy infiltration from Greece’s three northern neighbors, all satellites of the Soviet Union. Great Britain, which had been aiding both
Greece and Turkey, informed the United States in February 1947 that it was no longer able to do so. Truman promptly accepted the responsibility for the United States. In asking authority and funds to assist Greece and Turkey, he propounded a general principle that came to be called the Truman Doctrine: “I believe that it must be the policy of the United States to support free peoples who are resisting attempted subjugation by armed minorities or by outside pressures.”

President Truman’s proposal met a general favorable response in America, though some critics thought its scope was too broad. Congress acted after two months of debate. An act of 22 May 1947 authorized the expenditure of $100 million in military aid to Turkey and, for Greece, $300 million to be equally divided between military and economic assistance. The act also empowered the president to send military and civilian experts as advisers to Greece and Turkey. American aid thus begun and continued from year to year proved effective as a means of “containment” in that quarter. But the Truman administration moved quickly to assume broader responsibilities.

To Europe as a whole the danger from communism lay principally in the economic stagnation that had followed the war. Western Europe in the spring of 1947 was facing catastrophe after a severe winter. Food and fuel were in short supply, and foreign exchange would be exhausted by the end of the year. Large communist parties in France and Italy stood ready to profit from the impending economic collapse and human suffering.

The best protection against the spread of communism to western Europe would be economic recovery. On this reasoning, Secretary of State George Marshall, speaking at the Harvard commencement on 5 June 1947, offered American aid to such European nations as would agree to coordinate their efforts for recovery and present the United States with a program and specifications of their needs. Congress established the Economic Cooperation Administration to handle the program in April 1948 and at the end of June appropriated an initial $4 billion for the purpose. Thus was launched the Marshall Plan, or European Recovery Program, which was to continue for three years, cost the United States nearly $13 billion, and contribute to an impressive economic recovery in Europe.

The Marshall Plan was designed to aid in the recovery of nations with advanced economies that had been dislocated by the war. But communism was also a threat among the poverty-stricken masses in countries of Asia, Africa, and Latin America, where the modern economy had made little or no progress. The containment of communism required measures to raise the standard of living in countries such as these. It was with this purpose in mind that Truman, in his Inaugural Address of 20 January 1949, proposed his “Point Four,” or Technical Assistance program: “We must embark on a bold new program for making the benefits of our scientific advances and industrial progress available for the improvement and growth of underdeveloped areas.” The Point Four program got under way in 1950 with a modest appropriation of $35 million. Authorized expenditures for the next three years nearly totaled $400 million.

To stimulate the flow of private capital that hopefully would supplement government-to-government loans and grants, the legislation creating the Marshall Plan also called for establishing the Investment Guaranty Program. Initially, the agency issued insurance contracts for investments in Europe against the possible inconvertibility of local currency; in 1950 the coverage was extended to loss through expropriation or confiscation. As a result of the Korean War, U.S. foreign aid programs shifted in emphasis in 1951 from economic to military aid, thus increasing the importance of private U.S. overseas investment. In that vein, the Mutual Security Acts of 1951 (amended in 1953) and 1954 expanded the focus to guarantees to certain friendly developing countries. After several mutations, including a stay in the Agency for International Development, the guaranty program in 1969 was reestablished as the Overseas Private Investment Corporation and placed under the jurisdiction of the secretary of state. The program history over three decades appears to have been both a substantial inducement to private investment and, because of the fees charged, a profitable undertaking for the government.

**MULTILATERAL FOREIGN LOANS**

The Bretton Woods Conference of 1944, also known as the United Nations Monetary and Financial Conference and chaired by Secretary of Treasury Henry Morgenthau, ushered in a new era of international monetary cooperation. Designed to abolish the economic ills believed to be responsible for the Great Depression and World War II, it brought together delegates from most of the Allied
nations. From the conference came recommendations to establish a new international monetary system and to make international rules for an exchange-rate system, balance-of-payment adjustments, and supplies of reserve assets. The conference’s proposals led forty-five nations to establish the International Monetary Fund (IMF) in 1945 and the International Bank for Reconstruction and Development, or World Bank, in 1946. (Membership in the IMF is a prerequisite to membership in the World Bank. Traditionally, the managing director of the IMF is a European, whereas the president of the World Bank is an American.)

The IMF, the brainchild of Harry Dexter White, had as its chief purpose restoring exchange-rate stability in the countries that had been in the war and then to promote international monetary cooperation and the expansion of world trade. It was to provide short- to medium-term monetary assistance to member states experiencing balance-of-payments deficits and to prescribe methods by which recipient nations would be able to eliminate their deficit positions. The IMF has played a significant role in facilitating the growth of the world economy, but it has not been without its critics, who have argued that it imposes inflexible and onerous conditions on individual nations who are having difficulties in meeting their payments. They have charged that the IMF shows little consideration for differences in types of economies; that some of the stabilization programs offer no hope of permanent adjustment; and that the fund is often more interested in short-term, painful, quick-fix programs that do not address the fundamental problems. The latter complaint is bolstered by an examination of the fund’s policies during the Yugoslavia crisis in the later 1980s and its failures in meeting the needs of the Haitian crisis of the 1990s. Additionally, critics have complained that the IMF is biased against socialism and favors the free-market approach. While this charge may be debated, it does appear that strategic and political concerns have led the United States to lobby the IMF for increased leniency in the rescheduling of debts for Latin American countries, especially Mexico.

The World Bank’s purpose, after initially emphasizing the reconstruction of Europe after World War II, has been both to lend funds to nations at commercial rates and to provide technical assistance to facilitate economic development in its poorer member countries. Essentially, the World Bank was designed to complement the IMF’s short-term focus with longer-term developmental goals. It would provide loans aimed at encouraging the development of new, productive resources in countries facing a deficit—especially those resources for which there were reliable foreign markets. The bank’s charter stated that it was to promote foreign investment for development through loan guarantees; it was also to supplement private investment in projects it viewed appropriate when other sources of financing were lacking.

The World Bank obtained funds from four sources: capital subscriptions of its member countries, capital market borrowing, loan repayments, and retained earnings. In terms of its financial practices, the bank has had an excellent performance history in that it has earned a profit every year since 1948. In fiscal year 1991, it earned a net income of nearly $1.2 billion on loans in forty-two currencies of some $90 billion.

Robert S. McNamara, president of the World Bank from 1968 to 1981, shifted its goals from concentrating on infrastructure to the alleviation of poverty—the meeting of basic human needs. His successor, A. W. Clausen, a former president of the Bank of America, changed the World Bank’s focus in the early 1980s toward reducing the role of state in the economy and the possibilities of privatizing state-owned enterprises. By the end of the 1980s, the bank had shifted again and now began emphasizing the role of women in development and the idea of sustainable development and the environment.

As with the IMF, the World Bank has generated its share of criticism. There were complaints that the two were not coordinating their activities and in some instances actually weakened the fiscal basis of their debtor states. Also, critics have pointed out the bank’s efforts to reduce the role of state in the economy—in the belief that it would produce greater efficiency and better economic performance—often did not address the root problems. But it was the bank’s difficulties in dealing with debt crises, beginning in the early 1980s, that have prompted the most complaints.

THE INTERNATIONAL DEBT CRISES

From the end of World War II to the 1973–1974 oil crisis, governments gave and loaned to other governments in various ways, but increasingly through international institutions. Defaults were rare. However, the oil crisis resulted in an increase in oil prices that led to the sudden availability of vast sums of “petrodollars” that banks desired to
lend, often unwisely, and developing countries eagerly accepted. For example, the bank-held debt of non-oil developing countries increased from $34.5 billion in 1975 to $98.6 billion in 1982, with U.S. banks holding 36.7 percent of the loans.

With the Polish debt crisis of 1981 and Mexican crisis in 1982, the lending stopped abruptly, and since 1982 capital has flowed back from debtors to creditors, impairing the future of developing nations. In the early stages of the crises, at least nine large U.S. banks would have become insolvent if all of their foreign governmental clients had defaulted on their loans. By 1985 the severity of the crisis had passed for the creditor nations; however, the crisis was not over for developing countries, still confronted with staggering debts, who saw their standards of living decline significantly and found little hope for future relief.

Since the early 1980s, the heavily indebted developing nations have been involved in extensive financial negotiations with their international creditors. In 1992 the IMF was managing arrangements with fifty-six countries, twenty-eight in Africa, but the total number of agreements involved in the extraordinarily complex negotiations was much larger. These bilateral and multilateral debt rescheduling and adjustment undertakings involved widely disparate parties, often with contradictory objectives, which included international financial institutions (such as the IMF, the World Bank, and the creditor clubs in Paris and London), plus a number of transnational banks and official aid agencies of the major creditor nations. While most Latin American debtor countries had borrowed heavily from private, transnational banks, most of the African countries had loans from official bilateral and multilateral agencies. And the debt problem varied greatly. For some nations it was a question of short-term financial liquidity; for others it was more a matter of basic financial solvency. As a result of these negotiations, a global debt regime evolved with most developing countries undertaking substantial economic reforms, but it was not evident that these reforms, by themselves, would deal with the problems.

In 1982, Mexican credits accounted for 41 percent of the total combined capital of the nine largest U.S. banks, threatening their existence should Mexico default on its repayments. In August, when Mexico did not have the $2 billion needed to meet its repayment schedule, Secretary of the Treasury James Baker's staff arranged for $1 billion from the Commodity Credit Corporation to guarantee purchases of U.S. agricultural surpluses. The second billion came in a complicated package from the Department of Energy for future oil deliveries to the Strategic Petroleum Reserve, for which Mexico ended up paying roughly 30 percent interest. The Reagan administration also provided Brazil with $1.2 billion in additional loans to allow it to meet its repayment schedules. Two other U.S. allies, Turkey and the Philippines, both of which faced defaulting on their loans, benefited from loan packages worked out with the United States and the IMF. The United States, aiming to rescue American banks from their overexposure, had put forward a number of plans—most notably Baker's plan (1989)—which sought to lend without incurring loan writeoffs.

The 1990s saw a continuation of international financial problems. When Mexico again needed financial assistance in 1994, President William Clinton arranged for loan guarantees amounting to some $25 billion despite considerable congressional resistance. In 1997 and 1998 currency speculators disrupted the financial systems of Thailand, Indonesia, South Korea, Malaysia, the Philippines and Taiwan, and eventually impacted the American economy. With U.S. support, the IMF was able to stabilize the situation.

By the end of the 1990s many people believed that the problems of the huge debt being carried by developing countries was threatening the survivability of the creditor nations. This concern was reflected in the popular protests against the World Trade Organization, the IMF; and the World Bank in Seattle, Washington (November 1999), Washington, D.C. (April 2000), and Prague, Czechoslovakia (September 2000). The protestors argued that the developed nations were draining the developing countries of the natural resources without adequate compensation and incurring an ecological debt. They contended that this debt should be used to pay the financial debts incurred by developing nations and owed to the IMF and World Bank.

CONCLUSION

The impact of the experiences of trying to collect World War I war debts had led to the employment of lend-lease in World War II and to a grant system during the Cold War. The United States no longer wanted its foreign policy mired in the business of debt collection or to have the issue of
debts cloud its relations with other nations. In 1953 the Point Four program was placed, with other forms of foreign aid, under the Foreign Operations Administration. The so-called foreign aid appropriated annually and intended for friendly nations included aid for economic development and military assistance—which often was the larger package—in the form of grants. While somewhat diminished, grants of economic aid and military support continued into the post–Cold War decades.

The loans and extension of credits by the IMF and World Bank, as well as American banks, gradually came to play a major role in providing loans to developing nations. Indeed, the amount of these loans had become so large and burdensome in the post–Cold War decades that by the end of the century a movement had developed which asked, with modest success, that the wealthier nations agree to “forgive” substantial portions of these obligations.

Mandates and trusteeships have played an important role in the evolution of U.S. diplomacy and perceptions of the foreign policy process. After World War I, the mandate system was introduced at the insistence of President Woodrow Wilson, who believed that indigenous populations in the areas held under colonial rule should be brought either to independence or under benevolent tutorship of the powers holding sway over them. This was part of Wilson’s dream to replace the monarchies with democratic republics. Very few new nations actually evolved from the mandate system, and it remained for the trusteeship council emergent from the United Nations structure after World War II to carry on what Wilson began. The mandate name was abandoned in favor of trusteeships in order not to have the stigma of the moribund League of Nations to carry in its baggage. By the end of the 1990s, the membership of the UN reached 187 nations due largely to the work of the trusteeship council’s bringing them to nationhood.

LEAGUE OF NATIONS MANDATES

President Woodrow Wilson presented the text of the Covenant of the League of Nations to the Paris Peace Conference on 14 February 1919. He explained to his colleagues that they would find incorporated in the document an old principle intended for more universal use and development—the reference was to mandates for former colonies. In this fashion the mandate system became a part of the new world that Wilson imagined would emerge from the deliberations in Paris. Mandates developed historically from the practice of great power supervision of areas subservient to the controlling power usually adjacent to that power’s territory; acceptance of British, French, and American conceptions of the rule of law and colonial freedom and self-government; Edmund Burke’s suggestion of the trusteeship principle in administering British colonies in the interest of the inhabitants, taken to heart and subsequently expanded by Parliament after the American Revolution; and the Concert of Europe concept, in which Prince Metternich of Austria attempted to create a conservative coalition to preserve stability and prevent revolutionary changes in Europe at the end of the Napoleonic wars, and its application to former Turkish and French holdings in Africa and the Near East. While the principle may have been old, Wilson’s perception of it was new because he wished to universalize it.

Although the British and French delegations at Paris did not oppose the mandate system, they were not in the forefront of those demanding it. Nor were they particularly eager to accept Wilson’s freewheeling interpretation of the general mandate system as applying to any and all former enemy colonies. The Japanese and Italian representatives were even less enthusiastic about mandates that might restrict their control of former German colonies. They preferred a division of territory. The Americans were insistent that former enemy colonies would not be treated as spoils of war. In a meeting of the Council of Ten on 28 January 1919, the mandatory principle was discussed. Vittorio Orlando of Italy asked how the former colonies should be divided, what provisions should be made for government, and what should be said about independence. Baron Shinken Makino of Japan asked whether mandates had been accepted, and Georges Clemenceau of France responded that the question was to be taken up later. Wilson would not permit the subject to be buried, so the British prime minister, David Lloyd George, presented a proposal for defining mandates on 30 January 1919, suggesting a division into three types—ultimately defined as A, B, and C mandates. Without citing specific locations, it is sufficient to observe
that most of Africa, part of the Middle East, and
most of the Pacific island groups were considered
to be in one of the categories: A—mandates quickly able to be prepared for independence; B—
mandates needing tutelage for some time before
being considered for independence; and C—man-
dates that probably would never be ready for
independence.

Wilson's associates at Paris hoped for U.S. participation in the postwar enforcement of the Versailles settlement and did not feel they could strongly oppose him on the mandate issue. Many members of the conference sincerely believed that the mandate system might work, but that it had to draw on existing experience in the colonies and should not promise too much to peoples who could not in the foreseeable future be prepared for nationhood and full citizenship rights. Wilson agreed that in some cases this would be true, but he was less restrictive in the number of former colonies he would place in this category than were some of his colleagues.

There was a tendency at the peace confer-
ence to identify someone else's mandates as ready
to be placed in the category reasonably close to
independence with minimum preparation rather
than one's own. Lloyd George, for example, saw
most of the colonies being assigned to Great Britain and British Commonwealth nations as
more suitable for either direct annexation or
deferral. South-West Africa (Namibia), he argued,
should be annexed to South Africa because it was
not likely to proceed to independence; and South
Africa would be better able to care for the people
of South-West Africa under South African laws
and tax structure. Papua might better be classed
as an area that would never be self-governing, and
therefore should be permanently assigned to Aus-
tralia. He could visualize French mandates in
northern Africa being prepared for independence.
Clemenceau, however, was more inclined to see
British mandates as nearing preparation for inde-
pendence. In effect, then, the mandate system
would only be as good as the determination of the
powers in the league to carry it out.

Woodrow Wilson was the master planner
for the mandate system, but the man responsible
for laying out the detailed plans of the process
was General Jan Christian Smuts of South Africa.
The process began with Wilson's Fourteen Points,
drawn up by the journalists Walter Lippmann and
Frank Cobb under the general supervision of
Colonel Edward House. They read through the
president's statements of war aims and compacted
them into the program that Wilson set forth in an
address to Congress on 8 January 1918. Point 5
called for "A free, open-minded, and absolutely
impartial adjustment of all colonial claims, based
upon a strict observance of the principle that in
determining all such questions of sovereignty the
interests of the populations concerned must have
equal weight with the equitable claims of the gov-
ernment whose title is to be determined." It was
made clear in the Council of Ten discussions at
Paris, partly because of British fears concerning
the Irish and Indian independence claims, that
colonial questions would be restricted to colonies
belonging to Germany or coming into being as a
result of the war. In practical terms this meant
that mandates applied only to the German African
and Far Eastern holdings and the non-Turkish
parts of the former Ottoman Empire.

Secret treaties signed before or during the
war had divided these territories among the victo-
rious powers except the United States, which was
not a party to them. Wilson went to Paris det-

t ermined to set aside these treaties and for that pur-

ose had formulated Point 1 of the Fourteen
Points, which called for "open covenants of
peace, openly arrived at, after which there shall be
no private international understandings of any
kind but diplomacy shall proceed always frankly
and in the public view."

General Smuts set to work to carry out the
mandates charge embodied, at Wilson's insis-
tence, in Article 22 of the League Covenant. The
article made it clear that certain of the Turkish ter-
ritories were ready for nationhood almost imme-
diately, that central African peoples needed
mandatory powers that would guarantee their
human rights and political and moral tutelage,
and that the open door to trade would apply in all
mandates. It also determined that South-West
Africa and certain of the Pacific islands, because
of the sparseness of population, isolation, size,
and other circumstances, could best be adminis-
tered under the laws of the mandatory and as
integral portions of its territory, with safeguards
for the well-being of the inhabitants supervised
by the Mandates Commission. The Permanent
Mandates Commission, the later official title of
the commission, was to receive annual reports
from mandatory powers and complaints relative
to the treatment of inhabitants. The reports and
complaints were to be sent to the League Council
for deliberation.

Wilson met his first defeat on the mandate
issue when his allies refused to consider turning
mandates over to the administration of small neutral nations. The distribution followed the pattern of the secret treaties, with some other powers added to the list. Motives concerning the possession of mandates were mixed. Some Japanese saw mandates as preludes to annexation or as convenient means to establish secure military and market areas, while others saw them as symbolic of great power status and the promise of a stronger position in the future whether the system worked or not. The open door to trade and the defense of colonial peoples, plus democratization of the world, were the primary American objectives. British, French, and Belgian motives shaded to a greater or lesser degree along the lines of Japanese thinking. “Little England” advocates, who supported reduction in the size of the British Empire and a refocusing on trade expansion, were relieved to see the lessening of colonial responsibilities, while the imperial advocates were alarmed but convinced that the empire could hold together and peace could be secured while the United States participated in the peacekeeping system. France and Belgium were pleased to see the diminution of German power and could live with mandates if that were the result.

Japan proved a special case because it had emerged as a great power at a time when the main symbol of such status—empire—was on the decline. Japanese ambitions in China were set in the old imperial structure. During the war Japan secured a position as a major force in colonial exploitation of China as a result of the Twenty-one Demands presented to China, only to encounter demands for surrender of these privileges at the end of the war. Lloyd George and Clemenceau sided with Japan. This, combined with Japan’s threat not to join the League of Nations, forced Wilson to accept the assignment of German rights in Shantung to the Japanese—but with a pledge to return the province to full Chinese sovereignty with only the former German economic privileges remaining to them; Japan was also given the right to establish a settlement at Tsingtao (Qingdao). Thus, Wilson’s hopes for an anticolonial postwar structure were already on shaky ground.

Some scholars have argued that the Allies were not sincere in adopting the mandate process and intended to use it as a subterfuge for expanding colonial control. While in some instances this proved to be true, generally the mandates were administered in the interest of the people concerned and a large percentage of the Class A mandates were moved into independence. Most of these were in the former Ottoman Empire, such as Trans-Jordan, Syria, Palestine, and Lebanon. Wilson’s charge to the peace conference in the plenary session of 14 February 1919 was only partially observed; but his expectations on mandates were more fulfilled than in most other areas of the Fourteen Points. Wilson told the conference members that they were “done with annexation of helpless peoples,” and henceforth nations would consider it their responsibility to protect and promote the interests of people under their tutelage before their own interests. It would remain for the United Nations, not the League of Nations, to carry out this promise.

Often overlooked in judging Wilson’s objectives are the underlying premise and promise that he undertook to deliver as a result of American participation in the war—making the world safe for democracy. Success meant the elimination of the monarchical and colonial systems. Wilson envisioned the states that were to emerge from the mandate system as democratic republics.

UNITED NATIONS TRUSTEESHIPS

The United States entered the era following World War II with the same idea and again faced opposition from its allies. President Franklin D. Roosevelt attempted in the Atlantic Charter to reestablish the framework for bringing the colonial peoples of the world to free government. The ramifications of this were not lost on British Prime Minister Winston Churchill, who at one point, in a fit of pique, told Roosevelt that he did not become his majesty’s first minister in order to preside over the disintegration of the British Empire. Soviet Premier Josef Stalin, on the other hand, was ready with his own interpretation of what free government meant; it included only the right to be a communist state, insofar as the Soviet Union had the military power to ensure such determination of national sovereignty.

President Roosevelt, as a follower of President Wilson’s view of dependent peoples, spoke frequently to the issue of independent states in his foreign policy pronouncements of the 1930s. He attempted to promote a new relationship away from the orientation of his predecessors in his Good Neighbor policy in Latin America. His focus was on the preservation and expansion of democracy; and, in the vein of Wilson’s Fourteen Points, he set forth war aims in the Atlantic Charter and
his Four Freedoms speech. In the former, he persuaded his allies to agree to the principle of self-determination, and in the latter, he attempted to promote freedom of speech, religion, and from fear and want, which he related to his Atlantic Charter objectives. He irritated Churchill by his inclination to encourage the Indians by trying to contact Gandhi while the Indian leader was incarcerated and tried to establish rapport with such leaders in the Middle East as King Saud of Arabia. Also, he tried to convince the French and British to withdraw from their colonial holdings in the Far East.

The concept of trusteeship appeared first in discussions of the Big Three at Yalta in 1945 but was also discussed in general form in the Department of State during the war. It was agreed at Yalta that trusts would be set up under United Nations auspices, with decisions being made on the general procedure by the five powers having permanent seats on the Security Council. (Trusts were substituted for mandates in order not to have any carryover from the moribund League of Nations and because they were to have a broader definition.) Trusteeships would apply only to territories still under mandate in 1939, areas detached from the defeated enemies, or territories voluntarily placed under the system, with the specific geographic areas to be determined later.

John Foster Dulles represented the United States on the Fourth Committee at the twenty-seventh plenary meeting of the United Nations in 1945, which was charged with developing the trusteeship system. Dulles followed Wilson in his challenge to the colonial system, proclaiming that the committee was determined to assume the responsibility for boldly addressing the whole colonial problem, which involved hundreds of millions of people, not just the 15 million who might come under trusteeship. He presented a clarion call for the destruction of colonialism. The anticolonial thrust initiated by Dulles in the name of the committee became a part of the United Nations trusteeship system and continued over the next fifty-five years, implementing Wilson's dreams beyond his expectations and with results not imagined in his time. According to Alger Hiss, the State Department official who in 1948 would be accused of being part of a communist spy ring, there is considerable irony in the wholehearted support for the trusteeship system outlined by the United States at San Francisco. Hiss recalled that Churchill was skeptical of the operation and that Secretary of State Edward R. Stettinius turned to Hiss and told him to explain it to Churchill. Hiss off the top of his head set forth the structure of the trusteeship system, and Churchill put his okay on it. Thus, Dulles adopted as gospel a plan put forth by Hiss, whom he later treated as a pariah. There emerged such a myriad of states in Africa, the Near East, and Asia, with differing national objectives and systems, as to boggle the minds of those who originated the mandate system and its objectives.

Chapter 4 of the report of the United Nations Preparatory Commission ordered the Fourth Committee to deal with trusteeships in the interest of the trust peoples. Accordingly, the committee outlined the rules and procedures, including creation of the Trusteeship Council. While this looked very good to the creators of the trust system, reservations appeared immediately, including objections from U.S. Army and Navy spokesmen, who urged outright annexation of the strategic Pacific islands taken from the Japanese. The president and the Department of State proposed a compromise based on the anticolonial position in Articles 82 and 83 of the charter. As primary sponsor of the trusteeships, the United States could scarcely reserve certain areas for annexation. Article 76 sets forth the provisions and restrictions applying to trustee powers and includes procedures leading to independence, representative government, and economic development. It was overridden at the San Francisco conference establishing the United Nations, however, by insertion of articles 82 and 83 of the charter. These articles provide that areas within trust territories might be set aside as “strategic areas” under the direct control of the trustee, which is answerable to the Security Council, where the veto power applies, instead of to the General Assembly, where it does not apply. In this fashion Micronesia—comprising the Marshall, Caroline, and Mariana islands, but not the Gilbert, Nauru, and Ocean islands administered by Australia and the United Kingdom—became the strategic area of the Pacific under U.S. supervision.

CONCLUSION

The trust principle seems to work more effectively for the objectives established in the Charter of the United Nations than did the mandate system under the League of Nations, because the Trusteeship Council is composed of those determined to carry it through and because it is under constant public scrutiny. Regular and voluminous
MICRONESIA: THE ROAD TO SELF-GOVERNANCE

By the mid-1970s, the complex process of negotiating the eventual end of the U.S.-supervised Trust Territory of the Pacific Islands was well underway. The UN Trusteeship Council report in the July 1974 issue of the UN Monthly Chronicle noted the council’s concern as discussions between the United States and the Micronesian congress continued to be oriented toward the choice of free association for six districts represented in the congress. The district comprising the northern Marianas engaged in separate negotiations concerning commonwealth status under United States sovereignty. Reported discussions between representatives of the Marshall Islands and the United States also disturbed the council, which wondered how they would affect the inhabitants of the Carolines. Micronesia’s landmass was only about 700 square miles, comprising more than 2,000 islands in the three major archipelagoes and spanning some 3 million square miles of ocean. The northern Marianas’s apparent movement toward becoming the first territory acquired by the United States since the purchase of the Virgin Islands in 1917 was considered by the Trusteeship Council to be a literal violation of the trust arrangement intended to keep Micronesia together as an integral unit.

Members of the Trusteeship Council insisted that the United States should not proceed with incorporation of the area unless satisfactory arrangements were made with the Micronesian congress. The congress agreed to separate discussions, and a commonwealth agreement was signed on Saipan in February 1975, climaxing two years of formal negotiations; it was then to go to the sixteen-member Marianas district legislature for approval. In June 1975 the agreement was submitted to a United Nations–administered plebiscite, which was overseen by a committee of the Trusteeship Council. The council reported that it was properly conducted and that the results, which favored joining the northern Mariana Islands to the United States by commonwealth status, represented the will of the people. The islands were to be self-governing, and when all steps were carried out to accomplish this, the Trusteeship Agreement would be terminated for the entire Trust Territory as well as for the northern Marianas.

In 1979 four districts (Kosrae, Pohnpei, Truk, and Yap, in the Carolines) established themselves as the new Federated States of Micronesia (FSM), while two other districts formed republics, the Marshall Islands (1979) and Palau (1981). In 1986 the United States declared that the Trust Territory was terminated, and though the Soviet Union blocked UN Security Council approval of this measure, it was approved by the UN Trusteeship Council. In 1994 Palau became, like the FSM and Marshall Islands, a self-governing sovereign state with the United States responsible for its defense.

reports from the Trusteeship Council had dwindled to pamphlet size by 1972. By 1975 the last two trust territories, Papua New Guinea and Micronesia, were determining their course toward independence or other disposition. In all, eleven trusteeships had originally been assigned to the council. The other nine had been Nauru, Ruanda-Urundi, French Cameroons, French Togoland, Italian Somaliland, Western Samoa, British Cameroons, British Togoland, and Tanganyika. From the trusteeships or released territories, ten nations had emerged in 1947, several in the 1950s, fourteen in 1960, and others later. Very often the result has not been satisfying, for the virulent nationalism exhibited by the new states has mirrored the worst traits of their older counterparts. Many celebrated nationhood by immediately sinking into anarchy or by trying to annex neighbors in wars of “liberation.”

If success for the mandates and trusteeships is measured in terms of achieving independence, the trusteeship system obviously has been more successful. If it is measured in terms of achieving economic, political, and cultural development before nationhood, perhaps the more cautious approach of the mandate system has provided better results. In any case, the net result was that colonialism of the old order, with direct control of territory and people, and with no pretense of self-government, was dead by the end of 1975.

The objective of creating a nation-state system of democratic republics operating on a constitutional structure with governments of, by, and for the people—Woodrow Wilson’s dream—is far
from achievement. The most orderly and stable transitions came in the states that emerged from territories formerly under British control, where the population was generally educated for self-rule. Trust territories where there was literally no preparation for self-rule and independence emerged with bloody struggles for power and unstable systems of government. In a considerable measure this result arose from the failure of mandate and trusteeship powers to take seriously their charge to use all deliberate speed to prepare the populations for independence. All too often, however, the period of preparation was too short; and in some instances the viability of the states created might be questioned in terms of their ability to become economically self-sufficient. For better or for worse, the states now exist, and the next problem for them is to learn some degree of tolerance for one another and to curb the excesses of nationalism thus far exhibited.

Near the turn of the twentieth century, Secretary of War Elihu Root told a Chicago audience: “We are a peaceful, not a military people, but we are made of fighting fiber and whenever fighting is by hard necessity the business of the hour we always do it as becomes the children of great, warlike races.” Theodore Roosevelt's admonition, “Speak softly and carry a big stick,” says it more succinctly, and the great seal of the United States with an eagle clutching both an olive branch and thirteen arrows expresses the idea symbolically. The history of the United States offers many examples of the nation at peace and war, speaking softly while carrying a big stick. But does one characteristic dominate?

Although the nation's rise to imperial size and world power during the twentieth century may suggest military influence, historians do not agree among themselves. Samuel Flagg Bemis, a distinguished diplomatic historian, described manifest destiny as a popular conviction that the nation would expand peacefully and by republican example; it was not, in his view, predicated on militarism. During the expansionist period (excepting the Civil War), the army and navy were small and there was no conscription. Dexter Perkins, another distinguished historian of the same generation, would agree with this interpretation. The United States completed its continental domain, he said, with less violence than usually accompanies such expansion. Perkins believed that Americans have only reluctantly recognized the role of power in international affairs and that they desire a reduction of armaments compatible with national security. Undoubtedly influenced by Cold War events, particularly intervention in Vietnam, many writers have challenged such interpretations. Dissenters such as J. William Fulbright, chairman of the Senate Committee on Foreign Relations, saw a trend toward militarism in foreign policy arising after 1945, when extreme emphasis on defense and anticommunism led to a national security state with huge military budgets, increased executive power, and greater commitments abroad. Others maintain that militarism emerged at the beginning of the twentieth century, when—according to historian Gabriel Kolko—Presidents William McKinley, Theodore Roosevelt, and Woodrow Wilson “scaled the objectives of American foreign policy to the capacity of American power to extend into the world.” Still others discern imperialism broadly defined as a goal of American policy from the very beginning and suggest that recent military events are the logical culmination of trends over two centuries.

Militarism, like its frequent handmaiden, imperialism, is an avowedly distasteful phenomenon to Americans. The term can be broadly or narrowly defined and may be tailored to circumstances. Noah Webster defines militarism as predominance of the military class or prevalence of their ideals; the spirit that exalts military virtues and ideals; the policy of aggressive military preparedness. In his history of militarism, Alfred Vagts distinguished between militarism and the military way, the latter referring to the legitimate use of men and matériel to prepare for and fight a war decided on by the civilian powers of a state. Militarism does not necessarily seek war and therefore is not the opposite of pacifism; in its spirit, ideals, and values it pairs more precisely with civilianism.

Although most nations offer examples of militarism, the attitude is most often associated in the American mind with Prussia and Wilhelmian Germany. Expressions of militarism and policies reflecting it were clearly discernible in the Germany of that time. The writings of the historian Heinrich von Treitschke and of General Friedrich von Bernhardi seemed representative of a general view that war was natural and right; and Otto von Bismarck, called to lead the Prussian king's struggle for army reform without parliamentary inter-
ference, emphasized power at the expense of liberalism, once telling the parliamentary budget commission that iron and blood, not speeches and majority decisions, settled the great questions of the day. For a time the Prussian nobility regarded the army as their almost exclusive opportunity for power and rank and sought to discourage the rise of bourgeois elements in the officer corps. Loyalty was to their noble class for the maintenance of its privileges. With his swashbuckling manner, Kaiser Wilhelm II epitomized German militarism for Americans, and the 1914 invasion of Belgium—despite a treaty guaranteeing that nation’s neutrality (“just a scrap of paper” and “necessity knows no law” said Berlin)—represented the immorality of German militarism and its refusal to accept any constraints.

THE EIGHTEENTH CENTURY

In the American experience, some of the traditional marks of militarism are lacking. There has been no aristocratic class, except perhaps in the antebellum South, which regarded military values highly and the army as a career preferable to business and civilian professions. There have been few challenges to civilian dominance over the military and little disagreement during most of American history about a small standing army. In the United States, any militarism must exist alongside democratic, liberal, civilian traditions and sometimes even have their support. Generally, this support has not been lacking when achievement of foreign policy goals (continental expansion, defense of the Monroe Doctrine, neutral rights, preservation of the European or world balance of power) has seemed to require military power. With that support the evidence of militarism in the United States increases as the nation accepts greater foreign policy commitments.

Late eighteenth- and nineteenth-century American history shows few signs of militarism. Americans were not militaristic because there was no rationale for it. Yet these were not years of unbroken peace, for, as Root said, Americans were willing to fight when need was apparent. American fortune allowed war preparations after the crisis developed and permitted rapid demobilization when it was past, or as historian Daniel J. Boorstin, referring to the American Revolution and later American wars, said, “the end of the war and the end of the army were substantially . . . the same.” Strong pressures for militarism in the United States came mainly after a long development of antimilitaristic sentiment.

American military efforts in the Revolution and the successful preservation of independence brought no changes in colonial antipathy (learned from the English cousins) to standing armies. A standing army was, for the revolutionary generation, dangerous to liberty and a tool for establishing intolerable despotisms. Americans believed that those who had arms and were disciplined in their use would dominate and that a standing army was inconsistent with free government. As noted by Bernard Bailyn in The Ideological Origins of the American Revolution, such thoughts reflected the influence of earlier English writers and was dogma that prevailed with little dispute throughout nineteenth- and into twentieth-century American history. For colonists the British army might provide needed defense, but it should do so with few demands on colonial life or pocketbook. After 1763, when England kept several thousand troops in America, there was distrust in the colonies; on the eve of the Revolution, the Continental Congress memorialized the king with their grievances about the standing army in their midst and the commander in chief’s assertion of authority over civil governments in America. In the Declaration of Independence, the Founders repeated these charges. Many Americans were convinced that the army was not needed and colonial wars of past years—referred to by the names of the British monarchs—were of little interest to them. This attitude reflects the isolation of the colonies and illustrates its effect on military thinking. Thomas Paine emphasized it when he urged separation from Britain. Britain fought for its own interests, he said, not for any attachment to Americans: “She did not protect us from our enemies on our account; but from her enemies on her own account.” Independence would demonstrate America’s isolation and lessen the need for a large professional military establishment.

More important in colonial experience was the armed citizen, the embattled farmer who was ready at a minute’s notice to defend family and community. Most of the able free male inhabitants of an English settlement were armed because dispersed settlement made it necessary. They were accustomed to the rigors of hard life and were familiar with firearms. Although most of them served in the militia, the drills and reviews offered little instruction; the men were little inclined to military training or subordination. These plain citizens with arms were the military men; their
presence made civilian control over the army a reality well before adoption of a constitution in which that principle was firmly embedded. During the Revolution many of these armed men served in the Continental army, the militia, or in some irregular capacity. They have been variously described as ragged, dirty, sickly, and ill-disciplined, unused to service, impatient of command, and destitute of resources.

One foreign observer, however, believed the whole nation had much natural talent for war and military life. All descriptions were apt for the citizen soldiers for whom General George Washington sometimes despaired, but with favorable geography and foreign aid, without which success would have been difficult, they won. The victory amid political and economic confusion did not emphasize the military prowess of the Continental army or of the militiamen, and fortunately, too, for the civilian tradition, the man who commanded those victorious arms did not have the seeming messianic impulse of Napoleon, Charles de Gaulle, or Douglas MacArthur.

Washington reinforced civilian dominance at the time the nation was formed and precedents were set. He understood that the Revolution needed the support of public opinion as well as successful military efforts; he emphasized to his civilian soldiers their own interests (not those of some king) in the conflict; and he remained subordinate to Congress. At the end of the war, when soldiers were grumbling about back pay and unkept promises of future reward, Washington counseled patience and obedience. It was a time when politicians were scheming with discontented officers and there was imminent danger of military interference in political matters, but Washington's position prevailed. In June 1783, most of the army disbanded and the following December the Virginia planter-turned-general resigned his commission and went home. Never again in American history would the army be so close to open defiance of civilian authority. The disbanded troops met general public opposition to their demands for further pay; many received little or nothing. Civilian suspicion of military men was also revealed in public reaction to the Society of Cincinnati, a social and charitable organization of officers with membership passing through primogeniture. Opposition focused on the aristocratic trappings and possible military pressure on government. It was a natural civilian and democratic reaction from the likes of Thomas Jefferson, John Adams, and John Jay.

THE NINETEENTH CENTURY

The colonial heritage, experience in the Revolution, and constitutional constraints influenced the military policy of the new nation. The Constitution firmly established civilian dominance, although it did not prohibit a standing army. The president was commander in chief of the armed forces of the United States, including state militiamen called into the nation's service; Congress had the power to provide and support an army and navy but no appropriations for the army would be for more than two years; and Congress had the power to declare war. Under Congress's suspicious eye, the army remained small throughout the nineteenth century, except for bulges during the century's four major wars. Liberal sentiment—a heritage of the Enlightenment as accepted by Americans and passed on through the Declaration of Independence—emphasized tolerance, progress, and the individual; these traits allowed only restricted acceptance of military development, especially in the absence of any great threat and as American expansion moved apace with little opposition. Alexander Hamilton might call for substantial military preparations in 1797–1798 and support creation of a U.S. military academy (a proposal attacked as aristocratic and militaristic but nonetheless implemented in 1802). Secretary of War John C. Calhoun might in 1820 make a well-reasoned plea for the standing army against economy cuts, or Henry Clay might argue for greater defense in the face of an alleged European threat during the Latin American revolutions—but they failed to alter substantially the American mood for a small army. Diplomatic efforts of John Adams preserving peace in the late 1790s, or of Thomas Jefferson and John Quincy Adams extending the nation's boundaries, or unilateral pronouncements such as the no-transfer resolution and the Monroe Doctrine all seemed to provide at little expense what Americans wanted.

When diplomacy faltered, the United States did turn to war. Some of these wars were aggressive, fought by a young, nationalistic, and expansionist people. In the case of the Mexican War, there was heavy opposition to the conflict, marked notably by Henry David Thoreau's call for civil disobedience, more a challenge to the extension of slavery than to the war itself. There were many other armed conflicts in nineteenth-century American history than students may remember, if they ignore the numerous army engagements with the Indians—estimated between 1,200 and
1,500—lasting until 1898. These conflicts with Native Americans have posed serious and complicated questions for interpreters of U.S. history. Wars and diplomatic negotiations with England, France, Spain, and Mexico established the country's continental boundaries by mid-nineteenth century, but relations with the native inhabitants of these lands remained ambiguous and problematic into the latter part of the century. These relations were clashes of culture besmirched with greed, maladministration, and corruption and based on force to overcome resistance. Reconciling the territorial desires of the country and its people with respect for Indian lands was in the end impossible. While some leaders of the new nation might want to advance the nation's perceived well-being without sacrificing its honor in treating with indigenous people, it was never, as the historian Francis Paul Prucha notes in his *Sword of the Republic* (1969), the intent of the U.S. government to halt the westward movement for all time.

There was bound to be conflict, and despite their hostility toward standing armies, the country's leaders established an army, although small, to resolve problems caused by the movement of Americans into frontier lands. U.S. policy was established by treaties and laws and generally administered by civilian agents at first from the War Department and later the Department of the Interior. The regular army, frequently supplemented by militia troops, was available to provide force when deemed necessary. Many officers and their men had contempt for Native Americans, and there was excessive violence in handling Indian affairs, including extensive bloody wars to remove tribes from their homes as in Florida (1835–1842, a result of government policy on removal) or in actions of militiamen, as in the Chivington massacre in Colorado (1864). Robert Wooster in *The Military and United States Indian Policy, 1865–1903* (1988) remarks that a view of Indians as subhumans obstructing civilization's advance allowed officers to avoid moral misgivings in the face of brutal actions. Yet some officers such as General William Tecumseh Sherman, who supported strong action against Indians and did not view them as equals, understood their resistance.

The westward advance—imperialism under the name of manifest destiny, with army support—provides evidence of militarism, but there was little or no glorification of martial virtues or the martial spirit except as Hollywood might in later years portray it. Despite the army's role, there was a strong civilian influence on what was done. Sometimes when the army removed white invaders from Indian land or controlled trade with Indians there were complaints of military tyranny. Early legislation provided that persons apprehended for violating Indian territory would be subject to civil, not military, courts, and there were cases of civil actions brought against officers for performing such duties. There was also the belief among some army personnel that civilians frequently caused Indian problems, hoping to encourage military action. While fighting was an important part of the army's assignment in the West, it had a multipurpose role well beyond the use of force. Michael L. Tate in *The Frontier Army in the Settlement of the West* (1999) describes the army's major accomplishments in civilian-oriented tasks, including exploration and mapping, road and bridge building, agricultural experimentation, meteorological service, and a variety of services for persons going to and returning from the West.

Slavery provided the moral setting for the greatest threat to the Union and the most severe test of the civilian-military relationship in the nineteenth century. The occasion was a civil rather than a foreign war, and for that reason the internal threat seemed more imminent and restrictions on civil liberties more justified. President Abraham Lincoln was not happy about some measures taken nor the exuberance of some officers in carrying out regulations, but he thought preservation of the Union required adequate measures, even including suspending the writ of habeas corpus, detaining thousands of persons for disloyalty, sending hundreds of provost marshals into the country to oversee conscription and internal security, and using military officers and men in political campaigns to ensure election of administration supporters. Few people today would question Lincoln's motives, although his means are debatable. Yet national elections were not canceled (Lincoln defeated a general he had earlier removed from command), and the restrictions were not permanent although military governments were established in the South, some occupation troops remaining until 1877. Noteworthy, too, is the civilian control of the restrictive militaristic policies—a condition, according to some historians, not dissimilar to the civilian aspect of present-day militarism. In foreign relations, the Civil War demonstrated the nation's relative immunity to foreign dangers even at a time of great internal peril—what better argument to challenge calls for greater
military preparedness after the war? Also significant was Lincoln’s broad interpretation of presidential powers during wartime, a legacy enlarged by future chief executives whose actions have fed much of the debate on militarism and imperialism in recent American history.

When the guns fell silent after Appomattox, more than a million men went home and the fleet of almost 700 ships declined to fewer than 200, many unseaworthy. Public attitude was the usual postwar aversion to things military, although the war had its heroes and the people elected General Ulysses S. Grant president as earlier they had chosen George Washington, Andrew Jackson, William Henry Harrison, and Zachary Taylor. Also, as after earlier wars, veterans’ organizations developed to promote patriotism and economic self-interest and preserve wartime camaraderie. The Military Order of the Loyal Legion of the United States, as the Aztec Club after the Mexican War, was modeled on the Society of the Cincinnati and had little impact. The Grand Army of the Republic was of greater importance. Its influence was probably more effective on veterans’ benefits and patriotic observance than its sometimes divided opinions on foreign and military policies. As the historian May Dearing has noted, the GAR was so busy with patriotic exercises, textbooks with a loyal Northern bias, and military instruction in schools (denounced by writers, peace groups, and some labor unions as militaristic) that it had little time for “jingoistic fulminations against other countries.” Nonetheless, the patriotic exuberance may have encouraged public sentiment for war in 1898, and when war came the GAR leadership supported it and the territorial expansion that followed.

Still, old dogmas of civilian dominance over the military and a small army and navy prevailed, but there were changes affecting the economy and foreign policy that would alter the traditional civilian-military relationship over the next decades. In the thirty-five years following the war, the nation’s population more than doubled; by the end of the century, American manufacturers had made the United States the world’s industrial giant; American exports during the latter half of the 1890s exceeded a billion dollars annually. Few people could doubt America’s claim to the status of a world power: there remained only the emulation of European imperialism to give formal recognition of that fact, and that came with the Spanish-American War of 1898. Whether America’s fin de siècle imperialism was a great aberration, part of a search for markets, a continuation of earlier expansionism, an expression of manifest destiny, or simply a duplication of European practices, U.S. policy would not be the same again, and in the formulation of that foreign policy there were unmistakable signs of militaristic thinking.

As early as the 1840s, General Dennis Hart Mahan, father of the naval officer and historian Alfred Thayer Mahan, had urged creation of a more effective regular army to carry America’s influence to the world. Mahan believed that the United States was probably the least military of the civilized nations, “though not behind the foremost as a warlike one.” “To be warlike,” he went on, “does not render a nation formidable to its neighbors. They may dread to attack it, but have no apprehensions from its offensive demonstrations.” The Mexican War had demonstrated the military potential of the United States, and, however slow Americans were in profiting from the lesson, the rest of the world recognized it. General Mahan’s vision of military glory went far beyond defense of the nation to an extension of its power outside the continent. Despite Mahan’s vision and the arguments of such generals as Emory Upton, who deplored civilian control over strictly military matters and overdependence on armed citizenry in war, there was little change in American opinion.

While the navy experienced the same reluctance to abandon traditional military policies and became embroiled in politics and spoils, it was free of some of the public’s extreme suspicion of a standing army and benefited immensely from that apostle of navalism and imperialism, Alfred Thayer Mahan, and two of his sometimes overlooked contemporaries, Rear Admiral Stephen B. Luce, founder of the Naval War College where Mahan expounded his ideas, and Benjamin Harrison’s secretary of the navy, Benjamin F. Tracy, advocate of a battleship fleet. The naval building program also spawned lobbyists and vested interests in the industries providing the new matériel and equipment. Wanting to avoid overdependence on foreign suppliers, Congress in 1886 required shipbuilders to use only matériel of domestic manufacture. The following year the Bethlehem Iron Company agreed to supply the first American-made armor plate and in 1888 began production of the first steel propeller shafts for U.S. warships.

Like his father, Alfred T. Mahan had a vision of America’s world position—a vision, perceived through study of British naval history, not con-
fined to defensive preparations. The younger Mahan's message emphasized sea power as a source of national greatness: the building of a battleship fleet to protect U.S. interests, if not to reach distant countries at least to keep clear the main approaches to America. The sea is a highway, he said, and ships providing access to the world's wealth and traveling on that highway must have secure ports and must, as far as possible, have "the protection of their country throughout the voyage." The United States with safe frontiers and plentiful internal resources might live off itself indefinitely in "our little corner" but, suggested Mahan with a tone more of warning than speculation, "should that little corner be invaded by a new commercial route through the Isthmus, the United States in her turn might have the rude awakening of those who have abandoned their share in the common birthright of all people, the sea. The canal—a great commercial path—would bring the great nations of Europe closer to our shores than ever before and it will not be so easy as heretofore to stand aloof from international complications." He saw in Americans an instinct for commerce, preferably in their own ships, a possibility for colonies, and a need to control an isthmian canal. For him, war was sometimes necessary just as the policeman's work was necessary; through such organized force the world progressed.

As many Americans accepted Mahan's strategic proposals to give a historical validity to their imperialist, militarist policies, so many also adopted Charles Darwin's theory of biological development to lend scientific support for survival of the fittest in international relations. In his study of social Darwinism, the historian Richard Hofstadter remarked that although Americans did not have to wait for Darwin to justify racism, militarism, or imperialism—all present in American history before 1859—Darwinism was a convenient handle to explain their beliefs in Anglo-Saxon superiority, meaning pacific and belligerent expansion.

Few people typify the spirit of Mahan in the milieu of Darwinism as well as Theodore Roosevelt, a strong exponent of the "large policy" designed to make the United States a world power and possessor of colonies to provide bases and encourage trade. As a Rough Rider, public official, or historian, Roosevelt admired strength, pursued power, was sometimes a demagogue, sometimes chauvinistic, his ardent nationalism easily becoming militaristic. Roosevelt's call for a strenuous life revealed much that could be ominously dangerous: "We do not admire the man of timid peace. We admire the man who embodies victorious effort; the man who never wrongs his neighbor, who is prompt to help a friend, but who has those virile qualities necessary to win in the stern strife of actual life." He did not want to avoid war simply to save lives or money; the cause was what mattered. "If we," he said, "are to be a great people, we must strive in good faith to play a great part in the world. . . . The timid man, the lazy man, the man who distrusts his country, the overcivilized man, who has lost the great fighting, masterful virtues, the ignorant man of dull mind, whose soul is incapable of feeling the mighty lift that thrills 'stern men with empires in their brains'"—thus he characterized people unwilling to undertake the duties of empire by supporting an adequate army and navy. He urged Americans to read the Congressional Record to identify those opposed to appropriations for new ships, or the purchase of armor, or other military preparations.

These men, Roosevelt declared, worked to bring disaster on the country; they had no share in the glory of Manila; "they did ill for the national honor." He feared the nation would become a weak giant like China. That tragedy could be avoided through a life of strenuous endeavor. Every man, woman, and child had duties: the man, to do man's work; the woman, to be homemaker and "fearless mother of many healthy children"; and the child, to be taught not to shirk difficulties. Roosevelt had little patience for the timidity of those who opposed empire or their canting about liberty and consent of the governed "in order to excuse themselves for their unwillingness to play the part of men." Not many Americans had Roosevelt's eloquence or his platform, but many shared his sentiments.

THE TWENTIETH CENTURY

Nationalism, an effort to exert greater influence beyond the country's borders, and a willingness to threaten or use force, while not new in United States foreign policy, seemed more apparent as the country moved into the twentieth century. Several episodes of American foreign and military policy highlight this trend.

Deficiencies of the U.S. Army in the Spanish war necessitated a revamping of the military organization. Using European precedents, Secretary of War Elihu Root proposed several changes,
including creation of the Army War College and a general staff. Much opposition came from entrenched interests in the army and the state militias, but through compromise Root's proposals passed. America's participation in World War I was more effective because of these changes. For some people development of the general staff raised a specter of militarism. Walter Millis, a student of militarism, writing in 1958 commented on Root's contribution and mused that without it American participation in the Great War might not have occurred. "But Root, like all large figures," Millis said, "was only a reflection of his times. There were many other architects of the great disaster of militarism which was to supervene in 1914–18."

The new navy was begun under the administrations of James A. Garfield and Chester A. Arthur. In 1883, Congress approved four steel vessels, and the building program continued through subsequent administrations, especially the Mahan-influenced presidency of Theodore Roosevelt, when emphasis was on battleship construction. A major turn came after war broke out in Europe. Since Roosevelt's presidency, American naval policy had called for a navy second only to Great Britain. In 1915 policy proclaimed a navy second to none. The naval appropriations act of 1916 had no precedent for its naval construction plans. A strong opponent, House majority leader Claude Kitchin, argued futilely that approval would make the United States "the greatest military-naval Nation the world has ever seen." The act reveals an interesting dichotomy, showing the uneasy American attitude toward military measures by combining large appropriations for warships with a renunciation of armed aggression, and an endorsement, in principle, of disarmament. Wilson's support for a strong navy shows his realization of the interaction of military power and diplomacy. The navy would allow the United States to meet existing challenges and to perform the international tasks it expected after the war.

In Latin American policy and in implementation of the Monroe Doctrine, Americans showed a new assertiveness resulting, particularly in the twentieth century, in frequent military interventions, intervention to remain a standard response to political instability until the 1930s. In 1896, Secretary of State Richard Olney and President Grover Cleveland confronted the British with "the United States is practically sovereign on this continent, and its fiat is law upon the subjects to which it confines its interposition." A few years later, Theodore Roosevelt, fearful of European intervention (perhaps a German naval base in the debt-ridden Dominican Republic), accepted for the United States the role of international policeman in the Caribbean. From the Roosevelt Corollary, the Platt Amendment with Cuba, the responsibilities of dollar diplomacy, and the 1903 canal treaty with Panama, whose independence Roosevelt assured by timely naval maneuvers, there emerged a Caribbean foreign policy often characterized by the big stick. American troops and tutelage countered political and economic chaos. Clashes were bound to occur: in 1912, U.S. forces in the Caribbean for the first time went into battle to suppress revolutionaries, this time in Nicaragua. In ensuing years, the Dominican Republic, Haiti, Mexico, and Nicaragua experienced extensive interventions, often with violence and with a full-scale guerrilla war in Nicaragua in the 1920s and early 1930s. Guerrilla opposition was not new to Americans, who had faced it in the Philippines after the Spanish-American War.

If broad interpretation of the Monroe Doctrine in areas near the Panama Canal and if growing interests in Far Eastern affairs born of the Open Door and the search for that vast Asian market cast the United States in a role of greater involvement calling for more reliance on military solutions, this was not accompanied by surrender of traditional attitudes toward military matters. Compromises were always necessary: even entering the war in 1917 was put in the perspective of fighting German militarism, of fighting a war to end war. While most Americans might applaud a combative nationalism that had Roosevelt proclaiming, "Perdicaris alive or Raisuli dead"—when Raisuli, a Moroccan bandit, abducted an alleged American citizen near Tangier—or while pacifist Jane Addams might lose much of her popularity during World War I and have her speeches considered dangerous, or while Eugene Debs might be sent to jail in 1918 for a speech condemning war, these and similar events were more a result of the exuberant patriotism of the times than a widespread tendency toward militarism. In the postwar years there is substantial evidence that Americans wished to return to policies less likely to involve force. Much of the opposition to the League of Nations came from those who thought Article X of the Covenant deprived Congress of a free hand in deciding on war. These men did not want to guarantee the "territorial integrity and existing political independence of..."
all members of the League," for that might lead to a war not in America's interest. The disarmament conferences and the Kellogg-Briand Pact to outlaw war as an instrument of national policy did not usher in a long era of peace, but they were symptomatic of peaceful desire. Weary of the Nicaraguan imbroglio, President Herbert Hoover and Secretary of State Henry L. Stimson concluded that marine interventions were too costly and should end. Revelations of war profiteering, exposés of the armament industry, and the revisionist historical literature on U.S. entry into the Great War brought disillusionment and a determination that it should not happen again. Presidential power in foreign policy was suspect, the neutrality laws of the 1930s tried to close all loopholes that might lead to war, and there were restraints on presidential flexibility in foreign policy. One proposal, the Ludlow Resolution (1935–1938), even indicated distrust of Congress on the matter of war by urging that declarations of war should be by national referendum. These questions became more pressing as world crises multiplied. During the debate on American foreign policy in the late 1930s and early 1940s, each side proclaimed its approach as the true road to peace while the opponent's was sure to involve the United States in war.

THE INTERWAR PERIOD

Among isolationists in the interwar period there was fear of militarism. The historian Charles A. Beard felt the military interests seeking a larger navy would, if left to themselves, "extend America's 'strategic frontiers' to the moon." If Americans rejected the policy encouraged by Alfred Thayer Mahan, Theodore Roosevelt, John Hay, and Henry Cabot Lodge, and if by plan, will, and effort they provided "a high standard of life and security for the American people," using to the fullest the national resources, technical arts, and managerial skills in the United States, there would be no need for large military forces. Defense policy should be based on "security of life for the American people in their present geographical home"; the army and navy should not be huckstering and drumming agencies for profit seekers, promoters, and speculators or defenders of every dollar invested abroad. Guided by such a clarification of policy, Beard said, military authorities could make calculations adapted to clearly defined ends; until then they "will demand every gun and ship they can get." Beard saw military leaders committing themselves to a policy of trade promotion and defense all over the world. Sometimes, he believed, they took dangerous chances and then tried to convince the people that national interest or points of honor were at stake. As long as naval strategists demanded more ships, men, and financial support, by using "the kind of propaganda they have been employing," they were more a danger to American security than a guarantee of it.

Senators also frequently spoke out on these issues. Robert A. Taft also urged restraint on interventionist policies because he opposed war. He did not trust President Roosevelt; he thought there was little the United States could do about democracy abroad; and he felt war would expand the power of the federal government to the detriment of democracy at home. Not all isolationists would agree with this reasoning, especially since German and Japanese aims appeared more aggressive. Senator George Norris came to believe by the late 1930s that despite the dangers of militarism the United States must rearm.

The American Legion, an organization of veterans that emerged in the interwar period, also advocated programs of preparedness. The legion supported the idea of a naval disarmament conference in Washington in 1921–1922 but did not want to sacrifice an adequate navy for maintaining the position of the United States as a world power; nor did the legion want its support of the Kellogg-Briand Pact (1928) outlawing war as an instrument of national policy to imply any support for reduction in the nation's military establishment. Whether the American Legion has influenced public opinion or merely reflected it is uncertain. In the great foreign policy debate before Pearl Harbor, the organization had its own divisions on internationalism and isolationism; and, as for many Americans, the legion's general anticomunist stance gave way before the realities of World War II, returned with the Cold War, and adjusted to détente and the post–Cold War years. The size and organization of the American Legion have made it a more powerful lobby than its first antecedent, the Society of the Cincinnati; but it has also had public suspicion and criticism, reflecting perhaps the American civilian's distrust of military influence.

The first four decades of the twentieth century witnessed no marked trend toward militarism in the United States. But more than ever before in the nation's history, Americans were
having to come to terms with world power, having to think about international relationships that had been far from their minds in earlier times. Many Americans believed that the old truths of civil-military relations were still valid, although they realized that some concessions were necessary for adequate defense in a world not free of war. The big question then and still today centers on how much is adequate. In the interwar years, the army was seldom above 200,000 men and most often below 150,000; there was rejection of conscription until 1940 and much debate on the advisability of compulsory Reserve Officers Training Corps in colleges. The navy also suffered post-war neglect, and many officers regretted naval weakness in the Pacific, where they considered Japan the enemy. A change came with Franklin D. Roosevelt’s support of naval expansion and more jobs in the shipbuilding industry.

**WORLD WAR II**

A majority of Americans came to accept Roosevelt’s policy of gradually increasing both aid to the Allies and military preparation at home. When war erupted most people were still unaware that the free security from which they had unknowingly benefited for so long was gone forever. Many Americans believed that when the war was over national life would return to the prewar style. As Samuel A. Stouffer and others note in their sociopsychological study *The American Soldier* (1949), there was little feeling of personal commitment to war after the early sense of national peril had disappeared. The war was simply a detour that must be taken before one could return to the main, or civilian, road. At war’s end the soldier had no desire to reform the United States or the world; he was interested in himself and his family. Cessation of hostilities brought not-surprising demands for rapid release of fathers, sons, and husbands; by 1946 the number of men on active duty had fallen from over 12 million to little more than 3 million, which was reduced by half the following year. In his plans for the postwar world, Roosevelt had sensed the public mood and anticipated a small armed force. At Tehran, when Stalin suggested that Roosevelt’s idea of four policemen to preserve world peace might require sending U.S. troops to Europe, Roosevelt envisaged the United States providing ships and planes while Britain and the Soviet Union provided the land armies. And at Yalta the president doubted if U.S support for future peace would include “maintenance of an appreciable American force in Europe.” Clearly, the United States accepted an international role and would not make the mistake of rejecting membership in the new world organization, but Americans expected to fit their participation into a familiar mold requiring only limited military effort. This paralleled Wilson’s first hopes in 1917 that the American contribution to the war would come mainly from the navy and industrial production, and Roosevelt’s hopes in 1940 and 1941 that non-belligerency would prevent defeat of Germany’s enemies while keeping the United States out of war. These hopes were lost in events.

Although most Americans during and immediately after the war thought mainly of returning to peacetime pursuits with little or no consideration of America’s role in the world and what that role might require, there were military leaders pondering the country’s future and how to protect its interests. Even shortly before the Pearl Harbor attack, as noted by Michael S. Sherry in his *Preparing for the Next War*, General George Marshall was thinking about peace after the imminent war and the war to follow it. Despite this slight beginning, postwar planning did not become serious for more than a year, and even then the planners had to deal with many uncertainties including vaguely expressed plans from political leaders and lack of cooperation inherent in the rivalries among the army, navy, and virtually autonomous army air force. All aspired to a preeminent place in defending national interests perhaps challenged by Soviet expansion, a concern of the Joint Chiefs of Staff since 1942. Planning proposals that emerged included universal military training, unification of the services, and an independent and large air force, but unanimity was lacking except on the essential ability for rapid mobilization. A proposal for universal military training eventually received President Harry Truman’s support but never passed Congress. The country relied on the draft until 1973 with a brief hiatus in 1947–1948. The National Security Act of 1947 provided for coordination of the armed services and an independent air force. Although the war ended without planning consensus, hurried efforts in the latter half of 1945 brought recommendations advocating a policy of deterrence and preventive war. Sherry points out that such recommendations contrasted with earlier practice—going from a passive to an active defense. There followed military budgets lower than those
of wartime but higher than prewar levels and continued large research-and-development funding, allowing soldiers and scientists to remain partners. All of this, Sherry believes, created an ideology of preparedness and Cold War mentality permitting militarist influence to permeate American society.

THE COLD WAR AND AFTER

With the destruction of western Europe and the decline of Great Britain as a balancer of European power, the door to American retreat in the face of any new totalitarian threat closed. The challenge seemed to come from the Soviet Union, and this challenge as perceived by Americans has largely determined American foreign and military policies since 1945. Wartime cooperation with the Soviet Union had always been a marriage of convenience, although some hoped the social, economic, and political differences could be smoothed over to allow a peaceful working relationship after the war. Disagreements over Poland and Germany soon revealed the incompatibility of American and Soviet postwar goals. By 1947 the Truman administration was convinced that the world was polarized between the United States and the Soviet Union, and to protect itself the United States must preserve the balance of power against Soviet expansion. Truman came forth in broad rhetoric to tell the American people that the United States would support “free peoples who are resisting attempted subjugation by armed minorities or by outside pressures.” Not long after, the diplomat George F. Kennan in his “X” article in Foreign Affairs provided an analysis of Russian behavior and prescribed a response in the form of “a long-term patient but firm and vigilant containment of Russian expansive tendencies.” On these appraisals the U.S. government based its foreign and military policies and over the years perhaps went far beyond what Truman and Kennan had intended. In his Memoirs, Kennan regretted his failure to make clear that he was not talking about “containment by military means of a military threat” and his failure to “distinguish between various geographic areas.” Later reference to containment to explain American involvement in Vietnam disturbed Kennan. Certain areas of the world were more important to the United States, he said, and the world situation had changed since 1947; there was no longer only one center of communist power.

Although the major change in American defense policy came with the Korean War (1950–1953), even before that conflict there was much of the temper of the war years. Despite rapid demobilization of U.S. forces after World War II, they were still larger than during any peacetime in American history; the military budget was many times the 1940 level; President Truman was pushing for universal military training; and the United States was heavily armed, with a monopoly on the atomic bomb.

Nonetheless, Truman was reluctant to raise defense spending above $15 billion, much to the concern of military leaders and Secretary of Defense James Forrestal. On the eve of the Korean War, a committee of State and Defense Department officials described in a plan (NSC 68) the potentially rapid economic and military growth of the Soviet Union and emphasized the need for strength if there were to be any successful negotiations with the Soviet Union or any agreement on arms regulation. According to Paul Hammond, it was a program calling Americans to rise to the occasion by giving more effort and resources to prevent further deterioration of the strategic situation of the United States. The Korean War provided the impetus for the administration and public to accept the call: the national security budget shortly went above $40 billion and the number of military personnel on active duty more than doubled.

Events occurring and attitudes established during the five years after the end of World War II set a pattern for response to subsequent challenges to American foreign and military policies. Supporters argued that reliance on well-prepared armed forces supplied with the latest weaponry and stationed around the globe was a deterrent to war, while critics perceived it as an example of militarism little related to the defense needs of the United States and, as in Vietnam, sometimes disastrous.

Many conditions acceptable for achieving victory during World War II have been denounced as militarism in the postwar era. Believing that the war was essential for the achievement of legitimate national goals, most Americans accepted industrial mobilization, strong and sometimes secretive executive leadership, large armed forces, large military budgets, and the use of whatever weapons were available. From the beginning of the Cold War, however, there have been many dissenters who doubt any international danger and question the military
and foreign policies designed to counter communist aggression.

Probably the most cited example of militarism in American life is the military-industrial complex—an alliance between the military establishment and the companies supplying weapons and matériel used by the armed forces. The relationship was not new during World War II, but huge postwar defense budgets and the great dependence of some companies on government orders brought lobbying activities to new heights and saw substantial increases in the number of former military men on corporation payrolls. Add to this intellectual, political, labor, and geographic interests in various research projects or companies whose operations represented thousands of jobs, and there emerges a vast constituency to influence defense decisions. Defense spending for research and development also has had great impact on the nation's universities. The historian Stuart W. Leslie has described how large contracts from the military have influenced academic scientific research and maintained or established new laboratories under university management. The science and engineering departments did the research, consulted, and trained the graduates for work that was in demand by the defense establishment with the result, as Leslie says, that the military was establishing the scientific priorities.

In his Farewell Address of 1961, President Dwight D. Eisenhower warned against unwarranted influence from the industrial-military complex. Many critics of the complex disagree with much of American foreign and defense policy since 1945 and fail to see any challenge requiring a large military response. The sociologist C. Wright Mills saw a greater penetration of military men in the corporate economy, which seemingly had become a permanent war economy, while Gabriel Kolko argues that the military establishment is only an instrument of civilian business leaders who seek strategic and economic objectives. Many of the critics reveal the old animosity toward munitions makers who peddle their wares that soon become obsolete and necessitate a new round of even more sophisticated and destructive weapons. Modern weapons are many times greater than needed to destroy an enemy, but the nation's security is less than ever before. Failure to achieve international control over weapons, for which some critics blame America's lack of suitable initiative when it had a monopoly of the atomic bomb, continued the wasteful arms race.

**NSC 68**

One of the important Cold War documents that rationalized the military buildup to meet the communist challenge was NSC 68, principally authored by Paul H. Nitze, director of the State Department's Policy Planning Staff, sent to the president in April 1950, and referred to the National Security Council for comment. Influenced by the Berlin blockade, the communist victory in China, and the Soviet testing of an atomic weapon, the authors of NSC 68 composed a ringing, frightening call to rearm. Whether the strategies outlined in NSC 68 were proper and prudent for winning the Cold War or were excessive, too expensive, and a misinterpretation of Soviet intent, they are part of the general debate on the Cold War and the extent of militarism in American policy and life.

NSC 68 states that “the Soviet Union, unlike previous aspirants to hegemony, is animated by a new fanatic faith, antithetical to our own, and seeks to impose its absolute authority over the rest of the world.” If there is “any substantial further extension of the area under domination of the Kremlin [it] would raise the possibility that no coalition adequate to confront the Kremlin with greater strength could be assembled.” The authors described the military power of the Soviet Union and expressed belief that if a major war occurred in 1950 the Soviet Union would be capable of attacking selected targets in the United States with atomic bombs. To meet the Soviet threat the United States must possess superior overall power including military strength to guarantee national security and to conduct a policy of containment. The country should also produce and stockpile thermonuclear weapons. The rapid buildup would be costly but, “Budgetary considerations will need to be subordinated to the stark fact that our very independence as a nation may be at stake.”
and increased chances for their use—an unthinkable event, or so it seemed until Herman Kahn's *Thinking About the Unthinkable* (1969).

Opponents of postwar policies frequently centered their attacks on the president and his almost exclusive direction of foreign policy and his broad use of powers as commander in chief. According to critics, presidents have exaggerated foreign dangers and secretly committed the United States to other countries, entangling the nation in war in violation of the Constitution. Broad use of executive power from Washington's declaration of neutrality, through James K. Polk's occupation of disputed territory, Lincoln's reinforcement of Fort Sumter, Franklin D. Roosevelt's destroyer-base deal, and Ronald Reagan's Iran-Contra deal appears often in American history. The American people and their historians generally praise and admire (at least in historical perspective) the strong, active executive, but the Vietnam War and Watergate revelations caused a reexamination of presidential use of power. Some writers who supported presidential prerogative but became disillusioned in the later years of the Vietnam War have been at pains to distinguish which presidents faced real emergencies and were justified in wielding their authority. The distinction is difficult.

Critics also note Defense Department influence in foreign policy decisions as another example of militarism. During the John F. Kennedy administration, the Joint Chiefs of Staff at first opposed a comprehensive test ban treaty because it might reduce American vigilance and finally gave support only with extensive safeguards. During the Cuban missile crisis, the Joint Chiefs advised an air strike against Cuba, and earlier they had seemed at least tacitly to support American participation in military operations against Fidel Castro. Often cited are the optimistic and frequently misleading military reports of progress in Vietnam, reports that suggested victory was within reach with a little more effort. Acceptance of the idea that only the military people had the facts made effective challenging of Pentagon estimates difficult even for the sometimes skeptical President Kennedy. According to reporter David Halberstam, Kennedy's failure to match his growing inner doubts with his public statements would have made his successor's task extremely difficult even if President Lyndon B. Johnson had been less accepting and admiring of his military advisers.

No one can deny the widespread emphasis on military preparedness, the evident abuse of power by agencies created to improve American defense, the questionable American presence in Southeast Asia, and myriad other examples of militarism in American life. Reluctance to maintain a large standing army has given way before international realities that no longer allow the United States the cheap security described by the historian C. Vann Woodward. There have been attempts to maintain civilian control, and the Korean War is a case in point. The controversy between Harry Truman and General Douglas MacArthur over limiting the conflict to the Korean peninsula ended in victory for the president. While the people might wildly welcome MacArthur home and while they might be bemused by the concept of a limited war, they wanted little of his plan to broaden the war; nor were there many ready to accept MacArthur's belief that military men owe primary allegiance to the country and the Constitution rather than those “who temporarily exercise the authority of the Executive Branch.” General MacArthur won a brief, emotional victory—his New York ticker-tape parade bested Charles Lindbergh's almost two-to-one in paper tonnage—but it was General Eisenhower, with his promise to go to Korea to seek an early and honorable end to the war, who won the votes and became the soldier-hero president. His willingness to please the fiscally conservative Robert A. Taft wing of the Republican Party and his search for a strong military policy compatible with a sound, growing economy—a concern not new with Eisenhower—was no surrender to militaristic thinking. In fact, he feared that a prolonged military program might lead to a garrison state, and he wished “to keep our boys at our side instead of on a foreign shore,” even though some American troops remained abroad. At times, Secretary of State John Foster Dulles engaged in militaristic rhetoric, but policy remained generally cautious, although “massive retaliation,” “going to the brink,” and “liberation” were added to the slogans “containment” and “aiding free peoples everywhere”—slogans that undoubtedly affected popular thinking and allowed people to accept policies or actions without serious consideration. Involvement in Vietnam, where these policies and actions merged and gradually escalated, had no willing hand or perceptive mind to limit it until the commitment was very large. It was a self-perpetuating and self-deluding conflict without clear purpose, entangled in personal and national pride. Yet popular sentiment and journalistic and historical accounts of the war reveal a lively anti-
militaristic feeling that challenged authority and induced eventual withdrawal.

For some Americans the end of the Vietnam War dispelled fears of militarism. Others suggested only abandonment of American economic expansionist goals as seen in the open door, or open world, policies would reverse conditions feeding militarism. For still others, greater congressional supervision of foreign and defense policies, limiting executive initiative, was needed.

The end of the Cold War and the collapse of the Soviet Union by the early 1990s understandably encouraged greater questioning of America’s military and related policies that had been in place for over half a century. For many Americans the certainties posed by the fascist and communist threats were no longer present to bolster long-held assumptions. Ever since 1940 the United States had been preparing in varying degrees for one war or another. Was it not time now to enjoy a peace dividend? The question presumed that the new circumstances were strong arguments for change. There were reductions, but not to the extent that many critics hoped. By 1998 defense spending was 12 percent below the average level from 1976–1990. There was downsizing of military personnel, down to about 1.4 million in 1996. There were base closings, approximately seventy by 1998, but all proposals were strongly fought because of feared effects on local economies. Defense Department plans to cut military reservist positions ran into congressional roadblocks for similar reasons. These changes represented a halting, rather grudging trend. Michael Sherry, writing in the mid-1990s about America’s “militarization,” a more broadly defined and perhaps vaguer concept than the classic “militarism,” believed that the main rationale for militarization disappeared with the Cold War and that America would probably drift away from its militarized past without a clear or formal indication that it was doing so.

While Americans like Sherry might approve the trend but prefer a more deliberate course, others worried that the country was becoming complacent in the face of future dangers. In 1999, Secretary of Defense William Cohen was concerned about a widening gap between America’s civilian and military cultures and the possible effect on the well-being of the United States as well as the international community if the American people did not understand and support the military that helped to ensure global stability. The historians Donald Kagan and Frederick W. Kagan, in a study comparing the United States at the beginning of the twenty-first century with England in the 1920s, suggest that as England was unwilling then to prepare properly for defense, the United States seventy-five years later might not be maintaining sufficient armed forces to pursue an active foreign policy aimed at preventing war. The Cold War and its end, they argue, disguised America’s continuing interest as a world power in maintaining peace and stability in an increasingly fluid and still dangerous international community.

These views of America’s military and diplomatic policies and the dangers they pose for its democratic nature and its security are speculative. Finally, any control of militarism rests with the people and their traditions. Democracy is not always reliable, for a warfare economy has many constituents and overzealous patriotism may lead to uncustomary actions. American tradition is firmly on the civilian side. Americans have not easily accepted the martial virtues emphasizing authority and subordination, and, at least in theory, they have accepted beliefs in freedom and the pursuit of happiness. Nonetheless, civilian supremacy as a basic tenet in America’s civil-military tradition is not above challenge in the country’s history, even in recent years. The Truman-MacArthur controversy, while often cited as a victory for civilian dominance, was possible because other prominent military leaders supported Truman, and, as noted by the historian Ernest May, Congress and the public sided with one set of military leaders instead of another. The military historian Russell F. Weigley has suggested that the principle of civilian control in civil-military relations may need reexamination. He cites post–Cold War examples involving General Colin L. Powell, who publicly questioned U.S. intervention in Bosnia while the George H. W. Bush administration was debating the use of armed force there and later was critical of president-elect Clinton’s campaign proposal on admitting homosexuals to the military. Weigley also notes that General H. Norman Schwarzkopf, after retirement, was critical of aspects of Gulf War diplomacy. These examples followed the Vietnam War era when civil-military relations were strained by various policy constraints not to the liking of the military. Weigley concludes that the traditional civilian dominance may have an uncertain future. Obviously, tradition is not immune to erosion.

The historian Howard K. Beale believed that Theodore Roosevelt’s more ominous predilections
were restrained by democratic tradition, respect for public opinion, fear of political defeat in elections, concern for the nation’s well-being, acceptance of a cautious middle-of-the-road approach to problems, and a sense of the worth and dignity of the individual. These traits continue to have support from an American consensus. When American policy seems to veer too far from democratic traditions, opposition grows, particularly if there is no clear relation between policy and national security and, in the case of Vietnam, if there are continuing demands for men and matériel. Withdrawal from Vietnam did not alter the general trend of American foreign and defense policy, and the militarism that critics saw as part of it remained, but the end of the Cold War brought new, if still somewhat uncertain, directions.

Complicating the outlook may be the evolution of technology allowing development of more sophisticated and precise weaponry. Examples include use of cruise missiles or other “standoff” weapons destroying clearly defined targets without widespread damage and casualties while preserving no-fly zones over Iraq or intervening in Kosovo. Does such conflict, called “virtual war” by Michael Ignatieff in referring to Kosovo, mean that this type of violence becomes more acceptable to people reluctant to go to war? If American servicemen operate their weapons out of harm’s way and there are no body bags shown on evening television or if society is not called upon to mobilize, will there be less attention paid to such military action?

Technological innovation in warmaking and attempts to restrict casualty lists as much as possible are not new. One reason expressed for use of the A-bomb was that it might obviate the need for an invasion of the Japanese home islands and the anticipated loss of American lives. What is new is the extensive television coverage since the Vietnam War and its effect on public opinion. American military leaders and politicians may be concerned not only about their own casualties but also about civilian casualties on the other side and appearing too aggressive, thus losing public support. Fighting a virtual war has many complications and unresolved political, military, and moral issues, as Michael Ignatieff describes in his book, and there is no reason to believe that the United States will retain exclusive control of the new weapons. In the face of rapid international political and technological changes, what remains for the United States is to strive to maintain the credibility of its arms in the context of its democratic traditions.

CONCLUSION

Militarism is not a precise term and its definition may depend on one’s ideology or point of view, and one’s judgment of it may be determined by its extent and form. Classic militarism, epitomized for most Americans by Wilhelmian Germany or pre-Hiroshima Japan, has few examples in the American past, but war and preparation for war influencing the country’s society and having its support is increasingly apparent, particularly beginning in the last half of the twentieth century. This is not to say that the country has not engaged in war or military conflicts or that manifestations of militarism have not existed in earlier America. Nonetheless, general antipathy toward the military and a Congress keeping tight reins on military appropriations are readily apparent through the first century and more of U.S. history. In the beginning, the War Department (including naval affairs until 1798) had the secretary of war and one clerk and was considered in those early years, as recorded by Leonard D. White in his administrative history of the period, as a “difficult and unpopular department.” A century later, although the size had changed, it was still unpopular with many people, including politicians and labor leaders like Samuel Gompers, who may have been remembering the Pullman Strike when he said, “Standing armies are always used to exercise tyranny over people.”

While the early twentieth century may have begun to erode such views, it was World War II and the Cold War that brought significant changes to the country’s diplomatic and military policies, symbolized by the great growth of the State and Defense Departments. The secretary of war and his clerk at the beginning of George Washington’s administration grew by the beginning of the twenty-first century to about 90,000 civilian and military personnel occupying millions of square feet of office space in the Pentagon and numerous other federal and commercial buildings in the Washington, D.C., area. After World War II, Americans were willing to accept these changes because most of them no longer believed that isolationism was a viable choice for the United States, and many were convinced that there was a new totalitarian threat, similar in their minds to Hitler and Nazism. When events in Poland, Germany, Greece, China, and Korea seemed to confirm their fears, many Americans, perhaps influenced by Munich and the belief that appeasement was futile for stopping aggressors,
accepted containment, deterrence, and a buildup
of armaments with an ample supply of nuclear
weapons. Through these policies the Cold War
came to permeate American society.

While militarism, or at least the preparation
for war, was clearly evident during the Cold War,
its justification, if not all of its aspects, remained a
subject of debate. For critics who blamed the Cold
War on the United States by failing to recognize
the Soviet Union’s security interests, Washington’s
military response was dangerous, wasteful, tragic,
with a mindset that continued into the post–Cold
War era. For those who believed the Soviet Union
posed a real danger to this country and its friends,
the preparation for war was correct and need not
be regretted. The requirements for the future, with
its changing political arrangements and new tech-
nologies, remained open for even more concern
and debate as evidenced by proposals, which con-
tinued into the twenty-first century, for a missile
defense shield.

402
Probably no presidential farewell address since that of George Washington in 1796 has had a greater impact or more lasting quality than that of Dwight Eisenhower in 1961. Washington's is remembered mainly for his warnings against political factions and foreign alliances. Eisenhower's is remembered for his warning against the military-industrial complex. Coming from Eisenhower, who had risen through the military ranks and was assumed to be a “friend of big business,” the words surprised listeners but also carried great weight. Apparently the term itself may be attributed to him.

In mid-December 1960, Norman Cousins, editor of the *Saturday Review*, had suggested the idea of a farewell address. Eisenhower turned to one of his special assistants, Malcolm Moos, a young political scientist from Johns Hopkins University, to draft the speech, and worked closely with him in preparing the text. The president's closest economic advisers were not aware of the contents of the speech until they heard it broadcast.

Speaking to the nation on radio and television on the evening of Tuesday, 17 January 1961, Eisenhower said the following about the military-industrial complex:

Until the latest of our world conflicts, the United States had no armaments industry. American makers of plowshares could, with time and as required, make swords as well. But now we can no longer risk emergency improvisation of national defense; we have been compelled to create a permanent armaments industry of vast proportions. Added to this, three and a half million men and women are directly engaged in the defense establishment. We annually spend on military security more than the net income of all United States corporations.

The conjunction of an immense military establishment and a large arms industry is new in the American experience. The total influence—economic, political, even spiritual—is felt in every city, every State house, every office of the federal government. We recognize the imperative need for this development. Yet we must not fail to comprehend its grave implications. Our toil, resources and livelihood are all involved; so is the very structure of our society.

In the councils of government, we must guard against the acquisition of unwarranted influence, whether sought or unsought, by the military-industrial complex. The potential for the disastrous rise of misplaced power exists and will persist.

At a press conference the next morning, Eisenhower expanded on the military-industrial complex theme. In response to one question he said:

It is only a citizenry, an alert and informed citizenry, which can keep these abuses from coming about. And . . . some of this misuse of influence and power could come about unwittingly but just by the very nature of the thing, . . . almost every one of your magazines, no matter what they are advertising, has a picture of the Titan missile or the Atlas or solid fuel or other things, there is . . . almost an insidious penetration of our own minds that the only thing this country is engaged in is weaponry and missiles. And, I'll tell you we just can't afford to do that. The reason we have them is to protect the great values in which we believe, and they are far deeper even than our own lives and our own property.

Eisenhower's main concern was that military industries would exert an undue influence on government policy. Munitions makers were likely to encourage warlike policies in the interest of their own profits. Beyond that, Eisenhower saw a danger that individual companies might influence military strategy by their advocacy of their own weapon systems. Further, a great conglomerate of military industrial power might threaten individual liberty.

The main concern of others, like Seymour Melman, an industrial engineer and economist at Columbia University, has been that government policy, concentrating on the development and
maintenance of a big military industry, would have an unfortunate impact on the national economy.

Indeed, Eisenhower shared the concern about the economic cost of maintaining large armaments. In an address before the American Society of Newspaper Editors on 16 April 1953, he had called for control and reduction of armaments. He said that if an unchecked armaments race continued, "the best that could be expected" would be:

a life of perpetual fear and tension; a burden of arms draining the wealth and the labor of all peoples; a wasting of strength that defies the American system or the Soviet system or any system to achieve true abundance and happiness for the people of this earth.

Every gun that is made, every warship launched, every rocket fired signifies, in the final sense, a theft from those who hunger and are not fed, those who are cold and are not clothed.

This world in arms . . . is spending the sweat of its laborers, the genius of its scientists, the hopes of its children.

The cost of one modern heavy bomber is this: a modern brick school in more than thirty cities. It is two electric power plants, each serving a town of sixty thousand population. It is two fine, fully equipped hospitals. It is some fifty miles of concrete highway.

We pay for a single fighter plane with a half million bushels of wheat. We pay for a single destroyer with new homes that could have housed more than eight thousand people.

This is not a way of life at all, in any true sense. Under the cloud of threatening war, it is humanity hanging from a cross of iron.

**FORCES BEHIND THE MILITARY-INDUSTRIAL COMPLEX**

Historians have not yet devoted much study to the military-industrial complex. It has surfaced as a concept and concern only in very recent times. Moreover, well-developed bodies of theory and data are not readily available. The editors of the *Journal of International Affairs* have aptly summarized the situation:

Of all the political ideas that gained popular currency in the 1960s, the military-industrial complex is the concept perhaps most gravely deformed by public mastication. The debate of 1968 and 1969 over the influence of the military establishment in the United States proved, with few exceptions, consistently unsatisfying. After all was said, the concept of the military-industrial complex remained muddled and its attendant questions of international and domestic political influence were still unanswered.

Political leaders reflected the confusion of the man in the street, of business leaders, industrial workers, farmers, college students, and activists for conflicting causes. All were caught up in a dilemma—that armaments cause wars, and that armaments create prosperity. At the same time, nearly everyone agreed that some military forces were needed for national security, and these in turn depended upon some kind of military industry.

Here we can see the great dilemma of U.S. military-industrial policy: Can the security of the United States be better served, can the economy of the nation flourish more, and can the attending evils of arms manufacture be better reduced or avoided by government or by private manufacture of munitions? This was a question to which leaders gave their attention from the early days of the Republic.

The American military-industrial complex may be said to have had its origins with Alexander Hamilton and Eli Whitney. Those two men of genius were in the vanguard of a group of imaginative men who set the course for the national arms policy of the United States. Hamilton emphasized government manufacture of arms, though he recognized the need to develop a private arms industry as well if what he conceived to be the defense requirements of the country were to be met. Whitney was the entrepreneur par excellence who saw opportunities for profit in making arms for the government.

In 1783, Hamilton, a twenty-eight-year-old former lieutenant colonel, presented a report on a military peace establishment to the Continental Congress. In it he called for the establishment of "public manufactories of arms, powder, etc." and proposed the employment of troops in the national armories. This, he maintained, would be far more economical than the importation of arms from Europe. But Hamilton's concern for domestic arms manufacture went beyond the possible economies. He thought independence from foreign arms makers to be essential for national security.

In his celebrated "Report on Manufactures" in 1791, Hamilton offered a program whose central theme was the development of domestic industries for national security. Hamilton would encourage domestic arms production by a protective tariff and by an annual purchase of weapons as an incentive for continuous manufacture. Still,
in the long run, Hamilton looked to the desirability of government manufacture of all arms of war. His concern about the private manufacture of weapons was not that the private companies would become too powerful and would exert undue influence on national policy. It was that private companies could not be relied upon to provide the arms necessary for national security.

Eli Whitney of New Haven, Connecticut, desperately in need of capital, turned to the U.S. government with a fantastic proposal to manufacture 10,000 or 15,000 stand of arms at the very moment—when war with France threatened—that the government could not afford to turn down any halfway realistic proposal for making arms. As he followed the debates in Congress on proposed appropriations for arms procurement, Whitney decided that here was the best possible opportunity to get a government contract.

Whitney decided that the only practical way to produce 10,000 satisfactory muskets in the United States, where skilled armurers were few, was to reduce the complex steps of gunmaking to a series of more simple tasks, each of which could be done with less skilled hands, and to design machines that would duplicate some of the armorer's skill. For best results, it would be necessary to make parts precise enough to be interchangeable. This would permit the maximum division of labor and make it possible to accomplish repairs simply by replacing parts.

One of the most important contributions to the development of a domestic arms industry was the act of 1808 for arming the militia. By this time the national armories were making 5,000 to 10,000 muskets a year, but relatively few were being delivered by private makers under contracts of 1798, and, even though they were admitted duty free, almost none were coming in from Europe, where the Napoleonic wars were raging.

The act of 23 April 1808 provided for the appropriation of an annual sum of $200,000 for arms and military equipment for the militia of the United States, by either purchase or manufacture. The purveyor of public supplies, Tench Coxe, advertised in newspapers of the leading cities for bids for contracts to make muskets. Between 30 June and 9 November of that year, Coxe let contracts to nineteen firms for a total of 85,200 muskets. The contracts were for five years, with one-fifth of the total number, in most cases, due each year. However, the time schedules proved to be unrealistic and a number of the manufacturers unreliable.

Unique among the states, Virginia took upon itself the task of manufacturing arms for its militia independent of outside sources. Authorized in 1798, the Virginia Manufactory of Arms, occupying an impressive building along the James River in Richmond, turned out enough weapons between 1802 and 1821 to arm all the county militia—58,400 muskets, 2,100 rifles, 4,200 pistols, and 10,300 swords.

Soon a national arms system based upon two national armories and a group of dependable private firms was fairly well established. Beginning with the funds appropriated for the arming of the militia, the government gradually developed a policy of providing orders for the most promising establishments on a long-term basis. As to the advantages of public versus private manufacture of military arms, there was much to be said on both sides. In the earlier period there was strong sentiment in favor of depending solely on national armories. The national armories were readily available and less expensive, and they established price standards for private contractors. Private manufacturers seemed more likely to improve models, and to experiment with new materials and new methods. Both were needed for the best possible system of arms production.

Recognizing that the military-industrial complex does exist as a powerful, if informal, structure in American military and economic affairs, the following questions arise: How did it get that way? What are its consequences? What can be done about it?

The forces that have driven the development of the military-industrial complex include the following:

1. The national arms policy during the first half of the nineteenth century. The early decision to rely on production both in government facilities and by private firms for providing armaments set the stage. The policy of long-term contracts with private arms manufacturers planted the seeds for a permanent arms industry in peacetime.

2. Industrial expansion during the Civil War. The first industrial mobilization that approached total war created undreamed-of opportunities for profit and showed what might be done in arms production.

3. Industrial mobilization during World War I. This carried the opportunities a step higher, but the effects were only temporary, because no large-scale defense industry persisted.
after the war, when the drives for disarmament and isolation amid cries against profiteering by “merchants of death” discouraged such activities.

4. World War II expansion. This was several notches higher than the mobilization for World War I and was when many firms got their start in military production, and then continued after the war under conditions far different from the post–World War I period.

5. Government-sponsored research and development on a large scale. This major development during World War II had important consequences in the years that followed. This has been one of the keys to the growth of the military-industrial complex.

6. Nuclear weapons. This was another legacy of World War II that overshadowed defense policies in the postwar world.

7. The Cold War. The perceived threat of the Soviet Union to security in Europe, and the perception of communism as a worldwide threat led to an armaments race in both nuclear and conventional forces that gave a certain permanence to defense industries. Broad programs of foreign military assistance became a part of this, and added to demand for military production.

8. Korea. The communist attack against South Korea called up further military-industrial efforts and gave credibility to the fears of the Cold War.

9. Vietnam. This conflict maintained the demand for military equipment at a high level over a long period of time.

10. The Gulf War. Just when there were growing demands for cuts in military expenditures to help reduce the national deficit, the crisis in the Persian Gulf served to renew requirements for production.

11. The policy of maintaining a “guns and butter” economy in the buildup for Korea, for Vietnam, for the Gulf War, and for the Cold War in general meant that if the unsettling impact of continuous conversion and reconversion on domestic industries was to be avoided, some measure of a military industry on a more or less permanent basis would have to be maintained.

12. The economic impact of defense industries on local economies, and the supposed stimulus of defense spending on the national economy. This brings pressure from local industrial leaders and from local labor unions and workers in general who are employed in defense plants, from local chambers of commerce and businesses that stand to benefit from providing consumer goods and services to defense workers and their families, and from members of Congress and other political leaders anxious to stimulate employment in their districts.

THE IMPACT OF A PERMANENT MILITARY INDUSTRY

With all these forces at work, what are the consequences spawned from the powerful military-industrial complex? Several unfortunate consequences emerge—an undue influence on military policy and strategy, a tendency to extravagance and waste in defense spending, a negative long-range impact on the economy, and a possible weakening of the country itself.

To what extent do the pressures of manufacturers worried about profits, communities worried about unemployment, and members of Congress and presidents worried about local or general business depression—and ultimately about votes in key states—influence our choice of weapon systems, and thus affect the military considerations in our national strategy? Do we build a new bomber or a new missile or a new aircraft carrier because our strategy requires it, or because some group demands it, and then develop a strategy to include it? There always is the prospect that elements of a powerful military-industrial complex will influence national policy and strategy in the interest of favoring certain weapon systems not simply on the basis of military advantage, but for the benefit of the companies making them, or for the armed service using them, or for the locale where they and subsidiary instruments are made.

Why else would General Dynamics take out a two-page, full-color advertisement in Smithsonian magazine to proclaim its F-16 Fighting Falcon “the finest fighter in the world” and to review its achievements in producing the B-24 bomber during World War II and the B-36 afterward? Why would the same company take a two-page, color ad in National Review to extol the virtues of its M-1 Abrams tank? Why does McDonnell Douglas present a television commercial to “sell” its F-15 Eagle fighter aircraft?

In the fifty years after the conclusion of World War II, three forces led to the maintenance of a military establishment of unprecedented pro-
portions for the United States over such a length of time: the Cold War with the Soviet Union, involving an arms race throughout most of the period; the Korean War (1950–1953), and the Vietnam War (1964–1975). As the period ended (that is, as the Cold War at last appeared to have come to a close), a fourth situation assured continuation of military-industrial production—the deployment of forces and combat operations in the Persian Gulf region.

Military orders for goods and services went from $27.5 billion in 1964 to about $42.3 billion in 1969. The total defense budget for fiscal year 1969 was $79.788 billion, which amounted to 42.9 percent of the total federal budget, and between 9 and 10 percent of the gross national product (about the same percent as throughout the preceding decade). Defense funds went to every state, to 363 of the 435 congressional districts and to over 5,000 communities. Workers in

defense industries and in defense-related production in mining, agriculture, construction, and services comprised over 10 percent of the total labor force. The Defense Department itself employed as many civilians as the populations of New Hampshire, Vermont, and Maine combined.

Despite the lowering of tensions between the United States and the Soviet Union—and between Eastern Europe and western Europe—in 1989 and 1990, the Pentagon in 1990 still was planning to put $100 billion into the improvement of the nuclear arsenal over the next ten years. This was in addition to the continuation of the Strategic Defense Initiative (“Star Wars”) research program. The SDI effort began in a television address to the nation by President Ronald Reagan on 23 March 1983. It was a call for a defense system that would protect the United States from enemy nuclear missiles. The specific objectives of the program were not clear. At first it was offered as a more or less total net to protect against all missiles. Then it was suggested as something that would be valuable against missiles from China, North Korea, or other countries. Then it was seen mainly as protection of American missile silos so that the capacity to retaliate against a first strike would be guaranteed. To say the least, it was controversial largely out of conviction on the part of many scientists that it never would work, and on account of the vast expense involved. By 1987 the funding for SDI research and development had reached about $6 billion a year. The Department of Defense in 1990 estimated that the annual outlay would rise to about $12.5 billion in 1997. In September 2000 President Bill Clinton announced that he would not proceed with an order to build the missile defense system. Incoming President George W. Bush announced that he would continue the program. The total cost was estimated at $60 billion.

In any case, “Star Wars” was the epitome of the kind of program best calculated to encourage the military-industrial complex. It involved the expenditure of billions of dollars a year for many years, with no end in sight. Its effects spread into many kinds of activities and into many parts of the country. Much of it was conducted in secrecy. There was no way that it could be criticized for being over budget or behind schedule. Even many scientists who remained skeptical about the possible effectiveness of such a scheme were willing to acquiesce, and even to participate in it, for they saw it as a significant source for research funds when other sources were drying up.

At the end of the 1980s, Department of Defense officials were becoming concerned, not about an expanding military-industrial complex, but about a decline in American industrial capacity for military production. In 1990 the share of the United States in the world machine-tool market was less than half of what it had been in 1980. In the first half of the 1980s, the rate of growth of productivity in the United States was 3.5 percent, compared to nearly 6.5 percent in Japan. Deployment of forces to the Persian Gulf region changed all the impetus for reduction. That exercise in 1990–1991 added an estimated $30 billion to defense expenditures.

An increasingly significant arm of the military-industrial complex was the research community—the universities and private think tanks that lived on defense contracts. About half of all the scientific research being carried on in the United States in fiscal year 1969 was related to the military. Some 195 educational institutions received defense contracts of $10,000 or more during the year. The Massachusetts Institute of Technology, Stanford, and Johns Hopkins were among the nation's top 100 defense contractors.

A MILITARY-INDUSTRIAL COMPLEX INTERNATIONAL

Surely the greatest direct impact of the military-industrial complex on American foreign policy, and the greatest direct impact of American foreign policy on the military-industrial complex, has been in the transfer of arms among nations, programs of military assistance, cooperative production programs, arms sales abroad, and the rise of multinational corporations in arms and related industries.

One of the most serious charges leveled against the military-industrial complex is that it campaigns actively and effectively against arms control and disarmament, and exerts a controlling influence on the shaping of foreign policy. Those who traffic in military procurement have a vested interest in an unstable international environment. According to proponents of this view, the profits and power of the complex would decline catastrophically if real progress were made in limiting strategic nuclear weaponry and conventional weapon systems. For this reason, it is claimed, advocates of huge arms expenditures use all available means of shaping public attitudes and governmental behavior to perpetuate an illusion of...
great international danger emanating particularly from the communist bloc of nations. Modern “merchants of death” are said to pursue their own interests in complete disregard of humanitarian considerations.

Juan Bosch, former president of the Dominican Republic, writes of what he calls “Pentagonism.” No longer do advanced capitalist nations send out their military to conquer and exploit colonies. Foreign warfare or the threat of warfare provides “access to the generous economic resources being mobilized for industrial war production. What is being sought are profits where arms are manufactured, not where they are employed, and these profits are obtained in, and bring money in from, the place where the center of pentagonist power lies.” In short, the domestic population is exploited now as colonies were in the past.

But the serious question remains: Do not countries that have no substantial arms industry have a right to obtain arms from outside sources in order to defend themselves? And is it not in the national security interest of the United States to have allies who are well armed and equipped for military action?

The opening rounds of the Cold War took place in the intercontinental crossroads of the Near East. Only there did Russian efforts fail to consolidate a system of “friendly” buffer states along the Soviet borders. Communist guerrillas in Greece had threatened to extend communist influence in the Balkans and to deliver to the Soviets another strategic area for possible domination of the eastern Mediterranean.

What had brought matters to a head so far as American policy was concerned was not a new and sudden communist attack, but the announcement by the British in February 1947 that they no longer would be able to continue the assistance they had been giving to Greece and Turkey. This might have opened the door to communist penetration. Actually, it set the stage for the policy of military aid that came to be known as mutual defense assistance.

Even as the North Atlantic Treaty was being discussed in early 1949, the implication was clear that American matériel assistance to the participating countries would be necessary if the new organization were to have any real effectiveness as a deterrent to aggression. But President Harry Truman waited until the day after he signed the instrument of ratification to follow it up with a formal request for military assistance. Calling for $1.45 billion, this proposal would consolidate in one act the existing programs for Greece and Turkey, Iran, Korea, the Philippines, and the Western Hemisphere, with a new program for North Atlantic Treaty countries. It envisaged three types of assistance: (1) direct transfer of American military equipment; (2) expert guidance in using the equipment and in production of equipment; and (3) dollar aid to increase direct military production in Europe. Ten weeks later Congress approved the program in the Mutual Defense Assistance Act.

In three years of war in Korea, allied forces other than those of the United States and the Republic of Korea never reached as much as 10 percent of the total troop strength. The United States provided half or more of the logistic support for these forces, but this amounted to a relatively insignificant fraction of the total supplies and services furnished by the United States and Korean forces. But the problems of coordination, negotiation, and accounting were as great as if troop contributions had been several times as large.

A truck rebuilding program in Japan grew to a large scale for the Korean War efforts. Civilian automotive experts sent by the Department of the Army began to arrive in Japan in December 1947 to set up the first production lines. The plan was to rebuild motor trucks on a mass production basis. Although Japan was the foremost industrial power of the East, much in American methods of mass production was foreign to many Japanese workers and supervisors. They were not used to the close tolerances and rigid inspections necessary for the complete interchangeability of parts that is the basis for mass production, and many of their work habits and customs seemed quaint when compared with American factory methods. A training program soon overcame most of those obstacles, and completely renovated trucks began to roll off the assembly lines in ever-increasing numbers.

Old trucks brought into the plants first went to the disassembly line, where they were completely broken down to the last nut and bolt. These parts were then sorted, cleaned, and sent to the various shops. Engines, transmissions, carburetors, and other major assemblies were rebuilt in separate plants. Various parts came together on the assembly line after the fashion of Detroit. The new trucks—built of old parts—then went through a tune-up shop, received a new coat of paint, and a thorough final inspection, and then entered the supply system. In 1951 vehicles were coming off
some assembly lines at the rate of one every four minutes. Some 30,000 Japanese were working on
the project under the supervision of 50 ordnance officers, nearly 300 civilian experts from the
Department of the Army, and about 500 enlisted men from the Ordnance Corps. Here, surely, was
an indirect boost to the Japanese automobile industry, and perhaps a further thrust toward a “military-
industrial complex international.”

An aspect of the defense business that was becoming more significant, with a new twist and a
different thrust, was the sale of arms and equipment abroad. The provision of military equipment
to foreign countries around the world under the mutual defense assistance programs and other programs already has been mentioned, but there was more to it than that. Now there was a studied effort to persuade other governments to buy American military matériel.

As a part of military assistance to other countries, the United States at first emphasized cooperative production programs with certain of those countries. Undoubtedly, the cooperative production programs contributed significantly to European defense. But Europeans saw the whole effort as too much of a one-way street. The United States showed little inclination to accept European designs for cooperative production either in the United States or in other European countries, even when European designs were favored by those countries. According to one view expressed at the time, this situation was the natural result of American technological superiority and Yankee salesmanship. Another suggested that it was due at least in part to pressure by the U.S. government, which had been lobbied by its own defense industries.

Recognizing what was appearing to many to be the growth of an unhealthy situation, Secretary of Defense Robert McNamara suggested a “common market” in armaments within the NATO alliance. This would encourage trade among all the allies on the basis of economy and quality, including better opportunities for European nations to sell to the United States. The impediment to this scheme came not mainly from trade barriers but from government procurement policies. A serious blow to anything approaching the kind of “common market” that McNamara envisaged came in the fall of 1967 with a nationalistic restriction that Congress imposed on the Defense Appropriation Act. In this instance, the members of Congress who offered the restrictive amendment evidently were interested mainly in eliminating foreign competition for shipbuilding industries in their home districts. But the vote in support was so large that it seemed likely that other members might be seeking similar protection for other kinds of goods at a later time.

Another point of some criticism was in U.S. arms sales to developing countries that could ill afford them. In 1972 four nations—the United States (which accounted for one-third of the world’s total weapons), the Soviet Union, Britain and France—were responsible for more than 90 percent of all exports of arms to ninety-one developing countries. Total exports of U.S. arms to foreign countries from 1945 to 1972 (whether in grants or in sales) amounted to approximately $60 billion. This was a significant addition to the orders of American defense industries—and a further impetus to expansion and consolidation of the military-industrial complex.

Some critics have suggested that American enthusiasm for the expansion of NATO to include Poland, Hungary, and the Czech Republic was based less on concerns for national security than on the opening of new markets for the American arms industry. William Greider writes in Fortress America (1998) that an official of Lockheed Martin was on the ground in those three countries, and in other potential new member countries, even before the expansion agreements had been accepted. He was there to make a sales pitch for his company’s fighter planes, air transports, communication satellites, radar, and other matériel. Not that there was any new threat to the security of those countries, but now they would be moving to replace their old Russian-made armaments with more modern and compatible items from the United States. With pressure sales from British and French concerns as well as American, something of an arms race was under way in Latin America and in Asia.

After dropping sharply from an all-time high of $81.5 billion in 1984 (in 1997 prices) to a low of $42.2 billion in 1994, international trade in arms took a sharp upturn. By 1997 it had risen by 26 percent from that low point, and by 23 percent just over the previous year, to $54.6 billion. Three regions—the Middle East, East Asia, and western Europe—accounted for 80 percent of that trade in 1997, but arms sales to South American countries were rising at a rate of 20 percent a year from 1992 to 1997.

During the 1995–1997 period, Saudi Arabia was the leading arms importer, with a total of
$31.3 billion. Others in the top ten arms
importers were Taiwan, $12.5 billion; Japan, $6.8 billion; Egypt, $5.3 billion; Kuwait, $5 billion; Turkey, $4.9 billion; United Kingdom, $4.5 billion; South Korea, $4.2 billion; United States, $3.8 billion; United Arab Emirates, $3.8 billion. The United States was the main supplier of arms for eight of those countries (all except the Arab emirates, where France was the chief supplier).

The American share of world arms exports grew from 29 percent in 1987 to 58 percent in 1997. During that period, the Russian share of world arms exports declined from 37 percent to 4 percent; the British increased from 8 percent to 12, and the French from 4 percent to 11. In dollar amounts, world arms exports in 1995–1997 totaled $142 billion. The total for the United States during that period was $77.8 billion; for the United Kingdom, $18 billion; for France, $12 billion, and for Russia, $9.2 billion. In 1997 arms exports represented 4.6 percent of the total exports of the United States, 2.3 percent of the exports of the United Kingdom, 2 percent of the exports of France, and 2.6 percent of the exports of Russia.

While arms trade totals of North Korea were not high when compared with totals of other nations, it should be noted that in 1988, 32.3 percent of North Korea's total imports were in armaments, and 29.2 percent of its total exports were in armaments. By 1997 those figures had declined to 2.1 percent and 8.1 percent, respectively. The People's Republic of China's arms exports amounted to $1.1 billion in 1997, 0.6 percent of its total exports, and its arms imports were $142.2 million, 0.4 percent of its total.

A further complication on the international scene is the growth of domestic arms industries into international conglomerates and multinational corporations. When a great military aircraft manufacturer leaps national boundaries and takes in companies or builds plants in many countries, where does its loyalty lie? What control does its home country have over it? If a foreign branch builds planes or tanks or guns for a country that has become an adversary, how can the company be accused of trading with the enemy?

**CONTROL OF THE COMPLEX**

Granted that the national security of the United States requires a substantial military industry, a question remains: How can the unfortunate consequences of a powerful military-industrial com-

---

**THE MILITARY-INDUSTRIAL COMPLEX**

Jan Christian Smuts, a distinguished South African soldier and statesman who served in the British war cabinet (and who sometimes is regarded with Woodrow Wilson as a cofounder of the League of Nations), in December 1916 circulated his draft of a constitution for a league of nations. Its paragraph 17 stated:

That all factories for the production of direct weapons of war shall be nationalized and their production shall be subject to the inspection of the officers of the council; and the council shall be furnished periodically with returns of imports and exports of munitions of war into or from the territories of war into or from the territories of its members, and as far as possible into or from other countries.

Why, it can be asked, should a private company such as General Dynamics, most or all of whose business is with the government, be private? It has been shown that defense contractors often show less profit than comparable companies in civilian production, but with little or no risk, why should their profits be as great? Jacques Gansler estimated that in 1967 just four firms held 93 percent of the contracts for satellites, nuclear submarines, missile guidance systems, space boosters, aircraft fire-control systems, inertial navigation systems, jet aircraft engines, helicopters, and fighter, attack, transport, and tanker aircraft. This concentration became even more pronounced over the next twenty years. The number of military contractors and subcontractors of all types fell from 138,000 in 1982 to fewer than 40,000 in 1987.

Government ownership and operation would eliminate the need for any profit at all and reduce the pressures on the government for big defense spending for the benefit of a company. Of course, it would not eliminate this kind of pressure altogether. As we have seen, locales and political leaders apply pressure for defense orders in their areas whether the facility concerned is government or private, and subsidiary industries that benefit from defense production still would urge those expenditures that would benefit them indirectly.

There are those who contend that government industrial facilities would be less efficient and more costly than private concerns. That is not
necessarily true. The Springfield and Harpers Ferry armories were effective in producing high-quality rifles at lower cost than private factories; government navy yards have been effective in building ships (sometimes they were more costly because they paid higher wages and granted more paid holidays than private shipyards); the government's Philadelphia clothing factory has been effective; an army depot has been effective and far less costly than private contractors in overhauling tank engines.

In the development of ballistic missiles in the 1950s the army probably did as well in terms of cost and effectiveness at its Huntsville (Alabama) Redstone Arsenal as the air force did with its favored private contractors. In the end, the air force won out in that competition, some allege on account of politics, and thus gave a great boost to the private military industry of southern California.

Wartime still might require the conversion of civilian plants to military production. But that is a different matter. A thriving automobile factory has no real stake in converting to tanks or aircraft, and it would be reconverted to the civilian production when the immediate need had been met. Another approach might be to prohibit the export of armaments. This usually brings the rejoinder, “Well, if we did not sell arms to other countries, someone else would.” The answer to that is, “So be it; at least we would not be putting advanced American weaponry into the hands of potential enemies.”

A further step toward reducing undue influences of the military-industrial complex might be a more complete separation of government-sponsored research and development from those who have an immediate stake in the production of the items concerned. In any case, control must depend upon effective and sympathetic leadership at the top, in the White House and in the Pentagon.

CONCLUSION

An army that had resisted breech-loading rifles and cannon, automatic rifles, machine guns, motor trucks, and airplanes has now, since World War II, done a complete about-face. Now anything old is likely to be discarded. Certainly, improved weapons and equipment are desirable. But the military-industrial complex has betrayed an almost “Detroit mind-set” in developing new models every year or so. It is difficult to escape the conclusion that the constant quest for novelty is due in part to the activities of researchers and industrialists anxious to maintain the flow of research and development dollars and anxious to keep production lines going. This was a major factor in keeping defense budgets high. When people looked forward to a “peace dividend”—funds that might be available for other purposes—after the pullout from Vietnam, they were disappointed to find that there was little of a peace dividend. All kinds of new weapon systems were waiting to eat it up.

A more serious consequence of a powerful military-industrial complex is the drain that a permanent defense industry on a large scale creates on the national economy. Many people accept the myth that a big defense industry brings prosperity. They point to the economic well-being of a community that is dependent on a local defense industry. They point out that it really was World War II that brought the United States completely out of the Great Depression. There is some truth, of course, to those contentions. Defense industries do provide an economic shot in the arm. But in the long run, and for the country as a whole, defense industries on a big scale can only be a drain on the actual or potential economic well-being and strength.

A healthy partnership between the military establishment and private industry was sought from the early days of the nation. In more recent years, this has been actively cultivated as demands for national security have required a greater industrial base. It has been in the interest of corporate profits and individual careers as well as in the interest of national defense. At times, there have been evidences of costly mismanagement and of collusion, conspiracy, and even fraud. But for the most part the growth of what has come to be known as the military-industrial complex has been benign. Gaining a kind of momentum of its own, it has grown to have unfortunate consequences in spite of itself.

The greatest military rival of the United States in the post–World War II period was the Soviet Union. It devoted a large share of its resources to military production (from 9 to 10 percent of gross national product). By 1990 its economy was in chaos. The greatest economic rival of the United States, Japan, devoted a small share of its resources to defense (less than 1 percent of GNP). Its economy was flourishing at a high level.
Related to the question of prosperity and economic well-being is the broader question of the long-range strength of the nation. Military expenditures, stimulated by the military-industrial complex to unnecessarily high levels over extended periods of time, actually can pose a threat to national security. This was the concern that Eisenhower expressed in his address of 16 April 1953 and in other speeches early in his presidential term. It was a concern that General Douglas MacArthur expressed during the same period: “In final analysis the mounting cost of preparation for war is in many ways as materially destructive as war itself.”

The problem is to maintain a balance between overcommitment beyond capabilities of the armed forces and overextension of the military at the expense of the domestic economy. For example, after World War II, Great Britain was facing military commitments beyond its resources and had to call upon the United States to fill the gap. Arnold Toynbee wrote, on the other hand, that the ancient Assyrian Empire fell of its own military weight. And in the Peloponnesian War, the overextension of its military effort in the expedition to Sicily was the undoing of Athens.

In The Rise and Fall of the Great Powers, a provocative study published in 1987, Paul Kennedy warns that overextension in military commitments has been a critical factor in the decline of great powers over the past five centuries. He concludes:

Yet the history of the past five hundred years of international rivalry demonstrates that military “security” alone is never enough. It may, over the shorter term, deter or defeat rival states (and that, for most political leaders and their publics, is perfectly satisfactory). But if, by such victories, the nation over-extends itself geographically and strategically; if, even at a less imperial level, it chooses to devote a large proportion of its total income to “protection,” leaving less for “productive investment,” it is likely to find its economic output slowing down, with dire implications for its long-term capacity to maintain both its citizens’ consumption demands and its international position.

We therefore return to the conundrum which has exercised strategists and economists and political leaders from classical times onward. To be a Great Power—by definition, a state capable of holding its own against any other nation—demands a flourishing economic base. . . . Yet by going to war, or by devoting a large share of the nation’s “manufacturing power” to expenditures upon “unproductive” armaments, one runs the risk of eroding the national economic base, especially vis-a-vis states which are concentrating a greater share of their income upon productive investment for long-term growth.

An irony of modern war is that to preserve victory, the victors must maintain a large military establishment. At the same time, they force a strict limitation of arms on the late enemies. This permits the latter to devote their resources to expand their economies, and then they forge ahead of the victors economically.

But a major development of the last half of the twentieth century was the spread of low-intensity conflict with the support of international trade in arms. As John Keegan put it in A History of Warfare (1993):

The Western-style militarisation of the new independent states of Asia and Africa in the four decades after 1945 was as remarkable a phenomenon as it had been with the non-warrior populations of Europe in the nineteenth century. That it had many of the same doleful effects—overspending on arms, subordination of civilian to military values, superordination of self-chosen military elites and even resort to war—could be expected. It was equally to be expected that most of the hundred or so armies brought into being after decolonisation were of little objective military worth; Western “technology transfers,” a euphemism for selfish arms sales by rich Western nations to poor ones that could rarely afford the outlay, did not entail the transfusion of culture which made advanced weapons so deadly in Western hands.

Yet, African rebels and irregulars and government forces came to inflict casualties upon each other in appalling numbers.

The Military-Industrial Complex

See also Arms Control and Disarmament; Arms Transfers and Trade; Foreign Aid; Nuclear Strategy and Diplomacy.
From its inception, the United States has incorporated the most-favored-nation (MFN) principle into its trade policy. Until 1923 it adhered to its conditional form and thereafter to unconditional MFN treatment. Only with the passage of the 1934 Reciprocal Trade Agreements Act (RTAA), however, did Congress allow U.S. trade negotiators to use unconditional MFN treatment as an instrument of trade liberalization. That is, the MFN principle does not equate with free or freer trading environments. From 1778 until 1934, U.S. trade policy was explicitly protectionist. In this environment, the adoption by the State Department of unconditional MFN treatment did nothing to advance its program of trade liberalization. MFN treatment is an instrument of trade policy. Its use must be understood within the context of trade policy. In the United States, interest group pressures, the actions of policymakers, and the constraints and opportunities presented by the international political economy shaped policy over time.

MFN treatment means that policy discriminates among nationals and foreigners but treats all foreigners equally. National treatment extends the same privileges to foreigners and nationals alike. Equal treatment in general is known as nondiscrimination. As far as U.S. trade policy is concerned, two types of MFN treatment are relevant. Unconditional MFN treatment is provided gratuitously to nations eligible for MFN status. Under conditional MFN treatment, third parties must bargain and provide equal compensation in order to benefit from MFN status. Linked historically to MFN treatment in practice is the instrument of reciprocity. Reciprocity, or the exchange of trading privileges through bargaining, implies discrimination among trading partners. That is, benefits are not conferred freely.

The following example illustrates the difference between conditional and unconditional MFN treatment. Assume that the United States extends conditional MFN treatment to Germany, then signs a trade deal with Japan that provides for a reduced tariff on the import of Japanese televisions. Under conditional MFN, however, the United States will not allow German television imports at the new rate until German trade negotiators offer equivalent compensation. German trade negotiators may then offer, for instance, to accept imports of U.S. sewing machines at a lower rate. U.S. trade negotiators—since 1962, officials of the Office of the U.S. Trade Representative; before then, State Department officers—may accept the offer, if the increased value of American sewing machine exports to Germany balances the increased value of German television imports into America. If America were to extend unconditional MFN treatment to Germany, however, the latter would receive benefit of the U.S.–Japanese treaty without having to make any concessions.

As this illustration suggests, unconditional MFN treatment may constitute the means by which a multilateral trading regime is created from a series of bilateral agreements, since its use ensures that all eligible countries enjoy the benefits of past and future concessions. This has been the experience internationally during most of the post–World War II period. As discussed below, both the General Agreement on Tariffs and Trade (GATT) and its successor, the World Trade Organization (WTO), incorporated unconditional MFN treatment into their charters.

**MFN Treatment in Practice, 1776–1887: Conditional MFN within Protectionism**

At the time of the American Revolution, Great Britain and continental Europe adhered to unconditional MFN treatment, which they had done since the seventeenth century. To maintain the political and economic independence of the...
new American republic, the Founders focused on balancing internal economic development among industry, agriculture, and commerce. Once established, the national government aimed to develop the nation’s resources and secure neutral rights internationally. Leaders of the early republic did not seek autarky (that is, national economic self-sufficiency and independence). Indeed, Benjamin Franklin and Thomas Jefferson, for example, leaned toward free trade. However, since they believed that free trade would threaten America’s political viability, they sought access to overseas markets for U.S. commodities through both reciprocity and nondiscrimination. Ideally, they wanted the benefits of unconditional MFN treatment. But they were prepared to settle for equality of treatment with foreign nations. Moreover, they recognized that the great powers of Europe were unlikely to reciprocate on trade. Ultimately, they adhered to conditional MFN treatment to preserve the means to bargain for access to overseas markets, but this approach ensured that all trade treaties were bilateral, unique, and discriminatory.

In July 1776 the delegates to the Continental Congress were prepared to allow unrestricted imports into the U.S. market in order to gain diplomatic recognition and break Britain’s hold on Atlantic trade. John Adams, assisted by Benjamin Franklin, drafted a model commercial agreement that was approved by the delegates. It instructed trade negotiators to obtain equal national treatment or unconditional MFN treatment to gain access to Europe’s markets (and those of its colonies).

Neither side wanted the treaty to benefit Britain; French negotiators feared the consequences of a possible U.S.–British political reconciliation. U.S. negotiators wanted Britain and other European countries to buy access to the U.S. market with reciprocal trading privileges to their home and colonial markets. French officials only offered access to its home market. In 1783, France reverted to unconditional treatment and tried to interpret Article II in this way. U.S. officials balked; they decided to use reciprocity to secure equality of treatment.

During the early national period, U.S. officials had little success in opening overseas markets to American goods. They concluded treaties with Sweden and the Netherlands, but only the latter offered MFN access to both its home and colonial markets. In 1784 U.S. negotiators initiated another round of trade talks, using the 1776 plan as a blueprint. They succeeded only in securing a pact with Prussia in 1785, which secured the conditional MFN treatment granted by France in the 1778 treaty. Officials such as John Jay and Elbridge Gerry became convinced that a strict reciprocity approach would best serve U.S. interests, at least until negotiators gained experience in trade matters and America gained in importance within the international economy.

Crucial aspects of U.S. trade policy hampered the use of either reciprocity or conditional MFN treatment in a manner that benefited American exporters. Treasury Secretary Alexander Hamilton’s 1791 Report on Manufactures provided the justification for a protective tariff system to enable America to establish its own manufacturing base as the basis for economic development. After the War of 1812, Congress took up the recommendations of Hamilton and James Madison’s Treasury secretary, Albert Gallatin, and adopted the so-called American System sponsored by Senator Henry Clay: a nationalistic industrial policy based on high tariffs and support for domestic manufacturers. Until the Great Depression, many U.S. leaders, especially Whigs and Republicans, remained adamant that protectionism was the key to U.S. economic development, class harmony, and political independence.

Congress also subjected all imports to a uniform (single-schedule) tariff, leaving little room for officials to negotiate preferential bilateral agreements. Until Congress adopted a dual-schedule tariff in the 1909 Payne-Aldrich Act, there was little chance that trade negotiators could wield reciprocity, not to mention MFN treatment, to win concessions from trading partners. This limited policymakers in the executive branch to adjusting the level of tariffs: Democrats tended to lower tariffs to levels adequate to fund the budget, and Whigs and Republicans tended to raise tariffs to protect domestic producers from foreign competition.

Until the late nineteenth century, foreign markets were the concern only of commodity producers in the South and timber and fur exporters in the North. Hence, there was little interest-group pressure to persuade Congress to lower the
barriers that protected domestic industries and workers. Diplomacy served the economic and security interests of a developing country with a large domestic market and little disposition to global leadership.

State Department negotiators therefore sought equal access for American goods to the markets of European competitors by offering equal access in return. The administrations of Presidents John Tyler, James Polk, Franklin Pierce, and James Buchanan were especially interested in using reciprocity to pry open overseas markets. However, Congress generally refused to ratify the reciprocal pacts that State Department officials negotiated, fearing that the MFN clauses in earlier treaties might compel the United States to generalize proposed concessions. Opponents also recognized that the State Department paid inadequate attention to negotiating an equivalent exchange of concessions.

With others—Canada, Latin America, and Asia—U.S. trade officials sought special privileges and offered special concessions for raw materials and agricultural goods in the U.S. market. The expansionist Polk, Pierce, and Buchanan administrations were eager to experiment with new approaches. They sought either unilateral MFN treatment or one-sided agreements that assured the United States of MFN treatment. For example, treaties with China in 1844 and Japan in 1854 provided America with MFN access to both markets, but did not extend equality of treatment to the U.S. market for either China or Japan in return.

The United States held contracting parties to conditional MFN treatment even when commercial agreements contained ambiguous language or appeared to contradict each other. As Secretary of State John Jay put it in 1787, it would be inconsistent with "reason and equity," as well as with "the most obvious principles of justice and fair construction," to demand that the United States grant unconditional MFN treatment simply because a treaty—in this case the 1782 treaty with the Netherlands—failed to specify conditional MFN treatment. Just because "France purchases, at a great price, a privilege of the United States," the Netherlands cannot "immediately insist on having the like privileges without [paying] any price at all."

The use of conditional MFN treatment led to disputes with trading partners. For example, the so-called Convention of 1815 with Britain set the stage for a dispute with France over the Louisiana Purchase. The convention extended privileges to British ships in American harbors that French ships did not enjoy. In the absence of a specific MFN clause, France insisted that the United States adhere to the literal interpretation of the MFN clause. France claimed that it had given America an equivalent concession at the time of the Louisiana Purchase. Nonetheless, Secretary of State John Quincy Adams asserted that "the condition, though not expressed in the article, is inherent in the advantage claimed under it." Only when France reduced duties on wines in 1831—according to a request from Secretary of State Martin Van Buren—did the United States grant France the commercial privileges it sought.

**MFN TREATMENT IN PRACTICE, 1887–1933: CONDITIONAL AND UNCONDITIONAL MFN WITHIN PROTECTIONISM AND EXPORT EXPANSIONISM**

Until 1887, the United States was a relatively passive and highly protectionist country within the international economy. U.S. trade policy was nonnegotiable and nondiscriminatory and characterized by high tariffs. By the late nineteenth century, this policy complicated efforts of export-oriented sectors that sought to gain access to foreign markets. From the late 1880s, U.S. administrations identified opportunities that the international economy offered these interest groups and attempted to facilitate the expansion of exports on the basis of reciprocity and conditional MFN treatment. But Congress, dominated by powerful Republican protectionists such as Senators Nelson Aldrich and Reed Smoot, remained opposed to trade liberalization on principle. Before World War I, U.S. administrations from Grover Cleveland to Woodrow Wilson focused on export expansion. This was possible because Britain adhered to free trade even as America and Germany challenged and surpassed it in economic productivity and output. That is, the United States could continue to enjoy the benefits of Britain's free-trade policy without compromising its own protectionist policy. Yet the United States had limited success in gaining access to major overseas markets. Indeed, after World War I, the United States and its trading partners raised barriers to trade, exacerbating the financial and commercial imbalances created by the war. Both reciprocity and MFN treatment—conditional or unconditional—proved to be poor
instruments of trade liberalization as long as U.S. markets remained closed to competing goods from overseas.

As administrations and Congresses reaffirmed their commitment to Clay’s American System in the immediate post–Civil War period, Europe followed Britain’s lead toward trade liberalization. The 1860 Cobden-Chevalier Treaty, also known as the Anglo-French Treaty of 1860, between Britain and France epitomized the free trade–low tariff regime established across much of Europe by treaty and unconditional MFN treatment. When he assumed the chair of the Finance Committee, Aldrich remained steadfast to Morrill’s views on trade.

Aldrich championed the position held by the Republican Party that economic nationalism promoted class harmony. By excluding competition from imports, so the argument went, a high tariff wall would promote the well-being not only of producers and workers but also of consumers. As Aldrich put it in the Congressional Record of 5 August 1909: “If we permit American industries to live by the imposition of protective duties, competition in this country will so affect prices that it will give the American consumer the best possible results.” For Aldrich, the tariff was the price that overseas producers had to pay to enter the U.S. market. As such, protectionism placed the burden of generating revenue for the federal government on foreign producers and domestic consumers of imported “luxury” items.

Aldrich had a major hand in writing the McKinley (1890) and Dingley (1897) Acts, which allowed the executive branch to negotiate reciprocal trade treaties. However, he opposed the deals that administrations subsequently negotiated because they lacked equivalent exchanges of concessions. Wedded to the congressional committee system as the institutional basis for policymaking, Aldrich also fought the creation of a commission of experts to study the tariff “scientifically” and make policy recommendations. Committed to protecting the textile industries of his state, Aldrich obstructed the modest efforts of the Taft administration to reduce tariffs and sought to make what became the 1909 Payne-Aldrich Act as conservative a piece of trade legislation as possible.

NELSON W. ALDRICH: ARDENT TRADE PROTECTIONIST

An influential Republican senator from 1881 until 1911, Nelson W. Aldrich (1841–1915) used his position on the Senate Finance Committee—which he chaired from 1899 to 1911—to maintain protection. Elected to the U.S. House of Representatives in 1878, Aldrich was selected in October 1881 to fill the Rhode Island seat vacated by the death of Senator Ambrose Burnside. As a member of the Finance Committee, Aldrich apprenticed under Justin Morrill of Vermont, who chaired the committee for twenty-two years, until 1898. An ardent defender of both the American System and Congress’s authority over trade policy, Morrill opposed free trade, reciprocal trade agreements, and unconditional MFN treatment. When he assumed the chair of the Finance Committee, Aldrich remained steadfast to Morrill’s views on trade.

Aldrich championed the position held by the Republican Party that economic nationalism promoted class harmony. By excluding competition from imports, so the argument went, a high tariff wall would promote the well-being not only of producers and workers but also of consumers. As Aldrich put it in the Congressional Record of 5 August 1909: “If we permit American industries to live by the imposition of protective duties, competition in this country will so affect prices that it will give the American consumer the best possible results.” For Aldrich, the tariff was the price that overseas producers had to pay to enter the U.S. market. As such, protectionism placed the burden of generating revenue for the federal government on foreign producers and domestic consumers of imported “luxury” items.

Aldrich had a major hand in writing the McKinley (1890) and Dingley (1897) Acts, which allowed the executive branch to negotiate reciprocal trade treaties. However, he opposed the deals that administrations subsequently negotiated because they lacked equivalent exchanges of concessions. Wedded to the congressional committee system as the institutional basis for policymaking, Aldrich also fought the creation of a commission of experts to study the tariff “scientifically” and make policy recommendations. Committed to protecting the textile industries of his state, Aldrich obstructed the modest efforts of the Taft administration to reduce tariffs and sought to make what became the 1909 Payne-Aldrich Act as conservative a piece of trade legislation as possible.

In 1887, President Grover Cleveland called for duty-free status on raw materials. He wanted to recast the tariff as an instrument of export expansion. The 1890 McKinley and 1894 Wilson-Gorman Acts supported this approach. Both laws maintained protectionism, but they also sanctioned the pursuit of special reciprocal relationships with Latin American countries through lower duties on selected raw materials. Their aim was to expand U.S. exports to the region at the expense of British and European traders.
By the late 1890s, American exporters faced the probability of losing access to European markets. Some European countries now attached conditions to their MFN clauses. Average European tariff levels remained far below those of the United States—in 1900 European minimum or conventional rates averaged 10 percent while U.S. tariffs on dutiable items averaged 30 percent (and America offered concessions only on noncompetitive goods). But these tariff levels were trending upward. The goal of expanding exports was clearly under threat. The administrations of Presidents William McKinley, Theodore Roosevelt, and William Howard Taft responded by differentiating among trading partners. They maintained the approach of expanding markets in Latin America and protecting the domestic market, but they now used bilateral reciprocity to counter European trade restrictions. Under section 4 of the 1897 Dingley Tariff Act, Congress extended the bilateral reciprocity provisions of the McKinley tariff beyond Latin America to “France, Germany, Belgium, and other European countries.”

Because the single-schedule tariff and conditional MFN treatment remained features of U.S. trade policy, the efficacy of using reciprocity to maintain or expand access to European markets was limited. Indeed, U.S. trade negotiators could not compete with free-trading Britain for favorable tariff treatment from continental Europe. With U.S. manufacturers able to compete against European producers, European governments showed their displeasure with U.S. trade policy by putting tariff arrangements on a temporary basis and discriminating against U.S. products.

The ambiguity of MFN treatment among trade treaties created the basis for increasing commercial frictions between the United States and its trading partners once the executive branch acquired the capacity to use reciprocity as an instrument for expanding exports. The most notable example was the degradation of U.S. trade relations with Germany, beginning in 1905, which almost exploded into a tariff war but was resolved in 1907.

Beginning in the late 1890s, the German government pointed to numerous trade pacts, including the 1828 U.S.–Prussia Commercial Treaty, as evidence that America accepted unconditional MFN treatment. The Germans were particularly critical of the special commercial benefits the United States accorded Switzerland in 1898, in response to the Swiss government’s demand that the United States extend the same concessions granted France earlier in the year. Since an 1850 U.S.–Switzerland trade treaty explicitly provided for unconditional MFN treatment, the United States decided that “both justice and honor” required meeting the Swiss claims. When Germany claimed the same treatment, however, the United States renounced the MFN clauses in the 1850 treaty.

Germany renewed its protests when a 1902 reciprocity treaty with Cuba gave the latter an exclusive rate 20 percent below the rates provided for in the Dingley tariff. Germany argued that Cuba’s sovereign status required the United States to grant it commensurate reductions. The administration of President Theodore Roosevelt cheekily advanced the theory that the 1901 Platt Amendment, which forbade Cuba from entering into foreign agreements contrary to U.S. interests, rendered Cuba part of the U.S. political system, akin to a European colony. The incredulous German government threatened to retaliate with tariff revisions that targeted U.S. exports. It did so to induce the U.S. government to adopt unconditional MFN status, as Europe understood it. But powerful Republicans in Congress, including Speaker of the House Joseph Cannon and Senate Finance Committee Chair Nelson Aldrich, refused to budge. A major trade war was averted only when the U.S. and German governments concluded an executive agreement regarding a possible customs agreement. It outlined the terms of an exchange of the German conventional rate on nearly all items in return for U.S. concessions along the lines of the 20 percent cuts provided for in section 4 of the Dingley tariff.

With the introduction of a statutory minimum-maximum tariff schedule in the 1909 Payne-Aldrich tariff, U.S. trade negotiators held that the minimum rates in effect constituted unconditional MFN treatment as Europeans practiced it. Although the executive branch did not renounce conditional MFN treatment, and therefore remained technically free to alter policy, State Department officials were determined to use the minimum-maximum provisions in the act to embed the nondiscrimination principles of the Open Door policy in trade policy. Trade liberalizers in the executive branch adopted this approach to gain access to overseas markets and to attract the support of agricultural and export manufacturing interests as allies in the battle for a more liberal trade policy.

The administrative features of the Payne-Aldrich Act, including its establishment of the
Tariff Board, also enabled trade agreements to be hammered out within the executive branch, independent of Congress and largely free from public scrutiny. Unfortunately for trade liberalizers, the system proved rigid in operation, because Congress successfully resisted lowering U.S. minimum rates to European levels. Conditional MFN also remained in place. The Wilson administration and the Democratic majority in Congress thus abandoned the dual-schedule tariff for unilateral rate reduction and a single schedule in the 1913 Underwood-Simmons Act. Nevertheless, the 1909 Payne-Aldrich Act contended and institutionalized ways of dealing with liberalizing trade that would be built upon by the 1934 Reciprocal Trade Agreements Act.

After World War I, Republican Congresses and administrations rejected reciprocity altogether and reestablished protectionism. In this context, Secretary of State Charles Evans Hughes used the equality-of-treatment clause in section 317 of the 1922 Fordney-McCumber Act to put U.S. trade policy on an unconditional MFN footing. But this failed to increase international economic cooperation, since Congress also precluded any liberalization of the tariff in the act.

The third of President Wilson's Fourteen Points included a demand for “equality of trade conditions.” He recognized that nations that expected to increase exports needed to open their own markets to imports. This was especially so for America, which, Wilson hoped, would demonstrate international political and economic leadership in the post–World War I era. In addition to reinstating protectionism, the Fordney-McCumber Act addressed the issue of access to overseas markets for U.S. exports. Officials in the State, Treasury, and Commerce departments sought flexible retaliatory authority to counter discrimination. After much wrangling, Congress authorized the president to retaliate unilaterally against foreign discrimination. In addition, it stipulated in section 317 that the Tariff Commission established in 1916 monitor discrimination and make recommendations to the president. The State Department interpreted section 317 to be in harmony with unconditional MFN treatment.

As part of a State Department policy review, William Culbertson, a member of the Tariff Commission, suggested using section 317 to negotiate a series of trade treaties to extend equality of treatment and implement unconditional MFN treatment as broadly as possible. Inclined intellectually to free trade and uninhibited flows of capital, and institutionally sensitive to allowing trade wars to disrupt political relationships, State Department economic advisers Stanley Hornbeck and Wallace McClure agreed that discrimination against U.S. goods should be monitored, but recommended against retaliation unless officials determined it to be absolutely necessary. The policy review elicited strong support for the unconditional MFN approach. State Department officials wanted to avoid the bargaining associated with conditional MFN treatment, and they viewed unconditional MFN treatment as a way of avoiding diplomatic conflict, promoting trade, and improving foreign relations, including the trade negotiation process. They pressed Secretary Hughes to initiate a new round of trade talks based on the unconditional MFN principle. Hughes sold President Warren Harding on the idea. Congress offered no opposition; most members at this time did not engage trade as an issue at the technical level. The administration went forward with the decision on unconditional MFN treatment in February 1923. Hughes announced it in a circular letter to overseas posts in August.

In justifying the decision in a note to the Senate Foreign Relations Committee, Hughes argued that conditional MFN treatment was incapable of winning equality of treatment for U.S. exports, and that what might constitute equivalent compensation was “found to be difficult or impracticable.” “Reciprocal commercial arrangements,” Hughes averred, “were but temporary makeshifts; they caused constant negotiation and created uncertainty.” In his August circular, Hughes explained why a new series of trade pacts had to be concluded: “The enlarged productive capacity of the United States developed during the World War has increased the need for assured equality of treatment in foreign markets.”

From 1923 to 1930, the State Department negotiated trade treaties with forty-three countries; twenty-one of them contained unconditional MFN clauses. Nonetheless, in the context of the financial chaos and the payments imbalances created by world war and the postwar Versailles settlement, important markets such as Canada, Britain, France, and Germany increasingly shut their doors to U.S. exports.

U.S. trade negotiators had little to offer any country that accepted unconditional MFN treatment and equal treatment for U.S. exports. The Fordney-McCumber Act raised the average tariff on dutiable items some 38 percent and on all imports to an average of almost 14 percent. This
was lower than the average rate of the Dingley tariff. Yet the new tariff granted more protection than its 1897 predecessor, since Congress also instructed the executive branch to adjust duties by up to 50 percent to equalize production costs between home and foreign manufactured products. Moreover, the act redefined dumping to include any product imported at a price below the U.S. cost of production (rather than the producers’ own costs). In addition, Congress allowed the president to strip MFN status from any country that discriminated against American products or dumped goods into the U.S. market. The tariff now effectively excluded all competing goods.

The punitive responses and the single-schedule tariff regime reestablished by the Fordney-McCumber Act hamstrung all State Department efforts to negotiate unconditional MFN clauses in trade agreements. Tariffs could be adjusted only to equalize production costs or punish others for uncooperative acts. Equalization applied to all nations regardless of their MFN status. Discrimination applied selectively to nations that lost MFN status for their treatment of U.S. goods. To make matters worse for trade liberalizers, Congress supplemented tariffs with selectively applied quotas: a form of protection totally at odds with the MFN principle.

U.S. trade policy under the Fordney-McCumber Act, together with congressional insistence that allies repay their war loans to the U.S. Treasury, undermined international efforts to stabilize and reconstruct the post–World War I international system. Rather than assume the mantle of global leadership as Britain’s economic power waned, the Republican administrations of Warren Harding, Calvin Coolidge, and Herbert Hoover relied on private capital flows to ameliorate the payments imbalances created by war debts and reparations. These flows ultimately proved insufficient to overcome the foreign economic policy of these administrations.

In its ongoing search for a way to liberalize trade that Congress might find politically acceptable, the State Department began thinking in terms of an approach that involved both reciprocal bargaining and unconditional MFN treatment. During the Coolidge administration, economic adviser McClure suggested as much, saying that it might pave the way for bilateral negotiations with important trading partners. McClure, a friend of fellow Tennessean Representative Cordell Hull, worked closely with the future secretary of state to develop what would become the reciprocal trade agreements program. Both McClure and Hull preferred lowering trade barriers through bargaining rather than unilaterally reducing tariffs, which was the approach employed by the Wilson administration in the Underwood tariff. However, congressional Democrats adhered to the Wilsonian approach until the election of Franklin Roosevelt.

Congress reinforced its commitment to protectionism with its passage of the debilitating Smoot-Hawley Act in 1930. The act produced additional international economic conflict. Trading partners retaliated to protect themselves from the loss of the U.S. market, worsening relations and reinforcing the effects of global depression. The defensive reactions of trading partners, Britain and Canada in particular, demonstrated that the U.S. economy could be injured by foreign reaction. Politicians and officials recognized that trade policy could no longer be treated as an independent domestic issue. Further, when Britain failed to restore its pre-1914 position of international economic leadership following its return to the gold standard in 1925, the idea that international economy stability required American leadership began to gain support in some circles. Above all, the Smoot-Hawley Act demonstrated that the costs of protectionism were too high, prompting a turn toward a more liberal approach in trade policy, one within which all trade instruments, including unconditional MFN treatment, could serve as tools to lower trade barriers.

MFN TREATMENT IN PRACTICE, 1934–1974: UNCONDITIONAL MFN AS ONE INSTRUMENT OF TRADE LIBERALIZATION

The State Department under Cordell Hull moved forward with the trade liberalization program that it had championed since the nineteenth century. The 1934 Reciprocal Trade Agreements Act marked the beginning of a successful U.S. effort to liberalize trade and create a multilateral regime of commercial cooperation. The most important aspects of the RTAA were institutional. Foremost, Congress ceded to the executive branch the power to set and manage the trade agenda. Members of Congress voted to do so partially in response to the fallout from the Smoot-Hawley Act and the persistence and depth of depression. They were also persuaded by executive branch promises to compensate producers that were harmed by subsequent trade deals.
The RTAA formed the basis for the post–World War II multilateral system that employed bilateral reciprocity to negotiate lower trade barriers and enforce fair trade norms, and used unconditional MFN treatment to spread the benefits of reciprocal bargaining. The State Department used the RTAA to promote international trade, rather than just U.S. exports, and its officials recognized that America had to lower its trade barriers. In the run-up to World War II, the State Department granted concessions on an unconditional MFN basis as part of an effort to build an alliance to counter German and Japanese aggression. The RTAA approach—equality of treatment, a negotiable tariff, and executive-branch authority to negotiate agreements that would be binding without congressional ratification—would become the framework for international cooperation under the General Agreement on Tariffs and Trade.

Many State Department officials were liberals in the nineteenth-century tradition. They linked trade discrimination to political conflict. As such, they believed in free trade, to which Britain adhered until 1932. At the same time, they appreciated the power that Congress retained over trade policy. Hull and his advisers therefore chose reciprocity as a way to both lower trade barriers and placate members of Congress who remained wedded to protection. Unconditional MFN treatment would be the tool to maximize the benefit of bilateral treaties.

After keeping trade off the agenda during his first year of office to concentrate on reviving and regulating the U.S. economy, President Franklin D. Roosevelt proposed the RTAA to Congress, selling it as a domestic recovery measure. To placate wary members of Congress, the administration proposed no changes to the 1921 Anti-Dumping Act, retained the countervailing duty provisions in section 338 of the Smoot-Hawley Act, and agreed to subject the act to reauthorization in three years. The RTAA also said nothing about dismantling protection. The State Department took it upon itself to use both reciprocity and unconditional MFN treatment—linked for the first time in U.S. trade policy—as tools of trade liberalization.

In the interests of trade liberalization and international security, State Department officials pressed for few concessions in the series of negotiations that occurred before and during World War II. This was especially the case with Europe. (In Latin America, U.S. officials threatened to refuse to negotiate reciprocal trade and to withhold Export-Import Bank credits and other financial assistance unless governments satisfied their demands to settle debts in default to U.S. bondholders, treat U.S. direct investment in a fair and equitable manner, and adopt political reforms.) Determined to reverse the ill effects of U.S. protectionism, U.S. trade negotiators offered concessions to Belgium, Britain, Switzerland, and others, while tolerating trade barriers, currency depreciation, and other actions that closed overseas markets to U.S. products.

The State Department also decided to extend unconditional MFN treatment to most third-party countries. Under the RTAA, it was unclear which countries should be eligible to receive such treatment. The department moved initially to extend concessions to countries that did not discriminate against U.S. exports. Since all of America's major trading partners continued to discriminate against U.S. products, however, the State Department deemed this approach to be impractical. It concluded that the administration should withhold benefits only when others' discrimination was flagrant. In its view, such a stance would improve relations among nations. It therefore singled out Nazi Germany for retaliatory action. In moving in this direction, the State Department departed from the bilateral approach to reciprocity for which Roosevelt campaigned in 1932 and that Congress intended in the RTAA. (Roosevelt, his “brain trust” advisers, and key cabinet officials such as Treasury Secretary Henry Morgenthau Jr. doubted that the reciprocal trade program could play the role that Hull designed for it in achieving either the security or economic goals of the administration's foreign policy. For Roosevelt, trade, like all matters of foreign economic policy, took a backseat to domestic issues.)

In terms of expanding U.S. trade, the reciprocal trade agreements concluded between 1934 and 1945 achieved limited results. But actual trade expansion was secondary to building international cooperation against the Axis threat. In arguing for extensions of the RTAA in 1937, 1940, 1943, and 1945, State Department officials were explicit about the national security role of the trade program. Moreover, the State Department became convinced that the institutional structure of the RTAA, linking reciprocity and unconditional MFN treatment, should serve as the basis for constructing a post–World War II multilateral trade regime.

Hence, the linkage between reciprocity and unconditional MFN treatment was translated into
the norms of the General Agreement on Tariffs and Trade (GATT). In the view of State Department analysts, economic autarky and fascist aggression were bound together as causes of the world war. Thus, political cooperation was possible only if economic cooperation was established. During the war, State Department officials developed a blueprint for the structure of commercial cooperation in the postwar world. The lack of cooperation during the interwar period persuaded them that economic nationalism was the root of instability in the international system and degraded relations among nations. They resolved to make nondiscrimination in trade the basis for economic cooperation, which they believed was essential to an enduring postwar peace. The International Trade Organization (ITO) would monitor commercial relations on the basis of unconditional MFN treatment. But countries would also negotiate bilaterally to both open markets and preserve their recourse to measures to protect domestic producers and social welfare policies, as the RTAA prescribed.

In 1947 the administration of Harry Truman invited countries, including Russia, to Geneva, Switzerland, to negotiate a multilateral trade agreement; twenty-four nations accepted the invitation. Although the Soviet Union opted out of the process, twenty-three countries negotiated bilaterally on a product-by-product basis. The bilateral pacts became the multilateral GATT, since every signatory enjoyed unconditional MFN treatment. The nine countries that felt they could adhere to the demands of the treaty, accounting for 80 percent of world trade, implemented the GATT on 1 January 1948.

The State Department supported a more liberal approach to trade policy than the still-protectionist Congress and the other agencies of the executive branch, most of which were solidly “New Deal” in orientation. But it recognized political reality and retained the “fair” trade elements of the Reciprocal Trade Agreements Act in its negotiations for the International Trade Organization (and the GATT, after Congress rejected the ITO over sovereignty issues). The elements of the New Deal that provided for state responsibility for economic growth and social welfare were not going to be repealed. The United States, Great Britain, and other participants wanted to retain flexibility on domestic economic policy even as they agreed to liberalize international trade. And given their expectations regarding America’s position of leadership in the postwar order, U.S. architects of postwar trade policy concluded that it was America’s responsibility to offer asymmetrical concessions in order to establish the trade regime in which they were interested. Thus, unconditional MFN treatment became the guiding principle of an emerging liberal regime that retained the safeguards, restrictions, and exemptions of “fair” trade. Parties to the GATT promised to consult each other when conflicts arose and to resolve differences through a dispute settlement procedure. Reciprocity would be used as an instrument of both freer and fairer trade.

The GATT governed international trade until the World Trade Organization was established on 1 January 1995. Beginning with the 1947 session in Geneva, the GATT promoted trade liberalization through a series of negotiating rounds. With the Kennedy Round (May 1964–January 1967), negotiators adopted—with some exceptions—a formula for across-the-board percentage cuts, doing away with bilateral negotiating. For this round and the 1947 Geneva parley, Congress authorized tariff reductions of up to 50 percent of existing rates. Both rounds reduced tariffs some 35 percent. In both rounds, the U.S. promptly provided concessions to its trading partners, even if, like western Europe in 1947 and Japan and many developing countries in 1964–1967, they lagged in reciprocating. From 1947 to 1967, six GATT rounds removed tariffs as a barrier to the U.S. market. In doing so, U.S. policymakers placed a higher priority on stabilizing the American-led anticommunist alliance and promoting the economic reconstruction of its allies than on shielding domestic producers from foreign competition.

**MFN TREATMENT IN PRACTICE, 1974–2000: UNCONDITIONAL MFN UNDER SIEGE BUT PRESERVED**

The GATT relied on discrimination and retaliation to enforce an open, multilateral trade regime. The coexistence of unconditional MFN treatment and reciprocity in the GATT gave rise to tensions among members, because disparities in liberalization among participants widened over time. Under unconditional MFN treatment, countries that lagged in opening their markets enjoyed the benefits of a free ride on the system. When the United States experienced economic downturn during the 1970s and 1980s, domestic interest groups called for redress from participants who seemed to be
unfairly “gaming” the GATT. The United States seemed to be suffering within a system in which its trade negotiators ceded more to their counterparts from increasingly competitive trading partners—Japan in particular—than they received. In response, Congress resumed the activist trade-policy role from which it had retreated in 1934. Members of Congress introduced a plethora of retaliatory bills that had the potential of compromising America’s commitment to unconditional MFN treatment within the GATT framework. In most instances, the actions threatened by these so-called fair, or strategic, trade measures constituted interest group efforts to push policy in a nationalist direction. But the administrations of Presidents Gerald Ford, Jimmy Carter, Ronald Reagan, George H. W. Bush, and Bill Clinton handled them in (often illiberal) ways that kept the United States committed to the GATT.

Transparency in trade relations constituted a key principle of the GATT. Trade barriers were to be converted into tariffs, which then were to be lowered through negotiation. This approach reached its point of diminishing returns with the Kennedy Round. Nontariff barriers, which included such things as countervailing duties, technical barriers, import licensing, voluntary export restraints, and local content rules, were becoming significant obstacles to trade. The United States still adhered to the principle of nondiscrimination, but the GATT commitment to transparency was being lost.

Congress insisted that President Richard Nixon’s administration use reciprocity to defend U.S. producers when it authorized the so-called fast track negotiating process for the Tokyo Round (1973–1979). (Under fast track, Congress had to approve or reject a trade treaty. Its members could not amend it.) Most significantly, the Tokyo Round extended the GATT to cover non-tariff barriers (NTBs). While tariff negotiations continued on the basis of unconditional MFN treatment, however, NTB bargaining proceeded on a conditional MFN basis. The Tokyo Round in practice did little to reduce these barriers or to equalize access among the American, European, and Japanese markets. U.S. consumers were soon benefiting from a flood of well-made Japanese autos and electronic consumer goods. Besieged U.S. industries, however, petitioned Congress for assistance.

The 1974 Trade Act provided the basis for relief. Section 201 of the act authorized tariffs, quotas, and other remedies to facilitate orderly adjustment to increased competition from abroad. If the U.S. International Trade Commission (ITC) determined that imports were causing “serious injury, or threat thereof” to a petitioning industry, it could order up to five years of relief. As U.S. automakers and the United Auto Workers union discovered in 1980, however, ITC approval of import relief could not be counted upon. In such cases, interested parties appealed again to Congress for help. Congress proved willing to consider measures that violated the GATT to redress sectorial trade imbalances and compensate injured firms and dislocated workers. U.S. administrations used reciprocity to derail such efforts. In the case of the U.S.–Japan auto dispute, for example, the Reagan administration negotiated and secured a voluntary export restraint agreement in May 1981. This strategy kept U.S. trade policy within the GATT framework and thereby preserved the U.S. commitment overall to unconditional MFN treatment.

During the 1980s and 1990s, regional trade agreements posed another threat to the principle of nondiscrimination in U.S. trade policy. After the protracted Tokyo Round, the Reagan administration pursued regional free trade agreements even as it pushed for a new GATT round. The Bush and Clinton administrations did so as well, even after the Uruguay Round commenced in 1986. Advocates insisted that free trade agreements not only were compatible with multilateral trade liberalization, they actually promoted it, since the agreements addressed issues not handled successfully with the GATT framework (such as agriculture, services, investment, intellectual property rights, and various nontariff barriers). Nonetheless, free trade agreements with Israel in 1985 and Canada in 1987, as well as the North American Free Trade Agreement (NAFTA) with Canada and Mexico in 1992, marked a digression in U.S. trade policy from unconditional MFN treatment. At the same time, the Clinton administration remained committed to the successful conclusion of the Uruguay Round, which was completed in 1994. One hundred and eleven countries signed the pact, which established the World Trade Organization as the successor organization to the GATT.

During this period, Congress also linked MFN treatment to human rights. The Jackson-Vanik Amendment to the 1974 Trade Act, championed by Senator Henry Jackson, prohibited granting MFN treatment or Export-Import Bank credits to any “non-market economy country”
that restricted emigration, Jackson was primarily concerned about the emigration of Jews from the Soviet Union. To achieve its broader aims of diplomacy, the Nixon administration wanted to extend MFN treatment and access to export credits to the Soviet Union. The Nixon administration was also interested in the emigration of Jews but preferred to accomplish it through quiet diplomacy. Administration officials believed that Jackson's amendment had some value in sending a signal to the Kremlin regarding America's concern for human rights. However, as National Security Adviser Henry Kissinger argued, the administration would likely lose any leverage it had on the emigration issue once the Jackson-Vanik Amendment became law. This proved to be the case. From 1972 to 1974, some 87,000 people emigrated from Russia. For the period 1975–1977, the figure fell to a little more than 44,000.

The Jackson-Vanik Amendment also ensured that human rights became intertwined with the MFN debate on China, particularly after the Tiananmen Square massacre of June 1989. In this case, the Bush and Clinton administrations successfully “de-linked” MFN treatment from human rights. In 1999 the Clinton administration secured congressional approval of “permanent normal trade relations” with China.

From their first commercial agreement in 1979, the United States and the People's Republic of China conducted trade relations on the basis of unconditional MFN treatment. China was not a member of the GATT. MFN treatment for China was subject to annual renewal by the president, per the Jackson-Vanik Amendment, and had to conform to various requirements stipulated by the 1974 Trade Act. Until the Chinese government cracked down on the student demonstrators in Tiananmen Square, the renewal of MFN treatment for China was a pro forma affair. After the massacre, in which more than a thousand protestors and bystanders were killed by soldiers, members of the House and Senate sought to condition MFN status on China's performance on human rights. In 1990, the Bush administration gathered enough Republican support in the Senate to renew unconditional MFN treatment for China. But soon thereafter, members of Congress complicated the issue by demonstrating their willingness to condition MFN status for China not only on human rights but also on a range of strategic, political, and economic issues. To meet the concerns of Congress (and businesses interested in such matters as intellectual property rights and Chinese textile imports), both the Bush and Clinton administrations adopted a policy of “constructive engagement.” They used diplomacy to address human rights and other issues. At the same time, they continued to renew MFN status for the purpose of expanding trade and developing investment opportunities for U.S. corporations.

The Clinton administration initially favored linking unconditional MFN treatment to China's human rights record, but President Clinton ultimately proved unwilling to sacrifice the China market. After a protracted battle with human rights groups and members of Congress, the administration succeeding in “de-coupling” human rights from its trade policy on China in 1994. Over the next five years, Clinton administration officials worked to bring China into the newly created World Trade Organization and to put unconditional MFN treatment for China on a permanent basis. This culminated in an agreement of 15 November 1999 to make China a full member of the WTO.

The United States remained committed to unconditional MFN treatment within the WTO framework. However, by the end of the 1990s, further liberalization of trade within the WTO had stalled. Congress revoked fast track bargaining authority from the executive branch after the Uruguay Round, and the Clinton administration did not put a high priority on regaining it. The administration also declined to take a leadership position on the expansion of NAFTA to Latin America, as the Chilean and other governments hoped. With the remarkable expansion of the U.S. economy during the late 1990s, demands by Congress and interest groups for retaliation became less strident. To be sure, trade disputes continued. However, outside of MFN status for China, trade retrofitted in importance relative to finance as the “high-visibility” foreign economic policy issue.

The influence of multinational corporations on U.S. foreign policy is complex, but, generally speaking, they have not played a major role in the formulation and execution of foreign policy. This may seem a surprising conclusion, because it is now widely recognized that for much of U.S. history, but especially for the period beginning at the end of the nineteenth century and continuing throughout the twentieth century, there has been a strong correlation between U.S. foreign economic policy and U.S. foreign policy. Simply stated, historians and others have shown, rather convincingly, that economic expansion—the search for foreign markets for U.S. surplus agricultural and industrial production—has played a key role in American foreign policy, particularly after President Woodrow Wilson (1913–1921) enunciated his concept of a new world order predicated on classical liberal and capitalist principles.

In writing about the role of multinational corporations on U.S. foreign policy, however, the following points need to be made: (1) the first multinational corporations were not established until the latter part of the nineteenth century; (2) most of the first multinational corporations became “multinational” by reinvesting their foreign profits abroad, not by making investments overseas; (3) large businesses invested abroad where and when their executives thought profits were to be made, not because of foreign policy concerns, and, with some exceptions, because they did not unduly seek to influence the formulation of foreign policy; (4) while there were certainly loud calls for expanding markets overseas, even to the point of permitting businesses to engage in joint combinations otherwise prohibited by the nation’s antitrust laws, those business leaders advocating such policies were generally from smaller or midsize businesses and/or represented regional interests; and (5) to the extent that there was collusion or collaboration between public policymakers and business leaders (as in the case of the oil industry), it was just as often government that sought to use the nation’s industrial giants to achieve foreign policy objectives rather than the other way around.

Multinational corporations (MNCs) are corporations whose home offices are in one country but have significant fixed investments in other countries. These investments might be in factories or warehouses, transportation or telecommunications, mining or agriculture. Businesses that merely maintain local or regional sales offices abroad are generally not thought of as multinational corporations.

Corporations invest abroad for a variety of reasons. Among them are to open new markets or to hold onto existing ones; to avoid tariffs or other trade restrictions; to tap new sources of raw materials and agricultural production; and to take advantage of cheap foreign labor. Although the history of American MNCs goes back to at least the mid-nineteenth century and a significant number of MNCs had been established by the turn of the twentieth century, their emergence as a key factor in international commerce is really a product of the post–World War II period.

Americans had, of course, been involved in world commerce ever since the founding of the colonies in the seventeenth and eighteenth centuries. Colonial merchants often employed agents abroad (frequently family members) to promote their interests wherever they conducted significant commerce, most notably in London and the West Indies. Following the American Revolution and through much of the nineteenth century, they expanded their stakes abroad by opening branches that sometimes included fixed investments like warehouses. Some Americans even opened small businesses overseas or inherited existing businesses through loan defaults and bankruptcies.

Until the latter part of the nineteenth century, however, American businesses had not
made the types of direct investments abroad that would have classified them as multinational corporations. The reasons why were much the same as the reasons why even America's largest business enterprises sold mainly in local and regional markets. The United States lacked the transportation and communication facilities to allow businesses to operate on a national scale. American businesses also lacked the organizational structure and capital to compete nationally or internationally.

By the end of the nineteenth century all that had changed. With the establishment of transcontinental railroads and a network of branch lines that laced much of the nation together and a telegraph and telephone system that made nearly instantaneous communication possible, American business leaders could think in broad national terms. Other developments, including a single national currency and the expansion of capital markets, the mass production of consumer goods like food products and manufactured clothing, and major technological advances such as the manufacture of electrical generators, office equipment, and sewing machines, each requiring a specially trained sales force to sell and service them, made national expansion viable, even inevitable.

The same was true of the international marketplace. A dramatic increase in the speed of steamships plying the oceans between American and world ports, the completion in 1866 of the first transatlantic cable, the need or desire on the part of American business leaders to seek out new markets for increased U.S. industrial and agricultural production, and the need also to have reliable sources of raw materials and native agriculture, such as bananas from Central America, were only some of the supply-side forces driving U.S. economic expansion overseas after the Civil War. On the demand side were the attraction abroad of new U.S. industrial output and the importance of having a trained sales force able to explain and service the highly sophisticated technology that American manufacturers were producing.

**EARLY MULTINATIONAL CORPORATIONS**

The first American multinational corporation was I. M. Singer and Company (later changed to Singer Manufacturing Company), whose name became synonymous with the sewing machine. Established in 1851, Singer relied at first on independent foreign agents to sell its machines in Europe, even transferring to a French entrepreneur, Charles Callebaut, the rights to its French patent. Having successfully developed its own sales force and branches in the United States, however, and unhappy with the lack of control over these agents, some of whom even sold competing machines, the company decided to rely on its own salaried sales force and branch offices to market its product. By 1879 Singer was selling more machines abroad than at home and had branches in such distant places as India, Australia, South Africa, and New Zealand. In response to Europe's demand for its machines, moreover, it opened its first foreign factory in Glasgow, Scotland, in 1867. In 1883 it built a new modern plant outside Glasgow, where it consolidated the operations of the original factory and two others that had grown alongside it. It also built much smaller plants in Canada and Austria. By the end of the century other American corporations, including Westinghouse, General Electric, Western Electric, Eastman Kodak, and Standard Oil, often following Singer's experience abroad, had also opened plants or refineries in Europe.

Although talk was ripe at the end of the nineteenth and beginning of the twentieth centuries about gaining a larger American presence in the Far East and Latin America, most large American companies invested abroad where market success seemed most promising or where sources of raw materials could easily be developed; this meant primarily Canada, Mexico, and Europe. Canada was both a market for American exports and a source of such raw materials as gold, timber, and oil. As such it was the largest market for American investments, which totaled $618 million by 1914. In second place was Mexico, where Americans invested $587 million, mostly in mining and railroads but also increasingly in oil.

Europe was a primary market for U.S. industrial goods, including heavy industrial machinery, steam pumps, cash registers, electrical generators, reapers, and consumer goods, most of which were superior to European technology. American firms grew abroad largely by reinvesting their overseas earnings. In fact, by the turn of the twentieth century the United States had made such inroads into European markets that Europeans even talked and wrote about an “American invasion” of Europe, not dissimilar from American cries seventy-five years later against a Japanese “invasion” of the United States. By 1914, U.S. direct investment in Europe amounted to $573 million.
Worldwide, Americans invested $2.65 billion. Although this might not seem noteworthy by contemporary standards, it amounted to about 7 percent of the nation's gross national product or about the same percentage of the GNP as for the 1960s. On the eve of World War I, in other words, the United States had entered the still new world of multinational corporations, although that term was still unfamiliar and would remain so to most Americans for another half century.

**WORLD WAR I AND ITS AFTERMATH**

The outbreak of war in Europe in 1914 offered MNCs both danger and opportunity at the same time. On the one hand the belligerent powers had to be fed and equipped. Furthermore, the war opened to the United States the opportunity to move into markets in Latin America and the Far East hitherto dominated by Europe's two major industrial powers, the United Kingdom and Germany, each of which had to concentrate its attention on winning the war for its side. Furthermore, the opening of the Panama Canal in 1914 afforded new opportunities for increased trade between ports along the East and Gulf coasts of the United States and the west coast of South America and the Far East. In the Mississippi Valley it also kindled plans among the region's business and financial leaders to redirect some of the nation's largely east-west commercial traffic to such Gulf ports as New Orleans, Mobile, and Galveston.

The war turned the United States from a debtor to a creditor nation. Despite tremendous losses as a result of Germany's on-and-off submarine campaign, the United States supplied Britain and its allies with the goods and credits necessary to sustain the war effort before America's own entry into the war in 1917. The United States was even able to make substantial gains in Latin American markets at the expense of the European belligerents, more so, however, in mining and ore processing than in manufacturing.

After the war Washington passed two measures designed to strengthen the nation's position in foreign trade, especially in Latin America. The first of these was the Webb-Pomerene Act (1918), which exempted business combinations from the provisions of the antitrust laws. Congress approved the measure as a way to help small businessmen enter the foreign field by being allowed to form joint selling agencies engaged in business abroad. But the measure had also been pushed by larger business concerns interested in organizing more complex vertical combinations (that is, combinations performing more than one function in the chain of production, extending from the acquisition of raw materials through the manufacturing process and ending with the distribution and sale of the finished product). Although fewer than two hundred associations ever registered under the act, a number of supporters of the measure, including the Department of Commerce, continued to seek ways to strengthen it.

The second measure approved by Congress after the war was the Edge Act (1919), which provided for federal incorporation of long-term investment and short-term banking subsidiaries doing business abroad. Like the Webb-Pomerene Act, the measure was intended to encourage small banking firms to compete successfully against more established British firms and a few American financial institutions like the National City Bank, which had established foreign branches throughout Latin America, more in order to attract accounts at home than to make profits abroad. The Edge Act was also part of the government's program for meeting Europe's capital and banking needs and President Woodrow Wilson's larger program for economic expansion.

Also like the Webb-Pomerene Act, the Edge Act never lived up to its promise. In the two years after its passage only two corporations were established under its provisions. As late as 1956 there were only three Edge corporations. The simple fact was that, despite government encouragement to foreign investment and a brief flurry of activity in the two years immediately following the war's end, too much uncertainty about world economic conditions existed to sustain this level of effort.

**EXPANSION: 1925–1930**

Not until the mid-1920s, when the international economy seemed to stabilize, particularly in Europe, and the United States' own economy was booming, did U.S. corporations start to make substantial direct foreign investments. Encouraged by President Calvin Coolidge and his fellow Republican Herbert Hoover, first in his capacity as Coolidge's secretary of commerce and then as Coolidge's successor in the White House, the largest U.S. firms began to invest heavily in Europe, both in search of new markets and as a way of protecting themselves against trade barriers. Such
investments, usually in the form of foreign subsidiaries, branches, or joint ventures, also fitted well into the multidivisional, decentralized organizational structure begun at General Motors (GM) under the leadership of Alfred Sloan but adopted very quickly by other major industrial concerns.

Yet, as Sloan later wrote, the decision to invest overseas did not come easily, nor was it perceived as inevitable. GM's executives, for example, had to decide whether there was a market abroad for American cars and, if so, which models were likely to fare the best. They also had to determine whether to export entire cars from the United States, build plants to assemble imported parts, or engage in the entire manufacturing process overseas. If the latter, they then had to consider whether to buy existing plants or build their own. Invariably, these decisions involved such other considerations as the taxes and tariffs of host nations, the state of existing facilities and dealerships abroad, and the desire of foreign governments to protect jobs and national industries. In the case of General Motors, the corporation almost bought the French carmaker Citroën but decided against doing so, in large part because of the French government's opposition to an American takeover of what it considered a vital industry. GM did, however, buy the British firm Vauxhall Motors Ltd. and the German carmaker Opel. Even more important, it made a decision at the end of the 1920s to be an international manufacturer seeking markets wherever they existed and to build the industrial infrastructure necessary to penetrate and maintain them.

Although direct foreign investment as a percentage of the GNP remained about the same in the 1920s as it did at the turn of the century (about 7 percent), what made the 1920s different from earlier decades were where and what kinds of investment were being made. Investments in manufacturing, which had lagged behind mining and agriculture, now vaulted ahead of both. As it did so, direct investments in Europe almost doubled, from approximately $700 million in 1920 to about $1.35 billion by 1929; manufacturing and petroleum accounted for most of this increase. Significantly, much of the new investment came from firms that previously had not braved the waters of overseas markets. Businesses like Pet and Carnation Milk had well-established brand names at home on which they hoped to capitalize by joining together under the Webb-Pomerene Act to open new plants and factories in France, Holland, and Germany in the 1920s.

Almost as dramatic as the increase in direct investments in manufacturing abroad were those in petroleum, which increased from $604 million in 1919 to $1.34 billion by 1929. Although this included everything from the exploration of petroleum to its production, refining, and distribution, most of the increase was in exploration and production. Thanks to vast increases in the production of oil in Venezuela, American direct investments in petroleum in South America jumped from $113 million in 1919 to $512 million by 1929.

Even in the Middle East, which remained largely a British preserve, the United States made important inroads. Fearful of an oil shortage after the war and worried that the region might be shut to American interests, the United States pressured the European powers to give a group of American oil companies a 23 percent share of a consortium of British, French, and Dutch oil producers. Among these companies were Standard Oil of New Jersey (now Exxon) and Standard Oil of New York (now Mobil), which later bought out the other American firms. The consortium became the Iraq Petroleum Company (IPC), whose purpose was to explore and develop mineral rights in the former Ottoman Empire.

As a result of developments like these, total American investment in foreign petroleum increased from $604 million in 1919 to $1.34 billion dollars in 1929. By that year petroleum had become the second-largest sector in terms of American direct foreign investment, with mining ($1.23 billion) and agriculture ($986 million) falling to second and third places.

THE GREAT DEPRESSION

The Great Depression of the 1930s, beginning with the crash of the stock market in 1929, affected multinational corporations worldwide. As purchasing power overseas dried up, and as governments sought to protect existing markets by erecting high tariffs and other trade barriers, some U.S. corporations closed or sold factories and other foreign facilities and curtailed or stopped entirely making investments abroad.

At the same time, however, other American businesses sought to leapfrog obstacles to trade and protect existing markets by entering into business arrangements with foreign concerns, such as licensing and market-sharing agreements. With all the major world currencies having gone off the gold standard and become
nonconvertible (that is, not convertible into gold or other currencies like the American dollar or the British pound), most multinational corporations simply chose or were forced by host governments, as in the case of Nazi Germany, to reinvest their foreign profits.

In Latin America, American corporations also continued to invest, sometimes with assistance from Washington, in the development of resources, such as copper in Chile and Peru and lead and zinc in Argentina (although overall investments in South American mining dropped dramatically), and in public utilities including railroads. In the Middle East, American oil companies continued to challenge British oil hegemony by investing heavily in production facilities in Saudi Arabia, Kuwait, and Bahrain. Gulf Oil Company negotiated an oil concession from Kuwait. Standard Oil of California (Socal) established the Bahrain Oil Company and received a concession to look for oil in Saudi Arabia. Texas Oil Company (Texaco) acquired a half interest in the Bahrain Oil Company and in the California Arabian Oil Company (now Aramco) organized by Socal to develop its Arabian fields.

These same companies also entered into a number of agreements among themselves and with two British and Dutch companies, Anglo-Iranian Oil (now British Petroleum, or BP) and Royal Dutch Shell, to control the sale of crude oil and finished products to independent refiners and marketers. Of these agreements the most significant were the so-called “Red Line” and “As Is” agreements of 1928, which placed severe restrictions on where, with whom, and under what conditions the signatories could explore for oil and develop oil fields in the Middle East. Between 1928 and 1934 the As Is partners entered into three supplementary agreements to carry out these purposes. So successful were they that by 1939, seven oil corporations, five of which were American, monopolized the oil industry in the Middle East and controlled much of the world’s other oil supplies.

More generally, multinational corporations were able to weather the depression of the 1930s reasonably well. Between 1929 and 1940 total direct foreign investment by American firms declined only slightly, dropping from about $7.53 billion in 1929 to $7 billion in 1940. In Europe they increased from $1.34 billion in 1929 to $1.42 billion in 1940, while in South America they stayed the same, at about $1.5 billion for both years. In Europe manufacturing remained dominant, edging up slightly from about $629 million in 1929 to about $639 million in 1940. The most significant increase occurred in the petroleum sector, rising from $239 million in 1929 to $306 million in 1940. In contrast, in South America public utilities jumped from $348 million to $506 million during these same years, while petroleum actually dropped from $512 million to $330 million and mining fell from $528 million to $330 million; by 1940, public utilities had become the leading sector for direct American foreign investment in South America.

**WORLD WAR II**

As one might expect, U.S. entry into World War II in 1941 disrupted the normal channels of American commerce, discouraging or making impossible direct investments overseas. Between 1940 and 1946 such investments grew only marginally, from $7.0 billion in 1940 to $7.2 billion in 1946. In that year they amounted to only 3.4 percent of the GNP, the lowest percentage in the century. What American investments made abroad during the war were largely in the Western Hemisphere. Although investments in Canada and Latin America grew from $4.9 billion in 1940 to $5.6 billion in 1946, investments in Europe declined from $1.4 billion in 1940 to $1 billion in 1946. In Africa and the Middle East they remained steady at about $200 million for each of these years, while in the rest of the world they declined from $500 million in 1940 to $400 million in 1946.

Most of these investments went to further the war effort. No commodity was more important in this regard than oil, on which the entire machinery of war depended. So urgent was the need for oil, in fact, that the War Department invested $134 million in the construction of a refinery and pipeline in Canada as part of a project (the Canol Project) to open a new oil field in the Canadian Northwest Territories. The project had little commercial utility, and after the war it was abandoned when none of the parties to the project showed any interest in continuing it.

In the Middle East, Secretary of the Interior Harold Ickes, who also served as petroleum administrator for the war and generally distrusted the oil industry, even tried to obtain government ownership of American oil concessions in Saudi Arabia and Bahrain. Opposition from oil interests and doubts even within the administration about a government takeover of private enterprise ultimately doomed Ickes’s plans. An
effort, on the other hand, by several American oil companies to gain an ownership stake in the Anglo-Iranian Oil Company led to strong and ultimately successful opposition by the British, who objected to what they regarded as an attempt by Washington to lock them out of oil development in the Mideast, and by the Iranians, who wanted to delay until after the war any decision on its most vital resource.

During the war a number of major multinational corporations engaged in the production of strategic materials, such as oil and synthetic rubber, were accused in congressional hearings and on the floor of Congress of having conspired with the enemy before the war. In particular, the oil and petrochemical industries were charged with exchanging trade secrets in chemicals with the chemical giant I. G. Farben and other German firms deemed instruments of Nazi policy in return for trade secrets in oil refining. Civil and criminal actions were even brought against a number of these companies, the most notable being against Exxon, which in 1929 had signed an agreement with Farben recognizing its “preferred position” in chemicals in return for Farben’s recognition of Exxon’s “preferred position” in oil and natural gas. The two giant corporations also pledged close cooperation in their respective enterprises.

In 1942 the Justice Department brought a civil antitrust suit against Exxon, charging it with delaying the development of high-quality synthetic rubber because of its agreement with Farben, which prevented easy access to important data by other U.S. rubber companies. Although Exxon blamed the German government and not Farben for withholding the needed data, it entered
a plea of “no contest.” As part of its plea bargain it also agreed to release all its rubber patents free during the war, with the royalty on these patents to be determined after the war ended.

POSTWAR INVESTMENT: 1945–1955

Despite wartime criticism of the foreign operations of some American firms, including their ties with Nazi firms before the war, and notwithstanding the economic uncertainties that were bound to accompany the war’s end, a few of the largest U.S. corporations, often with considerable assets seized or destroyed during the war, began to plan for the postwar period. Among these was General Motors. As early as 1942 the company had set up a postwar planning policy group to estimate the likely shape of the world after the war and to make recommendations on GM’s postwar policies abroad.

In 1943 the policy group reported the likelihood that relations between the Western powers and the Soviet Union would deteriorate after the war. It also concluded that, except for Australia, General Motors should not buy plants and factories to make cars in any country that had not had facilities before the conflict. At the same time, though, it stated that after the war the United States would be in a stronger state politically and economically than it had been after World War I and that overseas operations would flourish in much of the world. The bottom line for GM, therefore, was to proceed with caution once the conflict ended but to stick to the policy it had enunciated in the 1920s—seeking out markets wherever they were available and building whatever facilities were needed to improve GM’s market share.

Other MNCs, however, adopted more cautious positions. Significant investments were made in Canada and Latin America in the mining of iron, uranium, and other minerals that had been scarce during the war, but of all the major industries, only the oil industry, worried as it had been after World War I about a postwar oil shortage, invested heavily overseas after World War II. Between 1946 and 1954 the value of these investments grew from $1.4 billion to $5.27 billion.

Even then, the type of oil investments before and after the war differed significantly. Previously they had been largely market oriented, their purpose being mainly to eliminate market competition. After the war Exxon, BP, Shell, and Mobil shifted their emphasis from market control to control of supply. The companies found that the infrastructure called for by the Red Line and As Is agreements of 1928, with their elaborate system of local and national cartels and quotas, was inefficient and difficult to maintain; moreover, the Red Line agreement established geographical limits to oil exploration in the Middle East. Much more effective, they concluded, would be control of a few crucial petroleum sources in the Mideast.

The opening of new fields by Gulf, Texaco, and Socony also raised the possibility that the As Is structure might be undermined. Conversely, control of these fields would guarantee the dominance of all the majors for years to come. Therefore, while maintaining their hold over marketing, the companies became much more interested in the supply end of petroleum. Exxon and Mobil withdrew from the Iraq Petroleum Corporation, which would have prohibited them from investing in the Arabian Peninsula without their other IPC partners, and instead bought a 40 percent share of Aramco. Socony and Texaco were glad to have them as partners both for their infusion of capital in what was a still risky venture and for their vast marketing capacity. The multinational oil companies also established a system of long-term supply agreements and expanded the number of interlocking, jointly owned production companies. In effect, the era of formal oil cartels gave way in the postwar era to a system of long-term supply agreements and an expansion in the number of interlocking, jointly owned production companies.

For other industries, however, pent-up consumer demand at home, the scarcity of similar demand in war-ravaged Europe and elsewhere, the lack of convertible foreign currencies, the risks attendant upon overseas investments as illustrated by the experiences of two world wars, restrictions on remittances, and the fact that a new generation of chief executive officers with less of an entrepreneurial spirit and more of a concern with stability and predictability than many of their predecessors, all served to limit foreign investment in the years immediately after World War II. Although investments in manufacturing, for example, grew from $2.4 billion in 1946 to $5.71 billion in 1954, most of this increase was in the reinvestment of profits of existing corporations, either because host governments blocked repatriation of scarce currencies or for tax and other reasons not related directly to growing consumer demand. Investments in other industries such as public utilities
($1.3 billion in 1946 and $1.54 billion in 1954) scarcely grew at all.

In at least one respect, government policy discouraged overseas investment after the war, particularly in manufacturing. As never before, foreign economic policy became tied to foreign policy. As the Cold War hardened in the ten years following the war, Washington imposed severe restrictions on trade and investment within the communist bloc of nations. The Export Control Acts of 1948 and 1949, for example, placed licensing restrictions on trade and technical assistance deemed harmful to national security. During the Korean War (1950–1953) even tighter controls, extending to nonstrategic as well as strategic goods, were imposed on the People's Republic of China.

It would be absurd to suggest that, absent these controls, American companies would have made substantial investments within the communist bloc. Nevertheless, the economic boycott of a vast region of the world contributed to the global economic uncertainty that normally inhibits direct foreign investment. According to the British, who were anxious to relax controls on the potentially rich markets of China, it also delayed its own economic recovery, another inhibitor to foreign investors.

That said, in the decade following the war the administrations of both Harry Truman and Dwight Eisenhower looked to the private sector to assist in the recovery of western Europe, both through increased trade and direct foreign investments. In fact, the $13 billion Marshall Plan, which became the engine of European recovery between 1948 and 1952, was predicated on a close working relationship between the public and private sectors. Similarly, Eisenhower intended to bring about world economic recovery through liberalized world commerce and private investment abroad rather than through foreign aid. Over the course of his two administrations (1953–1961), the president modified his policy of “trade not aid” to one of “trade and aid” and changed his focus from western Europe to the Third World, which he felt was most threatened by communist expansion. In particular he was concerned by what he termed a “Soviet economic offensive” in the Middle East, that is, Soviet loans and economic assistance to such countries as Egypt and Syria. But even then he intended that international commerce and direct foreign investments would play a major role in achieving global economic growth and prosperity.

THE INTERNATIONAL MONETARY FUND AND WORLD BANK

As European recovery became increasingly apparent in the early 1950s and as the demand at home for consumer goods began to be satiated, U.S. corporations started to look once more at overseas markets. Problems still remained, such as a shortage of dollars (the so-called “dollar gap”) and the lack of convertible foreign currencies needed to pay for essential goods from the United States and to remit foreign profits. But the International Monetary Fund (IMF) and the International Bank for Reconstruction and Development (IBRD, or World Bank) began to make loans intended to spur foreign trade and economic development. Established in 1944 at Bretton Woods, New Hampshire, as part of a new international monetary system based on the dollar, these twin financial institutions had remained largely dormant and ineffective as instruments of a new economic order. The IMF's primary purpose was to stabilize exchange rates, mainly by setting par values and supporting them with short-term balance-of-payments loans. The World Bank was intended to serve as a reconstruction rather than a development bank.

In the years immediately following the end of World War II neither financial institution was able to achieve its objectives. Faced with a staggering imbalance of trade and a severe dollar shortage, the IMF husbanded its resources and acquiesced in the growing number of exchange restrictions that took place as nations sought to protect their exchange values from the pressures of the free market. As for the World Bank, the problems of reconstruction and the degree of international financial instability after the war were far greater than the architects of the Bretton Woods system had anticipated. Unable to meet Europe's reconstruction needs with its own limited resources, much less to promote economic development in the Third World, and seeking to win the confidence of the American investor in order to float its bonds on the American capital markets, the bank followed conservative lending policies. It made a few reconstruction loans, but after the inauguration of the Marshall Plan in 1948, it purposely subordinated its lending activities to the new aid program.

Beginning around 1950, however, the World Bank expanded its long-term lending program from a level of $350 million in 1950 to more than $750 million by 1958. By the fall of 1958 it had invested $3.8 billion in development projects in
forty-seven countries, mostly in the Third World.
The IMF went through a more protracted transition than the World Bank, largely due to the fundamental disequilibria that existed in the international economy and the fact that the dollar was the only fully convertible currency. Not until the Suez crisis of 1956 did the fund, which had stopped all lending with the inauguration of the Marshall Plan, resume lending. That year it approved a standby credit of $738 million for England to pay for oil imported from the Western Hemisphere. By 1958 the fund had extended short-term loans of $3 billion to thirty-five countries.

In other ways as well, the government sought to spur direct foreign investments. For example, the United States negotiated tax treaties with a number of countries to prevent American businesses overseas from being taxed twice. It made investment guarantees to American firms venturing in western Europe. It increased the lending power of the Export-Import Bank, which had been established in 1934 to make short-term loans to American exporters but which over the years had made a number of long-term loans for development purposes.

THE OIL CARTEL CASE

Near the end of Truman’s term in office the Justice Department instituted an antitrust suit against the multinational oil corporations operating in the Middle East. Both Truman and subsequently the Eisenhower administration sharply cut back the suit. The government charged the five major U.S. oil corporations—Exxon, Mobil, Socal, Texaco, and Gulf Oil—along with two alleged coconspirators, Royal Dutch Shell and British Petroleum, with criminal violation of the nation’s antitrust laws by having engaged in a worldwide combination to restrain and monopolize U.S. domestic and foreign commerce in crude oil and petroleum products. The suit sought relief through divestiture of the defendants’ joint production, refining, pipeline, and marketing operations.

The oil cartel was one of a series of cases that the Justice Department brought against industries after the war believed to have collaborated with enemy powers before the conflict. In the short term, the cases were disruptive to a number of multinational corporations that had made major investments overseas before the war and may even have discouraged them from engaging in international business after the conflict; certainly this was the case with General Electric (GE), which had suffered losses during the war and had to fight a suit accusing it and its subsidiary, International General Electric, of having maintained a cartel in lamps and electric equipment. Eventually GE sold off a major part of its foreign holdings.

By the end of Truman’s administration, however, the White House had begun to rethink its foreign antitrust policies. This was most apparent in the oil cartel case. In 1951 Iran nationalized British Petroleum’s Iranian holdings. BP responded with a highly successful worldwide embargo of Iranian oil, which led to serious European oil shortages. For reasons of national security having to do with needing the same oil companies against which it had brought a criminal antitrust action to meet these shortages, President Truman had the criminal charges reduced to much less punitive civil actions. He did this over strong objections from Justice Department and Federal Trade Commission officials, who maintained that the agreement constituted a waiver of the antitrust laws as applied to the foreign cartel arrangements of the oil majors.

President Eisenhower believed that enforcement of the antitrust laws should not interfere with programs and policies deemed important or essential to the national interest, such as the promotion of trade and private investment overseas. Accordingly, he later ordered the oil cartel case confined strictly to firms headquartered in the United States and then pressured the Justice Department to grant a newly formed Iranian oil consortium (consisting of BP, Royal Dutch Shell, the five American majors, and a number of smaller independents) a waiver in the exploration and refining of Iranian oil. Since it was nearly impossible to prosecute the very actions it had encouraged and sanctioned on the grounds of national security, the antitrust case was now effectively reduced to just the marketing and price-fixing of oil. Although the case was to drag through the courts until 1968, its final outcome left intact the scaffolding of the cartel arrangements among the oil majors. The decrees obtained were limited to price-fixing and marketing arrangements only.

MULTINATIONAL CORPORATIONS, 1955–1990

By the middle of the 1950s the wave of antitrust suits by the Justice Department against major
industries with direct foreign investment had about run its course, although not all cases, such as the oil cartel case, had yet been settled. Furthermore, western Europe had largely recovered from the worst ravages of the war and in 1957 would form what became known as the Common Market. Great Britain, which would not be invited to join the Common Market, was moving toward full convertibility of the British pound. The “dollar gap,” which had worsened because of the Korean War and European rearmament, was turning into a “dollar surplus” that would cause its own problems in the 1960s. Thanks largely to American spending in Japan as a result of the conflict in Korea, that country had also begun its long course toward becoming a major industrial power, one that twenty-five years later would make it the envy of much of the rest of the industrial world, including the United States. Following the death of Soviet leader Joseph Stalin in 1953 and the end of the Korean War that same year, there was even a short lull in the Cold War, as Moscow's new leader, Nikita Khrushchev, made new peaceful overtures to the United States that would lead to the Geneva Conference of 1957 between Khrushchev and President Eisenhower and the so-called “spirit of Geneva.”

By the middle of the 1950s, in other words, economic growth had reached a point, and the world political situation had stabilized to such a degree, that many of the largest U.S. corporations were looking again to invest abroad. The country's foreign aid programs, which increasingly tied foreign loans and economic assistance to the procurement of American goods and services, also helped stimulate direct foreign investment.

The result was an expansion of MNCs in the middle of the 1950s that has continued largely unabated. Between 1950 and 1965 alone, the leading U.S. corporations increased their manufacturing subsidiaries in Europe nearly fourfold. In Australia, General Motors made significant investments. Even during the war GM had decided to manufacture and sell cars in Australia, where it had earlier purchased plants and established distributorships for its automobiles. In 1948 it still only manufactured and sold 112 vehicles. By 1950 production was up, but only to 20,000 cars. By 1962, however, GM was manufacturing 133,000 automobiles with expansion to a capacity of 175,000 already under way.

As the industrialized world recovered from World War II and as the United States built plants and factories and other facilities abroad, the nation's balance of payments turned into a deficit and gold reserves declined sharply. When he took office President John F. Kennedy responded by curtailing government spending abroad and encouraging American exports. President Lyndon Johnson established a program of voluntary—later made mandatory—restraints on direct foreign investment. Nevertheless the deficit continued to grow, and instead of being hoarded as they had been during the war, dollars in Europe began to be sold in what became known as the Eurodollar market. The selling of American dollars for other currencies and the inability of the United States to regulate the Eurodollar market led in 1971 to President Richard Nixon's decision to float the currency against other world currencies rather than to keep the dollar pegged to a fixed gold price as it had done since the Bretton Woods system of 1944.

While these measures had some immediate impact, in the long term they failed to prevent overseas investments by American firms. There were too many ways, for example, for these corporations to get around voluntary or mandatory controls, such as by downstreaming capital investments to foreign subsidiaries and by borrowing on the Eurodollar market. Furthermore, the opportunities abroad, the uncertain future of the dollar, the attraction of cheap labor in Third World countries, the growing importance of foreign oil and other raw materials, and the perceived need to get around voluntary or mandatory controls on overseas investments by American firms. There were too many ways, for example, for these corporations to get around voluntary or mandatory controls, such as by downstreaming capital investments to foreign subsidiaries and by borrowing on the Eurodollar market. Furthermore, the opportunities abroad, the uncertain future of the dollar, the attraction of cheap labor in Third World countries, the growing importance of foreign oil and other raw materials, and the perceived need to be close to foreign consumers all encouraged the migration of American capital overseas.

Interestingly, while Washington was trying to limit direct investments in the world's largest industrial nations, it actually sought to promote such investments in the Third World, which through the Vietnam War of the 1960s and early 1970s was viewed as a battleground in the Cold War between the United States and the Soviet Union. In 1969 Congress approved the creation of the Overseas Private Investment Corporation, the mission of which was to encourage private investment in less developed countries. To help build the infrastructure needed to attract private investors, the World Bank increased the number of soft loans (loans with below-market interest rates and generous repayment schedules) it made to less developed countries. Even the IMF got into the soft-loan business despite the fact that this had not been part of its original mission.

As American-owned MNCs continued to expand abroad they met increased foreign resistance and growing competition from foreign
rivals. The 1970s were a particularly troublesome decade for many of these enterprises, not so much in terms of competition as in overseas opposition to what many foreign nationals regarded as a form of rapacious American imperialism. Still operating in the poisonous world and domestic climate that was an outgrowth of twenty-five years of Cold War rhetoric and a highly unpopular war in Vietnam, MNCs were maligned as part of an American military-industrial establishment seeking world economic and political hegemony. Nor were these views limited to a radical left-wing fringe. Many respected national and international political officials, political theorists, international business leaders, and academics joined in the chorus against the MNCs. A spate of books appeared in the 1970s highlighting the world power of the multinational corporations and arguing that they had become states unto themselves beyond the control of any single nation.

A particular target, but certainly not the only one, of the critics was the oil industry. Drastic increases in energy prices resulted from huge consumer demand in the United States and the decision of the Organization of Petroleum Exporting Countries (OPEC), which had been formed in 1960, to use oil as a political weapon following renewed war between the Arab states and Israel in 1973. This led to a depletion of oil supplies, and prices for gasoline more than doubled in the United States.

Even respected authorities on the oil industry portrayed the multinational oil firms as a sovereign entity with its own form of government and with sources of revenue and influence that allowed it to dictate pretty much the terms and conditions under which oil would be produced and sold in the world. Although this was an oversimplified version of the power of the oil companies to control the production and price of oil, it resonated with the American public. Secret inter-industry correspondence and memoranda, much of it highly damaging and much of it revealed for the first time in 1974 by the Senate Subcommittee on Multinational Corporations, provided the basis for many of the charges made against the oil industry.

None of the charges made in the 1970s against the oil industry or, more generally, against multinational businesses prevented their further growth. In 1978 Congress passed legislation effectively deregulating most domestic commercial aviation, a process that had already been started by Alfred Kahn, head of the Civil Aeronautics Board. In the 1980s deregulation was expanded to include international aviation. By 1997 the United States had concluded agreements with twenty-four nations, thereby allowing U.S.-owned airlines to enter into operational and strategic alliances with foreign-owned airlines and in some cases even to partially own them. Deregulation of the telecommunications industry, concluding with the 1996 General Agreement on Trade in Services, allowed American Telephone and Telegraph (AT&T) and other American corporations in the telecommunications industry to enter into similar arrangements with their foreign counterparts. Between 1960 and 1965 assets of U.S. banks abroad grew from $3.5 billion to $458 billion. Fast-food chains and retailers like McDonald’s, Kentucky Fried Chicken, the Gap, and Nike opened thousands of outlets overseas. So did firms in such industries as chemicals and heavy machinery. As a result, in the 1990s sales abroad of U.S. subsidiaries were, on average, five times larger than all of U.S. exports.

Nor were direct foreign investments limited to American-headquartered firms as they had been for most of the postwar period prior to 1980. Businesses in South Korea, Taiwan, and most of western Europe competed against the United States for foreign markets and, indeed, for the U.S. market as well. As a result, between 1980 and 1995 the total amount of direct foreign investment grew more than six times to approximately $3.2 trillion. Between 1975 and 1992 the number of persons employed by multinational firms also increased from about 40 million to 73 million. In 1977 U.S.-based firms accounted for about 69 percent of the U.S. gross manufacturing output; by 1994 that figure had dropped to 57.6 percent. During these same years foreign-owned subsidiaries in the United States increased their market share of U.S. manufacturing from 3.4 percent to 13.2 percent. As of 1996 western Europe actually accounted for $1.59 trillion (about 50 percent) of the world’s foreign direct investment, while North America accounted for $905 billion (about 28 percent). Of the remainder, other developed countries, most notably Japan, accounted for about $402 billion (12.7 percent), while the rest of the world accounted for just $286 billion (or approximately 9 percent).

**A GLOBAL ECONOMY: THE 1990S**

With the development of a truly global economy by the 1990s, opinion with respect to the multi-
national corporations in home and host countries varied considerably. American multinationals have often been viewed abroad as purveyors of technology and business efficiencies and as bearers of products meeting an insatiable appetite for American goods. But a more negative image also developed. The growing competitiveness of the new world economy and a heightened emphasis on cost efficiencies, job reductions, retooling, and relocation led to complaints in home and host nations about declining market shares and lost jobs.

The transnational character of the multinationals proved irksome to the growing legion of laid-off workers and lower- and mid-level managers who felt most victimized by the new competition and the search for cheaper labor markets. Government officials sensed a loss of their sovereignty because of the ability of these corporations to move their operations, transactions, and profits upstream or downstream as their self-interests dictated. Transfers of technology were another issue pitting MNCs and host and home governments against one another, as they jockeyed to maintain or gain control of technological breakthroughs for reasons of national security and profits.

By the beginning of the twenty-first century, the fact that more and more of the world economy seemed to be dominated by a relatively few multinational giants also led to the ringing of alarm bells. (Estimates of U.S. multinational corporations in 2001 ranged around three thousand, but the numbers were declining because of a wave of corporate mergers.) Other problems creating tensions between MNCs, host governments, and home governments included jurisdictional disputes, cultural differences, nontariff barriers to trade, international agreements among the multinational corporations, and conflicting political agendas on such matters of principle as the environment, energy, human rights, accessibility to proper medical treatment and high-cost pharmaceuticals, sweatshops, and child labor laws.

CONCLUSION

Public opinion and government policy with respect to MNCs, in other words, conjure up the image of a fault line along the earth’s crust, quiet for the moment but with pressures building below that could—will—divide the earth above. Despite the best-educated guesses, however, nobody really knows just when and under what circumstances this will happen or how severe the damage will be. Already odd alliances have been formed among the parties most affected by the growth of MNCs. One of these took place beginning in 1991 when free-trade advocates in the United States found themselves joined by the multinationals but strongly opposed by rank-and-file workers over the approval of the North American Free Trade Agreement (NAFTA), which was ratified in 1992 despite labor’s objections. In 1994 the MNCs and free traders won a limited victory with the establishment of the World Trade Organization (WTO), which since its founding has focused much of its attention on breaking down remaining restrictions on the expansion of MNCs worldwide. It has had only moderate success, however, because it lacks judicial authority, something the U.S. negotiators refused to give it because of congressional reservations about granting extensive powers to the new body.

In the late 1980s, free traders in Europe joined with European workers in successfully opposing the proposed merger of Honeywell International and General Electric on antitrust grounds. The United States and the European Union also entered in a trade war. They clashed over European restrictions on imports of American beef and bananas, and the U.S. steel industry accused European firms of dumping steel on American markets. European business and political leaders retaliated with charges that Washington unfairly subsidized U.S. exports and rejected its efforts to resolve trade disputes.

These claims and counterclaims suggest that, in a world becoming smaller each day, with corporate mergers across national boundaries becoming more common and a technological and information revolution unlike any in the past, calls will continue to grow about bringing the aspirations of private enterprise more in line with national needs. How that will happen or whether it is even possible remain unanswered questions. The failure of the United States and Europe to resolve their economic differences and a growing movement toward economic regionalism in East Asia, including mutual currency supports, cooperative exchange systems, and an East Asian free trade area, even suggest a worldwide backlash already under way against economic globalization. At the same time, it is difficult to imagine anything less than a highly integrated world economy or one without the glue of the multinational corporations that helped bring it about in the first place.
BIBLIOGRAPHY

James, Harold. The End of Globalization: Lessons from the Great Depression. Cambridge, Mass., 2001. Argues that, while there are parallels between today’s situation and the end of the movement toward globalization following the Great Depression, one of the essential developments of the 1930s—economic nationalism tied to two of the major powers of the era, Nazi Germany and the Soviet Union—is not in evidence in the early twenty-first century.

Kapstein, Ethan B. “Workers and the World Economy.” Foreign Affairs 75 (May–June 1996): 16–37. Argues that the global economy, with its implicit promise of a better life for the working class, has not lived up to that promise primarily because the institutional structure established after World War II to support economic growth and development has forced many governments to follow stringent fiscal policies at labor’s expense.

Kaufman, Burton I. The Oil Cartel Case: A Documentary Study of Antitrust Activity in the Cold War. Westport, Conn., 1978. A history in which the author argues that Washington used the oil companies to achieve its foreign policy objectives.

Rodrick, Dani. Has Globalization Gone Too Far? Washington, D.C., 1997. Argues that globalization, including the expansion of the multinationals, may indeed have gone too far and that governments need to be more sensitive to the domestic ramifications resulting from economic globalization.

Sampson, Anthony. The Sovereign State of ITT. New York, 1973. Maintains that, through ruthless and sometimes illicit practices, ITT, one of the largest conglomerates of the 1960s and 1970s, became a worldwide business empire that defied control by any sovereign nation.

———. The Seven Sisters: The Great Oil Companies and the World They Shaped. New York, 1975. Adopts the argument that multinational corporations have had excessive control over the formulation of American foreign policy, but an important study and a solid history.

———. In the Hurricane’s Eye: The Troubled Prospects of Multinational Enterprises. Cambridge, Mass., 1998. Maintains that multinationals are facing increasing efforts by host and home governments to regulate their
operations as a result of an increasingly hostile domestic environment.

Wolf, Martin. “Will the Nation-State Survive Globalization?” *Foreign Affairs* 80 (January–February 2001): 178–190. Argues that nation-states will become stronger rather than weaker in the evolving international economy, and that further globalization will not be the destined result of market forces associated with the technological revolution but rather of conscious decision by nation-states to enhance their economic well-being.

At the Munich Conference of 1938, France and England followed a policy of appeasement toward Adolf Hitler, choosing not to challenge him on his takeover of Czechoslovakia in the hope that German aggression toward neighboring states would stop there and that war in Europe could be averted. The failure of this appeasement approach in preventing the outbreak of World War II subsequently made the Munich agreement a metaphor for weakness in foreign policy, and the “lesson” of the Munich Conference has permeated the American political world ever since. The Munich analogy has not only been used consistently in American presidential and governmental rhetoric but has also affected foreign policy decisions at crucial moments in U.S. history. Presidents from Franklin D. Roosevelt to George H. W. Bush, from the 1940s to the 1980s, have used the example of Munich as a warning to the public about the inherent dangers of appeasing aggressors.

THE ROAD TO MUNICH

During the fateful year 1938, the Nazi dictator Adolf Hitler took the first two steps in his Drang nach Osten, or drive to the east, by annexing Austria and the predominantly German sections of Czechoslovakia. In order to win Italian support, Hitler had promised to respect Austrian independence and to refrain from interfering in the small republic’s internal politics. At heart, though, he had never really abandoned his hope of uniting the land of his birth with his adopted fatherland, a feeling reciprocated by some Austrians. (Indeed, at the end of World War I, Austria asked to be united with Germany, but subsequently this was expressly forbidden in the Treaty of Versailles.) By early 1938 Hitler felt strong enough to cast his promises to the winds.

In February he summoned Kurt von Schuschnigg, the Austrian chancellor, to a conference at Berchtesgaden, the führer’s mountain retreat in the Bavarian Alps, and demanded the admission of prominent Austrian Nazis to the cabinet. Schuschnigg complied but called for an immediate plebiscite, which he felt certain would demonstrate popular opposition to union with Germany. The Nazis were apparently of the same opinion, for they at once demanded the resignation of Schuschnigg and a postponement of the plebiscite, threatening invasion by German troops as the alternative. Schuschnigg resigned on 11 March. His successor as chancellor, the Nazi Arthur Seyss-Inquart, immediately called in the Wehrmacht, allegedly to suppress disorders in Austria. On 12 March the German government proclaimed Austria to be a state of the German Reich, and two days later Hitler entered Vienna amid a great show of rejoicing. Anschluss was complete. France and Great Britain protested, but since neither had an interest sufficiently vital to go to war to prevent this action, no one raised a hand in resistance.

Hitler next turned to “rescue” what he termed the “tortured and oppressed” Germans of Czechoslovakia, in point of fact the most democratic state of Central Europe. Of Czechoslovakia’s 14 million people, about 3.5 million were Germans. These lived for the most part in the Sudeten area that fringed the western end of the republic, facing German territory to the north, west, and south. The Sudeten Germans, comprising just one of numerous ethnic minorities in Czechoslovakia, had shown little dissatisfaction with their government until 1932, when the Nazi movement first gained some strength among them. From then until 1938, the Sudeten Nazis, led by Konrad Henlein, kept up a growing agitation, first for complete cultural and political autonomy within Czechoslovakia and finally for union with Nazi Germany.

The Czechoslovak government made a succession of compromise offers, but these were one by one rejected by Henlein, who consulted Hitler at
each step. By September 1938 it was evident that nothing less than cession of the Sudetenland to Germany would satisfy the führer. The Czechoslovak government did not propose to yield to dismemberment without putting up a fight. It had a relatively efficient army and a defensible frontier. It also had defensive alliances with France and Soviet Russia. If it were attacked by Germany, and if its allies fulfilled their solemn obligations, a general European war was certain. This would, in all probability, involve England also.

In an effort to find a peaceful settlement for the Sudeten problem, Prime Minister Neville Chamberlain of Great Britain paid two visits to Hitler, at Berchtesgaden and at Godesberg, on the Rhine a few miles above Cologne. In the first (15 September 1938) Chamberlain ascertained that the führer would take nothing less than surrender of the Sudetenland to Germany. In the second, a week later, he submitted to Hitler a plan for the prompt and peaceful transfer to Germany of the areas of Czechoslovakia with populations more than 50 percent German, the fixing of the new frontier by an international commission, and an international guarantee of the independence of a Czechoslovakia shorn of these important segments of its territory and population. The Prague government agreed to these terms under combined and relentless British and French pressure.

To Chamberlain's consternation, Hitler rejected this proposal as too slow. Instead he demanded the immediate withdrawal of all Czech military and official civilian personnel from areas that he specified, with plebiscites to follow in other areas where the percentage of German population was doubtful. German troops, he warned, would occupy the specified areas on 1 October, whether or not Czechoslovakia accepted his ultimatum.

Czechoslovakia at once rejected this proposal and mobilized its army of 1.5 million men. France followed with partial mobilization, as did Belgium. France and Britain made it clear that they would assist Czechoslovakia if it were attacked, while Italy announced its intention of standing by its Axis partner. The threat of war was real.

**AMERICA HAS A STAKE IN APPEASEMENT**

At this point (27 September 1938) U.S. President Franklin D. Roosevelt entered the picture. Urging Hitler to lay the controversy before an international conference, he added: “Should you agree to a solution in this peaceful manner I am convinced that hundreds of millions throughout the world would recognize your action as an outstanding historic service to all humanity.”

Roosevelt also joined with Chamberlain and French Premier Édouard Daladier in a plea to the Italian dictator Benito Mussolini to persuade Hitler to accept a peaceful settlement that would give him substantially all he asked for. Hitler yielded to the extent of agreeing to meet with Mussolini and the French and British leaders at Munich. There, on 29 September, Hitler and Mussolini and Chamberlain and Daladier agreed on a plan that the Czech government perfuce accepted. It differed little from Hitler's ultimatum of a week before, merely allowing slightly more time for Czech withdrawal from the surrendered area. The American contribution to the crisis was confined to a message from Roosevelt reminding all the European powers concerned of their solemn obligation under the Kellogg-Briand Pact (1928) not to go to war with one another. The Soviet Union was not invited. In any case, it was assumed that war had been averted. Prime Minister Chamberlain told the people of England that he had brought back “peace with honour,” adding, “I believe it is peace in our time.”

Two Czechoslovak diplomats summoned to Munich were held overnight under Gestapo guard and confronted on the morning of 30 September with what the great powers had done. Prague was forced to give in to the pact's terms. Jan Masaryk, son of the founding father of the Czech Republic, warned Britain and France, “If you have sacrificed my nation to preserve the peace of the world, I will be the first to applaud you. But if not, gentlemen, God help your souls!”

The Wehrmacht was to be allowed to take over the German-speaking frontier area of Czechoslovakia during the first ten days of October with all the military installations it contained. What was left of the republic was to be placed under some kind of indeterminate guarantee, never enacted.

The Munich pact was hailed as a triumph of diplomacy over war, and Chamberlain returned home to a hero's welcome. Nevile Henderson, the British ambassador to Berlin at the time of the conference, later wrote that “it was solely thanks to Mr. Chamberlain's courage and pertinacity that a futile and senseless war was averted.” He wrote to his prime minister, saying, “Millions of mothers will be blessing your name tonight for having
saved their sons from the horrors of war.” The London Times reported that “No conqueror returning from a victory on a battlefield has come home adorned with nobler laurels.” Americans greeted the Munich settlement with profound relief that war had been avoided. Thus, the American government and people at this time obviously favored appeasement with Hitler as the alternative to war.

As Hitler violated his pledges and anti-Semitic outrages multiplied in Germany, Roosevelt publicly voiced disapproval. He recalled the American ambassador after the violent Kristallnacht (“night of broken glass” on 9–10 November 1938) in Germany, a wave of anti-Jewish riots and stringent repressive measures that followed the assassination of a German diplomat in Paris by a Jew.

Hitler fully reciprocated American dislike and recalled his ambassador. He viewed the United States as a racial mixture that could not even cope with the economic depression. The United States, with its political weakness and degenerate culture, he told his intimates in 1938, would prove no match for German will. The United States was too impotent to fight and would not go beyond meaningless moral gestures in international affairs. The German military shared his opinion. Using “racial arithmetic,” Hitler concluded that the polyglot United States was held together only by the glue of 20 million superior Anglo-Saxons or 60 million of valuable racial stock, therefore Germany, with its larger population of Aryans, was far more powerful. America’s neutrality laws in the 1930s merely strengthened his contempt.

The Munich settlement proved to be but the prelude to the complete extinction of Czechoslovakia as an independent nation. Hungary and Poland demanded and received slices of Czech territory where Magyars and Poles were numerous. As a result of the crisis, Hitler annexed to Germany more than 3 million Germans of the Sudeten region. Politically, Hitler’s success broke the back of the “Little Entente” (the alliance system of smaller states that sought to preserve the central European status quo as established by the Versailles system), gutted the French alliance system in Eastern Europe, and made the Third Reich easily the dominant power in the continent.

Internal dissension between Czechs and Slovaks in March 1939 afforded Hitler the final pretext for taking control of the destinies of those two ethnic divisions of the former republic. Hitler summoned President Emil Hácha to Berlin and induced him to “place the fate of the Czech people . . . trustingly in the hands of the Führer,” who presumably guaranteed “an autonomous development of its national life corresponding to its peculiarities.” On 15 March, Bohemia and Moravia became a German protectorate, which was promptly occupied by German troops. The Czech army offered no resistance. The disappearance of Czechoslovakia demonstrated Hitler’s readiness to extend his claims beyond “racial” areas and base them on the Reich’s needs for Lebensraum, or “living area.”

Hitler had declared at Munich: “This [Sudetenland] is the last territorial claim which I have to make in Europe.” His absorption of Czechoslovakia had given the lie to that declaration, and by April 1939 he was pressing Poland for consent to annexation of the free city of Danzig and a sort of German corridor across the Polish corridor to give Germany freer access to East Prussia. By this time even Chamberlain had lost faith in Hitler’s promises. He abruptly abandoned appeasement and, with France, gave guarantees of aid against aggression to Poland and later to Romania and to Greece, the latter threatened by Italy’s occupation of Albania. Geography would make it difficult to implement these guarantees effectively, but they at least served notice on the Axis powers that further aggression against their small neighbors would mean war with the great western democracies.

On 1 September, German forces, led by mechanized divisions and supported by overwhelming airpower, invaded Poland. Two days later, making good their pledge, Great Britain and France declared war against Hitler’s Germany. World War II had at last begun. Appeasement was finished.

THE MUNICH LEGACY
The very term “Munich” has since become synonymous with a typical example of dishonorable appeasement, that is, a situation when the vital interests of a nation are bartered away in return for minor concessions or none at all. Appeasement, according to this line of argument, may often result from national weakness or, worse, ignorance either from an inability to fight or a fundamental misconception of reality. In the case of Czechoslovakia, interests were literally given away without any concessions being extracted from Germany. This occurred because Great Britain and France were not militarily or economically prepared to fight another war, nor
were they psychologically prepared to fight for causes that, although just, did not affect them personally. Prime Minister Chamberlain summarized public opinion to Parliament prior to leaving for the Munich Conference, pointing out “how horrible, fantastic, incredible that we should be digging trenches . . . here because of a quarrel in a far away country, between people of whom we know nothing.” Furthermore, Chamberlain was motivated by a belief that by conceding to the demands of a minority people who wished to be reunited with their traditional nation, he would be able to avoid war and achieve “peace with honour.”

The Munich agreement soon became the archetype of failure of will in the face of moral confrontation, turning firmness into an essential virtue in the conduct of foreign policy. Statesmen, for fear of being called “Municheers,” have since been encouraged to go to the brink of war in the hope that by adopting an inflexible position, the aggressor will be forced to go to retreat. This outlook has been pervasive in the American political world since World War II. As Telford Taylor points out in his seminal work Munich: The Price of Peace (p. xvi), “Munich has become a standard weapon in the dialectic of politics,” but always in a pejorative sense.

AMERICA’S MUNICH GENERATION

It is impossible to understand American politics and diplomacy since Munich without understanding the intellectual world of those Americans who came to maturity in the interwar period. These were the same politicians, policymakers, and diplomats who had experienced the disillusionment of the Versailles system and the folly of isolationism. They had struggled through the Great Depression, which had reduced half of America’s population to penury. They witnessed the rise of communism (with its forced collectivization and purges), fascism, and nazism. They recoiled from the West’s abandonment of Czechoslovakia to Hitler in 1938 under the aegis of appeasement and were dragged into the second world war of their lifetime, the death toll this time probably reaching 60 million, including 6 million murdered Jews.

They also perceived a shrinking world in which war and peace were judged indivisible—the hard lesson of Munich, learned on both sides of the Iron Curtain. The analogy shaped a generation of diplomacy. Moreover, modern warfare, with its awful weapons of death and destruction and the equally awful contemplation that they could be delivered anywhere with impunity, caused the majority of Americans to rethink past policies and their role in the world. The usually cautious American public placed its faith in the collective security of the fledgling United Nations. The fact that the UN would not or could not play this promised role produced the moment of truth: Would the United States play the keeper of the balance of power? The answer would prove to be yes, launching what W. W. Rostow once described as the “American Diplomatic Revolution.”

In 1938 President Franklin D. Roosevelt had been unwilling to involve America in another war, and so had done little to strengthen British and French resolve at the Munich Conference. When Hitler invaded Czechoslovakia in March 1939, the United States reacted with shock and anger. The U.S. ambassador to Italy later recalled how he had expressed America’s dissatisfaction with Germany’s actions. He told the Italian minister for foreign affairs that “Hitler’s performance had greatly shocked American public opinion and that . . . the brutal methods employed by Hitler in seizing Bohemia and Moravia by armed force had created a profound impression on the United States.” Thus, when Hitler finished off Czechoslovakia, the United States lost all hope it had held of appeasement preventing war. The ambassador to France, William C. Bullitt, wrote to the secretary of state describing the feeling there: “The invasion of Czechoslovakia ends definitely all possibility of diplomatic negotiations. . . . There is only regret that Hitler’s action has ended the period when it was still possible to hope that constructive diplomatic action might maintain peace.” It became clear that war was imminent and that the policy of appeasement had failed.

By the time war came to America, Roosevelt had fully learned the harsh lesson of appeasement. In his Christmas Eve “fireside chat” of 1943, he assured the public that while the allies stuck together “there will be no possibility of an aggressor nation arising to start another world war. . . . For too many years we lived on pious hopes that aggressor and warlike nations would learn and understand and carry out the doctrine of purely voluntary peace. The well-intentioned but ill-fated experiments of former years did not work.” From this moment on, American presidents would time and again refer to Munich and the appeasement policies of the 1930s as the prime example of what to avoid in the future.
Munich was also an example of what had to be avoided during an election. During the 1944 presidential campaign, American journalists and politicians alike predicted that Roosevelt would lose many votes because of his presumably conciliatory attitude toward the Soviet Union. The Republican Party actually campaigned against the Roosevelt administration's "appeasement" policies, arguing for a tougher stance against the "communist threat." This trend continued throughout the decade, as shown by a March 1946 poll in which 71 percent of the public disapproved of the administration's policy toward Russia, while 60 percent considered their policies toward the Soviets as "too soft."

**THE COLD WAR**

After Roosevelt's death in April 1945, the incoming Truman administration was equally concerned with avoiding the experiences of the 1930s. President Harry S. Truman and his advisers believed that in order to avoid the mistakes of the previous decade, they had to resist the "totalitarian" Soviet Union before its appetite and power increased. In the postwar period this attitude emerged when the administration was faced with the issue of whether to share the secret of the atomic bomb with the Soviet Union or retain control for as long as possible. In arguing against sharing any knowledge with the Soviets, Secretary of the Navy James Forrestal stated that "it seems doubtful that we should endeavor to buy their understanding and sympathy. We tried that once with Hitler. There are no returns on appeasement." The Munich analogy was invoked to emphasize the futility of treating as reasonable an immoral and irrational adversary.

Another instance in which the Munich analogy came into play was the debate over the control of the Turkish Straits in August 1946. The Soviet Union proposed a joint system of control and defense by a body composed of Turkey and the other Black Sea powers, instead of Turkey retaining complete control. This proposal was met with alarm by the U.S. State Department, which saw this as an example of what was to become known as the "domino theory." This situation reminded politicians of the tumbling European dominoes of the 1930s. With loss of control in one area of Asia, the Soviet Union might move into other areas, increasing its strength along the way, which would only mean that the United States would have to fight communism later and under less favorable conditions. The Soviet Union could only be checked by employing a policy of containment, the rough intellectual outlines of which had been developed by George F. Kennan during and immediately after the war. As interpreted by Paul H. Nitze, Kennan's successor as director of the State Department's Policy Planning Staff, containment meant essentially a policy that sought to (1) block further expansion of Soviet power, (2) expose the falsities of Soviet pretensions, (3) induce a retraction of the Kremlin's control and influence, and (4) in general, foster the seeds of destruction within the Soviet system so that the Kremlin could be brought to the point of modifying its behavior to conform to generally accepted international standards. A key feature of containment envisaged the United States dealing with the Soviets from the position of strength. "In the concept of 'containment,'" noted Nitze, "the maintenance of a strong military posture is an ultimate guarantee of national security and as an indispensable backdrop to the conduct of the policy of containment." To Nitze, there was no substitute for the maintenance of superior force: "Without superior aggregate military strength, in being ready and mobilizable, a policy of 'containment'—which is in effect a policy of calculated or gradual coercion—is no more than a bluff."

The "lesson" of Munich, therefore, was to encourage firmness at all costs, even the risk of war. "Containing" Joseph Stalin was at the heart of America's Cold War.

**THE KOREAN WAR**

The best example of the manner in which the Munich analogy came to grip the minds of Truman and his advisers was the decision of the president to intervene in Korea in 1950. This is striking because the U.S. government completely changed its policy toward Korea on the basis of parallels between this situation and that of the 1930s. Prior to North Korea's invasion of South Korea on 25 June 1950, the United States had followed a policy of avoiding military engagement in the Korean Peninsula. This was mainly because American policymakers believed that Korea lay outside the "defense perimeter" of the United States and was relatively unimportant to its national security. Even at the beginning of June, American policy was to avoid sending military forces to Korea. This was the consistent position
of the Joint Chiefs of Staff, one that was twice considered by the National Security Council and twice approved by the president. Furthermore, during his famous National Press Club speech of 12 January 1950, the secretary of state, Dean Acheson, made this position plain.

The North Korean invasion changed policy dramatically. This was primarily because President Truman perceived the invasion as analogous to the aggressive actions of Hitler and Mussolini in the 1930s. Truman stated that when he first heard the news of the North Korean invasion his first thought was of the 1930s. He wrote:

I remembered how each time that the democracies failed to act, it had encouraged the aggressors to keep going ahead. Communism was acting in Korea just as Hitler, Mussolini and the Japanese had acted ten, fifteen and twenty years earlier. If this was allowed to go unchallenged it would mean a third world war, just as similar incidents had brought on a second world war.

Not only the president equated North Korean actions with those of the Nazis. The Washington Post, Baltimore Sun, New York Herald Tribune, and New York Times all alluded to the appeasement of the 1930s in their editorials on Korea. In the House of Representatives, Democrat Abraham Ribicoff of Connecticut asked, “What difference is there in the action of North Korea today and the actions which led to the Second World War? Talk about parallels!”

By classifying the Korean invasion as comparable to the aggressive actions of Hitler in the 1930s, Truman and his associates were led to the conclusion that in order to avoid the “appeasement” of the 1930s and Munich, they had to act to protect the lesser power from this aggression. Refusal to repel aggression would be nothing but appeasement. And appeasement, as history allegedly had shown, would ultimately lead to war.

The analogy with Munich would continue to be cited during the Korean War. Truman used it time and again to reassure the public of the continuing need for U.S. troops to be stationed in Korea. In December 1950, the first year of the war, Truman assured the country that “We will continue to take every honorable step we can to avoid general
war. . . . But we will not engage in appeasement. . . . The world learned from Munich that security cannot be bought by appeasement.” Critics who charged that the government was not employing sufficient force to counter the threat in Korea also used the analogy. The specter of Munich overshadowed everything. For example, Republican Senator William F. Knowland criticized the government, stating, “Talk of seating the Reds in the UN is appeasement. Talk of establishing a neutral zone in Korea is appeasement. Waiting around for Mao Zedong to become Tito is appeasement.”

In November 1950, Chinese “volunteers” entered the war and the Munich analogy began to take on the form of the argument that failure to wage total war was appeasement itself. General Douglas MacArthur, in charge of the United Nations forces in Korea, used this argument forcefully to criticize his own government as well as that of the British, taunting them with allegations of appeasement. When the British began to consider creating a demilitarized zone south of the Yalu River, the U.S. Joint Chiefs of Staff warned MacArthur that his war objectives might be altered “in the interests of pursuing negotiations with the Chinese.” MacArthur denounced this “widely reported British desire to appease the Chinese Communists by giving them a strip of Northern Korea.” He once again used the Munich analogy to remind the U.S. government that its credibility would suffer unless it stood firm on this issue. “Indeed, to yield to so immoral a proposition would bankrupt our leadership and influence in Asia and render untenable our position both politically and military.” Even more inflammatory was MacArthur’s statement following a remark by British Prime Minister Ernest Bevin that the “young” nation, America, needed sage advice, gained by experience, from Britain. MacArthur retorted that he “needed no lessons from the successors of Neville Chamberlain.” MacArthur played the Munich analogy for all it was worth, and eventually he discovered the consequences of pushing the analogy too far: in April 1951, after months of sparring, Truman fired him.

THE GENEVA CONFERENCE

The outbreak of the Korean War and the American reaction to it, more than any other single event, crystallized the Cold War mentality that had been more or less in a state of fluidity from 1945 to 1950. As part of this process, American understanding and appreciation of the realities and aspirations of Indochina were transformed. With the North Korean invasion across the Thirty-eighth Parallel, Indochina came to be seen mainly as an aspect of the larger problem of coping with the communist conquest of the Free World by the Soviets and Chinese. Or, as Truman put it: “We were seeing a pattern in Indo-China timed to coincide with the attack in Korea as a challenge to the Western world . . . a challenge by the Communists alone, aimed at intensifying the smouldering and anti-foreign feeling among most Asian peoples.”

The Cold War paradigm that portrayed the Indochina conflict as but a functional aspect of worldwide communist aggression was passed on intact to the Eisenhower administration. The Korean War, argued President Dwight D. Eisenhower, was “clearly part of the same calculated assault that the aggressor is simultaneously pursuing in Indo-China.” And, conversely, the working out of a settlement of the Korean War would presumably have a lasting impact on Indochina as well as on other nations in the region. In this way, then, the American fear of another Munich carried over into the Eisenhower administration.

In 1954 the administration feared that the Geneva Conference called to discuss the future of Korea and the division of Indochina would turn into “another Munich.” An armistice had been signed in Korea the previous year, but new concerns had arisen over the eight-year war in Indochina between France and the French Union and the communist-led Viet Minh resistance movement. The conference was arranged by Great Britain, the United States, the Soviet Union, and France and was also attended by countries with an interest in the issue, including the People’s Republic of China.

The United States was exceptionally hostile to any negotiation with Beijing. The Americans, especially Secretary of State John Foster Dulles, described the talks as “phony” and “unpalatable” because they represented the “psychology of appeasement.” Dulles was obsessed with the seating arrangements at the conference and even refused to shake hands with Chinese Foreign Minister Chou En-lai. Because Dulles equated Geneva with the Munich Conference he was determined to be firm whatever the outcome.

The United States has been roundly criticized for its behavior at the Geneva Conference. The delegation was so opposed to negotiations before the conference started that they even
attempted to sabotage efforts to reach any political settlement. As Richard H. Immerman observed:

If by these actions it exacted some concessions from the Communists, they were limited and more than offset by the strains they placed on the western alliance. If by resisting compromise and dissociating the United States from the result officials managed to avoid the label “appeaser,” they cost America countless hearts and minds, particularly those in the third world. Worst of all, by refusing to sanction the elections, Washington signaled the diplomacy—and international law—were not substitutes for force.

The American attitude was simply that any concession amounted to capitulation, for by this time the American political culture had come to equate all forms of negotiation with appeasement at Munich. The United States finally refused to sign the Geneva agreement, which divided Vietnam along the Seventeenth Parallel and promised elections in 1956 to unify the country under one government. When President Eisenhower returned from the conference, he gave the usual speech at the airport immediately upon his arrival. Although it was raining, Vice President Richard M. Nixon was adamant that Eisenhower should not carry an umbrella, lest the nation and the media be reminded of Neville Chamberlain and his famous umbrella.

THE CUBAN MISSILE CRISIS

The 1960s provided a classic situation in which the Munich analogy was called into play. During the Cuban Missile Crisis, President John F. Kennedy pointedly used the analogy in his speech of 22 October 1962, when he announced that he would implement a quarantine on communist Cuba in response to the discovery that the Soviet Union had been placing offensive weapons there. Explaining his decision, the president reminded the nation that “the 1930s taught us a clear lesson: Aggressive conduct, if allowed to grow unchecked and unchallenged, ultimately leads to war.” The transcripts of the Executive Committee of the National Security Council (ExCom) show that the Munich analogy was extensively used in governmental discussions during the crisis. In a meeting with the Joint Chiefs of Staff, at which the president explained that he was leaning toward implementing a blockade rather than more aggressive military action, General Curtis LeMay exclaimed: “This blockade and political action, I see leading into war. I don’t see any other solution. It will lead right into war. This is almost as bad as the appeasement at Munich.” The president was at a loss for words.

The lessons of Munich had particular meaning for Kennedy. His father, Joseph Kennedy, had been Roosevelt’s ambassador to Britain at the time of the Munich Conference, and John Kennedy had been a twenty-one-year-old university student. The elder Kennedy had been a longtime supporter of Britain’s policy of appeasement and continued to be throughout the war. John Kennedy, however, formed his own beliefs with the coming of World War II. He disagreed with appeasement so fervently that his honors thesis at Harvard was entitled “Appeasement at Munich.” This was published after his graduation under the title Why England Slept (1940) and became a best-seller. The book argued that appeasement was a weak policy that the United States should avoid at all costs. One can therefore imagine the effect on Kennedy of being labeled a “Munichic.”

This damaging term was also applied to Kennedy’s ambassador to the United Nations, Adlai Stevenson, in the wake of the crisis. There had been a confrontation during talks before the crisis on what to do about the Soviet threat. Stevenson had suggested that the president “should consider offering to withdraw from the Guantánamo naval base as part of a plan to demilitarize, neutralize and guarantee the territorial integrity of Cuba . . . [and offer] to remove the Jupiter [missiles in Turkey] in exchange for the Russian missiles from Cuba.” Kennedy vehemently disagreed with these proposals, saying that this was not the right time for concessions that could divide the allies and sacrifice their interests.

Stevenson’s suggestion met with a strong reaction from other members of ExCom, leading to the subsequent charge that Stevenson had “wanted a Munich.” This accusation appeared in a postmortem article by the journalist Joseph Alsop, who attributed the statement to a “non-admiring official.” It turned out that President Kennedy was actually the “non-admiring official” whose comments were used to discredit Stevenson. As a result, the article made Stevenson’s arguments for trading the Turkish bases seem less rational than they really were. This charge of being a “Munichic” was especially damaging to Stevenson’s political reputation. The irony, of course, was that the Jupiter missiles did play a secret role in resolving the crisis.
THE VIETNAM WAR

The Munich analogy was increasingly used by Washington to justify various actions during the Vietnam War. In 1954, when the French were nearing defeat in Vietnam, Eisenhower considered sending additional aid to supplement the economic aid already being supplied. In fact, by this stage, the United States was already funding three-quarters of the cost of the war but had not actually intervened militarily. Eisenhower considered this move and sought British support to use U.S. air and naval power in Indochina. In a letter to Winston Churchill, he used the Munich analogy in order to persuade the British to support American actions: “If I may refer again to history; we failed to halt Hirohito, Mussolini and Hitler by not acting in unity and in time. That marked the beginning of many years of stark tragedy and desperate peril. May it not be that our nations have learned something from that lesson?”

That John F. Kennedy thought and acted upon the same assumptions can hardly be open to question. In his words:

Viet-Nam represents the cornerstone of the Free World in Southeast Asia, the Keystone of the arch, the finger in the dike. Burma, Thailand, India, Japan, the Philippines and obviously Laos and Cambodia are among those whose security would be threatened if the red tide of Communism overflowed into Viet-Nam. . . . Moreover, the independence of Free Viet-Nam is crucial to the free world in fields other than military. Her economy is essential to the economy of all of Southeast Asia; and her political liberty is an inspiration to those seeking to obtain or maintain their liberty in all parts of Asia—and indeed the world.

For these reasons, added Kennedy, “the fundamental tenets of this nation's foreign policy . . . depend in considerable measure upon a strong and free Vietnamese nation.”

Under Kennedy, the number of U.S. troops in South Vietnam increased steadily, reaching some 14,500 before the end of 1963. Technically, they were engaged only in transportation, training, and advice, but these activities invariably exposed them to combat. Few questioned why they were there.

It was not until the advent of the Johnson administration, however, that the Munich analogy came into its own. President Lyndon B. Johnson and his secretary of state, Dean Rusk, considered Munich to be the most important historical lesson of their time. Remembering Munich, they saw weakness overseas as leading to World War III. Johnson explained, “Everything I knew about history told me that if I got out of Vietnam and let Ho Chi Minh run through the streets of Saigon, then I’d be doing exactly what Chamberlain did in World War II. I’d be giving a big fat reward to aggression.” Rusk was equally attuned to the lessons of the 1930s, which he described as the realization that “aggression must be dealt with wherever it occurs and no matter what mask it may wear. . . . The rearmament of the Rhineland was regarded as regrettable but not worth a shooting war. Yet after that came Austria, and after Austria came Czechoslovakia. Then Poland. Then the Second World War.”

This belief in the applicability of the Munich analogy to his situation led Johnson to increase troop levels, first to 300,000 and then to 500,000 by 1968. At a National Security Council meeting in July 1965 to discuss an increase in troops, an exchange occurred between Undersecretary of State George Ball, who was opposed to committing more men, and the U.S. ambassador to Vietnam, Henry Cabot Lodge. Lodge rebutted Ball's arguments, explaining that “I feel there is a greater threat to start World War III if we don’t go in. Can’t we see the similarity to our own indulgence at Munich?” No one present at the meeting questioned this statement. Even McGeorge Bundy, the national security adviser who often criticized others for using inaccurate analogies, did not comment. The administration's policymakers were convinced of the appropriateness of the analogy to their own situation in Vietnam, and often reminded one another of this fact. Even former president Eisenhower resorted to the analogy in advising Johnson in 1965. He warned the president not to be convinced by Britain's arguments for negotiation. Prime Minister Harold Wilson, he said, “has not had experience with this kind of problem. We, however, have learned that Munichs win nothing.”

Most important, the Johnson administration used the analogy to convince the public that its Southeast Asia policy was appropriate. A government film produced in 1965 entitled Why Vietnam? contained flickering images of Neville Chamberlain at Munich throughout the film. Further, when announcing his decision to send combat troops to Vietnam in March 1965, Johnson explained to the public: “Nor would surrender in Vietnam bring peace, because we learned from Hitler at Munich that success only feeds the appetite of aggression. The battle would be renewed. . . . bringing with it
perhaps even larger and crueler conflict, as we learned from the lessons of history.”

In the same year, Johnson argued that defeat in South Vietnam “would encourage those who seek to conquer all free nations within their reach. . . . This is the dearest lesson of our time. From Munich until today we have learned that to yield to aggression brings only greater threats.” Worse yet, a new wave of McCarthyism might pose rhetorical questions about how Vietnam was lost.

Similarly, Richard M. Nixon’s policy of détente with the Soviet Union and China failed appreciably to alter the image of Vietnam as a vital test case and an aspect of a larger problem. “An American defeat in Viet-Nam,” declared Nixon on 8 May 1972, in a message to the American people explaining his decision to mine the entrances to North Vietnamese ports, “would encourage this kind of aggression all over the world. . . . Small nations, armed by their major allies, could be tempted to attack neighboring nations at will, in the Mid-East, in Europe and other areas.”

No change was to be expected in the attitude of Gerald Ford’s administration. In his formal and foredoomed request to Congress in early 1975 for continued military aid to South Vietnam (and Cambodia), President Ford reminded his recent colleagues that “U.S. unwillingness to provide adequate assistance to allies fighting for their lives would seriously affect our credibility as an ally.” Saigon fell on 30 April. The collapse of South Vietnam together with the defeat of the pro-Western forces in Cambodia and subsequently in Laos marked the end of American influence in the area. For some, it came as no real surprise, for others, there were no words to explain it. The Munich analogy, in time, gave way to the “Vietnam syndrome,” which led many Americans to question the wisdom of using military power at all.

**REAGAN, BUSH, AND THE GULF WAR**

President Ronald Reagan’s foreign policy perspective was clearly the product of the past. Reagan’s mental pictures of the world had been formed when the Nazi storm was gathering in Europe and Imperial Japan was on the march in China. He viewed the world through 1930s eyes, and he learned his generation’s lesson that unwillingness to confront aggression invariably invited war. For him, the very word “appeasement” connoted surrender. President Reagan often invoked the image of Munich in order to belittle the critics of his Nicaraguan policies as “appeasers” of the Sandinistas. His administration had used Nicaraguan rebels, the contras, to pressure and ultimately cause the overthrow of the legitimate Sandinista regime. He was supported in this by the ambassador to the United Nations, Jeane Kirkpatrick, who argued in 1985 that the Munich analogy was appropriate in this case.

Reagan frequently made use of the Munich analogy during his presidency. In a March 1983 address before the Evangelist Society about the threat of Marxist-Leninism, he criticized the “historical reluctance to see totalitarian powers for what they are. . . . We saw this phenomenon in the 1930s.” He cautioned that “if history teaches us anything, it teaches that simpleminded or wishful thinking about our adversaries is folly.” In August 1983 he told the American Legion that “Neville Chamberlain thought of peace as a vague policy in the 1930s, and the result brought us closer to World War II. History teaches us that by being strong and resolute we can keep the peace.” Throughout its eight years, the Reagan administration bargained from a position of strength, at great cost to the public purse, to prove its point.

President George H. W. Bush relied heavily upon the Munich analogy in his speeches during the crisis in the Persian Gulf, which ultimately led to the Gulf War of 1990–1991. Munich was the perfect example in this case, and Bush used it to argue that to forget the lessons of appeasement would be to betray the sacrifices made in World War II. In a speech to the Veterans of Foreign Wars, Bush invoked World War II to reinforce his message of intervention. The United States, he said, had to stand “where it always has—against aggression, against those who would use force to replace the rule of law.” The Iraqi ruler Saddam Hussein particularly was linked to Hitler, to reinforce the necessity of standing up to dictators. “Half a century ago, the world had the chance to stop a ruthless aggressor and missed it. I pledge to you: We will not make the same mistake again.”

Possibly because the Vietnam syndrome had come to overshadow all foreign policy, Bush needed a historical analogy that would convince the American public that this was the fight worth fighting to the end. In doing so, Bush tried to avoid parallels between the Gulf crisis and Vietnam, which carried the stigma of a protracted and unwinnable involvement in a foreign war, by using Munich as the relevant analogy. When Bush announced that he was sending forces to Saudi Arabia, he reminded the country that “a half century ago our nation and the
world paid dearly for appeasing an aggressor who should and could have been stopped. We’re not about to make that mistake twice.”

Bush invoked the Munich analogy to persuade other nations that the world would be even more dangerous if the United States were to refuse to fight, and also used it when he praised the Soviet leader Mikhail Gorbachev for condemning the Iraqi invasion. He said that this demonstrated “that nations which joined to fight aggression in the Second World War can work together to stop the aggressors of today.” Consequently, the construction of a narrative in which Munich, not Vietnam, served as the perfect unifying symbol struck just the right chord.

CONCLUSION

Political leaders have used the Munich analogy to justify what they believe is critical foreign intervention and to remind the public of its obligations to defend liberty. They also have used it to divert attention away from thorny “public relations” problems such as the Vietnam War syndrome and even to discredit critics. In fact, the “lesson” of Munich has continued to be relevant even in the present, as each generation ostensibly seeks to avoid the mistakes of its predecessors. Just as the leaders of the 1930s learned much from World War I, post–World War II and Cold War leaders learned much from Munich: the consequences of futile good intentions. And while leaders of the twenty-first century may not fully comprehend the process whereby the Munich agreement became the prelude to the even greater tragedy of World War II, they do seem unlikely to dismiss it from their realm of political discourse. As Donald N. Lammers reminds us in Explaining Munich, “Taken one way or another, Munich has become the great ‘object lesson’ of our age.”

Efforts to control the production of and traffic in illicit drugs, commonly referred to as “the war on drugs,” seem like a relatively recent phenomenon. The visibility of struggles since the late 1970s against drug organizations, or “cartels,” based in the prosperous Colombian cities of Cali and Medellín did much to shape that perception. Narcotraffickers, as major figures in the South American drug business are called, were responsible for the influx of powdered cocaine, crack cocaine, and, increasingly since the late 1980s, heroin into the United States.

Public awareness of drug control as an aspect of U.S. foreign policy likely began with Operation Intercept in August 1969. U.S. officials designed Intercept as an intensive effort to curb the flow of marijuana and other drugs from Mexico into California. Within two years, as narcotics like heroin began entering the United States in unprecedented amounts from various points of origin, President Richard M. Nixon had declared a war on drugs, calling them a serious threat to the security of the nation.

The Colombian, Mexican, and other examples illustrate the fact that campaigns to control drugs have a history of their own, unknown though they may be. The impetus for international drug control, commencing at the beginning of the twentieth century, arose from concern among industrialized nations, most notably the United States, about the havoc that drugs could potentially wreak upon society. Alarmed at the incidence of opium smoking in their new colony in the Philippines, U.S. authorities acted to stamp out the practice among the overseas Chinese population. They discontinued Spain’s contract system under which Chinese smokers had purchased opium from licensed dens. Surprisingly elimination of the Spanish system actually increased the availability of smoking opium in the islands and led as well to a greater incidence of usage by the Filipinos themselves.

The motivation behind opium prohibition was simultaneously moralistic and economic. In the eyes of reformers and U.S. officials, good Christians only consumed intoxicants like tobacco and alcohol if they consumed any such substances at all. The smoking of opium bespoke spiritual degradation if not personal depravity. Moreover, colonials habituated to opium and opiates were deemed unproductive subjects who potentially could weaken a market economy. Drug usage therefore had no place in the American empire or, for that matter, in any colonial setting.

For nearly a century the United States clung to the idea of control at the source as the only possible path to effective drug control. Whether at international parleys or through bilateral and regional diplomatic efforts, U.S. officials steadfastly pursued this goal. At the same time, as this essay demonstrates, drug control did not, indeed could not, exist in a vacuum isolated from other foreign policy concerns. Ultimately this state of affairs meant that control at the source had to give way to competing, often more important, priorities. During World War II, for instance, drug policy reflected the exigencies of global war by encouraging the production of raw narcotic material should it be necessary for the medical needs of the Allies. Throughout the Cold War, U.S. drug control officials frequently subordinated their traditional objectives to larger security considerations. This practice all too often entailed countenancing involvement with illicit drugs by so-called security assets. In the 1990s, as the Cold War ended, efforts by the United States to promote comprehensive drug control abroad became indistinguishable from the very issues of governance and state stability. This was particularly true in the Andes, most notably in Colombia, and to a lesser extent in Mexico.
THE ORIGINS OF DRUG CONTROL

The United States was not the first imperial power to try to halt the consumption of proscribed substances. Spanish authorities in colonial Peru, for instance, reversed their early tolerance of coca chewing, known as *el coqueo*, as they sought to transform indigenous Inca culture and develop a productive workforce to serve Spain’s material and spiritual interests. In the process there arose a debate, which continued well into the twentieth century, over whether to prohibit native cultivation and use of coca. Like coca, opium has a complex past that is intermingled with issues of culture and power. The grafting of opium onto the culture of China roughly coincides with the history of the Qing dynasty. Opium smoking, likely enjoyed first by Chinese in Jakarta, Indonesia, evolved out of the habit of tobacco smoking. By the time of the mid-nineteenth century Opium Wars, when the dynasty showed unmistakable signs of instability, opium addiction permeated Chinese society.

The persistence of *el coqueo* among the indigenous people of Peru and the prevalence of opium cultivation and smoking among the very poor in China coincided around 1900 with a wave of reform, or prohibitionist, sentiments in both countries. The War of the Pacific, in which Chile defeated both Peru and Bolivia, lasted from 1879 to 1883 and briefly devastated Peru. Andean Indians endured especially oppressive conditions in the war’s aftermath. The prospect of political change and with it, a wide spectrum of social reforms, revitalized Peru after a revolution in 1895. Inevitably some reformers asked whether traditional Indian reliance on coca had a place in modern Peru. Around the same time in Asia, the Qing dynasty came under intense pressure from Confucian scholars and others to implement broad reforms as foreign powers vied with one another to obtain concessions and create spheres of influence. Destroying the opium business became a basic part of the reform agenda in China. Chang Chih-tung, a powerful scholar-official and advocate of reform, wrote, “The development of education is the best medicine to use for the suppression of opium.”

DRUGS IN THE UNITED STATES

The emergence of a drug culture, usually called a subculture, also occurred during an age of reform in the United States. The Progressive Era, as scholars have characterized the U.S. political scene, began around 1890 and persisted until just after 1920. The reform spirit of the time arose out of a felt need for order and stability amid waves of immigration, the promises and challenges of industrial consolidation, and recurring threats of recession. The historian Richard Hofstadter found that the reformers were responding to real conditions that needed to be addressed in a nation undergoing rapid urbanization. Perhaps more important, he also believed that they were engaged in a quest for meaning in their lives and, hence, were desirous of finding something akin to the sense of mission that had earlier inspired the Civil War generation. Social reform naturally became one of the causes they championed.

To be sure, Americans had inveighed against drink throughout their history, especially since the Jacksonian era. The influx of immigrants, many of whom drank as a matter of course, gave the temperance movement a new urgency in the late nineteenth century. Assimilation through acculturation became the standard by which reformers measured the success of their endeavors to transform immigrants into good Americans.

Moral and social reformers did not limit their evangelism to newcomers. They sought to curb, if not stop, excessive drinking among the male citizenry of the republic and tried to restrict, if not eliminate, the practice of prostitution. Ultimately they turned their attention to the use and abuse of opiates. In their striving to make the United States what is now inaccurately termed a “drug-free” nation, reformers created a deviant class within society. Before reformers singled out and stereotyped casual users and addicts as deviants, though, the educated and the well respected were more likely to use narcotics than members of the working class, who typically drank alcohol because of its comparatively low cost. The medical community, for instance, especially seemed to fall prey to opiate abuse. By the early 1900s researchers feared that middle-class women, young people with time on their hands, and hard-working, progressive professionals would succumb to the temptation of drugs.

The concern that educated whites would find drug use an exhilarating experience had some basis in fact. No less a social reformer than Jane Addams wrote in her account of life at Hull House that she and four classmates had experimented with opium while attending Rockford College. The data are not available to establish the extent of drug abuse or addiction during the Pro-
gressive Era; estimates range widely between one hundred thousand and one million persons. Usage, of course, often remained a secret known only to the user’s doctor or druggist. Despite public impressions that addiction was rapidly increasing, consumption may actually have been in decline in the early 1900s. Consequently the reality of a serious drug problem at that time remains open to question.

Even before the inception of progressivism, some reformers in the United States, baffled by the intractability of addiction, associated the prevalence of drugs in America with a foreign presence. These reformers did not directly charge foreigners with causing America’s problem with drugs. What they were alleging was rather more sinister. They contended that foreigners, often Asians, and other purveyors of drugs had managed to unlock the worst instincts of the American populace. That is, many Americans were predisposed to surrender themselves to the drug habit “based as it is,” in the words of a Massachusetts physician, “upon a [human] craving no laws can eradicate.”

It seems evident, therefore, that reformers in several drug-producing or consuming countries around the world had a common objective in the early twentieth century: to save from themselves those people living in a culture of drugs. Drug reformers rarely asked whether their basic assumptions about the drug cultures within their societies were accurate. By failing to so inquire, they consigned those subcultures to the margins of society. The ready identification of involvement with drugs as characteristic of a dangerous culture enabled Washington to promote its style of drug control as a desperately needed international goal. In 1903 the governing Philippine Commission failed in its attempt to return to the Spanish contract system in the Philippines. Charles H. Brent, Episcopal bishop of the Philippines and a leading antidrug crusader, declared the entire opium enterprise from import to sale to consumption an unacceptable “social vice . . . a crime.”

A report by the Philippine Opium Committee, set up in 1903 to study opium throughout East Asia, had recommended the creation of a government monopoly in the islands. Deriving revenue from opium, critics charged, would make the United States no different from Great Britain, which was still selling chests of Indian opium to the Chinese. Thus the U.S. Congress passed a law in 1905 mandating for the Philippines the total prohibition by 1 March 1908 of all commerce in opium except for governmental and medical purposes. As the law went into effect the opium business went underground, thereby creating not only an illegal drug subculture but also a chronic law enforcement problem.

The inability of law enforcement personnel in the Philippines to curtail the illicit trade in opium allowed the United States to propose a deceptively simple solution to the emerging global drug problem: control at the source. First at Shanghai in 1909 and thereafter at three meetings held at The Hague beginning in 1911, U.S. officials, notably with the help of Chinese reformers, called upon other major powers to control the production and manufacturing of narcotics. How such controls would come about could not easily be agreed upon. The British, for example, were reluctant to put a premature end to the declining Indian trade, and commercial interests in China did not want to surrender a lucrative source of revenue. Asian opium smokers living outside of China understandably feared the loss of accustomed access to their drug.

The Shanghai meeting constituted the opening skirmish in what some analysts have called a new Hundred Years’ War: the campaigns to control drugs in the twentieth century. The U.S. delegation, led by Brent and Dr. Hamilton Wright, who was well known for his work in Asia on communicable diseases, knew that mobilizing an anti-opium alliance would be no easy task. The meeting accomplished little more, therefore, than the introduction of the issue of opium control. Great Britain, for its part, continued not unreasonably to doubt China’s willingness and ability to prevent the spread of poppy production and opium smoking.

Shanghai did, however, set the stage for additional international meetings and gave Wright and other reformers a basis for insisting that the U.S. Congress pass domestic drug control legislation. Armed with the moral high ground for having put in place a program of strict prohibition in its Asian colony, the United States was determined to accept nothing less than the same from other regional imperial powers, namely the British, the French, and the Dutch. The realities of the economic importance of opium in East and Southeast Asia and the inception of the Great War impeded American plans. Other major nations in attendance at the Hague Opium Conference of 1911–1912 agreed only to take preliminary steps to bring the illicit trade in opium under control.

Meanwhile the United States moved toward passage of its first comprehensive drug control
law, the Harrison Act of 1914. During the first week of the Shanghai meeting the U.S. Congress had prohibited the importation of smoking opium. The limited and, for Wright, disappointing outcome of the meeting at Shanghai convinced him to intensify his efforts on behalf of federal regulation. Only when the United States had in place adequate federal antidrug legislation, he reasoned, could America legitimately ask other nations to follow its lead.

Fears based on race and class clinched the case for federal drug control. America's cultural majority perceived heroin, which was usually taken through subcutaneous injection, and cocaine, a drug reportedly favored by African Americans in the South, as substances that decent people shied away from. By definition those who consumed these drugs were exhibiting antisocial, deviant behavior. Since the American public feared the spread of addiction and its attendant dangerous and often criminal behavior, the advocates of federal control had virtually no trouble making their case.

With scant debate Congress passed the Harrison Narcotics Act in December 1914. President Woodrow Wilson soon signed it into law, and it took effect on 1 March 1915. This law, typical of the regulatory legislation of its time, promised to promote cultural homogeneity and social stability through the unlikely though quintessentially progressive device of revenue collection. Despite widespread popular support for prohibition, the Harrison law did not cut off access to narcotics any more than imperial edicts in Qing China had eliminated the practice of opium smoking.

THE TROUBLED 1920S AND 1930S

Ironically the domestic successes of drug reformers adversely affected U.S. efforts to promote a global antidrug strategy of control at the source. Expectations in America about how long it would take to put comprehensive controls into effect did not accord with the reality of the situation abroad. Any delay was unconscionable, in the view of some American observers, because the international drug problem had evidently become a grave one. "[S]muggling of narcotics in the United States," lamented Secretary of the Treasury Andrew W. Mellon in 1921, "is on the increase to such an extent that the customs officers are unable to suppress the traffic to any appreciable extent." The secretary's assertion gave anecdotal credence to unfounded public perceptions about the severity of the drug situation.

The newly created Advisory Committee on Traffic in Opium and Other Dangerous Drugs (OAC) of the League of Nations took charge of supervising the obligations incurred by the states signatory to the Hague conventions. Private individuals and those government officials who favored strict drug control doubted whether member states as well as the league itself possessed the political will to enact strict drug control measures. An impasse between Washington and Geneva developed during the early 1920s and kept the United States from influencing the work of the OAC until early in the 1930s. The Department of State's Division of Far Eastern Affairs, the bureau responsible for implementing drug policy, had initially hoped to find some way of cooperating with the OAC. In that spirit Dr. Rupert Blue, formerly the U.S. assistant surgeon general, attended the fourth session of the OAC in January 1923. He made it clear in his remarks to the OAC that the United States held both producing and manufacturing states responsible for escalating international drug problems. In Blue's estimation the only recourse was to call for strict controls on production and manufacture. Representative Stephen G. Porter, chairman of the powerful House Foreign Affairs Committee, who was as adamant as Blue about what U.S. foreign drug policy should be, wrote Secretary of State Charles Evans Hughes that "an effective remedy [to drug problems] cannot be secured by compromise."

Porter quickly transformed Blue's skepticism about the OAC into outright hostility. In May 1923 at the fifth session of the OAC, Porter refused even to engage in debate about U.S. proposals for immediate, comprehensive controls on manufacturing. In defense of his position, which had caused much consternation at Geneva, he belligerently remarked: "If when I get back to America anybody says 'League of Nations' to me, he ought to say it conveniently near a hospital."

Porter's bellicosity was in line with Department of State thinking. Secretary Hughes had made it clear that the nonmedical or nonscientific use of drugs was unacceptable and that global production of narcotics had to be controlled. In so doing, Hughes captured the essence of the dogmatic approach to drug control—control at the source—that the United States has pursued throughout the twentieth century. Hughes once observed: "Unrestricted production leads to uncontrollable consumption, especially when the product enters
international channels.” This assessment of the roots of the drug problem in America resulted in February 1924 in a walkout, led by Porter, of the U.S. delegation from the second Geneva Opium Conference, which had been convened to discuss the manufacturing of narcotics. Other states in attendance would not accept without reservations an American-initiated proposal to bring a rapid cessation to the drug business.

Compounding matters, and making multilateral action against drugs difficult to achieve, was the willingness to hold foreigners responsible, if not accountable, for whatever problems impaire U.S. antidrug efforts. The substances that most captured the attention of U.S. officials in the 1920s were opiates and, to a much lesser extent, cocaine and marijuana. Opiate traffic, increasingly in the form of heroin instead of smoking opium, primarily originated in East Asia. Heroin, once believed by some in the medical community to be a cure for morphine addiction, had initially reached a wide audience as a medicine for coughs courtesy of the Bayer chemical company of Germany. A manufactured drug, heroin could be synthesized from morphine fairly easily; as a result, officials could not readily pinpoint the precise origin of the heroin found in the illicit trade.

In the early 1920s drug manufacturing was concentrated among European nations, the United States, and Japan. The U.S. Congress had tried to control the export of manufactured drugs to Mexico in a section of the Narcotic Drugs Import and Export Act of 1922 by requiring exporters of such drugs to possess a proper certificate from the importing country. Congress amended the act in 1924 to prohibit opium importation for the manufacture of heroin. This legislation was meant to serve as a model for other countries but did not prevent the diversion of heroin manufactured outside the United States into illegal international channels.

The reluctance of manufacturing states to accede to controls that would mean a loss of market share turned the attention of the U.S. government to the less economically advanced drug-producing nations. Perhaps surprisingly Washington did not redouble prior efforts to curb opium poppy growth in China. Nor did diplomats serving in the Andes pressure leaders in Peru or Bolivia, where el coqueo was an integral part of national culture, to force peasants to stop farming coca. The fall of China after 1915 into a decade of internal strife dominated by regional warlords made efforts to halt poppy growing impossible. Not surprisingly, opium played a vital role in China’s economy during the warlord era. As for cocaine, many urban users switched to heroin as a cheaper drug of choice after scarcity and strict enforcement of state laws combined to drive up black-market prices for cocaine. Accordingly U.S. officials encouraged Andean nations to move toward gradual compliance with international agreements relating to coca production. More serious problems lay elsewhere.

It was almost by process of elimination, therefore, that Mexico emerged as the country where U.S. officials hoped to demonstrate that control at the source was possible. Turkey and Persia, as producers of vast quantities of raw opium for both the licit and illicit trade, would also have been suitable candidates for such an effort. Turkey, though, refused to comply with anti-opium agreements until 1932, which rendered diplomatic overtures from Washington useless. Persia, which by 1920 had replaced India in the opium trade with East Asia, depended heavily on opium-based revenue and had a deeply entrenched opium culture of its own, one that transcended class lines. As a result, implementation of international accords by either country was not feasible in the 1920s and early 1930s. Diplomatic efforts to force compliance would almost certainly have failed. Mexico therefore became the proving ground for control at the source.

Mexico’s proximity to the United States had rarely served it well. Not only had Mexico lost in war territory that became the states of New Mexico, Arizona, and California, it had also experienced U.S. involvement and intervention in its revolution during the 1910s. On economic and political matters the United States had frequently treated Mexican sovereignty as subordinate to Washington’s own national interests. So it would be, commencing in the 1920s, with the issue of drug control.

The United States disdained Mexican sovereignty for several reasons. In the first place many government authorities and private citizens looked upon Mexico’s Indian heritage as evidence of an inferior race. To make matters worse in the eyes of their detractors, the people of Mexico were not just inferior; they were unpredictable, an unpardonable trait in the age of progressive reform. In other words, cultural cohesion and political order in Mexico seemed unimaginable to many North Americans. Critics had to look no farther than Pancho Villa’s raid on Columbus, New
Mexico, in March 1916 for incontrovertible proof of this societal failing. Villa's men, rumor had it, steeled themselves for the raid by smoking marijuana; Villa himself reputedly neither smoked marijuana nor drank intoxicating beverages.

Marijuana seemed to be in plentiful supply along the vast open border between the two countries. U.S. officials concluded, not for the last time, that Mexican authorities lacked the political will to fight domestically produced drugs. With the creation of a black market for opiates in the United States following the enactment of the Harrison law, Mexico became an important transit country for illicit substances. Citizens of Yuma, Arizona, appealed in 1924 to the Department of State for help in dealing with the “unbridled vice and debauchery” they contended was plaguing the border region.

Moreover, corruption served to undermine Mexico's drug control efforts into the 1920s. In fact the matter was as much a question of the limits of federal authority as one of corruption, but U.S. critics of Mexico emphasized corruption wherever they seemed to find it. The State Department, predisposed to see corruption by Mexican officials who were believed to harbor Bolshevik sympathies, allowed a 1926 treaty with Mexico for the exchange of information about drugs to lapse after only one year of operation. U.S. consular officials in Ciudad Juárez had long doubted Mexico's good faith about drug control. When authorities in Mexico City dispatched a special agent to the Juárez–El Paso region in 1931, U.S. Consul William P. Blocker commented disdainfully, “The Mexican Government has at last decided to clean up the drug traffic on this section of the border.”

That attitude and the coercive diplomacy to which it gave rise would often characterize U.S. antidrug diplomacy, particularly in the Americas, from the 1930s through the 1980s; it tended to ignore not only the historical but also the practical reasons limiting the prospects for control at the source. The blunders that U.S. bureaucrats wore as they endeavored to contend with illegal drug trafficking for more than fifty years made it hard for them to understand why their presumptively unobjectionable goals were unattainable.

In contrast to their attitude toward Mexico, U.S. officials did not judge Bolivia, Persia, or China to be models worthy of emulation in the pursuit of control at the source. In the case of Bolivia, folk wisdom had maintained long before the modern era that without coca there would be no Bolivia. The movement toward coca prohibition that surfaced from time to time before 1900 in Peru had made few discernible inroads into Bolivia. For U.S. authorities to presume that they could alter the real economic and symbolic value of Bolivian coca was akin to cultural arrogance. Try they did, however, to influence public policy in Bolivia, although not as overtly as in Mexico. Conferees at the first Opium Conference at The Hague had agreed that drug control could never become a reality unless coca and cocaine were included among the substances being controlled. That determination meant that effective coca control must come to Bolivia. U.S. representatives in La Paz suggested to government officials there that cuts in coca production would indicate Bolivia's willingness to work with the international drug control movement. The effort got nowhere.

At Geneva in 1924 the Bolivian delegate, Arturo Pinto Escalier, said that his government found coca chewing to be “a perfectly innocuous activity.” More to the point he identified how vital coca was to maintaining the integrity of Bolivian culture. It would, he had previously told the OAC, “be impossible for the Bolivian Government to contemplate restricting the production of coca leaves without seriously interfering with the needs and economic life of the working population, particularly in mining districts, as coca leaves constitute for them a source of energy which cannot be replaced.” The United States would have to look elsewhere for control at the source.

The situation in Persia was also instructive for U.S. policy goals. Prior to the second Geneva Opium Conference, Moshar-ol-Molk, Persian minister for foreign affairs, declared that it would be difficult to establish an international anti-opium movement. The foremost obstacle was economic, even for those states fundamentally in agreement with the strict U.S. objectives. It was “impracticable suddenly to place a prohibition on [the opium business] without . . . the substitution of other products for the production of opium, and the adoption of an appropriate decision whereby the domestic consumption of opium could be gradually stopped.”

Persia's request for a program of crop substitution did not catch U.S. officials off guard. Elizabeth Washburn Wright, the widow of Dr. Hamilton Wright, had examined firsthand the opium situation there and became an advocate of increased silk production as a replacement for opium. She made the case for economic diversification in informal conversations with the Depart-
ment of State and in her capacity as an assessor to the Opium Advisory Committee.

A former State Department economic adviser, Arthur C. Millspaugh, who headed the American Financial Mission to Persia from 1922 to 1927, also made the connection between Persia's economic stability and the status of the opium trade. In the course of reorganizing Persia's finances the American mission assumed the task of collecting opium revenues. Millspaugh soon realized that any precipitous change in the opium situation would probably result in economic chaos and political instability. At the urging of the mission Persia indicated its willingness as early as 1923 gradually to reduce dependence on opium, particularly if foreign assistance were forthcoming. No one should underestimate opium's importance, Millspaugh noted, because "irrespective of the revenue which is derived by the Government from it, opium-cultivation in Persia constitutes one of the important agricultural industries, and the only one which makes any substantial contribution to the export trade."

By mid-1926, however, the Persian government, on Millspaugh's advice, had withdrawn an official request for a U.S. loan to help finance the difficult transition from opium to other commodities. U.S. officials had let it be known that they did not want to set a precedent by underwriting such a momentous change. If American banks bailed out Persia's drug-reliant economy, would they do the same for Bolivia or China? What would be the limits of such a potentially open-ended commitment? Also, why would banks invest heavily in an agriculturally based economy like Persia's? Short-term profits were unlikely to flow from the agricultural sectors of the world economy in the 1920s. Nor did the United States, after its withdrawal from the Geneva Opium Conference in 1925, want to be even remotely associated with the work of the league. A league-sponsored commission of inquiry to Persia after the Geneva conference recommended consideration of a crop substitution program. Persia itself, having worked within the confines of Millspaugh's mission since 1922, was increasingly unwilling further to surrender its financial autonomy to foreign control. For the foreseeable future the substitution of other crops for opium remained out of the question in Persia.

As for China, well into the 1920s conditions there were so chaotic that there existed no realistic hope for implementation of controls on opium growing. Even before the death of Yuan Shikai in mid-1916 and the subsequent onset of the warlord period, opium production and consumption was spreading throughout China, as had been the case in the late nineteenth century. British Minister Sir John Jordan, believing that the situation would lead to a desperate quest by the government for a reliable source of revenue, termed a proposal to establish an opium monopoly "a retrograde step." Opium's hold on China precluded the chance for significant reform. To American officials, plans to create a government opium monopoly, which meant adopting and enforcing over time a program of gradual suppression, flew in the face of reason. By the mid-1920s U.S. authorities concluded that gradualism was merely a cover for continuation of the twin vices of opium production and consumption. Making matters worse for proponents of opium control was an apparently successful effort by Japanese nationals to dominate a burgeoning market in North China for illegal morphine.

U.S. appeals to Chinese authorities to control the situation where practicable fell on deaf ears. Having reasserted nominal Republican control of China with the success of the Northern Expedition in 1928, the government of Chiang Kai-shek (Jiang Jieshi) thereafter strove to appease Washington while continuing to profit from the trade. Headquartered in Nanking, Kuomintang leaders managed, simply by announcing a policy of suppression, largely to place the blame on Japan for China's opium troubles, many of which were of its own making. This accomplishment was all the more remarkable because of the Kuomintang's intimate ties to the notorious Green Gang of Shanghai, a secret society that dominated the Chinese underworld and by 1930 controlled a great percentage of the illicit trade in smoking opium in South China. Its most notorious figure, Du Yuesheng, headed the local opium suppression bureau at various times. Few knowledgeable foreigners believed that opium suppression would come anytime soon to Shanghai and, hence, to South China.

Japanese adventurism rendered largely irrelevant the actual steps taken against opium by Nationalist China. Herbert L. May of the New York–based Foreign Policy Association remarked in 1926 that the Japanese "were manufacturing drugs on a large scale and the government [in Tokyo] was closing its eyes to what was going on." Like the regional militarists, or tuchuns, of China's warlord era, Japanese civilian and military officials in North China and Manchuria were
seeking to profit from the opium and morphine trade. The assassination in June 1928 of Zhang Zuolin helped to expose both Japan’s expansionist ambitions in North China and beyond, as well as the role of its Kwantung Army in the opiate business there.

The League of Nations dispatched a Commission of Enquiry to East and Southeast Asia in September 1929 to investigate both opium traffic originating in China and the incidence of opium smoking among resident Chinese outside of China. The commissioners found that local opium cultures created more than a social problem; they created alternative, underground economies that helped to destabilize the political economy of the region. The commission, linking the opium business to the security of nations beyond Asia, predicted further trouble with opium unless China brought production under control. This concern was echoed by delegates and observers attending the Conference for the Suppression of Opium Smoking held at Bangkok in November 1931. The American observer, John Kenneth Caldwell of the Department of State, condemned the smuggling of opiates from East Asia, which he declared was a growing problem for the United States. Nanking’s refusal to attend the Bangkok conference underlined the near stranglehold of opium on China.

China’s unwillingness to participate at the Bangkok meeting derived in part, though, from the threat to its security posed by the seizure in September of Manchuria by Japan’s Kwantung Army. Kuomintang leaders were persuaded that they would need all the resources they could muster, including those purchased by revenues from the opium trade, in order to contain Japan’s advance into North China. In that sense the Mukden Incident, which precipitated the taking of Manchuria by Japan, allowed Chiang Kai-shek to continue to use opium revenues for his own political and economic purposes while at the same time blaming Japanese military forces for poisoning China with narcotics.

The United States, though suspicious of the Kuomintang’s motives where opium suppression was concerned, increasingly supported China in its dispute with Japan over opium. The adoption of a tougher stand against Japan came with the appointment of Stuart J. Fuller to the position of narcotics chief in the State Department’s Division of Far Eastern Affairs. Fuller had served in the 1920s as a consular official in Tanjin where he observed the growth of Japanese involvement with the narcotics trade in North China. Fuller’s antinarcotic zeal was matched by that of Harry J. Anslinger, a onetime State Department official who had become commissioner of the Federal Bureau of Narcotics (FBN) with the creation of the bureau in 1930. Importantly, unlike their predecessors they were able to put aside tactical differences with the OAC and turn the League of Nation’s efforts against drugs toward the larger American policy goals of drug control at the source and improved interdiction of the illicit narcotics traffic.

Under the obvious fiction of a suppression movement, opium production, consumption, and addiction worsened in Nationalist China. U.S. military attaché Colonel Joseph W. Stillwell succinctly summed up the situation when he observed, “Opium is the chief prop of all power in China, civil and military.” U.S. reaction to conditions in China was remarkably muted. Fuller, U.S. ambassador Nelson T. Johnson, and Anslinger evidently believed that Chiang would turn against the traffic as soon as it was in his interest to do so. They therefore began to hold Japan to a stricter measure of accountability than China. Johnson wrote Fuller in March 1934 that the Japanese “have no moral scruples when it comes to opium or the use of the gun or the sword.”

Even though Fuller actually did criticize China before the OAC in May 1936, he saved his strongest language for Japan. “Let us face facts,” he intoned, “where Japanese influence advances in the Far East, what goes with it? Drug traffic.” One year later, as tensions were mounting between China and Japan, he told the OAC that conditions in Japanese-occupied areas of North China were “appalling and beyond description.” Yet neither in North China nor in Manchukuo were conditions quite what Fuller and other critics of Japan claimed them to be, either before or immediately after the inception of the Sino-Japanese War in July 1937. The reality of the situation scarcely mattered, however, to critics of Japanese expansion. To some observers the battle against drugs in North China was bigger than a mere defense of security. “Humanity,” stated the South China Morning Post, “has come to rely heavily upon American aid in the war on drugs.”

The characterization of American drug policy as a war on drugs precisely captured the spirit of what Fuller and Anslinger were trying to achieve in the 1930s through participation at OAC meetings and by means of bilateral diplomacy. In assessing the threat posed by drugs the
two Americans viewed traffickers and producers of drugs as criminals who, in their most heinous incarnation, were also mortal enemies of the state.

Anslinger later wrote about the use of opium as a weapon of war in occupied China: “The Japanese had coldly calculated its devastating value as forerunner to an advancing army; long before the steel missiles began to fly, opium pellets were sent as a vanguard of the military attack.” The inception of general war in Europe in September 1939 served to intensify American efforts to expose Japanese dependence on opiates as a way of maintaining order in their budding empire on the mainland. When the Pacific War spread to include the United States after the bombing of Pearl Harbor, the Federal Bureau of Narcotics chief declared in January 1942: “We in the Treasury Department have been in a war against Japanese narcotics policy for more than ten years. . . . We have experienced Pearl Harbors many times in the past in the nature of dangerous drugs from Japan which were meant to poison the blood of the American people.”

In slightly more than a decade narcotics had become inseparable from the security of Washington’s closest ally in Asia, China, and were playing a significant role in the development of Japan’s foreign policy. It scarcely mattered whether high-level Japanese officials in Tokyo actually countenanced a policy of using drugs as a weapon of war in China at any time in the 1930s; what was important was the perception, especially in Washington, that they were doing so. In sum the drug scene in East Asia in the 1930s announced the opening of an era in which antidrug policy would become an important, if not well known, aspect of the foreign policy of many nations.

Developments in Latin America during the 1930s also offered an indication of how drugs could undermine political stability and civic order and thereby have a deleterious effect upon a nation’s security. Shipments of illicit narcotics from Europe to Central America, which presumably were destined for the United States, nearly destabilized the Honduran government in the mid-1930s. While urging Honduras to deal more forcefully with the situation, Fuller and Anslinger were unable to determine the accuracy of reports alleging the involvement of North Americans in the trade.

That U.S. officials endeavored to influence the drug control policies of other countries partly resulted from a decision made by the League of Nations and reflected a tactical departure by Washington from its former hostility toward league-sponsored antinarcotic activities. The 1931 Manufacturing Limitation Convention had urged all countries, at the behest of the United States, to create an independent drug control office. In fact, the league singled out the Federal Bureau of Narcotics as a bureaucratic model that others might profitably adopt. Honduras, however, had neither the will nor the resources to follow the U.S. example.

More than any other country in the 1930s and early 1940s, with the possible exception of China, Mexico tested the limits of U.S. drug foreign policy. Would the United States be able to replicate abroad, whether through persuasion or coercion, its own restrictive approach to drug control? One prominent official in Mexico, Leopoldo Salazar Viniegra, did not believe that U.S. policy was worth emulating, a view essentially shared by domestic critics of Anslinger and the FBN. As a result of his dissent from Washington’s supply-side philosophy, Salazár found himself the object of intense public and diplomatic pressures that proved impossible to resist. In August 1939 he was forced from office as head of the Federal Narcotics Service and was immediately replaced by an individual more inclined to follow the lead of the Department of State and the FBN. The change in personnel did not soon lead, however, to a noticeable improvement in the drug situation at the U.S.–Mexican border. That did not occur until World War II, when the two nations experienced limited success in controlling drugs. Even then progress seems to have reflected as much the decline in wartime demand for illicit drugs as a victory for control at the source.

ORIGINS OF THE DRUG-SECURITY NEXUS

The advent of global conflict in the late 1930s presented U.S. policymakers with an opportunity and a challenge. In the first place war in Europe and Asia slowed the world’s illicit narcotics traffic, thus allowing Anslinger, Fuller, and George A. Morlock, who succeeded Fuller at the Department of State in 1941 upon Fuller’s death, to strengthen U.S. influence over the global drug control movement by moving the operations of the Permanent Central Opium Board and the Drug Supervisory Body to the United States. By the end of the Second World War, U.S. officials were virtually setting the agenda of the Commis-
sion on Narcotic Drugs (CND) in the newly created United Nations. The commission essentially accepted U.S. antinarcotics objectives as its own well into the 1970s.

Anslinger and his colleagues did not easily meet the challenge posed by global war, which brought into question his conviction that he and other antidrug officials should be seen as prominent policymakers in Washington. Yet during both the immediate prewar years and the war itself, the Federal Bureau of Narcotics and the narcotics office in the Department of State helped to maintain the security of the West against the Axis powers. On the most basic level, the FBN commissioner was responsible for meeting Allied demands for medicinal drugs. He did so under a directive issued through the War Production Board by working with the Defense Supplies Corporation and the Board of Economic Warfare. So long as the primary opium-producing nations outside of China neither fell to Germany or Japan nor adopted a neutral position in the war, Anslinger's task was fairly straightforward.

In the Americas the FBN learned, however, that Argentina and Chile might be producing opiates for Germany. There existed some fear too that opium from Peru and Mexico could find its way to the Axis. In the case of Argentina, Anslinger threatened unspecified reprisals against one major firm, Hoffmann-LaRoche Inc., if the allegations were proven. In the case of Peru, its role in the Allied war effort was secured by the sale of cocaine for medicinal needs through the lend-lease program. And in what can be interpreted as an important foray into the world of intelligence, the U.S. government may have paid informants as much as $10,000 per year during the war for information about drug production in Mexico.

Moreover, the inexorable spread of Japanese influence into the fertile poppy-growing regions of Burma gave the Japanese government a major source of opium for its medical needs. Anslinger and other U.S. officials did manage to prevent a similar accretion of Japanese power and influence in the Near East in Iran and Turkey by engaging in a preemptive purchase of large quantities of opium from those two willing suppliers. Anslinger would subsequently have the occasion in the early Cold War to reward the Iranian government for its wartime loyalty, if that is an apt description, to the Allied cause by not pressing the young shah on Iran's vast production of illicit opium, much of which found its way onto the black market in Indochina. Such diplomatic largess was repaid following the shah's ascension to the peacock throne in the wake of the coup of 1953 against Mohammad Mossaddeq's regime, when Iran became a reliable ally at the UN's Commission on Narcotic Drugs in the global struggle against drugs.

Providing the Allies with reliable sources of narcotics during the war and overseeing the maintenance of the global antiopium apparatus were not, however, the most important actions Anslinger undertook to guarantee the relevance of his bureau to U.S. global security interests. He avidly interpreted President Franklin D. Roosevelt's vague anticolonial sentiments regarding Southeast Asia as a clarion call to eliminate opium smoking from the former colonial possessions of France, Great Britain, and the Netherlands. Anslinger and officials in the State Department warned that continued opium smoking would render former colonies more susceptible to internal decay and, as a result, to either revolution or foreign subversion.

In the immediate aftermath of the war Anslinger was not so preoccupied with the FBN's role in the national security state that he ignored the opportunity to advance his country's supply-side agenda at the United Nations. Two examples demonstrate his remarkable attention to virtually all drug-related matters and at the same time reveal his apparent inability to learn from past experience about the limits of policies based upon the elusive goal of control at the source.

The end of the war witnessed both a gradual rise in drug use and addiction in the United States and the revival of an active, illicit drug trade from Mexico. Not satisfied with the dilatory response of the Mexican government to diplomatic overtures, Anslinger took Mexico to task in 1947 at the second meeting of the CND for what he saw as unacceptable laxity in its antidrug activity. The public rebuke evidently had the desired effect because officials in Mexico City soon promised to strengthen their antidrug efforts at home and became more actively involved in the work of the CND.

U.S. drug control authorities also feared that prosperity after the war might stimulate the international cocaine trade, which had substantially declined in volume even before the onset of the Great Depression. Hoping to prevent a recurrence they supported sending a mission to Bolivia and Peru, the purpose of which was to evaluate the place of coca in modern Andean society. Wartime developments led U.S. officials to believe that Peru might be willing to consider strictly control-
ling coca leaf production, but that hope proved premature. The Commission of Inquiry on the Coca Leaf recalled the integral place of coca in the Andes and concluded that only either improved socioeconomic conditions in producing regions or stronger government action, meaning political will, could bring about the desired results. Important for present purposes is that nothing about the commission’s findings, however negative in tone, persuaded U.S. officials to question their belief that Andean authorities were more or less favorably disposed toward a U.S.-style coca control program. The basic assumption that control at the source was a matter of time in the Andes would not be seriously challenged until the 1960s and after.

Instances like those involving Mexico and Bolivia and Peru were not unimportant to U.S. officials in the early Cold War, but they do not adequately show the intersection of security policy and drug control activities. It was in Asia that such a nexus was most readily discernible. FBN and State Department officials alleged that communists in China, like the Japanese before them, were prepared to ply their enemies with opium in order to suit their ideological ends. With the coming to power of the Chinese Communist Party in October 1949 and its subsequent exclusion of Western influence from China, Anslinger’s allegations about drug-related subversion of the West and Japan from Beijing could not be disproved. But having an adversary that was presumably willing to use narcotics as a weapon of war appeared to support the FBN chief’s traditional supply-side strategy. The Chinese communists had learned a vital lesson, however, by observing the actions of imperial Japan as it sought to subjugate China in the late 1930s: a people drugged with opium do not make good subjects.

Communist China’s centrality to the issue of drugs and security policy in the early Cold War merits elaboration. Traffic in heroin destined for Western markets resumed as World War II came to an end. Despite indications that the source of opium came partially from those areas of China controlled by the Kuomintang, Anslinger and the State Department were reluctant to blame their Chinese friends for the reappearance of the trade. For some months before the communists seized power and for some years thereafter, policymakers in Washington blamed Mao Zedong’s forces for orchestrating the world heroin business. The less Western observers had access to China and its remote opium-growing regions, the stronger the allegations were against the communists. Occasional doubters, whether in London or Washington, were drowned out by the mass of unverifiable information emanating from the FBN and Foggy Bottom. The CND became an important vehicle for disseminating Anslinger’s anti-China message.

It is hard not to conclude that a campaign of intentional disinformation was taking place. Available evidence indicates that to an extremely limited extent some communists did seek to exchange opiates for hard currency. There is no reliable indication, however, of a plan on the part of the Chinese Communist Party to demoralize the West with heroin. Instead it seems more likely that the head of the FBN, in making his allegations against the communists, actually was collaborating in the effort to hide covert operations against the Beijing government by Kuomintang forces operating out of the Golden Triangle, the heart of opium production and traffic in Asia. The objectives of U.S. security policy toward China, although in theory separate from drug control policy, had taken precedence over the pursuit of control at the source, which in the early 1950s was seen by some officials in Washington as an obstacle to the containment of communism.

In Thailand the logic of Cold War policy fashioned dubious linkages with unscrupulous leaders like General Phao SRIyanon, whose personal and political fortunes derived from and depended upon the trade in opium. Throughout Indochina numerous participants in the opium trade, whether in the hills or the cities, offered their allegiance to the United States and its allies in Saigon. In return their reliance upon opium as a source of income remained undisturbed and probably increased. The export trade in heroin from Southeast Asia grew rapidly. And in Indochina the appearance of U.S. advisers in the 1950s and combat forces a decade later sparked a resurgence of the regional drug trade. Thus the 1953 UN Opium Conference, which on paper adopted a spectrum of controls on opium, was an exercise in futility where Southeast Asia was concerned. Rising levels of drug usage and addiction in the West by 1960 and after resulted to some extent from a countenancing of the drug trade in the name of national security.

The convergence of narcotics policy and security interests in the early Cold War made drugs available to untold numbers of Americans. Another important long-term legacy of the drug and security policy nexus from the 1950s onward was the willingness of authorities to ignore the
drug-related activities of Central Intelligence Agency assets such as the contras in Nicaragua, General Manuel Noriega in Panama, spymaster Vladimiro Montesinos in Peru, and others, until those assets became expendable. A drug policy bureaucracy that set aside its own primary goals in the name of security was virtually abandoning the right to define its own mission. Objectively, illicit drug trafficking constituted a serious foreign policy problem for the United States, not a dire threat to the nation. Yet the historical efforts of Anslinger and others to propagate a supply-side strategy as the only acceptable road to drug control rendered drug policy hostage to other, more important foreign and security policy interests. In this way the linkage between drugs and security was cemented. To perpetuate the influence of the FBN, drug control authorities accepted a subordinate place at the policymaking table.

In the 1960s several important developments marked U.S. drug control policy. As if in testimony to Harry Anslinger's tenure as narcotics commissioner, which came to a close in 1962, nations from around the world signed and ultimately ratified the 1961 Single Convention on Narcotic Drugs, thereby placing under one instrument nearly all international antidrug accords. A consensus, more symbolic than real, had been reached favoring a supply-side approach to drug control. The practical effect for Washington of the convention was to place increasing emphasis upon bilateral relations. In that process frustration became the order of the day: drugs from Southeast Asia continued to reach consumers in the West. Latin America became an even greater source for cocaine, marijuana, and heroin. Demand for drugs by recreational consumers and chronic users seemed to rise exponentially. Organizational changes did little to reduce demand; without Anslinger the FBN, mired in scandal, became in 1968 the Bureau of Narcotics and Dangerous Drugs (BNDD). But the BNDD had no leader with Anslinger's stature to dominate the policymaking process.

Chaos, however, did not necessarily come to characterize U.S. drug policy. The 1960s had begun with an appeal from Mexico to the Eisenhower administration for antidrug help. By 1964 the Agency for International Development (AID) in the State Department had devised a program that previewed the future direction of U.S. antidrug assistance programs. Included in the aid package were funds for both crop eradication and weapons to combat the illicit traffic out of Mexico. Throughout Lyndon Johnson's presidency U.S. authorities tried but were unable to formalize trans-border antidrug operations with Mexico.

In the Andes an Inter-American Consultative Group on Coca Leaf Problems met at Lima in 1964 but achieved little. Bolivia refused even to sign the Single Convention on Narcotic Drugs until 1975, and Peru, although a signatory power, declared that reducing its coca crop could not be considered for perhaps twenty-five years. Complicating the already sensitive relations between Washington and Lima was the creation of a national coca monopoly in 1969.

Notwithstanding these several setbacks in the cause of drug control, the earlier linkage of drugs and security offered a new way to promote drug control. A variant of supply-side tactics, the road to drug control would increasingly emphasize law enforcement as part of a general foreign aid package. U.S. policymakers in the 1960s worried that the “revolution of rising expectations” in the Third World, which encompassed important drug-producing countries, could not easily be controlled. They nevertheless sought to do so by tying together development and security assistance as provided to local law enforcement programs by AID, part of which was intended to be used for narcotics control. It is not clear from available evidence whether the drug control performance of producer states improved, but that outcome is doubtful given the frequent additional funding that Washington made available for drug control in the 1970s and after. Drug control, therefore, had all but disappeared by the late 1960s as an autonomous foreign policy issue. Starting in 1969 the association between drugs and security would grow closer still.

**THE LIMITS OF DRUG CONTROL**

The more U.S. drug officials equated their activities with security policy, the more diversified became policy objectives. The event that brought about this diversification was Operation Intercept at the Mexican border. In subjecting all traffic at the border to great delays in order to restrict the flow of drugs north from Mexico, the administration of President Richard M. Nixon did two things. First, it made drug interdiction as important as control at the source. Second, and more significant, it served notice that drug production and trafficking threatened U.S. security and was evidence of a lack of political will by the country...
of origin in the fight against drugs. Since Intercept, U.S. policymakers in the executive branch and Congress have assumed the existence of an adversarial relationship with most producer and trafficking states.

In a major exception to this general rule, Turkey and the United States worked out an arrangement in 1972 that persuaded the Turkish government briefly to halt state-regulated production of opium poppies. Large amounts of Turkish opium had found its way into the heroin trade destined for western Europe and the United States. In severing what was termed the “French Connection,” the Nixon administration temporarily muted congressional and public criticism of federal drug policy without disturbing the linkage between drug control and security policy.

Despite the administration’s success with Turkey, congressional committees took an increasing interest in the course of U.S. drug policy and strategy. As early as 1971 the House Foreign Affairs Committee expressed concerns about the extent of abuse of Southeast Asian heroin by servicemen returning from Indochina. One committee report, in line with traditional U.S. policy, held that “the problem must be attacked at the source.” What differed was the manner of attack that Congress had under consideration: a preemptive buy of the Southeast Asian heroin supply. Officials in the executive branch summarily rejected such a proposal at least twice by mid-decade. Even without knowing the costs of annual preemptive buys, the idea found scant favor in the White House or among drug control officials because it threatened to raise drug control as an issue on its own merits, which might undermine the favored drug-security relationship.

As the assault on executive policymaking prerogatives was being defeated on one front, the drug-security nexus was being reinforced on another. The patience of the United States for the apparent inability of Latin American states to control production and trafficking was wearing thin. In the process, the pre-1969 diplomacy of persuasion inexorably gave way to the politics of pressure and coercion. Following Operation Intercept both the United States and Mexico had endeavored to put the best possible face on a contentious situation by hastily devising what they termed “Operation Cooperation.” Soon thereafter authorities in Mexico City initiated La Campaña Permanente, in which Mexican resources and assistance from the Drug Enforcement Administration (DEA), one of the successor agencies to the FBN, were used to curtail opium poppy growth and heroin production.

So far as can be ascertained, Mexico’s drug control record in the late 1970s was a relatively good one. But as the United States and Mexico tried to find common ground against drugs, political developments in Washington made that task more difficult. The House Select Committee on Narcotics Abuse and Control came into existence in 1976. Headed by activist congressmen who were dedicated to crop eradication and wanted to militarize the antidrug fight, the committee looked beyond recurring promises and began to assess performance in Latin America’s drug control record. Mexico naturally caught the eye of drug control proponents in the United States. It is clear that President José López Portillo had in his government officials who were profiting from drug production and trafficking. What López Portillo knew about that situation remains unclear; in any event, by the time Ronald Reagan’s presidency began in January 1981 members of Congress and some administration officials, although few then in DEA headquarters, were doubting Mexico’s good faith regarding drug control. Ironically Mexicans had their own doubts about the U.S. antidrug commitment because of strict legal prohibitions against the spraying of paraquat on domestic marijuana. The inequality of power in U.S.–Mexican relations made that concern irrelevant in the bilateral relationship.

Mexico, of course, was not the only country subjected to close scrutiny by the United States. Colombia called attention to itself when it considered a plan to legalize and tax the marijuana trade and also after the boom in the cocaine industry became apparent. Peru and Bolivia were heavily criticized in Washington for failure to enforce the coca controls envisioned by the 1961 Single Convention on Narcotic Drugs. Bolivia especially fell out of favor with Washington during and after the year-long hold on power by General Luis García Meza as a result of what has been accurately termed a “cocaine coup.” To U.S. authorities Bolivia seemed little more than a nation in thrall to the coca leaf and hence cocaine. Throughout the Andes the so-called kings of cocaine were in the process of constructing a powerful, albeit decentralized narco-empire.

Viewed from the perspective of official Washington it is not surprising that pressure instead of persuasion increasingly characterized U.S. drug policy by the 1980s. The United States consciously set out to transform drug control
policies and operations in Latin America at that

time. The House Select Committee on Narcotics
Abuse and Control, more than any other congress-
ional committee, resolved to hold to account
Latin Americans, and the Reagan administration
as well, for the integrity of antidrug activities.
With no specific mandate except for the pre-
sumed interests and fears of an ill-defined public
constituency, the committee held hearings, con-
ducted study missions, and released reports
about the status of drug control in the Western
Hemisphere.

Not only did the committee rally support in
Congress during the 1980s for a foreign policy
calling for a comprehensive eradication of crops
in the Andes and in Mexico, it also demanded a
dramatic improvement in the rate of drug inter-
diction, thereby criticizing the antidrug efforts of
the Reagan administration. Committee leaders
encouraged militarization of the war on drugs
over the vocal opposition of Secretary Caspar
Weinberger and the Department of Defense. By
the end of the decade, though, it seemed as if
selective low-intensity warfare had taken its
place, next to control at the source and interdic-
tion, as another basic component of U.S. antidrug
strategy. Low-intensity conflict as a fundamental
aspect of U.S. strategy would come to the fore
after the drug summit held at Cartagena, Co-
mbia, in February 1990, with U.S. assistance to
Peru and Colombia increasingly emphasizing law
enforcement assistance and military aid against
drug production and trafficking. It would con-
tinue throughout the 1990s and ultimately meta-
morphose into Plan Colombia at the turn of the
twenty-first century.

Also desirous of pressuring Latin American
leaders to do more to control drugs were the three
agencies most responsible for drug law enforce-
ment: the DEA, Customs, and the Coast Guard.
DEA agents had operated abroad at the invitation
of host governments since the agency's creation in
1973. In the strictest sense their mission was to
gather information and assist in the training of
local antidrug forces, such as the mobile units cre-
ated in the early 1980s in Bolivia and Peru.
Nowhere was the DEA presence more controver-
sial than in Mexico, where in early 1985 the agent
Enrique Camarena Salazar and his Mexican pilot
were abducted, tortured, and killed. The case
remained unsettled to the satisfaction of the DEA
for some time, despite the arrest and successful
prosecution of many of those allegedly respon-
sible for the crime.

Demonstrating how negatively the Camarena

case affected U.S.–Mexican relations was the
national-interest certification accorded Mexico in
1988. Several years earlier Congress had passed a
law requiring the White House to "certify" whether
drug producing and trafficking nations were com-
plying fully with U.S. drug policy objectives. Fail-
ure to do so could result in the suspension, and
possibly termination, of various kinds of foreign
assistance. In 1988, in order to lessen congress-
ional pressure on the administration to name
Mexico as a country lacking the political will to
attack drugs and to express displeasure with Mex-
ico about the Camarena incident, the White House
accorded Mexico less than full certification.

Whether or not that was the case, narcotics
foreign policy became highly politicized under
Ronald Reagan. Fidel Castro's Cuba and the Sand-
dinista leadership in Nicaragua were charged with
sponsoring the transport of drugs, especially
cocaine, to the United States. At the same time,
the Reagan administration largely ignored drug
trafficking by anti-Castro Cubans and the
Nicaraguan contras. The administration's ready-
ness to portray the situation so greatly at odds
with reality had historical precedent, as we have
seen, in Anslinger's allegations about Communist
China's involvement with the opiate trade.

Pressure for Latin America to adopt U.S.-
style drug control programs can also be seen in
the handling of economic development programs
funded by the Agency for International Develop-
ment. So limited was U.S. and international help
for crop substitution and alternative development
strategies that few farmers in Bolivia or Peru, the
countries where this assistance was needed most,
could have been expected to turn away from coca
for another crop no matter how volatile the mar-
ket price of coca leaves. The point is not that Bolivi-
ans or Peruvians were demanding absolute
dollar-for-dollar income replacement; they were
not. Rather, coca farmers, as well as processors
and small-time traffickers, sought a reliable
source of income if they were going to ignore the
market forces that made coca an attractive eco-
nomic choice. As structured in the 1980s and
early 1990s, though, the development strategies
devised in the United States failed to address
the basic concerns of thousands of South Americans
participating in the coca-cocaine business.

Indeed, aid programs were closely linked to
effective crop destruction and hence were tied as
well to presidential certification. The Agency for
International Development never had the financial
means, let alone the disposition, to address any but the most visible symptoms of this vicious cycle. When viewed in that light President George H. W. Bush's promises at Cartagena about development assistance for the Andes, as one component of the Andean Strategy announced in September 1989, seems somewhat disingenuous. U.S. drug policy toward Latin America was relying on pressure rather than diplomacy and persuasion in two other important respects. On 8 April 1986 President Reagan issued a national security decision directive to the effect that drug production and trafficking constituted a grave threat to the security of the hemisphere. Hence those nations under attack by the drug lords, especially in the Andes, ought to defend themselves individually or in concert. In practice this meant a greater emphasis on control at the source and a relentless effort in source countries to interdict illegal drugs. The United States would provide advice, training, and equipment, although the drug war would be waged first in South America and second in its surrounding international waters.

This strategy largely ignored competing security objectives that tended to compromise antidrug objectives. Panama's Noriega, for example, was arguably the Reagan administration's most vital security asset in Central America despite his well-deserved reputation for double-dealing. Noriega was deemed indispensable to the administration and remained so as long as William Casey headed the CIA. Also, the administration chose to overlook the involvement of several Honduran military officials in the drug trade because Honduras served as a sanctuary for the contras. Such contradictions in security priorities were not lost on those nations, notably Colombia, that were on the front line of the drug war.

U.S. pressure against producer, processing, and transit countries accompanied the militarization of drug strategy. Going far beyond an upgrading of the mission of the Coast Guard, the United States virtually insisted that the battle be taken to source countries. To be sure, aid for military operations came after being requested by Latin American governments. Yet it is worth asking how much of a choice Bolivia had in March of 1986 when Operation Blast Furnace was being proposed. So long as Colombia sought U.S. assistance, it had few viable options other than armed confrontation with the Medellín cartel after the assassination of presidential candidate Luis Carlos Galán in August 1989. The Bush White House viewed the response to the killing as a test of the will of the government of Virgilio Barco Vargas. (Indeed, when Barco's successor, César Gaviria, sought to craft a Colombian response to the violence of the Medellín and Cali cartels, Bob Martinez, head of the Office of National Drug Control Policy, proclaimed that Colombia was on trial before the world.)

Unwillingness abroad to strike directly at illicit production and trafficking would have jeopardized U.S. aid programs. With this implicit threat at the ready, the United States—in early 1987, more than two years before the Galán murder—had fashioned a more extensive antidrug strategy for the Andes, Operation Snowcap. But Snowcap, slow in getting underway, soon ran into difficulty, especially in Peru where the Maoist Sendero Luminoso (Shining Path) controlled coca-growing areas in the Upper Huallaga Valley. Proposals to dispatch U.S. special forces into the Andes were too controversial for Lima to accept openly, but by mid-1991 President Alberto K. Fujimori had agreed to their limited use.

The evolution of a more coercive antidrug strategy in the 1990s inevitably led to greater expectations about Latin American performance in Washington. Controlling drugs moved into the highest rank of foreign policy priorities, at least rhetorically, as the Cold War ended. Yet neither crop eradication nor drug interdiction, despite several spectacular, singular achievements, significantly reduced the flow of drugs in the Americas until after mid-decade.

Policymakers had long argued that an activist drug control strategy abroad would help to control consumption at home. Not until Congress passed the 1988 Anti-Drug Abuse Act would they seriously begin to address the issue of demand, and they did so thereafter largely as an aspect of law enforcement. Demand reduction strategies primarily existed as a by-product of other goals. In effect authorities were betting that widespread craving for popular drugs, notably cocaine, would eventually decline. What they assumed, however, to be a cyclical theory of demand in reality resembled a spiral model, that is, one with absolute usage steadily increasing.

Drug control strategy was also intended to deter newcomers from entering the business at all stages, from production to sale on the street. A tougher approach in the Chapare of Bolivia, in the Upper Huallaga Valley of Peru, or even in the cays of the Caribbean would produce the desired result of lowering drug availability and consumption on the streets of New York, for example. Likewise a
strategy that emphasized strict and certain law enforcement might compel lesser players to get out of the game. Had policymakers paid closer attention to what they read in the analyses of Peter Reuter and his colleagues at the Rand Corporation, they would not have been so sanguine about the prospects for success of such a strategy. The risk factor for entrepreneurs entering the drug business was statistically insignificant, whereas the rewards were sufficient to sustain the promise of unaccustomed wealth.

Also anticipated as a result of drug strategy in the 1980s, particularly after Reagan issued his national security directive, was the apprehension of major traffickers. A number of seizures of important figures did take place, especially in Mexico and Gaviria’s Colombia, but they did not appreciably affect the structure or functioning of the drug trade out of South America or Mexico, let alone within the United States. (Likewise, the heroin trade out of Southeast Asia scarcely depended upon the continued participation of its two most notorious leaders of the late twentieth century, Lo Hsing-han and Khun Sa, each of whom at one time or another swore off further involvement with opium.)

One outcome of the focus on major traffickers in Latin America would be a reduction in money laundering. The seizure of Noriega and the arrest of top officials of several major banks by the mid-1990s held out the promise of greater success over time, yet that hope was tempered by the realization that the laundering of money remained a serious problem in Panama, a nation whose government owed its very existence to the United States.

Another expected result of the battle against drugs was an increase in the price of drugs so that the economic incentive to consume them would decline. Again, U.S. strategists would do well to heed the analyses prepared at the Rand Corporation. For street prices appreciably to rise, the rate of interdiction would have to be far greater than it has ever been. Even if as much as 30 percent of illegal cocaine is seized, and few experts claim that seizures come close to that figure, the available supply would probably keep prices down and profits for traffickers acceptably high. Not even the vigorous pursuit of the longtime strategy of interdiction presents a serious threat to the major trafficking networks.

As the Cold War waned, policymakers looked to the war on drugs to provide U.S. forces with a contemporary military mission, however limited. After the Department of Defense under Secretary Dick Cheney overcame its reluctance to get involved in the drug war in Latin America and the Caribbean, commitments in the form of advice, training, and limited operations proliferated on a unilateral and bilateral basis. Yet the war remained a low-intensity conflict for both practical political and diplomatic reasons. As a result the war was deemed a losing budgetary and doctrinal proposition for the U.S. military and evoked demands for little more than a minimal expenditure of resources. Until the late 1990s it remained unclear what the mission for U.S. forces would be.

The unanticipated consequences of the Reagan-Bush drug war in Latin America were no more salutary. Inter-American relations were strained by the politics of pressure, which would decisively turn to coercion particularly toward Colombia after Ernesto Samper took office as president in 1994. Earlier, palpable tension at the San Antonio drug summit in February 1992, dubbed Cartagena 2, challenged the facade of a common front against drugs. The militarization of antidrug strategy and the process of certification, both of which arguably constituted an implicit denial of the sovereignty of producer, processing, and trafficking nations, placed the United States in the position of dictating a major aspect of regional relations. At the least, certification was demeaning to producer nations in that it assumed a lack of willingness to take action against drugs. The process of certification was something of a throwback to the 1920s and early 1930s in assuming that the drug issue existed apart from other vital issues such as the suppression of radical insurgencies.

It seemed too that defining the drug business as a threat to national security contributed to the realization of that very condition in the Andes. The institutional integrity of Bolivia, Colombia, and Peru was weaker in the early 1990s than before. Perhaps the economic troubles confronting those countries would have undermined national political and social institutions even without the compounding factor of the illicit drug business. Yet pressure from Washington to wage war against drugs in the name of national security made the governing process more difficult.

The Clinton administration continued to prod the three Andean nations as well as Mexico to act more vigorously to attack drug production and trafficking. Nevertheless, during President Bill Clinton’s first term in office, the fiery rhetoric of the recent past was missing. This approach to drug diplomacy reflected the reduced priority the
White House was giving to drug control as a foreign policy objective.

CONTINUING CHALLENGES

Beginning in the mid-1990s there were a number of positive developments in the war on drugs. DEA agents were advising their counterparts around the world; even China and Vietnam turned to the United States for assistance. The defeat of Sendero Luminoso in Peru, combined with a disease that severely damaged the nation's coca crop, drove the drug business out of the Upper Huallaga Valley until late in 2000. The Bolivian government of Hugo Banzer adopted a policy of "zero tolerance" toward coca growing outside of government-approved areas. An uneasy peace existed between growers' unions and the government as alternative development projects failed to provide sufficient income for former coca farmers. Also at the turn of the new century, Iran was cracking down on the opium business; and aid in the form of $43 million in spring 2001 persuaded the Taliban in Afghanistan to go after the heroin trade. Following the terrorist attacks on the United States on 11 September, however, the price for heroin from Afghanistan plummeted. U.S. and international drug control officials believed that the Taliban was dumping large stockpiles of heroin to pay for weapons in the event of conflict as the United States sought to capture or kill the reputed leader of the terrorist network, Osama bin Laden, whose headquarters were located in Afghanistan.

Serious challenges nevertheless remained for U.S. drug control officials, especially in the Caribbean and Mexico. Mexican authorities at all levels remained susceptible to bribery and threats from that nation's major drug organizations even as cartel leaders were arrested and faced the prospect of extradition to the United States for trial for their activities. During a visit to Washington in late summer 2001 President Vicente Fox pledged to cooperate closely with the administration of George W. Bush on common problems related to drugs. Whether that effort would be enough to lessen the expanding role of the drug business in Mexican politics, particularly at the state level, remained to be seen.

Illicit drugs from Latin America that were not transported to the United States from Mexico often came through Caribbean nations where authorities were unable, and in some instances unwilling, to handle a problem as complex as the one posed by drugs. The result was a greater presence of U.S. law enforcement personnel as advisors. Even Cuba began to share information with Washington about drug trafficking. Nothing happened in either Mexico or the Caribbean to suggest that drug control would soon disappear as a major foreign policy issue in the region.

However serious a challenge drugs posed to governance elsewhere, that threat paled in comparison to drug-related problems in Colombia. By 2002 foreign assistance to Colombia as part of Plan Colombia, a multiyear effort by the government of President Andres Pastrana to wipe out the drug business and defeat his nation's guerrilla insurgencies, made Colombia the third-largest recipient of U.S. foreign aid behind Israel and Egypt. Indications of progress by Bogotá against drugs in the early and mid-1990s proved illusory. Neither the destruction of the Medellín and Cali cartels nor the death or incarceration or extradition to the United States of cartel leaders slowed the traffic in cocaine and crack, heroin, and (to a lesser extent) marijuana out of Colombia. Indeed, antidrug assistance served to embroil the United States more deeply than anticipated in the Colombian crisis. The government in Bogotá controlled barely 60 percent of the national territory. How U.S. aid could affect that perilous situation remained anyone's guess. The leftist insurgency had begun in the mid-1960s and showed little sign of abating, all the more so because rebel forces increasingly relied upon income from drugs to fund their activities. Negotiations between the government and rebels had created a safe zone, dubbed "Narcolandia." Should a settlement eventuate, there was no way of predicting its durability.

What had begun a hundred years earlier as an effort by the United States to promote social reform abroad was closely linked in the twenty-first century with matters of governance and national identity. Foreign lands continued to supply the United States with illicit substances; in so doing they met rather than created a demand for drugs, though U.S. leaders did not publicly admit that reality until the early 1990s. The more that supplier and transit nations accepted U.S. antidrug strategy, and declared drugs to constitute a security threat, the more difficult for them became the process of governing. Attention to demand alone, long advocated by some producer states, could not overcome the multifaceted problems posed by drugs. For better or worse drug control had become an important, sometimes crucial, facet of American foreign policy.

See also INTERVENTION AND NONINTERVENTION; THE NATIONAL INTEREST; PAN-AMERICANISM.
No concept in the history of American foreign policy has been more contentious than the "national interest." Both words in the phrase are troublesome. "National" implies something the entire nation can rally around; hence, the phrase often serves as a summons to patriotism. To oppose, or even question, the national interest pushes the opponent or questioner perilously close to sedition or treason. As for "interest," few terms are more elastic. The inhabitants of any country would have to be dull indeed not to be "interested" in much that goes on in the world; the inhabitants of a powerful, ambitious country like the United States can expand interests almost ad infinitum. Complicating the matter further is the fact that definitions do not necessarily the national interest make. What actually is the national interest is for history to determine. And even history does not always get it right.

For every country, national interest starts with safety of the national territory; for Americans, the arguing started just past that irreducible minimum. And it started early.

WHAT WASHINGTON AND JEFFERSON (EVENTUALLY) AGREED ON

Quarrels over the national interest commenced with America’s birth as an independent nation. Nearly everyone in the Continental Congress, and everyone not a Loyalist, agreed on the advisability of an alliance with France and cheered when that alliance was obtained in 1778. But no sooner had the French held up their end of the bargain—by cornering Cornwallis at Yorktown—than Americans began to squabble about how far beyond victory attachment to France ought to extend. Benjamin Franklin, the senior American commissioner in Paris, counseled continued closeness, both from gratitude for services already rendered and in expectation of additional French aid. Franklin doubtless was influenced by the adulation he received in Paris (a staged meeting between Franklin and Voltaire set the philosophes swooning), but, personal popularity aside, he believed the infant United States would need French help to avoid being sucked back into Britain’s orbit. Franklin’s fellow commissioners, John Adams and John Jay, were more inclined to doubt French bona fides and less inclined to fear the attraction of America’s late colonial master. (Adams in addition suffered from excruciating envy of Franklin, and his Puritan mores were scandalized by Franklin’s liaisons with the ladies of Paris.) As it happened, the tension between the two conceptions of the infant national interest produced a peace treaty that preserved the alliance with France while extracting important concessions from Britain.

Unfortunately, the concessions proved to be more impressive on paper than on the ground—particularly the ground of the Ohio Valley and the Great Lakes. The British refused to evacuate forts in the region and defied the Americans to do anything to oust them. (The rationale for their continued occupation was the failure of the American government to honor pledges regarding debts and Loyalists, but their reason was simply that they could, and that influential groups in Britain defined Britain’s national interest as holding what Britain had.) Thomas Jefferson, who had inherited Franklin’s Francophilia along with Franklin’s diplomatic post in Paris, and who carried this attitude to his position as President George Washington’s secretary of state, found the British intransigence insufferable. The group that grew up around Jefferson—the nascent Republican Party—agitated to punish perfidious Albion.

Their cause was complicated by the outbreak of the French Revolution, and the onset of the wars provoked by that pregnant event. For most of a century, the American colonies had been caught in the crossfire between Britain and France; the
most recent installment of this modern Hundred Years’ War had sprung the colonies free from Britain’s grasp. But freedom did not preserve them when the crossfire resumed in 1792. The question that then faced Americans was: With which side did the American national interest lie?

Jefferson and the Republicans answered the question one way—France’s way. The Jeffersonians did not necessarily forgive French violations of American neutrality (centering on seizure of American ships), but they felt more threatened by Britain’s infractions, which now also included seizure of ships. The more fervent among them would have repaid French help in the war of the American Revolution with American help in this war of the French Revolution; yet even those who stopped short of wanting to honor the alliance to the letter conceived a kinship with the new republic on the Atlantic’s eastern shore. In this view (and in a pattern that would persist for two centuries in American politics), the national interest at home and the national interest abroad were intimately entwined. Domestic republicanism dictated support for foreign republicanism.

Alexander Hamilton and the Federalists demonstrated a similarly married definition of the national interests at home and abroad. Hamilton was no great fan of American republicanism, having argued at the Constitutional Convention for a monarchy; not surprisingly, he held no candle for French republicanism. On the contrary, he admired the energetic executive of the British government (which he did his best to imitate as Washington’s Treasury secretary and most trusted adviser), and he judged that America’s future lay in close ties to Britain’s governing and merchandising classes.

The national interest was whipsawed between the Republican and Federalist views for two decades. The Federalists (under Washington) negotiated and ratified the easy-on-Britain Jay’s Treaty and (under John Adams) fought an undeclared naval war against France. During this conflict, the Federalists succeeded in outlawing—by the Sedition Act—their opponents’ definition of the national interest. The Republicans (under James Madison) fought a formal war against Britain. The Republicans’ war—of 1812—was a fiasco for the United States, with the burning of Washington City being but the most egregious example of America’s inability to defend itself.

Yet the conflict had the salutary effect of ending the first phase of the debate over the national interest. Americans had learned something from their long ordeal. The Bonapartist turn of events in France cured the Jeffersonians of their revolutionary romanticism, while the Hamiltonians (who lost their champion in the infamous duel with Aaron Burr) were disabused of their Anglophilia by British impressment of American seamen. Both sides settled on the wisdom of staying out of other countries’ wars. George Washington had urged eschewing “permanent alliances”; Thomas Jefferson denounced “entangling alliances.” Permanent or entangling alliances seemed unwise, and a strong majority of Americans concurred in keeping clear of them. No definition of the national interest would persist longer or sustain more general acceptance than this idea that other people’s quarrels were for other people to settle. God in his wisdom had put an ocean between Europe and America; Americans in their wisdom had crossed it. Most saw no reason to cross back.

**EXPANSIONISTS ALL**

One reason Americans did not go back east was that they were too busy going farther west. The end of Europe’s wars freed Americans to concentrate on what they and their ancestors had been doing since the start of the seventeenth century: claiming new territory and dispossessing the aboriginal inhabitants. Independent America inherited from imperial England the general idea that Indians had no rights worth respecting; Indian lands might be claimed and parcelled out, subject only to the ability of the claimants to drive the Indians off. This attitude was not quite universal; a few English and Americans spoke up for the Indians. But between the more common view of Indians as beneath respect, and the ravages of introduced diseases upon the aboriginal populations, Americans expanded west almost as though the Indians were not there.

The Treaty of Paris of 1783 confirmed American title to the lands lying east of the Mississippi. (Confirmed title against European claimants, that is. No Indians sat at the Paris negotiations, and none were asked to approve the treaty.) The Louisiana Purchase of 1803 doubled the American national domain again, pushing the western boundary to the crest of the Rocky Mountains. Diplomatic and extra-diplomatic machinations brought Florida into the American fold.

Nearly all Americans approved this heedless expansion. Federalists poked fun at Jefferson,
who had to abandon his strict constructionism lest Napoleon change his mind about Louisiana; and General Andrew Jackson incurred criticism for hanging one British trader and shooting another in Florida. But on the whole, more land was conceived to be in the obvious national interest.

There was something else behind the pro-expansionist feeling. Since Puritan times, many Americans believed their country was unique: the site of the terrestrial working-out of the will of God (either the Christian God of the Puritans or the natural God of Jefferson and Madison). The expansion of America, in this view, signified the extension of providential designs, with benefits not merely for America but for humanity at large. Other nations have defined their national interests to include people beyond their borders, but none have done so more vigorously or consistently than the United States.

The identification of the American national interest with the interest of humanity reached an early apex during the 1840s, in the era of “manifest destiny.” The annexation of Texas, the conquest of California and New Mexico, and the acquisition of Oregon seemed to most Americans a convenient collaboration between God and the United States. To be sure, the war with Mexico occasioned complaint among northern Whigs, but their complaint had less to do with the extension of American authority than with a fear that the territory acquired in the war would strengthen the institution of southern slavery.

In fact, slavery never sank roots in the trans-Texas southwest. Yet difficulties in organizing governments for the Mexican cession did reopen the slavery debate and led, via “bleeding Kansas” and the Dred Scott decision, to the Civil War. The bitter sectional ordeal took the smugness out of the manifest destinarians and the wind out of the sails of territorial expansion. The generation that came of age with the Compromise of 1850 and remained in power until the Compromise of 1877 had trouble enough holding together the territory America already owned; it had little energy or inclination to acquire more. Secretary of State William Seward got Congress to purchase Alaska in 1867, but only because Russia’s sale price made it a bargain the legislators could not refuse (especially when the price included generous kickbacks to the legislators themselves). Ulysses Grant tried to annex Santo Domingo, but the Senate said no.

A DEMOCRATIC EMPIRE?

By the end of Reconstruction, the Industrial Revolution in America was under full steam. And as the country redefined itself—from rural and agricultural to urban and industrial—it similarly redefined its national interest. Or tried to. Many Americans interpreted the shift from agriculture to industry as indicating that territory per se no longer mattered; America’s expansionist impulses—which none denied still existed—should look to markets rather than land. Yet others contended that land still counted. They observed the overseas empires of the other great powers and judged that American greatness would be measured by the same material yardstick. Moreover, enough of the spirit of manifest destiny survived the Civil War (the Union victory did wonders for the self-confidence of the winners) to support a sense that American institutions and values could revivify a weary and corrupted world.

After fighting broke out in Cuba in 1895 between Cuban nationalists and Spanish loyalists, Americans sided with the nationalists: first sentimentally, then politically, and finally militarily. The American war party—led by Republicans Theodore Roosevelt and Henry Cabot Lodge and journalists Joseph Pulitzer and William Randolph Hearst—included individuals who dreamed of an American empire akin to the empires of Britain, France, and Germany. But what won William McKinley his war declaration against Spain in April 1898 was a feeling that America had an obligation to prevent atrocities in its own backyard. (It was during the 1890s that the Monroe Doctrine of 1823, asserting American primacy in the Western Hemisphere, achieved the status of an enforceable national interest.) When congressional skeptics of the McKinley administration’s motives, led by Henry Teller, attached to the war resolution an amendment forsaking American ownership of Cuba, the amendment sailed through the Senate without debate.

But wars have a way of altering reality, and after American forces captured Manila, the urge to empire took a different tack. McKinley negotiated a treaty with Spain granting Cuba independence but transferring the Philippines to the United States. The president claimed that Providence told him his country had an obligation to uplift and Christianize the Filipinos. (Obviously, it was a Protestant Providence, as most Filipinos were already Christians—but Roman Catholics.)
When McKinley laid the treaty before the Senate for ratification, the country witnessed one of the most distilled debates in American history on the nature of the national interest. The imperialists asserted that annexation of the Philippines would benefit the United States economically (by providing a stepping-stone to the markets of Asia), diplomatically (by anteving America into the imperial sweepstakes that dominated international affairs), and militarily (by providing naval bases and coaling stations for the U.S. fleet). Beyond this, American control of the Philippines would advance the interests of world civilization. “It is elemental,” Albert Beveridge told his Senate colleagues. “It is racial. God has not been preparing the English-speaking and Teutonic peoples for a thousand years for nothing but vain and idle self-contemplation and self-admiration. . . . He has made us the master organizers of the world to establish system where chaos reigns. He has given us the spirit of progress to overwhelm the forces of reaction throughout the earth.”

The anti-imperialists construed the national interest quite differently. A radical few denied that God had any special plan for America, but others simply held that American exceptionalism worked better by example than by force. Indeed, to ape the European imperialists would undermine all that made America unique and worth emulating. Carl Schurz, a refugee republican from Prussia after the failed revolution of 1848 there, and a Lincoln Republican in the American Civil War, predicted that annexation would embroil the United States in an imperial conflict like those that ate the blood and treasure of the other imperial powers. “The Filipinos fought against Spain for their freedom and independence, and unless they abandon their recently proclaimed purpose for their freedom and independence, they will fight us,” Schurz said. The imperial road would lead his adopted country into dire peril. “The character and future of the Republic and the welfare of its people now living and yet to be born are in unprecedented jeopardy.”

The imperialists won the battle but lost the war. Even as the Senate (narrowly) accepted McKinley’s treaty, Filipino nationalists launched the war of independence Schurz predicted. The American war in the Philippines was the long, dirty antithesis of the short, clean American war in Cuba. Americans committed (and suffered) atrocities like those they had castigated Spain for committing against Cuba; the whole experience soured the American people on empire. By the time U.S. forces finally suppressed the Philippine insurgency, Americans had discovered that their national interest did not include empire. They needed another four decades to divest themselves of the Philippines (Puerto Rico, which did not want to be divested, remained American), but they were never tempted to repeat the imperial experiment.

**A SIGH FOR VERSAILLES**

Reinforcing Americans’ reluctance to engage in entanglements abroad was the suicidal behavior of the European imperialists, who locked themselves in a death struggle starting in 1914. For the first year of the Great War, Americans once again congratulated themselves and their forebears for having left that benighted continent; by consensus the national interest indicated adhering to the advice of Washington and Jefferson about eschewing alliances.

But the twentieth century was not the eighteenth or early nineteenth. American commercial and financial interests had grown tremendously, making the United States more dependent than ever on foreign markets. American merchants demanded the right to trade with the belligerents; American bankers insisted on being able to lend in London and Paris and Berlin. Woodrow Wilson wanted to keep clear of the conflict and tried for a time to rally his compatriots to neutral thinking as well as a neutral policy. But he could not resist the calls for belligerent trade and belligerent loans, and before long the tentacles of capitalism began to draw the United States into the war. Because the British had a better fleet than the Germans, most American trade, and the financing that funded the trade, flowed to Britain and France, making the United States a de facto member of the Allied powers by 1916. Germany recognized the situation, and in early 1917 declared war on American shipping. Wilson responded with a request for a formal war declaration, which Congress granted.

At the time, few in Congress or outside it questioned that the American national interest required defending American vessels and American nationals against German attack. Some, however, did question whether U.S. participation in the war required putting U.S. troops on the ground in Europe. “Good Lord! You’re not going to send soldiers over there, are you?” queried a shocked senator of a War Department spokesman.
The War Department did send the troops, which helped break the back of Germany's desperate final offensive.

But what else they accomplished was open to doubt. The British and French knew what they were fighting for (although the rest of the world did not until Lenin leaked the secret treaties that spelled out the Allies' imperialist war aims). The Americans were far less sure of their own purposes, not least because Wilson had waffled all over the landscape of politics and diplomacy. At various times he talked of being too proud to fight, then of achieving peace without victory, then of making the world safe for democracy. His Fourteen Points seemed rather many, with some too vague and others too specific. In any case, the British and French demonstrated at the postwar peace conference that they would have nothing to do with Wilson's airy abstractions. Germany had lost, and Germany would pay—in treasure, territory, colonies, and markets. Wilson could have his precious League of Nations, the proto–world government he hoped would prevent another such war. But he would have to make of it what he could.

Which turned out to be nothing at all. Even more than Wilson, Americans were confused as to why they entered the war. The only national interest that seemed directly threatened was the right to trade with belligerents. But the British violated America's neutral rights as consistently, if less egregiously, than the Germans (who, short on surface ships, had to resort to U-boat torpedoes to enforce a blockade). Was there an American national interest in preventing another European war? On this point, as on any other meaningful topic touching the national interest, the answer turned on the cost. Of course, it would be to America's benefit for Europe to remain at peace, but would the benefit outweigh the cost of an indefinite commitment to enforce the mandates of this new League of Nations? Did Americans wish to play policemen to the world?

The Senate said no in twice rejecting the Treaty of Versailles. Wilson summoned a simple majority for the treaty, but not the two-thirds supermajority ratification required. Under the rules specified by the Constitution, the Senate declared that membership in the League of Nations was not in the American national interest. Whether it really was not in the national interest, time would tell.

WILSON WITHOUT THE PREACHING

And not much time, at that. Calvin Coolidge may not have spoken for all Americans when he proclaimed that the business of America was business, but he spoke for those who counted during the Republican decade after the war. Disillusionment with the war's outcome—millions killed, including 60,000 Americans, to little positive effect observable from across the Atlantic—reinforced the feeling that Washington and Jefferson had been right. Foreign entanglements were a fool's game. There was still American engagement abroad, but it was chiefly the engagement of private, corporate interests, backed at times by federal officials (including the bright new star of the Republicans, Commerce Secretary Herbert Hoover) yet rarely rising to the level of a widely supported national interest.

If anything, the national interest seemed to point in precisely the opposite direction. During the latter half of the 1920s, the authors Harry Elmer Barnes, C. Hartley Grattan, and others attacked American participation in the late war as the work of private interests—chiefly financial and mercantile—parading as the national interest. During the 1930s this attitude enveloped Capitol Hill, where an investigative committee headed by Senator Gerald Nye laid blame for America's feckless involvement in the war at the feet of the “merchants of death.” The Nye committee provided ammunition to congressional isolationists, who legislated neutrality for the United States in the event of another war. Yet this was a different neutrality from that which had defined much of the national interest from the 1790s to the 1910s. Where America's historic neutrality had been actively defended, twice by war (in 1812 and 1917), the legislated neutrality of the 1930s would be preserved by abandoning American neutral rights. The Neutrality Act of 1937, for example, forbade the sale of munitions to belligerents (no more “merchants of death”), outlawed loans to belligerents (no more lopsided lending) and barred American travel on belligerent ships (no more Lusitania—or at least no more American deaths on such ships). The neutrality law also allowed the president to insist that trade in goods other than munitions be conducted on a cash-and-carry basis, with the purchasers taking responsibility for the cargoes before they left U.S. shores (no more American ships showing up in the crosshairs of belligerent periscopes).
Americans might have quibbled over the details of the neutrality laws, but by all evidence they supported the general idea. Twenty years after the fact, American involvement in World War I seemed an exercise in fatuity, the likes of which should be avoided at nearly all cost. Yet no sooner had they reached this consensus than events began to erode it. In appallingly short order, Italy brutalized Ethiopia, Japan raped China, and Germany severed Czechoslovakia. Many Americans thought it would be impossible to retain the country’s self-respect without taking action against the organized violence abroad. Others concluded that if the violence was not stopped now, it would inevitably engulf the United States, as it had in World War I. But still others came to the opposite conclusion: to them, the muggings abroad underscored the necessity of neutrality. If the world insisted on going to hell, let it do so, but do not let it take America down with it.

The outbreak of the second great European war of the twentieth century, in September 1939, polarized American opinion further. A group calling itself America First wanted to widen the Atlantic and Pacific oceans and keep American boys securely at home. Mere discussion of U.S. intervention, the America Firsters said, discouraged Britain and France from doing for themselves what needed to be done. An opposing group, the Committee to Defend America by Aid ing the Allies, advocated a forthright policy of supporting those countries opposing Nazi Germany. With luck, such support might stop short of American belligerence, but that ultimate step could not be ruled out—nor should it be, lest Adolf Hitler take heart from American aloofness. This latest round of the debate over the national interest continued for two years, until the Japanese attack on Pearl Harbor. As even the narrowest definition demanded defending American territory, by transgressing U.S. borders the...
Japanese guaranteed American belligerence. Had Hitler not gratuitously declared war on the United States while the waters of Hawaii were still stained with American blood, debate doubtless would have continued regarding whether the national interest required fighting Germany. But in the event, Americans entered both wars—in the Pacific and in Europe—united in defining the national interest as requiring the defeat of the Axis. Woodrow Wilson might have been wrong about some things, but he now seemed right about America’s inability to insulate itself from a world at war.

ENTER IDEOLOGY

Defining national interest during war is easy: to defeat the enemy. Things get harder after the war. Wilson discovered this; so did Harry Truman. In each case the trouble was with the Allies, who during war agreed on the primacy of victory but after victory had their own national interests to pursue.

The interests of the Soviet Union after World War II entailed control of its East European neighbors. This was not what the United States had been fighting for, and in denying democracy and self-determination, it constituted an affront to American principles. Whether it constituted a challenge to the American national interest was a separate question. Franklin Roosevelt gave signs of thinking it did not, at least not seriously; Harry Truman, upon succeeding Roosevelt, thought it did.

More precisely, what Truman and his Cold War cabinet considered the challenge to the national interest was the aggressive expansionism they perceived to be inherent in Soviet communist ideology, and which was currently manifested in the Soviet occupation of Eastern Europe. Had Truman and his advisers been convinced the Kremlin had no designs west of the Elbe River, they would have slept more soundly and planned less ambitiously for the future of Western Europe; but instead they chose to interpret trouble in Iran, Greece, and Turkey as leading indicators of trouble farther west. In the March 1947 speech that unveiled the Truman Doctrine, the president described the world as divided between “alternative ways of life,” with the communist way attempting to subvert and destroy the democratic way. By Truman’s reasoning, the fate of America hung on the fate of Greece and the other countries under threat; it followed that the American national interest required defending Greece and those other countries.

Congress, and apparently the American people, endorsed Truman’s definition of the national interest. Truman got the $400 million he requested for Greece and Turkey. Then he got the several billions he requested for aid to Europe. He got the Senate to accept the North Atlantic Treaty, committing the United States to the defense of Western Europe. And although he did not ask for a formal declaration of war, he got the Congress to underwrite his decision to defend South Korea against North Korea when war broke out on that divided peninsula in 1950.

Never in American history had the national interest been redefined so radically and swiftly. Scarcely a decade before, Congress had forsworn the use of force even to defend American ships and citizens against direct attack. Now, the United States was pledged to defend half the world and was actively fighting in a small and intrinsically unimportant country half a world away.

Why the change? Two reasons. First, although World War I had suggested that any major European conflict would eventually embroil the United States, Americans required World War II for the lesson to stick. In the twentieth century, American peacetime connections to Europe—business and financial connections primarily, but also cultural and social connections—were so deep and pervasive that Europe’s troubles became America’s troubles, and Europe’s wars became America’s wars. The Cold War commitment to Europe—through the Marshall Plan and the North Atlantic Treaty Organization (NATO), especially—represented an effort to keep America out of war by keeping Europe out of war.

The second reason for the radical redefining of the national interest was simply that Americans could. Had the United States been Luxembourg, Americans never would have dreamed of underwriting European reconstruction or defending South Korea. But after 1945 the United States was the richest, most powerful country in the history of the world. Rich people buy insurance policies the poor decline, both because the rich have more to insure and because they can afford the premiums. The ambitious policies undertaken by the Truman administration represented a form of insurance—a way of keeping Americans richer and more powerful than anyone else.
NATIONAL SECURITY, NATIONAL INSECURITY

But as any savvy insurance agent discovers, there is no end to what might be insured. Buying a house? Insure the house, of course, but also ensure the mortgage payments. Taking a vacation? Insure against bad weather.

Likewise for the United States during the Cold War. America’s assorted alliance systems—NATO, SEATO (Southeast Asia Treaty Organization), CENTO (Central Treaty Organization), the Rio Pact, ANZUS (the Pacific Security Treaty among Australia, New Zealand, and the United States)—insured not primarily against attacks on the United States but against attacks on countries related, in one way or another, to American security. Pakistan offered electronic listening posts and launchpads for spy planes. Australia pledged troops to the defense of the Middle East, whose oil then meant little to America directly (the United States still exported oil) but meant much to Western Europe. South Vietnam mattered psychologically: if that wobbling domino fell, it would unsettle the neighbors and might ultimately ruin the neighborhood.

This would be bad for American business, which had a bottom-line interest in preserving as much of the world as possible for market penetration. It would also be bad for American morale. Since Plymouth Rock and the “city on the hill” John Winthrop had promised next door at Boston, Americans had always considered themselves the wave of the future. Two communist revolutions in the twentieth century—in Russia and in China—cast serious doubt on this presumption. Additional advances by the communists could only unnerve Americans further.

During the Cold War, the term “national security” often supplanted “national interest” in American political parlance. And security connoted not simply physical security—the ability to fend off foreign attack—but also psychological security. In no other way can the hysteria that gripped the United States during the McCarthy era be explained. Indeed, by most measures the United States was more secure than it had ever been. Its power—military, economic, political—compared to its closest rivals had never been greater. Americans, however, often acted as though they were in greater danger than ever. Red screenwriters and pink professors apparently lurked in every studio and on every campus, ready to deliver America to communist tyranny; accordingly, Congress and the courts mobilized to identify and silence them. Nationalism in Iran and land reform in Guatemala aimed a dagger at America’s heart; the Eisenhower administration sent secret warriors to overthrow the offending regimes.

Although much of the danger existed only in American heads (and on the agendas of those elected officials, bureaucrats, arms makers, and others who had profit and career incentives to magnify the communist threat), it was not entirely fabricated. In 1949 the Soviet Union broke the U.S. nuclear monopoly; by the mid-1950s, the Soviet air force possessed hydrogen bombs and long-range bombers; and by the early 1960s, Moscow’s strategic rocket forces could deliver the big bombs across oceans and over the pole. For centuries, other countries had lived with the threat of imminent physical attack, but until now the twin moats of the Atlantic and Pacific had protected the United States and allowed Americans the luxury of time in organizing armies when war did come. The nuclear revolution in military technology erased the oceans and collapsed time; with luck, Americans might now get twenty minutes’ warning of Soviet attack. By definition, paranoia is unreasonable, but it is not always unexplainable. If the American definition of national security exhibited a certain paranoia during the Cold War—and it did—the country’s unaccustomed vulnerability to sudden and potentially annihilating attack was as good an explanation as any.

NO MORE VIETNAMS

Even for rich folks, insurance premiums can be a burden. The insurance Americans purchased for Southeast Asia eventually broke the bank—or at least the willingness of Americans to continue to pay.

In one sense Vietnam was inevitable. By the 1960s the American national interest was being defined so globally that hardly a sparrow could fall anywhere on earth without the U.S. government wanting to know why, to know whether the sparrow had jumped or been pushed, and, if pushed, to know whether the pusher wore scarlet plumage. Somewhere or other, sooner or later, the United States was bound to find itself defending a regime so weak, corrupt, or unpopular—especially since the chief criterion for American support was opposition to communism, rather than the positive embrace of democracy—as to be
indefensible at any reasonable cost. The country where this occurred happened to be Vietnam, but it might have been Cuba (actually, it was Cuba also, but Fidel Castro worked too fast and cleverly for the Eisenhower and Kennedy administrations) or Iraq (Iraq likewise, but again the revolution succeeded before the United States reacted) or the Philippines (which similarly faced a leftist insurgency but managed to hold on).

Beyond its own problems, South Vietnam revealed something fundamental about the Cold War definition of the American national interest. As the world’s only full-service superpower (the Soviet Union possessed a first-rate military but its strength in other areas was vastly overstated, as time revealed), the United States was more or less free to define its national interest however it chose. But having once agreed upon a definition, Americans were constrained to defend that definition lest they lose face with friends and enemies. Credibility counted when American commitments outran American capabilities. By no stretch of anyone’s imagination could the United States have defended simultaneously all the regimes it was pledged by the 1960s to defend; its resolve and success anywhere had implications for its prospects everywhere.

That was why Lyndon Johnson and Richard Nixon went to such lengths to prevent the communist conquest of South Vietnam, and why Americans took failure there so hard. They might reasonably have accounted Vietnam simply as someplace where local conditions could not support an incompetent regime; if the American approach to Vietnam had actually (rather than metaphorically) been an insurance policy, Vietnam would have been written off and Americans would have gone about their business.

But Vietnam was not merely business—certainly not to the families and friends of the 60,000 service men and women who lost their lives there. Americans had indulged the illusion they could secure half the planet against revolution. In their post-Vietnam disillusionment, many Americans wondered whether they could secure any of the planet against revolution, or whether they ought to try. “For too many years,” explained Jimmy Carter, the first president elected after Vietnam, “we’ve been willing to adopt the flawed and erroneous principles and tactics of our adversaries, sometimes abandoning our own values for theirs. We’ve fought fire with fire, never thinking that fire is better quenched with water. This approach failed, with Vietnam being the best example of its intellectual and moral poverty. But through its failure we have now found our way back to our own principles and values.”

Carter was certainly speaking for his own administration, but how many other Americans his “we” comprised was problematic. The reflexively anticommunist definition of the American national interest—the definition that had enjoyed consensus support since the early Cold War—had indeed been discredited in Vietnam, but a credible replacement had yet to appear. Nixon’s candidate, détente, based on the provocative notion that capitalism and communism—even Chinese communism—could coexist, had spawned an entire school of opposition, called neoconservatism. Carter’s human rights–based approach appealed to those appalled by the dirty linen that kept tumbling out of the Cold War hamper, but struck others as naively woolly-minded.

The only thing nearly all Americans could agree on was that the national interest dictated avoiding anything that looked or smelled like another Vietnam. Liberals interpreted this to mean not sending troops to prop up ugly autocracies abroad. Neoconservatives interpreted it to mean not sending troops unless the U.S. government and the American people were willing to follow through to victory. With the blades of the last helicopters from Saigon still whoomp-whomping in American ears, the liberal and neoconservative conditions amounted to the same thing.

**LONELY AT THE TOP**

The neoconservatives helped Ronald Reagan win the White House in 1980, and they strove, shortly thereafter, to forge a new consensus around the old verities of the Cold War. Their man mouthed the right words, calling the Soviet Union an “evil empire” and summoning America to “stand tall” again. He dispatched troops to Grenada to loosen what he called “the tightening grip of the totalitarian left” there, and he added the Reagan Doctrine to the list that had started with Monroe, continued through Truman, and made lesser stops at Eisenhower, Johnson, Nixon, and Carter. In its own way, the Reagan Doctrine was more ambitious than its predecessors, which were essentially negative in concept and formulation (that is, aimed to prevent—respectively—European expansion in the Americas, communist subversion, destabilization of the Middle East, another Cuba, another Vietnam, and a Soviet takeover of
the Persian Gulf). The Reagan Doctrine advocated something positive: the replacement by rightists of leftist Third World regimes, notably in Nicaragua, Afghanistan, Angola, and Cambodia. Above and beyond all this, the Reagan administration embarked on a big defense buildup, including the first steps toward what Reagan's partisans respectfully called the Strategic Defense Initiative and others derisively, or merely conveniently, called "Star Wars."

Although the American people cheered Reagan's speeches (which made all but hardened skeptics feel warm and fuzzy), supported his defense buildup (which provided welcome jobs during a nasty first-term recession), and reelected him by a large margin (over a candidate, Walter Mondale, who imprudently promised to raise taxes), they never cottoned to the neoconservative definition of the national interest. In the case of Nicaragua, the Congress explicitly cut off funding for Reagan's covert war against the Sandinista government. (Administration operatives would not take no for an answer and circumvented the congressional ban by the methods that produced the Iran-Contra scandal.)

Americans were much happier at a turn of events that started in Moscow in 1985 and gradually, then rapidly, redefined the politics of Europe. Soviet Premier Mikhail Gorbachev's plan to revitalize Soviet socialism required a respite with the West and led to the first important arms reduction agreements since the start of the Cold War. More important, Gorbachev's reforms required the Soviet client states of Eastern Europe to initiate reforms of their own, which led, in rapid-fire succession during the second half of 1989, to the dismantling of East European communism. By then, the anticommunist momentum was overwhelming, and before dissipating at the end of 1991 it swept aside Gorbachev and the Soviet Union itself.

The end of the Cold War was dazzling—and disorienting. Although the definition of the American national interest had shifted during the four decades since the start of the Cold War, with a particular break at Vietnam, it had always included the Soviet Union as a fundamental reference point. Now that reference point was gone, and Americans struggled to find a new one. Defense of the American homeland remained the sine qua non of the national interest, but nothing and no one offered a credible, or even conceivable, challenge on that count. (Terrorists, the new staple of Tom Clancy and other writers of thrillers, might blow up a building here or there, but such activity fell into the category of crime rather than war.) Defense of the U.S. economy could still arouse the American people: when Saddam Hussein seized the oil of Kuwait and threatened the wells of Saudi Arabia, President George H. W. Bush was able to marshal support behind an effort to protect what his secretary of state, James Baker, summarized in a word: "jobs." But military force was a blunt instrument for economic diplomacy; more appropriate were the North American Free Trade Agreement and the accords that moved China toward membership in the World Trade Organization. Even these noncoercive measures, however, enlisted far from unanimous support. Despite the unprecedented prosperity of the decade after the Cold War, many Americans registered real skepticism of the general phenomenon of globalization.

The hardest question for Americans during the 1990s was whether the American national interest included the defense of human rights overseas. Did the national interest require, or even suggest, dispatching troops to Bosnia to stop the "ethnic cleansing" there? To Somalia to deliver food to starving children and restore order where government had vanished? To Haiti to reinstall a president democratically elected but driven from office? To Rwanda to prevent the massacre of a half million men, women, and children on the wrong side of a murderous tribal conflict? To Serbia to secure self-determination for the Kosovo Albanians?

Beyond the basics of human rights, what about the promotion of democracy? Since the French Revolution, Americans had applauded the installment of governments responsible to the governed; but was this something worth making a fuss, or a fight, over? Should economic aid to the former Soviet republics be conditioned on elections and the rule of law? Should China be pressured to allow dissent and competitive politics?

By the beginning of the twenty-first century, Americans had reached no consensus on these issues. No single definition of the national interest commanded the support of any substantial majority. The concept was still invoked: the administration of George W. Bush entered office in 2001 promising a foreign policy based on the "national interest" (rather, the new Bush men and women implied, than on the squishier standards of the outgoing Clinton administration). But they offered few specifics as to what their definition of the national interest entailed. Perhaps when they did, it would rally their compatriots behind a sin-
gle, stirring vision. More likely, given the experience of two centuries of American history, it would simply spark more debate.

**BIBLIOGRAPHY**

Nationalism suffers from confusion both over the meaning of the term and over its role in the modern world. Its antecedents may be found in the fifteenth and sixteenth centuries, with the rise of the nation-state under dynastic rule, but its ideology and vitality are no older than the late eighteenth century, the period of the American and French revolutions. Nationalism represents a political creed in which the people offer their supreme allegiance to a nation-state. It underlies the cohesion of modern societies and legitimizes a nation’s assertions of authority over the lives of its inhabitants.

DEFINING “AMERICAN” NATIONALISM

The earliest manifestation of nationalism, as opposed to mere patriotic impulses, was the rejection of an ancien régime and the transfer of sovereignty from monarch to people. There is in this event a note of liberation of the nation from oppression, either internal or external. As Hans Kohn pointed out in 1957, “Nationalism is inconceivable without the ideas of popular sovereignty preceding.” In the words of Carlton Hayes, it is a state of mind, “a modern emotional fusion of two very old phenomena; nationality and patriotism.” If freedom to realize one’s individual potential can be realized only in the nation-state, then nationalism becomes the antithesis of tyranny and oppression.

But this is not necessarily the totality of the nationalist experience. When the nation demands the supreme loyalty of its citizens, the freedom of the individual may be sacrificed to the welfare of the state. In this elevation of the state there is the concomitant denigration of the outsider and the temptation to advance the nation at the expense of other nations. As nationalism evolved in the nineteenth century, it assumed the ugly forms of imperialism, racism, and totalitarianism; it helped to stimulate world wars in the twentieth century.

It is these pejorative qualities that have led some American critics of nationalism to separate the American experience from the nationalism of Europe. Paul Nagel, an intellectual historian at the University of Missouri, refused even to use the term in dealing with American nationality. For him, “‘Nationalism’ regularly has implied a doctrine or a specific form of consciousness conveying superiority or prestige.” Such glorification of country, he felt, should not be part of American loyalties because of the essentially different view of their land and themselves that distinguished Americans from other nationalities. Despite disquieting links between manifest destiny and European imperialism, most American critics find a qualitative difference in American nationalism.

One of the fundaments of nationalism is the sense of folk, of a kinship derived from a common ancestry. Where this bond is lacking or is of secondary importance, a common religion serves as a unifying force. Usually a people united in race or religion also have a clearly defined territory with which they are identified, either in the present or in the past. None of these attributes fits American history. Although England was the primary supplier of settlers, colonial Americans were also fully conscious of their Scottish and German roots at the time of the Revolution. An attenuated Calvinist heritage was as close to common religion as could be found in the eighteenth century, and this was vitiated by the fact that where there were established churches, they were more likely to be Anglican than Calvinist. It was a secularized religious spirit that was found in America. A specific territorial claim evoking national emotions was lacking among a people for whom territorial concerns were equated with an expanding frontier. America was more an idea than a geographical entity.

The “invention of America,” as the Mexican historian Edmundo O’Gorman has happily phrased it, marks a major departure from the experience of more organically developed nations. The mythic
The roots of Italian or Japanese peoples are nourished by a prehistory that tells of special strengths an Aeneas brought to Rome from Troy and special considerations conferred on Japan by virtue of divine descent. It is difficult to locate these qualities in a nation whose beginnings followed the invention of the printing press in western Europe by little more than a generation. The words and deeds of founders could be checked and countered, just as John Smith’s tales about Virginia were examined by contemporaries who kept modern records.

Granted that every nation is a mixture of races with synoptic religious values, America is one of the very few nations the distinguishing features of which may be traced directly to the needs of other peoples at a particular period. The courage to embark on an American adventure, as well as the knowledge and skills necessary to discover and settle the New World, stemmed from a Renaissance belief in the capacity of man to achieve a new life. Such a conception was beyond the grasp of the medieval mind. The Reformation’s pursuit of individual salvation outside the claims of established religions provided a moral imperative to much of the colonizing experience. Boston became a new Jerusalem when older Zions in Rome, London, and even Geneva had failed. Above all, the potential existence of vast quantities of precious metals in the New World gave a powerful impetus to the discovery and exploitation of American resources. The road to a transformation of life in a secular world, opened by the information of the Crusaders about the Levant and the Orient, led to Europe’s colonizing of the Western Hemisphere. American nationalism was touched by all these forces.

The first problem, then, in defining American nationalism is to identify it. An automatic expression of nationalism did not accompany the establishment of the United States. The emotions of the American Revolution were attached to state rather than to nation, and the search for a substitute for a historic memory or a common church or a unifying ruling elite required forty years before it could bind the loyalties of Americans. It was an issue that absorbed the energies of the founders of the new republic and achieved a tentative resolution only after the War of 1812. By that time, the focus of nationalist sentiment was on the special conditions of liberty protected by a new and superior government that had no counterpart elsewhere.

The development of a national identity proceeded throughout the nineteenth century, and continued to be a preoccupation of Americans in the twentieth century. The effort to find suitable symbols to display loyalty was a lengthy process. As late as the Civil War there was more than one design of the national flag. It was not until 1942 that the ritual for its display on buildings or on platforms was completed, and the pledge of allegiance was made obligatory in many schools only a generation earlier. The insertion of “under God” in the pledge of allegiance was a product of the pieties of the post–World War II era. Even the national anthem, “The Star-Spangled Banner,” was not so designated until 1931. The insecurity over identification of nationalism is equally apparent in the sensitivity over the meanings of “Americanism” and “un-Americanism.”

A second, and overlapping, element in nationalism is the peculiar relationship between state and federal governments. The question had its roots in the making of the Constitution, as did the term “federal” used by its framers. It was a euphemism designed to secure support for a new basic law that implied the supremacy of a strong central government. An open affirmation of this purpose in 1877 would have meant the failure of the Constitutional Convention in a country where primary loyalties still belonged to the states and where the word “federal” suggested a fair sharing of power. The struggle between state and nation, begun with the failure of a genuine federal system under the Confederation, was a persistent theme in American life for three-quarters of a century. Although it was present in the Jeffersonian challenge to Alexander Hamilton in the 1790s and in Federalist disaffection from the Jeffersonian conflict with England in the next decade and a half, its dominance over American life coincided with southern sectionalism, culminating in the Civil War. That conflict ended not only in the triumph of the North but also in the vesting of new mystical powers in the Union and the Constitution. Nationalism after 1865 would always be equated with a nation, “one and indivisible,” with the “unum” in “e pluribus unum” superior to the “pluribus.”

A third strand in American nationalism, which is also as old as the Republic, is the special destiny of America. The hand of Providence as well as of man is involved. If America is a “new world,” its rise must have a divine meaning; and that meaning was always translated into some form of sharing the blessings of liberty with less-favored peoples. The religious quality inherent in the image of a “chosen people” was enhanced by
the secular opportunities open to Americans. Vast, empty, rich lands held insecurely by European imperialists seemed manifestly destined for American occupation. Movement into Texas and California was a fulfillment of a destiny not only to occupy the entire continent but also to help the rest of humanity see how that occupation would spread the principles of free speech, free religion, self-government, and boundless economic opportunities that were denied to the Old World. Here was a sense of mission that sharpened in clashes with Britain or with Spain, but it was a mission that was susceptible to foreign influence. The unique character of a civilization serving as a beacon to others, a model to be copied, could be (and was) compromised by the change in status from a small, vulnerable republic to a continental empire with overseas ambitions. The altruism of an earlier time was thoroughly mixed, at the end of the nineteenth century, with prevailing influences of social Darwinism and Anglo-Saxon racism.

Most of the elements making up America's self-image of a divinely favored nation still survive, even though the trauma of a great economic depression in the 1930s, the burdens of world governance in the 1950s, and increasing doubts over social injustice and corruption at home and exploitation abroad have had disillusioning effects upon the meaning of the American mission. Yet with all these doubts, the connection between God's special favor and the American way of life remains part of nationalism. And, for all its flaws, the virtues associated with the record of American nationalism suggest distinctive qualities not found in other national experiences.

**CONSTRUCTING AN AMERICAN IDENTITY**

The most difficult period to identify in the evolution of nationalism is the time of its inception. The very name of America came comparatively late into the consciousness of the British colonies, and the first awareness of a separate destiny is a matter of continuing speculation. Boyd Shafer found an incipient national loyalty appearing as far back as 1740, during King George's War. Paul Varg of Michigan State University settled on 1759, Britain's annus mirabilis in the war with France. Richard Merritt, a Yale political scientist, employed quantitative techniques to determine that 1770 was the year when key colonial newspapers cited "America" more frequently than "British colonies" in their columns. Although by the middle of the eighteenth century it was obvious that Americans were becoming something more than transplanted Englishmen, many future revolutionaries were quick to proclaim their British affiliations as the mother country triumphed over France in the French and Indian War. There was genuine pride in membership in a great British empire. As late as 1775, the poet Philip Freneau was convinced that Britain could and should "rule our hearts again," if only the rights of the American part of the empire were respected.

After the Revolution had shattered that empire, no automatic transfer of loyalty from London to the Confederation, with its seat in Philadelphia, took place. To a New Englander or a Georgian, Philadelphia was as distant as London. The differences between North and South, tidewater and piedmont, were potentially as deep as differences between Americans and Englishmen. Culture as well as geography distinguished the Bostonian from the Virginian, and the tidewater Virginian from the Scottish frontiersman of the Blue Ridge. Some of the most fundamental characteristics of the American way of life—freedom from arbitrary government and freedom of speech and religion—were Virginian or Pennsylvanian as well as American. The America of 1776 could have remained as much an abstraction as Europe was then and now. The experience of Latin American revolutions a generation later could have been that of the former British colonies.

The vulnerability of a young republic in a world of hostile monarchies provided a major incentive for the cultivation of an American identity. The strength of nationalism was an inspiration to American statesmen aware of the temptations that quarreling American states offered to Europeans awaiting the demise of the American experiment. An anxious neighbor like Spain to the west and south, and an angry neighbor like Britain to the north, looked forward to exploiting the divisions among the former colonies. Even the ally France observed American weakness with complacency, knowing that it would bind Americans to their French patron.

The anticipated failure of the republican regime made success all the more important to the Founders, and this success depended on a strong pride in their achievements. Richard Morris pointed out that an ideology of nationalism could be built on what Europeans regarded as intolerable infirmities: the spectacle of a free people governing themselves under conditions of lib-
erty no other people enjoyed, and managing their affairs in such a way as to be an inspiration to the less fortunate. As Thomas Paine phrased it in his Crisis, the United States would be in a position “to make a world happy, to teach mankind the art of being so—to exhibit on the theatre of the universe a character hitherto unknown, and to have, as it were, a new creation intrusted to our hands.”

There was an important distinction, however, between pronouncing American superiority on such grounds and building a foundation to support it. Poets, playwrights, and even lexicographers were as sensitive to the importance of building institutions to sustain American achievements as were the diplomats and statesmen. Noah Webster's labors on a dictionary were intended to establish an American language distinct from the English of the mother country. At one and the same time his dictionary would proclaim the differences between the two nations and provide a standard that could be used to deepen those differences in the future. His work was a success, but not quite on the terms he had set. The American language was only partially freed from its inferiority complexes.

Other intellectuals of this period harked back to classical antiquity to assert the American distinctiveness. The American republic was to be accepted, not as a replication of any contemporary European nation but as an improved reincarnation of ancient Greece and Rome. From language to architecture to political imagery, the classical period was invoked. If Rome had its Aeneid to glorify its origins, the Connecticut poet Joel Barlow was willing to offer his country The Columbiad, which attested to

A work so vast a second world required,
By oceans bourn'd, from elder states retired;
Where, uncontaminated, unconfined,
Free contemplation might expand the mind,
To form, fix, prove the well-adjusted plan
And base and build the commonwealth of man.

Whatever its poetic merits, The Columbiad claimed a new world to be even more superior to the Old World than Rome was to its rivals. But, like Rome, the United States was prepared to grant to mankind something better in human relations than it had ever witnessed before.

This language was the stuff of nationalism. It was also braggadocio, inviting the mockery of enemies and condescending friends. If, as Europe observed, America was no Rome, certainly Barlow and Freneau were neither Virgils nor Homers. America's pretensions were fair game for Europeans of all stripes. It was the American abroad whose national sensibilities were most exposed. John Adams, minister to Great Britain under the Confederation, was never more the American than when he was snubbed at the Court of St. James's. Even in France, which came to the aid of the United States in war, Thomas Jefferson, Adams's counterpart at the Bourbon court, was a victim of many of the slights suffered by Adams, although French motives were less hostile.

That America was unlike other nations was not the question. It was the nature of the differences that distressed diplomats in Europe. French enthusiasts of America were frequently as negative as open adversaries were. The idealization of Americans as Rousseau's “noble savages” stirred European sympathies for the United States, but the European emphasis upon savagery over nobility stirred resentment among Americans. One of Jefferson's more emotional moments in Europe was his encounter with the pejorative opinions of French intellectuals concerning the American character. His Notes on the State of Virginia was a response to those Europeans who shared the views of the naturalist Georges Buffon that animal life in America was inferior in size and strength to that of the Old World. Jefferson's response went beyond a literary effort; Buffon received skins and skeletons of American animals sent to France at Jefferson's behest to prove the equality, if not the superiority, of life in the New World. Even more galling was the charge of the philosophe Abbé Guillaume Raynal that human life degenerated on the American continent. This observation contained aspersions on American virility as well as on American genius. Jefferson countered this assault with a spirited presentation of Indian virtues. He labored valiantly, but under obvious handicaps, in pointing out poets and artists, mathematicians and scientists, to match the products of Europe. Benjamin Franklin and David Rittenhouse were not the equals of Galileo and Newton.

The vigor of American ripostes to perceived insults to their nationality inspired more derision than respect among Europeans of this period. None was more devastating than the Reverend Sydney Smith, a Yorkshire wit who reacted to American claims to being “the greatest, the most enlightened, the most moral people upon earth” by asking rhetorically, “In the four quarters of the globe, who reads an American book? or goes to an American play? or looks at an American picture or statue?” So much for the pretensions of American nationalism. A sense of inferiority in
relation to older civilizations seemed to have given rise to a hyperbolic style of self-defense that invited ridicule.

But Smith's famous article in the *Edinburgh Review*, which appeared in 1820, would have been more deflating had it appeared a generation earlier, when Barlow and Freneau were poetizing. Between 1783 and 1815 national pride expanded enormously to encompass a much larger company than a few diplomats abroad and the Hartford Wits at home. The nation, having acquired an inland empire and having faced down Britain in war, again shared its exhilaration. The very newness and freedoms of an empty land lacking oppressive government or a cultivated aristocracy, which Europeans translated as barbaric and uncultured, were the reasons for American superiority.

The Revolution had not stimulated nationalism among most Americans in the immediate postwar years. National attention was on the disarray—economic and political—that separation from Britain had brought. There was little occasion for self-congratulation. Such loyalty to country as was visible in this period was to the patriarchal figure of George Washington, and even this symbol did not emerge un tarnished from the political debates. In the absence of a court, and even of a flag, Washington's services as the unifying father of his country were vital for the rallying of national sentiment. He was the Cincinnatus of America who sacrificed himself to perform services no one else could provide, and then retired rather than retain power. His was a vital function for the growth of nationalism, and yet it was incomplete. He found himself enmeshed, and ultimately damaged, by political controversy in the last years of his presidency. The Fourth of July, Independence Day, was a supplementary unifier, as toasts were drunk and cannons fired in honor of the Declaration of Independence. But as exciting as the celebrations may have been, they were as much a victory over the British by Pennsylvanians or New Yorkers as a victory by Americans.

The wave of nationalism that failed to rise in the 1780s and 1790s finally broke over America in the second war with Britain. The Francophilists that had briefly prevailed among Jeffersonians had dissipated in the disillusionment over the policies of the French Republic and in recognition of the dangers of Napoleonic imperialism. Federalist failure to exploit Francophobia fully during the Quasi-War with France in 1798–1800 reflects a deficiency in the quality of nationalism as much as it does the political power of the Jeffersonian opposition. Anglophilia, more enduring among Federalists of the Northeast, ended more gradually. For those who could not forsake British ties for reasons of custom or conviction or commerce, the consequence was isolation from most of their countrymen and, ultimately, extinction of the Federalist Party as a political entity. The majority of that party joined Republicans in a nationalism influenced by the trans-Appalachian and trans-Mississippi West. Federalists had exerted minuscule influence in 1783, and the Republican Party did not come into being until the Louisiana Purchase of 1803.

During the War of 1812, Jonathan Russell, a businessman-politician, was inspired by the *Constitution*'s victory over the British frigate *Guerrière* to burst out in a paean of praise of its commander, Isaac Hull. The event elevated Hull to Washingtonian heights:

> Yes! deathless, oh Hull, shall thy fame live in story
> And cheer, in the battle, our sons on the wave—
> Through ages unborn shall the beams of thy glory.
> Unclouded, illumine the march of the brave.

If such a minor figure as Hull could evoke such emotion from such an unlikely source, it is understandable that the common soldier, who was ignored after the Revolutionary War, would also receive attention. Congress finally granted pensions for revolutionary war service in 1818. American identity was no longer a problem on 4 July 1826, when the two great builders of nationalism and independence, Thomas Jefferson and John Adams, died within hours of each other on the fiftieth anniversary of the Declaration of Independence they both helped to write. A generation earlier, when Washington died, the apotheosis of the first president was still a tribute to a single man, no matter how significant the deification was in the fashioning of national unity. On Independence Day of 1826, the passing of the second and third presidents of the United States was the occasion for the nation's apotheosis of itself.

**CONTINENTAL EXPANSION AND THE “YOUNG AMERICA” SPIRIT**

For nationalism to flourish, it was obvious that the United States had to prove its experiment successful. The War of 1812 was one proving ground. More significant than a diplomatic success against
Britain was the spectacular rise in the national economy, sparked by population increase, territorial acquisitions, and technological changes in transportation and industry. Speaking of the period after the Treaty of Ghent, Henry Adams observed, “The continent lay before them, like an uncovered ore-bed. They could see and they even could calculate with reasonable accuracy the wealth it could be made to yield.” The steady accumulation of power to the central government at the expense of the states was equated with the growth of America. Nationalism implied the denigration of sectionalism and states’ rights.

The argument for centralizing government during the Confederation had been fought on the assumption that no other government could perform that function. States’ rights might rally libertarians worried about the tyranny of rule from afar, but the veterans of the revolutionary war returning to their farms and villages were more concerned about economic depression and foreclosures on their properties than with the potential evils of a distant national government. Had there been a stronger central authority in the Confederation, revolutionary war heroes of the order of Ethan Allen, who proposed attaching Vermont to Canada, and George Rogers Clark, who considered a Spanish connection to secure Kentuckians’ access to the Gulf of Mexico, would have been less tempted to join with the former British enemy and the hostile Spanish neighbor. Where the states individually or collectively as the Confederation had failed to respond to Indian or European threats in the West, the Union drove the Indians out of the Northwest, saved the nation from the British in 1812–1815, and wrested Florida from the Spanish in 1819. As the western territories entered the Union their loyalties were to the nation that welcomed them rather than to any pristine colonial commonwealth. Unlike the original thirteen states, they had been created by acts of the federal Congress.

Still, the centrifugal forces that had always been a part of the American experience had not disappeared. Such “good feeling” as existed after 1815 did not have its premise in the end of sectionalism or even states’ consciousness; rather, the “American system” of Henry Clay was built on a common hostility to British economic power that would help to mesh the economies of the North, the West, and the South. If there was temporary harmony at this time, it was largely because each section had unrealistic expectations of special advantage from congressional support of tariffs or of internal improvements.

The slave-oriented South found the Union ultimately a threat both to its economy and to its society, and in the Civil War provided the greatest challenge the Union had to surmount in the nation’s history. The war was considered by some as a struggle between two competing nationalisms. In the years preceding this conflict, the Union became the most vital national symbol to the North. Southern challenges on constitutional grounds became increasingly insufferable. The South’s interpretations signified more than just a peculiar gloss of the Constitution; the North regarded them as a rending of the instrument of America’s sovereignty and the consequent extinction of the American nation. While loyalty to a section greater than loyalty to the nation could be considered patriotism, by 1860 the majority of the country was convinced that an effective American sovereignty could be expressed only in a unified nation.

A generation earlier, Alexis de Tocqueville, that astute French visitor, wrote, “The Union is an ideal nation that exists, so to speak, only in the mind.” It also existed in the heart. The passions over slavery converted it into something more than a means of achieving effective government. The Union became an object of reverence, the indispensable foundation of national values.

Daniel Webster attempted to exploit this sentiment to deflect sectional rivalry into the popular channel of xenophobia. In a direct insult to Austria in 1849, President Zachary Taylor promised recognition to Hungary if its revolution succeeded, and then, after its failure, his successor Millard Fillmore gave its leader a tumultuous welcome to America in 1852. Secretary of State Webster not only rejected Austria’s subsequent protest but went out of his way to taunt its minister to the United States, Chevalier J. G. Hülsemann. He lectured the Austrian on Hungary’s good sense in imitating the American Revolution. Should the
Austrians have any objection, they must reckon with the fact that "the power of this republic, at the present moment, is spread over a region, one of the richest and most fertile on the globe, and of an extent in comparison with which the possessions of the House of Hapsburg are but as a patch on the earth's surface."

This well-publicized letter struck just the chord Webster hoped to reach in Americans. The appeal to chauvinism with hyperbolic rhetoric performed an important function in 1850. It united North and South in opposition to Europe. But the forces of disunion that Webster had hoped to dissipate were stronger than those of nationalism. In even greater desperation a decade later, Secretary of State William H. Seward tried to divert the country from war by urging President Abraham Lincoln to turn over the executive powers to him so that he could save the Union by initiating war against France or Spain, or all of Europe. The president rejected the proposal, but unrealistic as it may have been in 1861 and fantastic as it has sounded to later generations, the spirit behind the plan was the same one that had propelled the American system of Henry Clay, the Mexican War maneuvers of President James K. Polk, and Daniel Webster's note to Hülsemann. Antagonism to the Old World was a staple of American nationalism, especially in times of crisis.

The traumas of sectional conflict resulted in the removal of the constitutional question from nationalism. The Union had triumphed and with it sentiments of nationalism. The sobriety with which nationalism was expressed in the middle years of the century yielded to a reassertion of the older boisterous spirits. The end of war witnessed a period of even more rapid growth in population, wealth, and power than had been seen fifty years earlier, after the Treaty of Ghent. It also revived—in exaggerated ways before the century was over—the idea of mission that had been implicit in the American self-image from the beginning: the notion that God had given America a special portion of blessings, and with it a mission to share them with less-favored peoples.

Prior to the Civil War the most vocal articulation of the American mission had accompanied crises with Spain or Britain or France over their possessions in North America. They all violated a divine plan. While the idea of providential occupation of the West antedated the annexation of Texas and the demands for Oregon—and, indeed, may be found in Jeffersonian ruminations in the 1780s—it was John L. O'Sullivan, editor of the Democratic Review, who in 1845 specifically charged foreign hostility and jealousy with "limiting our greatness and checking the fulfillment of our manifest destiny to overspread the continent allotted by Providence for the free development of our yearly multiplying millions." Texas, California, and Oregon—and even Upper Canada—were equated with empty land awaiting the arrival of Americans to bring it under proper cultivation.

Americans did not regard these views or the actions that followed from them as analogous to European imperialism; they were simply the natural spread of free peoples and free institutions into unoccupied space wrongly claimed by others. Although such assertions might have sounded hypocritical to hostile observers, even opponents of the Mexican War could concede that the mission to spread liberty bore marks of idealism. Frederick Merk found in expansionism a spirit that was "idealist, self-denying, hopeful for divine favor for national aspirations, though not sure of it." So if manifest destiny was connected with the grasping for land, it was also linked to the land's improvement by peopling it with what Americans of the period considered to be a better society than could have been achieved under its original proprietors. In the midst of the Mexican War, former secretary of the Treasury Albert Gallatin defined the American mission as a great experiment in which "a representative democratic republic" had a chance to try out its ideals on a large scale. "If it failed, the last hope of the friends of mankind was lost, or indefinitely postponed; and the eyes of the world were turned towards you. Whenever real or pretended apprehension of the imminent danger of trusting people at large with power were expressed, the answer was 'Look at America.'"

In this spirit the migration of Americans to Texas or California or Oregon signified not exploitation of native peoples, or governance over unwilling subjects, but the sharing of liberties over a wider area. The growing United States had spilled its surplus population into neighboring territories that were relatively empty. When those territories were sufficiently populous, they would enter the Union, ultimately as full and equal partners of the older states. If there was conflict within the United States over their admission, this was a function of the slavery quarrels, not of a desire for imperialist control on the part of the nation.

But it was difficult to deny that the partial dismemberment of Mexico compromised the missionary spirit behind manifest destiny. The opposition of such distinguished figures as John...
Quincy Adams, an authentic expansionist, and the poet James Russell Lowell helped to arouse a sense of guilt over a war that many abolitionists regarded as an act of aggression by southern slavery interests. That Mexican and Indian populations, no matter how scattered, lived in California or New Mexico gave a taste of imperialism to the fruits of American nationalism. Was manifest destiny, then, merely a mask for American conquest of a weak neighbor?

Although a repugnant element can never be expunged from nationalism, extenuating factors refine the annexation of Texas and even the ensuing war with Mexico. Manifest destiny was more than an instrument of southern interests; the pull of California had attracted New England mercantile ambitions as well. More important, it was a national rather than a sectional impulse, with a powerful England, as in the case of the Oregon quarrel, a major antagonist in 1844. The hope was that the two Canadas would sue for admission to the new and enlarged Union. O'Sullivan speculated that Canada, as easily as California, could be the next "customer."

Arrogant and self-serving as this language sounded in press, pulpit, and schools, its users could unreservedly contrast the freedom of religion and self-government in the territories under American control with the repression of a state church in Mexico and the limitations of political freedom in Canada. When the demands for annexation threatened to get out of hand, as in the pressure for the absorption of all Mexico, opponents stopped the threat effectively. Partisan fears of Mexico parceled into slave states may have been a powerful incentive for opposition, but they were fueled as well by the unpalatable prospect of governing an unassimilable population that would not participate in the American political process.

Although controversy continues to swirl about the purity of American motives in continental expansion, it does not apply to the display of nationalism in this period. It was genuine and widespread. If any emotion could have overcome the deep divisions within the Union in the middle of the nineteenth century, it was pride in American institutions and in the nation's power to proclaim them to the world. Had it not been for the slavery issue, Thomas Bailey of Stanford University speculated, "Americans would not only have swaggered more in the subsequent years but would have grasped more territories." As it was, the Young America spirit that flourished in the wake of the Mexican War expressed itself in provocations against Europe. The Revolution of 1848 was a suitable occasion for its display. George Bancroft, historian and diplomat, from his post in London expressed America's approval of the revolutions: "Can we show ourselves lukewarm, while the Old World is shaking off its chains and emancipating and enthroning the masses?"

**THE AMERICAN MISSION ABROAD: IMPERIALISM AND EMPIRE**

Changes that occurred later in the century provided a different gloss both to the idea of manifest destiny and to the meaning of mission. The new "manifest destiny" of the 1890s involved acquisition and control of an overseas empire. Although the older xenophobia and the civilizing mission remained, they were more strident in their tone and also more derivative of the European experience. The distinctions between European and American imperialism appeared to blur at the turn of the century. It was not that the popular nature of nationalism had altered significantly. The beer-garden simplicity with which the flag was venerated in the 1890s and the gusto with which the Spanish were rebuked for their behavior in Cuba linked Theodore Roosevelt to Davy Crockett. Finley Peter Dunne, the leading press satirist at the time of America's rise to world power, put words into the mouth of his Mr. Dooley that would have been as fitting half a century before: "'We're a great people,' said Mr. Hennessy earnestly. 'We are,' said Mr. Dooley. 'We are that. An' th' best iv it is, we know that we are.'"

What was different was a respectful interest in European imperialism and a wish by many American leaders to imitate it. As the burgeoning American economy produced enormous wealth, the instant oil, meat-packing, and rail barons sought marriage alliances with the Old World and pursued culture by bringing the French Middle Ages or Tudor England architecturally to their Rhode Island estates or New York City palaces. But they were conscious that they still lacked a sense of ideological security that European aristocrats possessed as a birthright. The spirit of Teutonic, and especially Anglo-Saxon, solidarity filled some of the needs of an insecure upper class. Although England may have remained a commercial and political rival, there was a surge of appreciation for the kinship of the two peoples that would account for the greatness of both.
The scholar-diplomats George Bancroft and John Lothrop Motley had commented earlier on the role that racial stock had in assuring a nation’s greatness. Both had been students in Germany. Granting his distaste for some aspects of Prussian militarism, Bancroft claimed that it would be the instrument to win “more rapidly liberty in Europe than all that the Kossuths, Garibaldis, and Mazzinis could effect in half a century.” Motley celebrated Teutonic virtues by noting that Holland’s struggle with Spain in the sixteenth century “must have particular interest, for it is a portion of the records of the Anglo-Saxon race—essentially the same, whether in Friesland, England, or Massachusetts.” Another diplomat, James Russell Lowell, more poet than scholar, brought the good news to England that “the duty which has been laid upon the English-speaking races, so far as we can discover, has been to carry over to the great lessons of liberty combined with order. That is the great secret of civilization.” In a major disquisition on democracy in 1884, Lowell had spoken of the problems that Americans encountered with the irresponsible masses in the large cities that were composed of peoples of inferior stock. America’s success in overcoming these obstacles to become a great democracy could be traced to the fact that “the acorn from which it sprang was ripened on the British oak.”

The only trouble with these perorations was the implication of a junior partnership for America in the racial connection. This became increasingly unacceptable to nationalists. A colonial relationship with even the best of the Old World did not fit America’s self-image by the time the nineteenth century ended. America would be superior to Britain even in racism. Albert J. Beveridge of Indiana pointed out to the Senate that “God has not been preparing the English-speaking and Teutonic peoples for a thousand years for nothing but vain and idle self-contemplation and self-admiration . . . And of all our race He has marked the American people as His chosen nation to finally lead in the redemption of the world.”

For those who might not heed a divine appeal, the mandate of social Darwinism brought the same message. The transfer of Darwinian principles from a struggle among species for survival to a competition among nations moved the naturalist’s theory of evolution from biology to sociology and international relations almost from the moment of its conception. Presumably the laws of nature justified power in the hands of the fittest; and in the late nineteenth century the arena for the display of national superiority lay in carving out colonial empires in Asia and Africa. For the United States to stand by and remove itself from this competition would be an admission of inferiority. Since the American continent was filled, expansion would have to take place overseas. The alternative would be both a sapping of national strength and increasing advantage to European competitors in the Darwinian struggle for greatness.

The naval historian Alfred Thayer Mahan, more than any other figure, tied together the strains of racial pride and Darwinian sanctions with the economic significance of the acquisition of colonies. Such an undertaking would solve the problems of surplus goods flowing from what appeared, after the Panic of 1893, to be an overdeveloped economic plant. It would also satisfy the defense needs of the nation, through a navy protecting routes to new colonies. Lastly, it would address the imperative of carrying the blessings of American civilization abroad.

Indeed, the American mission was ultimately the most important rationalization for imperial control. The Reverend Josiah Strong, secretary of the Evangelical Alliance and a powerful publicist for expansion, exhorted Americans to respect their sacred trust by bestowing their privileges upon other sectors of humanity. After all, “they are not proprietors, apportioning their own, but simply trustees or managers of God’s property. . . . Our plea is not America for America’s sake,” he wrote in Our Country (1885), “but America for the world’s sake.” It is this eleemosynary spirit that gave meaning to President William McKinley’s reluctance to leave the Philippines under Spanish control or under its own governance. In confessing his agony over the decision to annex the islands, he finally realized, “there was nothing left for us to do but to take them all, and to educate the Filipinos, and uplift and civilize and Christianize them, and by God’s grace do the very best we could by them, as our fellow-men for whom Christ also died.”

The gulf between McKinley’s understanding of America’s mission and those of the French, British, Germans, and Russians was not as wide as the gulf between McKinley’s or Theodore Roosevelt’s conception of mission and that of Jefferson or John Quincy Adams. The Monroe Doctrine had made it clear that America was to serve as a model for others to emulate, but not as an instrument to involve itself in the afflictions of the less fortunate. America’s own system could only be corrupted by such involvement. So Adams con-
cluded when he counseled President James Monroe not to intervene against Turkey on behalf of the admired Greek revolutionaries. But by the end of the century the combination of racial pretensions, Darwinian impulses, and putative economic imperatives had broken one great barrier of isolationism. They affected more than the special interests of navalists, businessmen, or missionaries. Even so sensitive a scholar as Frederick Jackson Turner found virtue in overseas expansion. He "rowed with the tide of the new nationalism," Ralph Gabriel noted in his *Course of American Democratic Thought*, at least for a while, as he pondered the effect of the passing of the frontier upon American democracy. It was hoped that settlement of Hawaii and the Philippines could have the same beneficial results for democracy as the settlement of Ohio and Iowa had in the past.

For Turner and for most Americans, the new manifest destiny was a mistake, an aberration of American tradition. In the wake of Filipino resistance to American occupation in 1899, William Jennings Bryan observed, "Destiny' was not as manifest as it was a few weeks ago." Most American leaders were slower to realize this than Bryan had been. The tide of empire finally receded, but not before it had left a permanent imprint on the fabric of American nationalism, or at least had deepened indentations that had always been there. The country came to recognize the incompatibility between the governance of Iowa and the governance of the Philippines; the former was based on self-government and eventual statehood, the latter, on imperial control over unsimilable peoples. The result was the gradual disengagement from the imperial plans of 1900, and ultimate independence for those islands.

**NATIVISM AND “AMERICANIZATION”**

If nationalism in the twentieth century recoiled from the problems of assimilation abroad, it could not avoid those problems at home. The rise of Anglo-Saxon racism coincided with massive emigration from non-Anglo-Saxon eastern and southern Europe, which raised questions about the dilution not only of the race but also of the institutions of America. Not all the nativist reactions were hostile. Some were patronizing and even melioristic. The Daughters of the American Revolution and other patriotic societies recognized their duty to "Americanize" the foreigner, to teach him proper speech and manners as well as values. The public school would be the instrument, according to Josiah Strong, by which "the strange and dissimilar races which come to us are, in one generation, assimilated and made Americans." American Catholic and Jewish historical societies, accepting the importance of Americanization, were organized in the 1880s and 1890s to show the nation their own ties with the American past. Their objective was to justify themselves as Americans, different in background but sharing in the creation of a new people. The constitution of the American Irish Historical Society expressed the hope that "in the days to come, that lie in the womb of the future, when all the various elements that have gone and are going to make the republic great, are united in the American,—the man who in his person will represent the bravest elements of all the old races of earth,—we declare that the deeds and accomplishment of our element shall be written in the book of the new race, telling what we did and no more; giving us our rightful place by the side of the others."

Such modesty of aspiration on the part of an immigrant group and such generous impulses on the part of the patronizing older stock were balanced by less edifying side effects of the racist component in nationalism. Ethnic and religious communities vied with each other in claiming credit for contributions to the national history or character, while the Anglo-Saxon elite, under the impact of war and depression in the twentieth century, blamed immigrants for the nation's troubles. War inevitably stokes nationalist passions, and World War I was no exception. The case then was not simply undifferentiated immigrants. German-Americans were identified as enemies with dangerous attachments to the ancestral country. Such manifestations of nationalism at its worst were seen in the banning of Beethoven, the conversion of sauerkraut into liberty cabbage, and the removal of German language instruction from schools. The vehement denunciation of the "hyphenated" American by Woodrow Wilson and Theodore Roosevelt during the war assumed that hyphenation applied to the Irish and Germans, not to the British. The latter's heritage was indistinguishable from the Americans' in 1917.

The revival of the Ku Klux Klan in the 1920s, with its particularly ugly brand of national exclusiveness, was another manifestation of the Anglo-Saxon tradition translated into a self-conscious white Protestant ascendency. Immigration restriction rather than immigrant amelioration was a consequence of this mood in the period of
disillusionment that followed World War I. It is ironic that a generation later, in the aftermath of another world war, the followers of Senator Joseph McCarthy, many of them from ethnic backgrounds that could not meet the test of Americanism in the past, led a nationalist assault on the loyalty of the older elite.

In the struggle with Soviet communism after World War II, McCarthy's unprincipled attacks on putative American communists numbered among their victims not merely the principles of civil liberties but also the American eastern “establishment,” mostly Anglo-Saxon, which was accused of negligence and worse in the struggle of the nation against external enemies. The emotions of the time evoked the xenophobia of earlier crises, except that the “American” embraced a wider constituency. Nonetheless, the nationalism that was demonstrated in the 1950s, as much as in the 1920s or in the 1890s, was a narrow and self-centered view of the nation's interests.

**AMERICANIZING THE WORLD**

Despite the many xenophobic impulses released in the name of nationalism, the missionary elements did not disappear in the twentieth century. The retreat from moral uplifting of the natives of the Caribbean or East Asia was short-lived and replaced by an attempt to uplift the entire world, not merely those regions under American governance. In both world wars American democracy became the exemplar for the world. Although Woodrow Wilson won a reputation as a supreme internationalist, seeking a new world order that would end national rivalries, his new order would be on American terms. His conception of the American mission was to disseminate those progressive values, both economic and political, that would serve America's own interests in the world. It was nothing less than the remaking of the world according to an American pattern. Wilson himself rejected a narrow distinction between nationalism and internationalism. “The greatest nationalist,” he claimed, “is the man who wants his nation to be the greatest nation, and the greatest nation is the nation which penetrates to the heart of its duty and mission among the nations of the world.”

In this context the mission of World War II and the Cold War was a continuation of the Wilsonian worldview. The United Nations would replicate the League of Nations by serving to help America fulfill its duty to humanity. Both the goals and the methods were clearly outlined. Nations would be freed from fear of conquest, with American military power protecting them from Nazis or communists; they would be freed from want by the application of American technology to their economies; they would be freed from ignorance by American learning spread through a Fulbright scholarship program or a Peace Corps. These were the benign purposes of the Marshall Plan and Point Four. They reflected an idealism embodied in President John F Kennedy's inaugural address in 1961. The language in which they were expressed lacked the overt racial biases and self-satisfied smugness that had characterized many early missionary activities. The publisher Henry Luce anticipated an “American century,” in which the United States would serve “as the dynamic center of ever-widening spheres of enterprise, . . . as the training center of the skillful servants of mankind, America as the Good Samaritan, really believing again that it is more blessed to give than to receive, and . . . as the powerhouse of the ideals of Freedom and Justice.”

In 1967, Ronald Steel claimed that Luce's American century was in fact a Pax Americana, with very few distinctions between its dictates and those of Rome's imperialism. Whether America willed it or not, it built a world empire to serve its own economic needs; it elevated communism into a monster out of all proportion to the threat presented; it arbitrarily divided the world into Manichaean spheres of good and evil; and, in the name of altruism, it helped to turn parts of Southeast Asia into a wasteland. As Americans reflected with disillusion upon the exaggerated promises of the Truman Doctrine, undertaken in the afterglow of successes in World War II when the United States sought to extend its system throughout the world, they discovered flaws in even the most altruistic postures. Nationalism was a cover for the erosion of civil liberties identified with McCarthyism, for the corruption of government by the accretion of enormous power in the hands of the executive, and for the corresponding diminution of power in the Congress. While the cruelties of American imperialism of the Theodore Roosevelt era may have been smoothed, the brutalization of the American character stemming from the anticommunist campaigns in Asia and Latin America was even more distressing.

The result in the post-Vietnam era was a decline in the nationalist spirit. The conscious abuse of the flag by many of the younger generation was a symbolic act of revenge upon a nation
that, in the name of liberty, sought conquest of the world for selfish reasons. The very idea of an American mission was called into question, not simply the matter of its betrayal. The result was a retreat by both conservatives and liberals into a neoisolationism stance in the 1970s. Conservatives would turn America’s attention back to its own problems, rather than waste resources on an ungrateful world. Liberals urged a less grandiose vision for America’s role in the world, blaming American arrogance for troubling the peace of the world.

Both sentiments were present in American society in the last years of the twentieth century. But they were subsumed under a triumphalism that followed the end of the Cold War and implosion of the Soviet empire. President Ronald Reagan’s vision of American power seemed to have been realized. Democratic capitalism was to be the model for the world. The striking victory over Saddam Hussein’s Iraq in 1991 marked the nation as the world’s sole superpower. That the American way of life was the ideal toward which all peoples strove—and most did envy—sparked a nationalist pride that almost effaced the memory of failure in Vietnam. But doubts about the reality of American dominance of a fractious world dimmed the optimism of those who saw the “end of history” in the demise of capitalism. The world at the turn of the twenty-first century was in as much turmoil as it had been when the Soviet Union was the nation’s powerful adversary. The shortcomings of American society were also as much—or more—in evidence as in the past, as hitherto quiet minority voices were heard. David Waldstreicher in 1997 observed that Native Americans and African Americans had no reason to celebrate the national fêtes that accompanied Independence Day. Nationalism seemed to many Americans to have been tainted by the realities of the nation’s history. For Walter A. McDougall, hubris inhered in the familiar temptation to reform the world in the American image. There were limits not only to national virtues but also to national power.

But there is nothing unique about the present mixed emotions about American nationalism. Indeed, skepticism about nationalism is endemic in the American system. Although nationalism is dependent upon an allegiance above all others, the nature of American pluralism militates against a monistic devotion. The nation must compete for public attention. For all its flaws in the past and the present, the special qualities associated with American nationalism—an open society, a mobile society, and above all a society divinely favored—will remain a force in America as long as the nation-state system of governance prevails among the peoples of the world.

The National Security Council (NSC) has been a ubiquitous presence in the world of foreign policy since its creation in 1947. In light of the tension between the Soviet Union and the United States, policymakers felt that the diplomacy of the State Department was no longer adequate to contain the USSR. The NSC was created specifically to coordinate the various strands of national security policy among the agencies then operating under the rubric of national security. Originally, it was centered around a council dominated by the military services and the State Department and was a paper-driven organization that mostly discussed papers prepared by staff. Both President Harry Truman and President Dwight D. Eisenhower enhanced the role of the council while relying upon interdepartmental staffs for information and analysis. John F. Kennedy chose to use the NSC quite differently. He rarely called the council together, relying instead on the newly appointed national security adviser and his staff. Lyndon B. Johnson followed suit and even enhanced the role of the national security adviser and his staff while calling together the council only for its public relations value. By the presidency of Richard M. Nixon, the NSC had become the national security adviser and his staff, although the original term continued to be used to describe the effort of the president to integrate national security policy. The story of the NSC, therefore, is the story of the evolution of the organization established in 1947.

ORIGINS

For more than 150 years, presidents of the United States conducted foreign policy with the advice of a secretary of state; a small, select group of foreign service officers; and, perhaps, a personal adviser. As he directed American foreign policy during World War II, President Franklin D. Roosevelt continued this tradition through his very personal diplomacy and his reliance on friends and advisers who had served him so well during the era of the Great Depression and the New Deal. The frustrating process of resolving complex problems of strategy and diplomacy within the unstructured and chaotic Roosevelt administration led a number of wartime leaders to search for a new institutional arrangement to fulfill the postwar obligations of a world power.

Concern also centered on the elevation to the presidency after the death of Roosevelt in 1945 of the untested Harry Truman. Worried about the growing tension between the Soviet Union and the United States, many members of Roosevelt's cabinet, including Secretary of the Navy James Forrestal, assumed that the former senator from Missouri would need help from a formal council of advisers to provide the leadership necessary in the postwar period. Forrestal and his supporters began the search for a new institutional arrangement to advise the new president and provide coordination between the various military services, the State Department, and other agencies concerned with foreign affairs.

The opportunity for change unexpectedly arose when President Truman first proposed the unification of the military services, a proposal influenced by General George C. Marshall and his own experience in the Senate as chairman of a committee to investigate the national defense program. The fragmentation that had developed during World War II was now exacerbated by the development of airpower and the creation of three separate air forces, one for each service. Truman first proposed unification in December 1945 in a special message to Congress. The proposal met with hostility and protest. It was studied, debated, attacked, and revised for the next year and a half. With the support of Marshall, the army backed the plan for unification, but James Forrestal and the navy, supported by a coterie of congressional members, were adamantly opposed. The navy
wanted to ensure the maintenance of its own air force and, furthermore, Forrestal was opposed to any system that would deprive the navy secretary of a seat in the cabinet and direct access to the president.

But Forrestal was also eager for the military services to be an integral part of foreign policy. He began to seek an alternative to the plan for unification, one that would integrate the decision making of the military services and the State Department without also jeopardizing the position of the navy. He called upon an old friend and former business associate, Ferdinand Eberstadt, to study and recommend an organizational system that would preserve the nation's security. The National Security Council emerged out of Eberstadt's recommendations. Eberstadt's plan emphasized coordination more than unity. The military establishment would remain decentralized but would be surrounded by several coordinating groups, the most important of which was the prototype of a coordinating body chaired by the president and composed of representatives from the State, War, and Navy Departments. Under this plan, the navy, and Forrestal, would continue to have a voice in policy.

Truman's advisers, including General Marshall, were suspicious of any congressionally imposed group that would usurp the president's power to conduct foreign policy and fulfill his duty as commander in chief. When Truman sent his proposal to Congress, a national security council was missing, made unnecessary in his view by the organization of a National Military Establishment with a unified armed services and a single secretary of defense. The navy rallied its supporters in Congress, and it appeared that after eighteen months of negotiations, unification would be defeated. Finally, to stave off defeat and achieve his goal of a unified armed services, Truman agreed to the idea of an advisory council. Meanwhile, his staff members were working on a revised draft of the original proposal. By the time they finished changing a word here and a phrase there, the precisely defined council with an executive director confirmed by the Senate had become a group purely advisory in nature, with no authoritative, statutory functions and a staff appointed at the sole discretion of the president.

Few, if any, members of Congress recognized the ramifications of the proposed National Security Council. Since it was part of the unification act, the legislation did not fall under the jurisdiction of the Senate Foreign Relations Committee but went instead to the Senate Armed Services Committee, which was concerned only with the future of the military services and gave little time to the other agencies created by the measure. The ambiguous language describing the council and its responsibilities meant that some inclusion of advice from the military services in the formation of national security policy would be considered by the president. Otherwise, the law provided little guidance to presidents and their advisers.

THE TRUMAN AND EISENHOWER YEARS

The National Security Act of 1947 established four new coordinating agencies: the National Military Establishment, the Central Intelligence Agency (CIA), the short-lived National Security Resources Board (NSRB); and the National Security Council. The statutory members of the NSC were the president; the secretaries of defense and state; the secretaries of the army, navy, and air force; and the chairman of the NSRB. Forrestal's attempt to gain the ear of the president had resulted in a membership distinctly weighted toward the military. After Forrestal was replaced, amendments to the act in 1949 eliminated the three civilian secretaries of army, navy, and air force and added the vice president to the council.

Since 1949 these four—the secretaries of state and defense, the president, and vice president—have been the core of an ever-changing set of presidential advisers. Virtually from the NSCs inception, the director of the Central Intelligence Agency and the head of the Joint Chiefs of Staff (JCS) have participated in its meetings as “advisers.” Often presidents, beginning with Truman, have added the secretary of the Treasury or the director of the Bureau of the Budget (later the Office of Management and Budget) to the mix.

The ambiguity that made for successful compromise provided little guidance for actually organizing the NSC. The statute provides a council “to advise the President with respect to the integration of domestic, foreign, and military policies relating to the national security.” To do this, the Council is to “assess and appraise the objectives, commitments and risks of the United States in relation to our actual and potential military power.” The council has no statutory function and operates with a staff appointed at the discretion of the president. The NSC is also unique in its relation to Congress. Unlike other
executive agencies created by Congress, it has no obligation to report to the legislative branch. With such a vague mandate, initial decisions concerning the NSC’s structure seemed particularly important. Members of the defense group envisioned the council as part of the military establishment. It should be housed with the military, they argued, and, more importantly, the president should appoint the secretary of defense to preside over meetings in his absence. In other words, the secretary of defense rather than the secretary of state would be the principal adviser to the president on matters involving national security. Encouraged by his staff, however, Truman housed the NSC in the Executive Office Building. Furthermore, his trust in Marshall guaranteed that the secretary of state or his deputy, Robert Lovett, would sit in the chair of the presiding officer. The State Department was the key player in U.S. national security policy.

All of the NSC members agreed, for varying reasons, that the president should attend NSC meetings as seldom as possible, and Truman shared that view. But there is nothing in the legislation that indicates a president has an obligation to be present. Some supporters of the NSC felt that the presence of the president would inhibit the necessary frank exchange of views, but few presidents, including Truman, shared that opinion. The Berlin blockade brought Truman to some meetings in 1948, but it was not until the Korean War that he began to value the NSC process and depend upon NSC meetings. As Forrestal had foreseen, the very structure of the NSC made it useful as a warmaking body. It was a mechanism for bringing together the views of the diplomats, military officers, intelligence analysts, and economic prognosticators.

The war also brought home the fact that Truman’s NSC system needed some repair. As a reaction to both the fall of the Chinese Nationalists and the detonation of an atomic bomb by the Soviet Union, a review of U.S. policy was begun in early 1950 that would ultimately result in NSC 68, the consummate Cold War paper. At the same time, the president mandated a review of the NSC process. But while NSC 68 was a milestone in the conduct of American foreign relations, the NSC procedural study made very little impact. The basic problem rested with Truman’s reluctance to have a national security assistant. By 1950 the NSC executive-secretary had returned to private life and the president’s valuable assistant, Clark Clifford, had joined a law firm. As Truman faced war in Korea and dissension at home, there was no one to coordinate policy or mediate disagreements among the various members of the NSC.

Since the end of the Truman administration, the NSC has gone through many incarnations. Each presidential candidate has heaped criticism on the system used by his predecessor and promised reform. Each president has then largely restructured the process of making national security policy. The ambiguity inherent in the creation of the NSC has allowed presidents to impose their own system on what was given to them by Congress. Because of its legislative base in the National Security Act of 1947, no president can abolish it, but several presidents, among them John F. Kennedy and Lyndon Johnson, irreparably changed it. Others, such as Richard Nixon and Ronald Reagan, reached beyond the 1947 act by stretching and manipulating the NSC for their own purposes. After more than forty years and ten presidents, several stages in the evolution of the national security process have emerged.

President Dwight D. Eisenhower came closer to implementing the NSC as it was originally conceived than any of the presidents who followed him. As he campaigned for the presidency, Eisenhower criticized what he referred to as Truman’s “shadow agency.” The battles of the Cold War required a stronger national security process and a revitalized NSC, he argued. Eisenhower saw the NSC as the premier coordinating agency for protecting American security. In addition, he answered the complaints against Truman by appointing a national security assistant to be the chief facilitator of a coordinated policy. But Eisenhower, like Truman, did not believe in providing the NSC with a policymaking staff in the White House. The agency had a secretariat run by an assistant, but staff work continued to be done in the various departments and agencies.

After his election, Eisenhower restructured and strengthened the NSC system by dividing the NSC process into three parts. The first of these involved the writing of the policy papers that were examined and critiqued by the council. Every agency represented on the council, plus the secretary of the Treasury and the heads of the JCS and CIA, were to choose someone on the assistant secretary level to be a member of the interdepartmental Planning Board, the substitute for the former NSC senior staff of President Truman. This group wrote the papers presented to the council and tried to resolve disagreements over policy between agencies. Each week the formal NSC meetings
considered the papers, generally sent them back again, and finally approved the revised version.

Summaries of the meetings between Eisenhower and the members of the council, the second part of the process, often reveal freewheeling discussions dominated by the secretaries of state and Treasury. Few of these discussions, however, were about immediate policy matters. The council never discussed the decision to disallow funding to Egypt for the Aswan Dam, for example. Many meetings were devoted to the annual budget that the president presented to Congress. This is not a surprise, since budgets make policy. Other meetings were largely devoted to long-term or general policy issues.

Nevertheless, Eisenhower rarely missed an NSC meeting. In fact, the NSC took an inordinate amount of his time, since he would get together before the meetings with his national security adviser to go over the agenda and often had smaller meetings in the Oval Office at the conclusion of the meetings. The former army general was a man who believed in both an orderly process and planning.

The Operations Coordinating Board (OCB) was the third part of the Eisenhower national security process. Basically an interdepartmental group of deputies or assistant secretaries, the members met each week to make sure that policy decisions were coordinated and carried out. Although their task seemed straightforward, the OCB was also designed to make sure that CIA covert actions did not operate at cross-purposes with the other policy positions.

Eisenhower regarded his remade NSC as an important policy tool. Gathering together the NSC members, their numerous deputies and assistants, and the ancillary groups from the CIA and JCS, Eisenhower used the NSC as a device to keep political appointees and civil servants informed and committed to the final decisions. Everyone would have a stake in the policy if they had participated in writing the original paper and observed the discussions of the council meetings. The Eisenhower era was marked by this extensive set of meetings and the many policy papers they produced. By the president's second term, however, the designated agency representatives dreaded their participation in the NSC Planning Board meetings, and the council meetings began to sound stale. Disagreements over words and phrases replaced those of substance.

Although the work of the NSC was top secret, Eisenhower and his national security adviser were eager to talk about the orderly process behind the policies. They gained that opportunity when the Subcommittee on National Policy Machinery of the Senate Committee on Government Operations held hearings in the first six months of 1960. The committee was chaired by Senator Henry Jackson, a Democrat from Washington State, and was an effort both to discredit the administration before the presidential election and to serve as a vehicle for Jackson to enter the world of national security policy. Regardless of the motivations, it provided one of the rare glimpses into national security policymaking.

Witnesses were called from both the Truman and Eisenhower administrations. Those from the Truman administration were uniformly critical of the NSC, while Eisenhower's national security advisers not only defended their process but indicated that the NSC played a central role in making foreign policy. The NSC was, in the words of national security assistant Robert Cutler, the “top of policy hill.” The impression that emerged from the subcommittee hearings was that of a passive president beholden to a paper-driven, ponderous, bureaucratic process. The emphasis in these hearings on Eisenhower's extraordinary use of the council proved very damaging to him as well as to the NSC.

Eisenhower and his advisers were eager to promulgate the view that the general was a man who relied on planning procedures and the advice of NSC members rather than making policy precipitously in response to crisis. His was an orderly system that he urged his successor to follow. Unfortunately, Eisenhower's efforts to promote his NSC system failed to explain fully its value to him. Neither Eisenhower nor any other president ever made policy within the NSC structure. Policy was made in the Oval Office. Eisenhower used the complicated NSC structure to encourage a sense of participation on the part of the policymakers. Council meetings informed those at the deputy and assistant secretary level and promoted a sense of loyalty. But policy was not formulated there. Neither the Jackson subcommittee nor the incoming administration understood the duality of policymaking represented by the NSC and the Oval Office.

Ironically, Eisenhower's use of the NSC appears consistent with the original view of its creators. The NSC was a mix of State Department, Defense Department, and intelligence representatives with other participants joining the group for special projects. It was created to advise the president and met at designated intervals. There are various indications that Eisenhower was thinking...
about a more streamlined system by the end of his second term, but he made no changes. Although the policymaking process in the Eisenhower administration is generally given high marks, no president since Eisenhower has scheduled as many NSC meetings or participated in them as fully and as often.

THE KENNEDY AND JOHNSON YEARS

President John F. Kennedy completely dismantled the highly organized institutional NSC system, establishing arrangements more amenable to his governing style and, it would appear, to succeeding presidents. Whereas Eisenhower took his experiences as an army commander into the White House, Kennedy emerged from the much more freewheeling structure characteristic of a U.S. senator's office. Critical of Eisenhower's cautious diplomacy and reluctance to increase military budgets, Kennedy was convinced that the stolid, paper-based structure of the NSC system described in the Jackson hearings was responsible for what Kennedy perceived as the timid foreign policy that marked Eisenhower's national security policy. Both the Planning Board and OCB disappeared. The statutory council remained, but was rarely used. Yet, under Truman and Eisenhower the council was the heart of the NSC. It was here that the presidents gathered the opinions of all their advisers representing every facet of national security policy. The council was the mechanism for the widespread input of advice. After Kennedy, the NSC meant the adviser not the council.

Kennedy chose to follow the recommendation of the Jackson subcommittee and initially used the NSC as a more intimate forum for discussions with only his principal advisers. But one of his first decisions irrevocably changed the national security policymaking system. He appointed McGeorge Bundy as a national security adviser (as opposed to an assistant). Bundy, who expanded the role of facilitator and added the role of personal adviser, chose a small policy staff of a half-dozen people to work with him. For the first time, the White House had an independent national security policy staff, a step that reflected Kennedy's scorn for the bureaucratic State Department.

With fewer council meetings and more staff work, the NSC also became less of a planning group and more of an action group concerned with the events or crisis of the moment. Eisenhower administration veterans pointed out that under their system a Bay of Pigs could never have happened, since the idea would have been vetted by desk officers in the State Department, military representatives, and intelligence officials plus discussion in NSC meetings. Of course, they exaggerated the effect of the NSC system on policy. Bad policy can rarely be improved with good process and Eisenhower, for all of his dependence on procedure, began the training of the Bay of Pigs exile army. After the Cuban fiasco, Bundy and his staff were moved into offices closer to the president and the role of White House staff was strengthened by Kennedy's belief that the CIA and the JCS had misled him.

As Kennedy's national security adviser, Bundy was hardly the anonymous staffer, but he was rarely quoted in major newspapers or featured on television. He took seriously his role as presidential adviser and provided the president with staggering amounts of information, sending him home each night and weekend with reports, articles, and books to read. Kennedy rarely attended a formal meeting of the council, relying instead on smaller meetings in the Oval Office. An executive committee, or special committee, for example, was formed to manage U.S. operations in Cuba. The ExCom gained fame because of its successful work in the 1962 Cuban missile crisis.

Beginning slowly in 1961, the NSC was transformed. Aided by a White House staff, the national security adviser personally presented to the president the range of views and options that had been the function of the council during the Eisenhower administration. President Kennedy called NSC meetings for purposes of public relations. He preferred to work with the White House adviser and for the most part abandoned larger meetings. After 1961, presidents accepted the basic assumption that a White House staff and national security adviser were preferable to the unwieldy NSC meetings staffed by every department concerned with national security.

When President Kennedy was assassinated, Lyndon Johnson inherited his advisers and his reliance on the White House national security staff. Throughout his political career, Johnson had concentrated on domestic policy issues. Perhaps his insecurity in the face of the new burdens he faced accounts for his return to the practice of meeting with the National Security Council during the first year of his administration. He soon abandoned it, modifying the more informal style of Kennedy to suit his needs. Bundy continued to bring detailed information to the new president.
and worked to integrate policy, functions that had once been a product of the NSC system. The NSC staff remained small. Bundy had three assistants: one was detailed from the CIA, a second from the Defense Department, and a third from the Office of Science and Technology. Another staff member was an expert on foreign economic policy. The executive secretary, Bromley Smith, completed the staff. Traditionally, the persons holding the positions of executive secretary and his assistants changed with presidential administrations and the concomitant arrival of new national security advisers. But Smith was an exception and stayed on under Johnson. He was especially valuable because he had experience as an NSC staffer under both Eisenhower and Kennedy and could provide some institutional memory. He was an essential participant in the procedural work of these administrations. For example, he was responsible for the “situation room,” a top secret center of communication; conferred with Bundy on agenda items for meetings; and often sat in for Bundy when he was out of town.

Despite Bundy’s emphasis on process, in the Johnson White House he was regarded as an adviser as well as a facilitator. Johnson’s decision to send Bundy on a fact-finding mission to Vietnam illustrates the way in which the line between the two functions began to disintegrate. Finally, Bundy and his successor, Walt W. Rostow, assumed a third role, that of presidential spokesman. As the Vietnam War hit the headlines, McGeorge Bundy became a media “star.”

Bundy resigned his position in December 1965 and during the following March, Johnson chose Walt W. Rostow to replace him. Rostow, who was a member of the State Department’s Policy Planning Staff at the time of the Kennedy assassination, was a man of strong opinions who was not shy in expressing them. When others in the White House began questioning Johnson’s conduct of the Vietnam War, Rostow stood firmly behind the president.

After convening twenty-five NSC meetings, Johnson began replacing them with small “Tuesday lunches” attended by the secretaries of state and defense, the national security adviser, the director of the CIA, and the head of the JCS. Others were invited when issues called for additional participants. Given the amount of staff work required, these lunches combined the attributes of mini–NSC meetings and Oval Office policymaking sessions. Rather than diminish Rostow’s role as national security adviser, the Tuesday lunches enhanced his position. Before each meeting Rostow discussed the agenda with participants and assembled the necessary documents, including a background paper. This was the task of a facilitator, but as Rostow readily admitted, he often added his own views. This further blurred the demarcation between facilitator and adviser. Lyndon Johnson’s last years in office were dominated completely by the Vietnam War. Regardless of who attended any given Tuesday lunch, the primary topic remained the same. The president listened to friends and former colleagues in the Senate who urged him to bring the conflict to an end. Abject surrender in whatever form, however, was anathema to this proud Texan, and so he chose to act on the advice of the loyal supporters with whom he lunched each week, thus isolating the political leadership in the agencies. When the loyal members of his cabinet introduced a dose of reality and finally convinced him it was a war he could not win, the weary Johnson declined another term as president.

THE NIXON, FORD, AND CARTER YEARS

Richard Nixon promised to restore the National Security Council and blamed many of the unsuccessful foreign policies of Kennedy and Johnson on its abandonment. Nixon entered the presidency with very specific views on organizing the national security apparatus that were based on his experience in the Eisenhower administration. Soon after his election, he handed the task of reorganizing the NSC system to his national security assistant, Henry Kissinger. Although touting the changes as a return to the Eisenhower model, Nixon displayed neither trust nor regard for officials in the State Department. Seeking complete White House control of national security, he carefully chose a secretary of state, William P. Rogers, who had little foreign policy experience. Nixon’s personality was so different than Eisenhower’s that whereas the national security machinery was in the Eisenhower style, actual policymaking was quite different.

The NSC structure encompassed a number of interdepartmental groups representing the senior officers of an agency. Even when council meetings were in abeyance, as in the Johnson administration, these groups existed to assure presidents that they were hearing from every agency on a particular issue. During the 1960s the State Department representative had chaired each
of these groups. The newly organized Nixon NSC expanded these interdepartmental policy committees and added approximately 120 people to the NSC system. The principal committee was the Senior Review Group, which bore a slight resemblance to the Eisenhower NSC Planning Board. This group was on the assistant secretary level, but with Nixon's support, Kissinger came to dominate that group as well as other groups that he chaired. The president was sending a clear signal that the White House would control the agenda.

Despite Nixon's campaign oratory about restoring the Eisenhower model, this control was one among several of the profound differences between the Eisenhower NSC and the Nixon system. Quite apart from personalities, the major difference between the Eisenhower and Nixon systems was the position of the State Department within the policy process. Eisenhower's principal and trusted adviser was Secretary of State John Foster Dulles, whereas Nixon's choice for secretary of state was the inexperienced Rogers, a clear indication that the State Department would be at the periphery of the policymaking process. Nixon's national security assistant, Kissinger, shared his desire to bypass the State Department and conduct foreign policy from the White House. The NSC staff grew accordingly and a third model for the NSC system emerged: the NSC as a small State Department under the control of the president and national security adviser. A flow of paper representing the requests of the NSC for agency input continued to move, but, in contrast with previous years, the requests did not seem to matter. Agency personnel suspected that the process of making them was designed to keep them occupied while Kissinger and Nixon made policy.

As in the previous administration, frequent official NSC meetings were held early in the Nixon presidency, but the thirty-seven meetings in 1969 diminished to twenty-one in 1970 and only ten in the first two-thirds of 1971. As the NSC moved away from formal meetings, the committee system stepped into the vacuum and gained importance. While the Nixon White House tapes show an overbearing president with little respect for his national security adviser and an almost subservient Kissinger, in fact the two men were in agreement on both policy priorities and the manner in which to implement them.

DIALOGUE WITH MAO

On 21 February 1972, President Richard Nixon and Henry Kissinger, his assistant for national security affairs, met in China with Chairman Mao Tse-tung and Prime Minister Chou En-lai. The following are excerpts from a memorandum of that conversation.

Chairman Mao: (looking at Dr. Kissinger) He is a doctor of philosophy?

President Nixon: He is a doctor of brains.

Chairman Mao: What about asking him to be the main speaker?

President Nixon: He is an expert in philosophy.

Dr. Kissinger: I used to assign the chairman's collective [sic] writings to my classes at Harvard. . . .

Chairman Mao: [Nixon and Mao] must not monopolize the whole show. It won't do if we don't let Dr. Kissinger have a say. You have been famous about your trips to China.

Dr. Kissinger: It was the president who set the direction and worked out the plan.

President Nixon: He is a very wise assistant to say it that way. (Mao and Chou laugh.)

President Nixon: When the chairman says he voted for me, he voted for the lesser of two evils.

Chairman Mao: I like rightists. People say you are rightists, that the Republican Party is to the right. . . . I am comparatively happy when these people on the right come into power.

President Nixon: I think the important thing to note is that in America, at least at this time, those on the right can do what those on the left talk about.

Dr. Kissinger: There is another point, Mr. President. Those on the left are pro-Soviet and would not encourage a move toward the People's Republic, and in fact criticize you on those grounds.
Both were intent on controlling and conducting foreign policy and both were convinced of the need for secrecy.

The Nixon and post-Nixon NSC arrangements illustrate the difficulty of separating policy, process, and personality. Henry Kissinger exemplifies this problem. First as national security assistant and then as secretary of state, he insisted on full control of people and ideas. He used the diffuse NSC interdepartmental process to better accomplish his goals and bent it to his needs. Given his belief in secrecy, Kissinger often did not tell his staff what he was doing.

The results of the Nixon-Kissinger approach were mixed. They turned China policy around but failed to end the war in Vietnam. Kissinger personally began lengthy and open negotiations in the Middle East, while Nixon directed the secret intervention in Chile that resulted in the seventeen-year dictatorship of General Augusto Pinochet. Kissinger and Nixon basically took advantage of the NSC mechanism to achieve their goals, making it their handmaiden. Meanwhile, Nixon ignored Secretary of State Rogers, a pliant individual who did not try to impose his own views or those of his department. When he resigned and Kissinger took over at State, any potential conflict between the secretary and national security adviser was laid to rest.

When President Gerald Ford succeeded Nixon, he reestablished some equilibrium between the State Department and White House. National security adviser Brent Scowcroft assumed a low profile and moved to establish better relations between the State Department and the White House.

In the tradition of his predecessors, President Jimmy Carter quickly reorganized the NSC staff and stated the intention of placing more responsibility on the departments and agencies. The numerous committees of the Nixon-Ford White House were combined into two subordinate committees, the Policy Review Committee and the Special Coordination Committee. However, Carter appointed as his national security adviser a man every bit as strong willed and as opinionated as Henry Kissinger. Zbigniew Brzezinski reorganized the staff to eliminate most of the vestiges of the Kissinger years. Rather than function as a mini-State Department, his staff was to carry through the usual coordination of policy and serve as a kind of think tank for the president. Aware of the tendency of his predecessors to overshadow the secretary of state, he also assured the president, press, and public that he would cooperate with the secretaries of state and defense. The prospects for harmony seemed good, as Brzezinski and Secretary of State Cyrus Vance had served as cochairs of the Council on Foreign Relations while Secretary of Defense Harold Brown had worked with Brzezinski on the Trilateral Commission, a group to increase cooperation between the United States, western Europe, and Japan. The climate of cooperation promised smooth working relationships. Recognizing earlier problems between the NSC and the secretaries of state and defense, Carter asked for an internal study on integrating policy six months after taking office. The report, prepared by Philip Odeen, emphasized process and organization rather than personalities. In the long run, however, Carter's policy process was influenced far more by personalities than procedure.

It did not take long for Brzezinski, a dynamic man with wide-ranging interests, to become the predominant foreign policy spokesman of the Carter administration. Despite earlier plans, Carter's policy process was among the most centralized in the post–World War II era, with Brzezinski as the fulcrum. Like those of Kennedy and Johnson, it evolved into an informal structure, this time revolving around a Friday morning breakfast between Brzezinski, Vance, and Brown. Unfortunately, each man often emerged with a different interpretation of the discussion. The rivalry between the national security adviser and the secretary of state that had existed in the Nixon years took on a different cast under Carter when it became clear that Brzezinski's views on American foreign policy were quite different from those of Secretary Vance. Brzezinski, for example, sounded the death knell for détente on 28 May 1978, when he strongly attacked Soviet and Cuban activities in Africa. On 14 June, however, Vance made it clear that the White House approved of his plan to send an American diplomat to Angola for talks with the government there. Brzezinski also made it clear that negotiations over the Strategic Arms Limitation Talks (SALT) were linked to Russian meddling in Africa and its support for African revolutionaries. A more conciliatory Vance dismissed the notion of linkage between the two issues. The secretary of state also assured the House International Relations Committee that he was the only one who spoke for the president.

It was Brzezinski, however, who saw Carter several times each day and served as the liaison between the cabinet secretaries and the president.
He prepared summaries and reports of meetings and discussions held under the national security tent between the principal participants of policy meetings and did not hesitate to give his opinion or express his disagreement with Secretary Vance or Secretary of Defense Brown.

Carter, a former governor of Georgia, had very little foreign policy experience. His personal goals included improving human rights, curtailing the military, and reaching out to the Third World in Africa and Latin America. Brzezinski, on the other hand, concentrated on such traditional Cold War problems as outsmarting the Soviets and encouraging the Chinese to look to the United States to the detriment of the USSR. Carter had success in accomplishing his own goals, but as international tensions unfolded, particularly the Soviet war in Afghanistan, he was pulled between the views of Vance and Brzezinski. By the time Secretary Vance resigned in 1980, Carter had accepted the views of his national security adviser and sounded like another cold warrior. Meanwhile, foreign policy lost its coherency as the administration spoke with two voices instead of one.

To observers, the disarray in the Carter administration seemed to be one more example of a national security system out of control. The publicity generated by Brzezinski drew attention to the organization of national security in the White House and the fate of the NSC itself. Although Brzezenski’s staff never reached the size of the Kissinger staff of about two hundred (of whom fifty were professionals), it was a large staff of about one hundred (of whom thirty were professionals) and, like Kissinger’s staff, it was a policy staff. Meanwhile, the NSC atrophied. Only ten NSC meetings were held while Brzezenski was the national security adviser. Even the Nixon and Ford administrations had held 125 meetings in their eight years in office.

In April 1980 the Senate Foreign Relations Committee for the first time, under its chairman, Frank Church, held hearings on legislation requiring Senate confirmation of all national security advisers. Two powerful national security advisers had become major policymakers yet were free from confirmation proceedings and were not required to testify before the Foreign Relations Committee. The effort to require accountability on the part of the national security adviser was ultimately unsuccessful. A consensus existed that presidents should be allowed to pick their own advisers and organize their administrations according to their own views and personalities.

But the attempt did highlight the duality of foreign policymaking within the White House.

THE REAGAN, BUSH, AND CLINTON YEARS

President Ronald Reagan began his administration by reversing a trend and appointing a low-key national security assistant who would return to the pre-Kissinger model. Unfortunately, in an aberration from the designated use of the NSC, Reagan also used the national security system as an operating agency, with far-reaching results. Unfamiliar with and initially uninterested in national security affairs, Reagan, who had no trouble working with a triumvirate of domestic advisers, seemed unable to find the right national security person with whom to work. As a result, he had a record six national security advisers.

Richard Allen, the first, was the only one since the origins of the NSC who did not have direct access to the president. Allen answered to Edwin Meese, a former Reagan associate who was now White House general counsel. He failed to gain the confidence of Meese and, despite his low profile, Allen immediately had turf battles with the intrepid secretary of state, Alexander Haig. Allen left office within a year and was followed by William Clark. Clark had no experience or background in national security policy but was close to Reagan, having served as his executive secretary when Reagan was governor of California. Someone who knew the president seemed more likely to be a successful assistant for national security. Clark was familiar with the president’s work habits, goals, and governing style. He had complete access to the Oval Office, meanwhile building a strong staff of sixty-one to compensate for his own weakness. He could offer little in the way of substance, however, and resigned in 1983.

Meanwhile, the world had not waited for Reagan to find his way. Iranians, after overthrowing the shah, storming the American embassy, and taking American hostages, finally released the Americans on January 20, 1981, the day of Reagan’s inauguration, but became an important anti-American and anti-Western force in the Middle East. In Central America, Reagan faced a revolutionary, left-wing government in Nicaragua. President Carter had not conformed or encouraged this new government but had chosen to accept it. Reagan and his advisers, on the other hand, saw the new Nicaraguan rulers, the Sandinistas, as part-
ners in the Havana-Moscow nexus. Reagan assumed that Nicaragua, like Cuba, would try to export its revolution throughout Latin America. Therefore, Nicaragua was seen as a danger to U.S. interests, and so the administration began to support the military opposition to the Sandinistas, those known as contras.

Congress tied the hands of the president when it prohibited the use of funds to overthrow the Nicaraguan government. Reagan, however, was determined to rid Nicaragua of the Sandinistas and sought a different way to reach the contras. He turned to the one group outside the purview of Congress, the national security adviser and his staff. From 1983 to 1986, national security advisers Robert McFarlane and John Poindexter, who followed McFarlane in 1985, were the chief architects of the disastrous Iran-contra policy. With the help of national security staff assistants who scorned the constitutional issues involved, they devised a plan to send arms to Iran for its war against Iraq. The payment for the arms was then sent to the Nicaraguan contras.

For the first and only time in its history, the NSC became an operational agency. National security adviser McFarlane made secret trips to the Middle East while U.S. marine lieutenant colonel Oliver North, a staff assistant, coordinated the activities against the contras. Trading arms for money, the essence of what became the Iran-Contra scandal, was soon discovered and investigated, discrediting both the president and the participants. The fifth national security adviser, Frank Carlucci, a respected and experienced veteran of the Defense Department, was then called in to clean house. Finally, in 1987 General Colin Powell stepped into the position.

The Reagan interlude illustrates the failure of the NSC system when a president fails to exert leadership within the policy process. Created for battle in the Cold War, no president between Truman and Reagan entered office without a strong commitment to developing a policy process that could cope with the problems presented by the global interests of the Cold War. These presidents, cognizant of the problems posed by international responsibilities, also brought into the White House men and women who could implement their policies. As a result, the glaring deficiencies of the original 1947 legislation were invisible. The act provided the NSC with an ambiguous mandate that ignored the necessity for an adviser and staff as key participants in the making of national security policy.

Taking a cue from President Carter, Reagan included his vice president, George H. W. Bush, in many of the important national security decisions of his administration. As president, Bush—who had been ambassador to the United Nations, director of the Central Intelligence Agency, and the American representative to China—reorganized the national security process, as had previous chief executives. His national security adviser, Brent Scowcroft, and Scowcroft's deputy, Robert Gates, were at the center of the national security process, chairing the top panels of the senior officers in all the national security agencies and thus setting the agendas.

President Bush continued the use of the Principals Committee, which had been established in 1987 by Reagan. This committee was virtually the original NSC with the addition of the secretary of the Treasury, the chief of staff to the president, and the national security adviser. As was true of the NSC, the chairman of the JCS and the director of the CIA also attended, while others were invited as needed. Both Truman and Eisenhower would have recognized this group, although neither would have acquiesced to any committee of principals that did not include the president, the ultimate “principal.” Instead, National Security Presidential Directive-1 noted that both President Bush and his vice president could attend any and all meetings.

Bush, like his predecessors, did not rely upon this system for making foreign policy. He valued secrecy and loyalty and relied on an unusually small set of advisers who shared similar worldviews. Bush's mini-NSC was composed of Scowcroft, Secretary of Defense Richard Cheney, and Secretary of State James Baker, who met with the president in the Oval Office. They were occasionally joined by the General Colin L. Powell, now chairman of the JCS, and Gates after his appointment as the director of the Central Intelligence Agency in September 1991. The fact that the Bush administration did not use the NSC did not diminish the role of the national security adviser. In 1991, for example, the president sent Scowcroft to the Middle East and China, not Secretary of State Baker.

Predictably, President William Clinton changed the national security process, this time by adding a broad economic element to the National Security Council. The secretary of the Treasury and the chief of the new White House Economic Council were added to the NSC as well as the ambassador to the United Nations, Madeleine K.
Albright. The Principals Committee and Deputies Committee were both retained. As usual, there were discussions in the media about relationships between national security principals, in this case Secretary of State Warren Christopher; Defense Secretary Les Aspin; and the national security adviser, Anthony Lake. But the perception of problems within the Clinton administration were partly a product of a disorganized White House and the president’s initial lack of interest.

By Clinton’s second term, a succession of crises had brought Clinton into the heart of foreign policy and the administration began to change. All the original players, Christopher, Aspin, and Lake, left the administration. Samuel R. Berger, Lake’s deputy, became the national security adviser and Albright became the first woman to serve as secretary of state. Albright was a more colorful secretary, but, like Christopher, she apparently was relegated to traditional diplomatic tasks. She never seemed totally without influence, but the heart of the policy process remained within the gates of the White House. National security policy was again dominated by the president’s staff, in particular by Sandy Berger, whose office was just steps away from the president and for whom the president’s door was always open.

When George W. Bush took office in January 2001, he quickly nominated a strong and experienced secretary of state, General Colin Powell, and moved on to nominate an equally experienced secretary of defense, Donald Rumsfeld. Under the Bush plan, the national security adviser would return to the position of facilitator, bringing information to the president and acting as a liaison officer bridging the gap between the State and Defense Departments.

CONCLUSION

No president has ever made national security policy in the National Security Council. The NSC was not created as a policymaking body but as an advisory body to the president. The Cold War brought into the policy process various agencies and groups whose views were important but rarely coordinated. Foreign policy was no longer just in the hands of the State Department. The Defense Department and the JCS, joined by the CIA and the Treasury Department, were all players on the field of U.S. global power.

Therefore, even when presidents avoided the formal structure created early in the Cold War, they found it necessary to find a substitute. Interdepartmental committees and the Committee of Principals were all created to fill this role. The turning point in the history of the NSC came in 1961 with the election of John F. Kennedy. When Kennedy brought into the White House a national security adviser with a staff, he began an inexorable move toward a completely new process. Even though it continued to meet sporadically, after 1961 the NSC was nothing more than the president’s adviser and his staff, which soon evolved into just the president’s staff.

Personality has been more important to the policy process than structure. That each president uses the NSC differently is part of the received wisdom about the policy process. Every president uses the NSC differently in order to differentiate himself from his predecessor as campaign promises for new policies are subsequently translated into new processes.

Since it was created by an act of Congress, no president can abolish the NSC. For the most part, however, it has evolved beyond recognition. The interdepartmental and ad hoc committees that form the crux of agency participation bear only a slight resemblance to Truman’s senior staff or Eisenhower’s Planning Board, and the dominant role of the national security adviser has changed the equation since the time when chairmen set the agenda.

The effect on policy is difficult to gauge. The danger faced by most presidents has been the tendency to rely on a few loyal advisers. If they do not participate in NSC meetings or the meetings of “principals,” presidents become isolated. They do not have a forum for contrary views and are remote from those who must defend and implement their policies. Nixon and Kissinger may be prime examples of this isolation, but presidents such as Johnson and George H. W. Bush also preferred selective advice.

The NSC of the 1947 statute is probably dead and certainly obsolete. The end of the Cold War and the American position as the strongest global power probably requires a different kind of national security organization in order for the president to be truly advised in this new century.

Nativism is a construct scholars employ to explain hostility and intense opposition to an internal minority on the grounds of its imputed foreign connections. Appearing in three basic forms in American history, nativism was first characterized by antagonism toward Catholics during colonial and early national eras. Anti-Catholicism peaked from the 1830s through the 1850s, concomitant with the growing debate over slavery. This variant reflected themes popular since the Protestant Reformation, stimulated by American fears of French, Spanish, and papal threats in the New World. After the Civil War, anti-Catholic nativism became more secular, mirroring complex economic, cultural, and social upheavals and—most notably—an inchoate sense of nostalgia for a “purer” republic.

A second form of nativism, manifest in the dread of alien radicalism, emerged during the 1790s when the wars of the French Revolution embroiled the United States and threatened the republican experiment. A third manifestation of nativism, sometimes overlapping with anti-Catholicism and antiradicalism, developed during the 1840s as citizens celebrated their “manifest destiny” to bring the benefits of democracy and republican government to the Pacific. Girded by “scientific” analyses that touted Anglo-Saxon superiority against other peoples, racial nativism became crucial in the debate over imperialism at the turn of the twentieth century, underlay the incarceration of the Japanese-American minority during World War II, and remains today an important touchstone in ongoing arguments about multiculturalism, immigration, and trade.

Scholars analyze nativism in several ways. One approach, exemplified in John Higham’s unsurpassed Strangers in the Land (1963), stresses actual, face-to-face conflicts and tensions between early settlers and subsequent arrivals. Higham underscores immigrant battles for social, political, and especially economic advancement in an individualist and competitive culture. He explores the organized nativist movements between 1860 and 1925 that resisted these newcomers, and he assesses skillfully both reality and hyperbole within nativist stereotypes, all the while focusing on the all-important sociocultural settings in which nativism has waxed and waned.

Other historians and social scientists, reflecting the long-dominant primacy of the liberal consensus (from the 1930s to the 1970s), accentuate both ideological and psychological functions of nativism as clues to understanding tensions and fault lines within national culture. Here Richard Hofstadter and David Brion Davis look to a broader definition of the term, describing nativism as a state of mind of native-born and naturalized citizens seeking to define their own Americanness by condemning real and alleged alien challenges to national values and institutions. For these historians, nativism signifies the ideology of persecuting groups, invariably bigoted, while targeted minorities emerge generally as victims.

In the last quarter of the twentieth century, cultural and social historians focused more critically upon contests for power, assessing minorities more empathetically, “from the bottom up,” often attacking traditional political elites. The Vietnam War, Watergate, black and feminist drives for equality, and growing concern by many at colossal inequities in wealth and shrinking opportunity, all interact with an increasingly multicultural society and tarnished political system to undercut the very idea of legitimacy. Scholars who embrace cultural studies—much influenced by such French theorists as Jacques Derrida, Jacques Lacan, and Michel Foucault—explain battles for power and prestige between newcomers and nativist defenders of the old order by deconstructing such categories as economics, race and ethnicity, and gender and sexuality. Assessing these categories may not only allow new clarity in com-
prehending power relationships embedded in given contexts ("texts"), but the careful reading of evidence ("discourse") may also afford scholars a better sense of their own relationship to their realm of inquiry, indicate how the notion of "historical objectivity" invariably conveys values and requirements of dominant cultures, and supply the chance to make connections within, and between, governing and contending, often complicit, cultural paradigms. Cultural studies at its best respects history as fluid and uncontrollable (even by elites), and considers questions of cause-and-effect less important than understanding ways in which parts of the historical past (and theories like Antonio Gramsci's hegemony and complicity) fit together.

Although emerging mainly as varied forms of domestic intolerance, nativism has affected, and been affected by, United States foreign policy. On one hand, animosity toward immigrants and fear of alien influence have diverted attention from real national problems and their sources and solutions. Conversely, nativist stereotypes and images have impeded the efficient formulation and implementation of foreign policies. On several occasions, meanwhile, nativist endeavors to legitimize parochial agendas by identifying them with the nation's interests have generated crises involving the federal government. Withal, by encouraging disdain for the European concept of power politics, nativism has strengthened the nation's self-image of innocence and exceptionalism in a decadent world. Hence, the study of nativist ethnocentrism and xenophobia provides clues to aid historians in clarifying the interplay between domestic issues and foreign relations. These clues help to explain the persistence of moralism and rigidity in American diplomacy and the presence of emotionalism as an important problem for national self-interest.

Yet with the exception of the federal immigration acts of 1921 and 1924, optimistic tendencies have generally kept nativism from becoming national policy. In several cases, however, nativists achieved power sufficient to affect the nation's course. The Alien and Sedition Laws (1798) sought to stifle Jeffersonian opposition to Federalist foreign policy during the Quasi-War with France (1798–1800). But when President John Adams negotiated for peace (perhaps his most courageous accomplishment), the legislation backfired, split the Federalist Party, and helped Thomas Jefferson become elected president in 1800. During the 1850s, the Know-Nothings (or American) Party hastened disintegration of national politics when its crusade against Irish-Catholic immigrants offered citizens a choice to avoid confronting slavery, the greatest sectional crisis the nation had known. In the late nineteenth century, nativism intensified many social and economic difficulties wrought by the dislocating forces of industrialism, urbanization, and unprecedented immigration from lands nativists deemed benighted. As long as the economy remained robust, ample room existed for newcomers. But when the economy turned sour, as it did cyclically between 1870 and 1914, nativists looked more for the easy explanation—the new immigrants, of course—than they did shortcomings of the capitalist system.

The only nation that was "born in perfection and aspired to progress" (to use Hofstadter's felicitous phrase), the United States also confronted war in the twentieth century in ways that focused attention on the enemy within, the Trojan Horse that would undermine the peaceable kingdom. The United States went to war not to "muddle through" or merely win, like the British, but for moral reasons befitting its exalted and self-anointed global status. Messianic prophecies demand total obedience and World War I unleashed an unprecedented campaign of repression against German Americans, foreign- and native-born Bolsheviks, socialists, anarchists, and pacifists. Wartime intolerance did not cease with the Treaty of Versailles. Indeed, the Red Scare after World War I attested not only to problems attending the failure to make the world safe for democracy, demobilization, and the emergence of the Bolshevik adversary in the Soviet Union, but also to the desire, continuing into the 1920s, to purge the nation of all cultures that did not embrace traditional Anglo-Saxon Protestant virtues. This failed effort at national purification influenced attitudes toward international cooperation, immigration, the World Court, and the Soviet Union. A similar reaction, christened "McCarthyism" after its most renowned practitioner, Senator Joseph McCarthy, exploded after World War II, and the controversy over Watergate in the early 1970s revealed a similar cleansing dynamic, albeit in inverted form, which eventually consumed the presidency of Richard M. Nixon.

**EARLY FORMS OF NATIVISM**

Anglo-American nativism arrived in America with the first settlers. Imbued with ideas of founding a
city on a hill in the Massachusetts Bay Colony to honor God and redeem the Church of England, and harboring in Virginia a sense of commercial destiny built on racial dominion over blacks and First Nations, colonial Americans from England also nursed resentment against other white ethnicities—Irish, Dutch, German, French, and Spanish, for example, depending upon region and issues. Occasionally, as during the ethnonationalist French and Indian War (1754–1763), nativist feelings burst forth. In Pennsylvania, English colonists followed Benjamin Franklin's lead in questioning local German loyalty to the crown.

After independence, the new multicultural nation faced the need to define its identity. Although the Frenchman Hector St. John de Crevecour spoke of the American as a “new” man, the Anglo-American connection died hard, if at all. With unity a key requirement for survival in a world of despotism and monarchy, many citizens expressed hostility toward European immigration—even as the new Republic became increasingly multicultural and multiracial. This animus was understandable. Diversity heralded faction, as dangerous to a republic as the concentration of centralized power. Thomas Jefferson warned that immigrants might “warp and bias” the path of the nation and jeopardize “the freest principles of the English Constitution, with others derived from natural right and natural reason.” Indeed, the American alliance with France—crucial to independence—became an albatross during the next fifteen years. The French Revolution, ironically styled in part on its American predecessor, terriﬁed Federalist Party leaders.

The ﬁrst organized expression of antiradical nativism came in 1798, when Federalist hostility exploded against both France and Jefferson’s Democratic-Republicans. Influenced by Secretary of the Treasury Alexander Hamilton, whose Francophobia knew no bounds, President George Washington rejected any diplomacy that might offend Britain, at war against France since shortly after the revolution. Washington’s diplomacy, therefore, aided Britain and opened a gap between Hamilton and Secretary of State Jefferson, a partisan of France. The fear of immigrants as a source of faction and corruption affected both emerging political parties in the new nation. The bipartisan Naturalization Act of 1795 required aliens to renounce earlier allegiances and disavow titles of nobility. But the more extreme Federalists—men and women of orthodox social, cultural, and religious attitudes united by their pessimistic view of human nature and aristocratic demeanor—worried lest incoming French émigrés, United Irishmen, and British radicals sow sedition and “Jacobinism” among the populace.

In fact, France did meddle in American politics, seeking to defeat Jay’s Treaty in 1794 and to influence the election of 1796 in Jefferson’s favor. The attachment of many immigrants to Jefferson alarmed Federalists. Democratic-Republican societies in New York and eastern Pennsylvania included recent Irish and Scots-Irish arrivals. These groups participated in the Whiskey Rebellion of 1794, led opposition to Jay’s Treaty, and hence appeared connected to the intrigue of French agents like Joseph Fauchet and Pierre A. Adet. President Washington warned of this connection in his Farewell Address in 1796, but seemingly to no avail. By 1798 Federalists recalled that factionalism helped wreck the Articles of Confederation and now made the Republic vulnerable to external enemies.

The infamous XYZ affair and subsequent undeclared naval war with France presented Federalists the chance to use their control of foreign policy, in Federalist politician Theodore Sedgwick’s words, “a glorious opportunity to destroy faction.” Divisive issues having stimulated the lust for power in Federalists and Democratic-Republicans alike, politics now mirrored “a complete distrust of the motives and integrity, the honesty and intentions of one’s political opponents.” Consequently, Federalist stalwarts, moving “to crush internal opposition in the name of national security,” moved to create an army and navy, to construct arsenals, and to abrogate the treaties of alliance and of amity and commerce of 1778. The more moderate wing of the party supported President John Adams’s decision to seek a diplomatic solution to the crisis, but “high” Federalists became increasingly ambitious. Given reports of a pending French invasion, the hawks demanded that Adams declare war. Although the president resisted their demand, he did link his political opponents with France and hence added his voice to an outburst of nativism that momentarily diverted the Federalists from serving the national interest.

The Quasi-War generated widespread fear within Federalist circles that French spies and their internal collaborators threatened national security. Representative Harrison Gray Otis denounced “wild Irishmen” and “the turbulent and disorderly of all parts of the world” who came to the United States “with a view to disturb our
own tranquility after having succeeded in the overthrow of their own governments." David Tappan, Hollis Professor of Divinity at Harvard, warned graduating seniors against infidels and impending world revolution. Congregationalist minister Jedidiah Morse called attention to the machinations of the “Bavarian Illuminati,” a cabal of radical atheists who already had infiltrated American churches and schools.

The Alien and Sedition Laws, as they became known, sought to root out such subversion, and in the process destroy the Democratic-Republican opposition, slow immigrant participation in political life, and compel support for Federalist measures. These laws increased the period of residency required for citizenship, empowered the president to expel aliens suspected of activities deemed “dangerous to the peace and safety of the United States," and provided penalties for citizens who engaged in rioting, unlawful assembly, or impeding the operation of the government. The Sedition Act did not weigh exclusively against immigrants. Premised on the assumption that war would be declared, the Sedition Law aimed to gag political criticism and would expire on the last day of Adams's term. The law, rooted in the seventeenth-century British concept of seditious libel, also reflected the Federalist view that government was the master, not servant, of the people. Any critique of government was dangerous because it subverted the dignity and authority of rulers. Politics was not a popular right; it belonged “to the few, the rich, and the well-born.”

Certain that Democratic-Republicans stood poised to undermine the Constitution and overturn the government, Federalist judges turned their fire on Jeffersonian editors and publicists. With stacked courts presuming guilt unless defendants proved their innocence, published criticism of elected officials became synonymous with conviction. As Jeffersonians resolutely opposed Adams's call for an accelerated defense program, they encountered the heavy hand of Federalist patriotism, which included indictment of Philadelphia Aurora editor William Duane and the incarcerations of Scots publicist James T. Callender, the Irish-born Vermont congressman Matthew Lyon, and Pennsylvania editor Thomas Cooper.

John Adams withstood the war cry emanating from Federalist hawks and courageously dispatched William Vans Murray, the American minister at The Hague, to France, where he signed the Treaty of Mortefontaine (1800) ending the naval conflict and abrogating the “entangling” Franco-American treaties of 1778. In the interim, as the “Black Cockade fever” raged and Federalists sought to extirpate Illuminati and other subversives, Jeffersonians mounted an effective counterrattack, organizing politically and continuing to attack Adams. Jefferson and James Madison drafted the Kentucky and Virginia Resolutions, respectively, condemning the administration's violation of individual and states' rights, and the malevolence felt by many immigrant groups toward the Federalist Party became implacable. In the election of 1800, Jefferson narrowly triumphed—a victory in which Scots-Irish and Irish, Pennsylvania Germans, and New York French played a role.

The election of 1800 signified the political arrival of America's immigrants, heralded the nation's multiethnic future, and underscored the importance of public opinion—the people's right “to think freely and to speak and write what they think.” With the Federalist Party in eclipse—an unintended consequence of the nativist outburst of 1798—nativism remained a potent force in New England. During the War of 1812 delegates to the Hartford Convention (1814–1815) threatened secession after denouncing the impact of the war upon their section's economy, declaring that European monarchs were “dumping” paupers on American shores, and proposing a constitutional amendment that would exclude naturalized citizens from holding civil office or serving in Congress.

**THE MID-NINETEENTH CENTURY**

Federalists attempted to safeguard the new nation (and their own political fortunes) against revolution by muzzling dissent and seeking to bar immigrant radicals and alien poor. These campaigns continued in the three decades before the Civil War—an era of unsettling change, disorder, and—for many Americans—uncertainty and anxiety. Jacksonian America featured the convergence of modernizing transportation and market revolutions, the emergence of liberal capitalism and government bureaucracy, as well as the concomitant growth of slavery and sectionalism and the dispossession of most Indian tribes east of the Mississippi River.

During this era, nativism became more complex, drawing its inspiration from a variety of
sources. Antebellum xenophobes expressed the need for consensus at a juncture when constant and bewildering change appeared to threaten “the old landmarks of Christendom and the glorious common law of the Founding Fathers.” A lack of institutional authority and standards strengthened the drive for common ideological unity. The very diversity of this period—with its myriad religious groups, faddist sects, and voluntary organizations—implied divisiveness and stimulated anxiety about the nation’s future and tensions between individualism and community in a modernizing polity. Nativists took up the battle against autonomous groups combining secrecy with a demand for total loyalty. Such organizations as the Church of Jesus Christ of Latter-Day Saints, the Masonic Order, and the Roman Catholic Church troubled native-born and Protestant Americans as the antithesis of the egalitarian ideals of Jacksonian Democracy. In this era of “Pax Britannica,” nativism provided worried Americans a series of contrived threats—moral equivalents of war—with which to rebuff autocratic adversaries and thus bolster the legitimacy and authority of republican institutions.

Anti-Catholicism during the Jacksonian era transferred the battle for democracy from the level of intellectual combat in the national arena to parochial politics and mob violence “where every son of liberty could strike his blow for righteousness.” The Adams-Onís Treaty of 1819, concluded between John Quincy Adams and the Spanish minister Luis de Onís, struck such a symbolic blow. This “transcontinental treaty” extended American claims to the Pacific and thus “liberated” a vast expanse from a Catholic state. Four years later President James Monroe warned the European Quadruple Alliance not to intervene in the affairs of the newly independent Latin American republics. Monroe’s “doctrine” was, of course, upheld by British sea power. Yet not a few Americans held to the belief that Europe’s despots might attempt to reassert their power in the Western Hemisphere.

Such was the message of the artist and inventor Samuel F. B. Morse, who in 1834 warned of a Catholic plot to undermine the Republic. Echoing his father, Jedidiah Morse, in decrying the apathy of most Americans, Morse’s Foreign Conspiracy Against the Liberties of the United States declared that the European Leopold Association, currently assisting American bishops in the Mississippi Valley, was in fact an entering wedge through which Prince Metternich of Austria and Czar Nicholas I of Russia would seize control. A year later fellow New Englander Lyman Beecher published A Plea for the West. A prominent minister who became president of Lane Theological Seminary in Cincinnati (with St. Louis, a stronghold of Catholicism), Beecher grasped the significance of American know-how for westward, ultimately global expansion and evangelicalization. Beecher hated demon rum, dueling, religious complacency, Unitarians, and Catholics. Unless Americans accepted God’s challenge and transacted their extraordinary destiny, they could expect dreadful retribution. Either Protestant faithful would evangelize the west and the world, or the area would be captured by an institution that destroyed freedom of thought, cloaked its true atheism behind specious symbols of religiosity, generated revolution wherever it appeared, and knew no limit in its quest for riches and power. If Catholicism were not halted, Beecher averred, the republican experiment would expire in a wasteland of ignorance and infidelity.

The idea of America as a contingent experiment verging on the most abject failure provides a recurrent theme in nativist literature, linking congregationalist ministers in Federalist New England, to avatars of 1840s revivalism like Beecher, and to twentieth-century fundamentalists like Billy James Hargis and Jerry Falwell. Beecher no doubt spoke for traditional congregationalist clergy seeking to redress its loss of established power by spreading New England Protestantism westward. But the expansionist connotation of his message was clear, and alongside the influx of Irish and other Catholic immigrants, it generated concern among those unsettled by cultural change.

The immigration of the 1830s and 1840s indicated to nativists that Europe’s leaders might not be able to launch navies across the Atlantic, but they could send their illiterate, destitute, and criminal elements. Perhaps because the economy recovered well from the Panic of 1837, and Europe seemed far away, anti-Catholicism did not become a staple of the Mexican War (1846–1848). That it did not underscores the marginal relationship between nativism and foreign policy at this juncture. Although observers on both sides of the debate on the war disparaged the imputed racial inferiority of the Mexican adversary, Protestant nativists never succeeded in making the conflict a religious jihad. Some southern denominations—moved by the racialism that girded slavery—did warn that the “yoke
of papal oppression would be placed upon every state of the Republic” unless Mexico was crushed. But the absence of a unified anti-Catholic base was clear in the strength of other Protestant enemies, especially in northern states—including the “peculiar institution” of slavery, war generally, and the Mexican War in particular. Indeed, not a few northern Protestants scorned the threat posed by an aggressive slave-power conspiracy to extend its dominion into the western territories. Human bondage—here and now—proved more compelling than human bondage allegedly engineered by the Vatican.

More important, the cultural and social change that so alarmed Morse and Beecher had diluted Protestantism, secularized it, and stretched its basic tenets. Hence, most Americans rebuffed attempts to link Mexico with the Catholic menace. Midwestern Protestants generally held few uncertainties about the nation’s future and the durability of their civilization. Mexican culture was primitive and impotent, and Mexican armies posed no threat to national safety. The historic Catholic culture of the Mississippi Valley would not halt American expansion to the Pacific.

Nevertheless, tales of Catholic atrocities persisted through the 1830s, 1840s, and 1850s, stimulating nativist imaginations (a form of ultra-Protestant pornography) and in urban and urbanizing venues making life difficult for Irish immigrants. The Awful Disclosures of Maria Monk (1836), which detailed lustful priests, compliant nuns, and strangled babies born of unholy wedlock, was the best known of this apocryphal confessional literature, and sold more than 130,000 copies over the next twenty years (earning the sobriquet, eventually, as the Uncle Tom’s Cabin of the anti-Catholic crusade). For their part, Irish immigrant supporters of the Young Ireland movement spoke out in their new country against English rule and incurred violent reactions in Brooklyn, Philadelphia, and Boston, among other cities. Anti-Catholic hostility centered upon such issues as the alleged role of immigrants in urban political corruption, trusteeship, the correct version of the Bible to be used in public schools, and rivalry in labor markets. In the late 1840s more than a million immigrants—expelled by famine—arrived in America “with hatred in their hearts for the British.” The new arrivals made it necessary for politicians to heed their interests, thereby transforming urban politics in several venues.

Anti-Catholicism affected but was not coeval with antebellum nativism. Xenophobes also condemned non-Catholic immigrants and native Americans whose sociopolitical affiliations or religious tenets challenged local power structures or dominant cultural ideals. In addition, numerous immigrant groups—including Scots-Irish Presbyterians in Philadelphia and German radicals in the Ohio Valley—joined the Protestant crusade, as did many native-born Catholics. Bishop John J. Hughes of New York took the lead in denouncing the radicalism of Hungarian patriot Lajos Kossuth, while Boston Irish Catholics denounced German “48ers” as “red” republicans, anarchists and despoilers of the Sabbath. In fact, between 1846 and 1855 more than a million Germans came to the United States, leaving behind revolution and potato famine, and becoming politically active in their new home. This activism, though not unified, unsettled nativists.

The arrival of three visitors in the early 1850s connected nativism with foreign relations and domestic politics more closely than any episode since the 1790s. Hungarian nationalist Lajos Kossuth fled Europe after leading a failed uprising against Austria in 1848. Attacking New York’s Bishop Hughes as an agent of Habsburg despotism and warning of a Vatican conspiracy to rule the world, Kossuth sought to enlist mercenaries to return to renew Hungary’s battle for independence. Kossuth captured the imagination of Americans until most realized that he might upset the delicate balance between the means and ends of foreign policy. Democratic leaders who might have aided him did not embrace his cause. And by 1852, the Whig Party had sanded along sectional lines as a result of the slavery controversy. Hence, Kossuth failed to enlist political support and had to settle for leaving behind, in the words of historian Thomas A. Bailey, “Kossuth beards, Kossuth hats, Kossuth overcoats, Kossuth cigars, the Kossuth grippe, and Kossuth County, Iowa.”

The arrivals of “Father” Alessandro Gavazzi and Monsignor Gaetano Bedini early in 1853 for a time appeared to transfer the battle for Italian unification to the United States. Gavazzi was an apostate monk who took part in the rebellion of 1848, while Bedini, representing the pope on his American visit, resolutely opposed Italian unification. Gavazzi’s nationalistic denunciation of Bedini for leading papal forces at the Battle of Bologna converted what had been a pleasant visit for the papal nuncio into an ordeal, as hostile crowds greeted his every appearance.
The fear of immigrants assumed political meaning during the 1850s as the slavery question slowly immobilized both parties. In 1854 the secret Order of the Star Spangled Banner transformed itself into the American Party, or “Know-Nothing” Party (as New York newspaper editor Horace Greeley dubbed them), because members claimed to know nothing about the organization. Party faithful claimed to endorse the asylum ideal—they would welcome all immigrants, except paupers and criminals—as long as the newcomers promised to abstain from politics. The initial strength and subsequent weakness of the Know-Nothings lay in their promise of an issue, the danger of immigration, that skirted the slavery dispute. Nativism in this instance was less an end in itself than a means to achieve national unity amid growing sectional crisis.

Despite its nationalist gloss, the Know-Nothings were defined mainly by sectional and local conflict. Southern Know-Nothings focused their attention primarily on the tendency of most immigrants to settle in, and augment the political clout of, northern states. Conversely, New England Know-Nothings were often reformers, and most detested slavery. This contradiction undercut the American Party, which survived only as long as the Republic avoided commitment on the slavery question. Ironically, Know-Nothing nativism served to toughen immigrant resolve and cohesion. Abraham Lincoln wooed the German vote in 1860 by seeking to learn the language, reading a German-language newspaper, and naming immigrant Germans to his cabinet.

Know-Nothing nativism also toughened the resolve of Irish Americans who, though caricatured unmercifully, began to win the battle for urban America against lower-class Protestants. Indeed, by the end of the century, the Irish would join nativists in defending the United States against the “new” immigration from southern and eastern Europe.

Yet by the end of the Civil War, nativists could show no federal legislation restricting the immigration. American religious tolerance survived the socioeconomic turmoil and mob violence of the 1830s and 1840s, the Mexican War, and the Know-Nothing movement. Until the 1880s, in fact, confidence in the nation’s power to assimilate newcomers checked nativism in most regions. Even the radical Irish Fenians, who used American soil to harass British North America after the Civil War—including an “invasion” of Ontario launched from Saint Albans, Vermont, in May 1870—fell far short of involving the United States and Britain in a war to free Ireland. In short, the “free security” of the Republic, afforded by the Atlantic and Pacific and weak neighbors to the north and south, combined with a hardy strain of Anglophobia to undermine resentment against Irish immigrants. The alchemy of the melting pot, which held that Americans had only to wait a generation or two to see immigrants assimilated, dominated the national mood. Immigrants had much to offer. As Justice Oliver Wendell Holmes observed, Americans were “the Romans of the modern world, the great assimilating people.”

**IMMIGRATION LEGISLATION AND MORE NEWCOMERS**

Until the 1880s it appeared that even the Sinophobia that flared in California in the 1850s would dissipate. Chinese laborers had proved essential in constructing the Union Pacific Railroad as it passed through the Sierra Nevada. The Fourteenth Amendment shielded the Chinese, as it did African Americans, while the Burlingame Treaty of 1868 mollified nativists by allowing Chinese who entered to provide inexpensive labor, but prevented them from becoming citizens. Economic troubles and social unrest, however, laid the basis for the Chinese Exclusion Act (1882), which proscribed immigration for a decade and marked a key change in the federal government’s laissez-faire policy. The Chinese Exclusion Act codified the idea of a Yellow Peril and denied that Asians were assimilable. This legislation had a clear racial basis and hence also influenced attitudes toward the “new” southern and eastern European immigration. The historian Roger Daniels credits the law as providing “the hinge on which all American immigration policy turned.” The legislation—renewed and amplified in 1884, 1888, and 1892—also influenced similar laws in Australia, Canada, and other English-speaking countries. As one senator told President Rutherford B. Hayes, they were “a cold pebble in the public stomach which cannot be digested.”

The Exclusion Act and its amendments mortified China’s government, which ironically practiced its own policy of ethnoracial exclusion against outsiders until Western powers in the 1840s and 1850s compelled the Chinese to treat whites as equals. China protested often against this inequality, but to no avail. With depression...
and social unrest increasing, Sinophobia swept the Pacific Northwest and Rocky Mountains during the 1880s. In 1885, after a local water company in Tacoma, Washington, hired Chinese to lay pipe despite high white unemployment, a riot razed Chinatown and drove Chinese residents from the city. The incident, which locals deemed a "glorious victory," resulted in China receiving from the United States an indemnity of $10,000. A year later a similar workingmen’s riot in Seattle forced most of the Chinese from the city and compelled President Grover Cleveland to mobilize military force to restore order. A systematic series of arrests occurred in San Francisco and Los Angeles in 1893, and by October sixty-four Asians were in prison pending the outcome of their appeals to avoid deportation. In 1894 these difficulties were settled after Li Hung-chang informed William Bowman, the American counsel at Tientsin, that Sino-American relations were near the breaking point. Then war with Japan intervened to weaken China’s position, and the Gresham-Yang Treaty of 1894 succeeded in placing exclusion and registration laws passed since 1882 on a proper treaty basis.

Resistance to newcomers who were “not like us” burgeoned between 1890 and 1920. No equivalent period in American history can match the twenty million immigrants who came to the United States. Here was the stuff of a colossal saga—given added significance by the sight of the Statue of Liberty, dedicated in October 1886 in New York’s harbor, near Ellis Island, the arrival point for most immigrants. The Statue of Liberty inspired millions of newcomers, and Emma Lazarus’s poem inscribed at its base promised a better tomorrow:

Give me your tired, your poor,
Your huddled masses yearning to breathe free,
The wretched refuse of your teeming shore.
Send these, the homeless, tempest-tost to me,
I lift my lamp beside the golden door.

If the newcomers’ contribution was to provide fodder for the unprecedented economic growth of this era, economic difficulties and accompanying social strife undercut the positive view of immigration many citizens held. Businessmen and reformers joined labor leaders and workingmen in arguing that immigrant gifts paled before their role in promoting domestic discord. By stressing the European origins of class conflict, critics of the American urban-industrial scene like Edwin L. Godkin, Jacob Riis, Richard T. Ely, and Josiah Strong warned of the radical portent of this immigration. Missing the deep conservatism of the great majority of newcomers from southeastern Europe, they also failed to see that new urban governments lacked requisite administrative experience to deal with their problems. According to reformers, the new immigrants were the problem, settling in cities and corrupting politics. National immunity from the ills of Europe seemed to have expired, and the melting pot seemed more a pressure cooker.

This perception gained strength as Americans sought to make sense of the intense labor-management strife of the era. The Chicago Haymarket Riot in May 1886 ushered in a decade of industrial strife and catalyzed in American minds a dread of foreign conspirators. Fearful adversaries of “long-haired, wild-eyed, bad smelling, atheistic, reckless, foreign wretches” did not distinguish between Marxists and anarchists. Indeed, patriotic citizens parcelled together all varieties of immigrant radicalism and left the package in front of the house of labor.

Fears of national decay heightened after the panic of 1893 and ensuing depression. An angry agrarian crusade attacked capitalism and international finance with a cataclysmic rhetoric not designed to reassure jittery easterners. Labor discontent reached bloody pinnacles during the Homestead and Pullman strikes. As time seemed to run out, portending the end of opportunity, geography seemed to conspire. As the historian Frederick Jackson Turner told the American Historical Association in 1893, the era of the frontier—the dynamic font of individualism, liberty, and democracy—had ended. Americans would have to find something new to supplant the source of those characteristics that made the nation great.

As the center seemed incapable of holding, an assemblage of New England Brahmins—graduates of Harvard—formed the Immigration Restriction League. The league championed Anglo-Saxonism and embraced a nostalgic view of the region’s homogeneous past. They pored over the works of John Fiske and John W. Burgess, who applied precepts of social Darwinism to history and politics. Cheering the Foran Act of 1885, which had prohibited European contract labor, the restrictionists gathered behind Henry Cabot Lodge of Massachusetts and developed a series of literacy tests as the best way to halt immigration. While the House passed a literacy bill five times between 1895 and 1917 (with Senate support
after the first failure), presidents as distinct as Grover Cleveland, William Howard Taft, and Woodrow Wilson vetoed the legislation. Only in 1917 did Congress prevail over the veto.

In a society that questioned its ability to resolve conflicts, citizens looked for evidence of the republic’s virility. The Reverend Josiah Strong expressed this anxiety in *Our Country: Its Possible Future and Its Present Crisis* (1885), which excoriated the communal disruption wrought by excessive materialism. This development threatened America’s traditional Anglo-Saxon, Protestant culture in its quest to evangelize the world. As Lyman Beecher had a half-century earlier, Strong anticipated a “righteous empire” of Protestantism expanding and spreading the American way throughout the world. Not surprisingly in an era that witnessed the final relegation of America’s Indians to reservations and penury and southern African Americans to Jim Crow, *Our Country* and other of Strong’s writings embraced the racist thesis that civilization would reach its zenith when Anglo-Saxons extinguished less vigorous peoples and secured international hegemony. Domestic corruption jeopardized this divine mission, made all the more imperative by the impending “final competition of races, for which the Anglo-Saxon is being schooled.”

Strong advocated the mission of the United States rather than its manifest destiny. Just as Protestant Christianity would remedy domestic ills—socialism, intemperance, and the Mormon and Catholic threats—so too would Anglo-Saxon torchbearers of Protestantism carry their message to the far corners of the earth—not on the end of a sword, but through the persuasive power of example.

Pressure engendered by various domestic crises during the 1890s stimulated chauvinists and nativists alike. Richard Hofstadter’s concept of a “psychic crisis” does not explain the William McKinley administration’s decision for war against Spain in 1898, but by underlining the close relationship between the domestic distress of the 1890s, nativism, and the new bellicosity in American diplomacy, the construct suggests why Americans were eager for foreign adventure. During the decade the United States went to the brink of war with Italy, Chile, and Great Britain over issues peripheral to the national interest. Nativism served as a catalyst for these episodes, demonstrating its function to unify a divided nation by focusing on foreign problems and threats. In 1891 a New Orleans mob lynched eleven Italians and Italian Americans immediately after they were acquitted of the charge of murdering the city’s police chief. The episode did nothing for Italian-American relations, especially when Theodore Roosevelt deemed it “a rather good thing.” After Italy demanded compensation for the families of the deceased and Washington demurred, Italy cut full diplomatic relations. War talk flared among jingoists and one Georgian promised to muster a company of soldiers “to invade Rome, disperse the Mafia, and plant the stars and stripes on the dome of St. Peter’s.” As immigration restrictionists disparaged Italians and other southeastern Europeans and big-navy men called for an ambitious building program, President Benjamin Harrison chose the statesmanlike course and apologized to Italy. The war scare passed. But many journals observed that in the face of the threat national unity replaced sectional bickering.

A NEW CENTURY OF IMMIGRANTS

Nativism diminished at the beginning of the twentieth century. A robust national economy shielded newcomers, even as the assassination of President McKinley by Leon Czolgosz, an American-born radical, led Congress in 1903 to bar “anarchists or persons who believe or advocate the overthrow by force or violence of the Government of the United States . . . or the assassination of public officials.” The nation’s immigration bureaucracy grew quickly after 1900, boasting more than 1,200 workers by 1906. A year later Congress established the Immigration Commission, which in 1911 issued a huge report that popularized the distinction between the “old” and “new” immigration. The former was salutary, the latter baneful. The Immigration Commission also searched for illness at Ellis Island and on the West Coast, as bacterial and viral outbreaks—long associated with specific immigrant groups—became a means to distinguish “healthy” Americans from sickly aliens. In 1793, Philadelphians deemed an outbreak of yellow fever “Palatine Fever,” to indicate German immigrant responsibility for the outbreak; in 1832 nativists attributed a cholera epidemic on the eastern seaboard to Irish-Catholic immigrants; and in 1900 the Chinese in San Francisco took the blame for an outbreak of bubonic plague. By 1907, in addition to anarchists, immigration undesirables excluded from American shores included paupers, polyga-
Nativism

Roosevelt and the Japanese exchanged several diplomatic notes, which became the basis in 1907 for the so-called “Gentleman’s Agreement,” an executive agreement that restricted passage of Japanese laborers from Hawaii and Japan to the United States unless they had “already been in America.” The arrangement, shifting Japanese migration to the United States from basically male to female, quieted but did not halt anti-Japanese agitation. Foreign-born Japanese (Issei) remained “aliens ineligible to citizenship,” while second-generation citizens (Nisei) found the Fourteenth Amendment a poor guarantee of the rights of citizenship against discriminatory law and custom. After leaving office, Roosevelt himself concluded that cultural and economic conflict was inevitable in relations between Americans and Asians.

Nativism reached its apogee during and directly after World War I. Just prior to American intervention in the conflict, congressional restrictionists overcame President Woodrow Wilson’s veto and passed the major recommendation the Dillingham Commission made six years earlier. The Immigration Act of 1917 barred illiterate adult immigrants; set a head tax of eight dollars per person; and excluded vagrants, alcoholics, advocates of violent revolution, and “psychopathic inferiors.” Passage of a literacy test and the establishment of a barred zone in the southwest Pacific—which closed the gates to Asians not already banned by the Chinese Exclusion Act and Gentleman’s Agreement—indicated that the Great War heralded a more sinister era in the history of American nativism.

WORLD WAR I AND THE 1920S

With the outbreak of war in Europe in August 1914, the geographical and political isolation—that placed foreign policy above controversy, rendered immigrant attitudes nonpolitical, facilitated assimilation, and shielded the melting pot—quickly dissipated. Foreigners who earlier solicited American support—like Edmond Genet and Lajos Kossuth—annoyed nativists, but did not change American noninterventionism. Even the wars with Mexico and Spain underlined unity. But now Europe seemed much closer. President Wilson’s assurance that the United States would not intervene notwithstanding, nativism as a force for patriotism and national unity stressed conformity—targeting German Americans and political radicals. Divisive themes, like...
anti-Catholicism and Teutonic racism, disappeared from the nativist lexicon.

Nativism in World War I had much in common with xenophobia during the Quasi-War. The chief assertion of American nationalism, termed “100 percent Americanism” after U.S. intervention, attested to the realization of cultural and social diversity amidst crisis. First- and second-generation immigrants comprised one-third of America’s population—a point made more problematic by the loss of confidence by Progressive reformers. Hence, the preparedness campaign during the period of neutrality (1914–1917) focused primarily on German immigrants. Well-organized, prosperous, and self-consciously retaining old-world customs, German Americans mobilized following the outbreak of war to block munitions shipments to belligerents and counter sensational “Hun” propaganda stories emanating from London. In January 1915 the German-American Alliance met in New York, demonstrating a great show of unity—and outraging American nativists.

This gathering coincided with Germany’s announcement of submarine warfare against Britain and with German attempts to bomb American vessels and munitions plants. Soon politicians and editors condemned the apparent conspiracy, decrying “hyphenate” Americans (but never Anglo-Americans, the antiwar activist Randolph Bourne pointed out) and heeding former President Roosevelt’s point that any apostasy from total allegiance smacked of “moral treason.” “America for the Americans!” he thundered. “Our bitter experience should teach us for a generation . . . to crush under our heel every movement that smacks in the smallest degree of playing the German game.” President Wilson’s counsel at the outset that Americans “be neutral in thought as well as in deed” quickly went by the board as citizens chose sides and sought to profit from the conflict by selling matériel and munitions to the belligerents. Britain, of course, held the advantage there.

As American neutrality became increasingly pro-British, radicals and dissenters joined German immigrants as surrogate enemies for patriotic citizens. Men like Henry Cabot Lodge and Augustus Gardner, wealthy New England Brahmins, moved easily from attacking new immigrants and labor unions to alerting citizens about the dangers posed by pacifists and German Americans. Citizens organizations like the National Security League and American Defense Society competed to strengthen the military and impose unity in all areas of life. German submarine warfare and propaganda played into the hands of these grassroots patriots, whose distrust of immigrants was shared increasingly by the Wilson administration. Although the German-American Alliance forbade political activity, state and local immigrant groups continued to lobby, no doubt exacerbating the bitter feelings that peaked during the 1916 election campaign. Denouncing “that small alien element among us which puts loyalty to any foreign power before loyalty to the United States,” Wilson and the Democratic Party portrayed Republican candidate Charles Evans Hughes—who refused to get involved with the hyphenate issue—as “a dupe of the Kaiser in pro-British areas, and as a Roosevelt-dominated jingo spoiling for war with Germany in areas with a large Teutonic population.” The president played both sides of the nativist coin.

The mailed fist of patriotism fell even harder on German Americans once the United States entered the war. Ironically, as the Republic moved to make the world safe for democracy, American-style, patriots nearly tore up the Bill of Rights. Ethnic fidelity now became a sine qua non of foreign policy, even more so with the Russian Bolshevik Revolution of November 1917. German culture came under attack on all fronts, with hamburgers, sauerkraut, Beethoven, and German language instruction disappearing. The Department of Justice gave vigilante groups like the American Protective League carte blanche to ferret spies and saboteurs from the German-socialist-pacifist–International Workers of the World–trade unionist monolith. In Collinsville, Illinois, an area previously scarred by racial and labor-management violence, Robert Paul Praeger was lynched in April 1918. Praeger was a socialist and a radical, and his death drew little support for civil liberties. Indeed, most observers considered Praeger’s hanging evidence of the inadequacy of federal legislation to suppress sedition. The New Republic called this argument “a species of sickening cant,” but editors and politicians who disdained vigilante justice praised passage of the Sedition Act of 1918.

Nativism did not diminish with the end of the war. Indeed, the martial psychology of 1917–1918 intensified in the face of postwar domestic dislocations, the apparent menace posed by the Bolsheviks, and, most important, the sudden loss of unity and purpose fostered by war. “War is the health of the state,” Randolph Bourne averred cynically, but with peace American
democracy suffered anew. The Red Scare of 1919–1920 reflected anxiety at the racial violence, inflation, and economic recession attending demobilization and reconversion, as well as the appearance of new American communist parties, directed by the Moscow Comintern, and significant immigrant presence in the violent steel and textile strikes of 1919. Led by Attorney General A. Mitchell Palmer and “sustained by large numbers of business and political leaders, corporations and interest groups, several agencies of government, superpatriotic societies, and the press,” federal agents targeted as security threats anarchists, communists, radical labor groups, and other citizens who had opposed the war.

The Bolshevik threat affected debate on the Treaty of Versailles and the League of Nations. Republicans and Democrats alike denounced as misguided Wilson’s messianic prophecy to remake the world in the Republic’s image and pointed out that Americans could never trust Old World statesmen. “Men had died,” the poet Ezra Pound wrote, “for an old bitch gone in the teeth, a botched civilization.” Hence, when Wilson argued that the new League of Nations would stem the Bolshevik threat, Columbia University President Nicholas Murray Butler retorted that the Versailles Treaty was “unpatriotic and un-American,” an example of “subtle, half-conscious socialism.” American fears peaked on 2 June 1919, when a dynamite explosion rocked Palmer’s home on K Street in Washington (and blew up the perpetrator), and bombs exploded at the homes of leading citizens in eight other cities. An erstwhile Quaker with political ambitions, Palmer set out to destroy the “reds” and capture the Democratic nomination for president in 1920. He created a General Intelligence Division, led by J. Edgar Hoover, which soon amassed more than 200,000 cards detailing the character of radical organizations and publications and the case histories of more than 60,000 “dangerous radicals.”

Incapacitated by a stroke, Wilson could not restrain Palmer, whose crusade soon left its mark. Within months the Palmer raids, strengthened by support from the newly formed American Legion, led to the deportation of 249 Russian immigrants whose Bolshevism was more imagined than real. The Lusk Committee in New York expelled five socialist delegates from the state legislature; business leaders fostered scare propaganda to deflect labor grievances; California prohibited Japanese from owning land; an Illinois mob turned on Italian settlers, beating them and razing their homes; and one patriot charged that Albert Einstein’s theory of relativity had Bolshevik origins. Most Americans, one cynic noted, could not distinguish between Bolshevism and rheumatism, but no matter. The Soviets would provide a whipping boy for nativist patriots for the next seventy years.

When domestic conditions improved in 1920, the Red Scare collapsed—but not before Palmer himself became a victim of the episode. His presidential hopes evaporated along with the crisis. Nonetheless, World War I and the Red Scare cast a long shadow into the 1920s and beyond. Soviet-American relations were poisoned from the beginning by judgments and actions conditioned by wartime and postwar xenophobia. Bipartisan disillusionment with the politics of Europe contributed to the economic protectionism of the 1920s and also influenced the refusal of the United States to join the World Court. The linking of radicalism with disloyalty tarnished the labor movement for more than a decade. In Massachusetts, two Italian anarchists were executed after a trial that arrayed the values of the Brahmin establishment against alien radicalism. Liberals may have been outraged and transformed the defendants into martyrs after their death, but presiding Judge Webster Thayer’s censure of Nicola Sacco and Bartolomeo Vanzetti as “anarchist bastards” epitomized the feelings toward southeastern Europe and radical politics held by most Americans.

Most important, the Red Scare gave the Immigration Restriction League “evidence” to show that the melting pot threatened American society and culture. The early 1920s witnessed the full flowering of Anglo-Saxon racism, part of the nostalgic drive toward Protestant Anglo-conformity that gave the decade its ambivalent cultural tone. The “roaring twenties” clashed with an “anxious twenties,” in which sober citizens questioned the multicultural, interdependent, consumer-oriented future and hearkened toward a simpler past. The notion that a person’s genes determined one’s destiny found expression in university quotas and employment restrictions against Jews, the writings of Lothrop Stoddard and Madison Grant, the popularity of IQ tests and eugenics, and the renewal of congressional debate on immigration. Led by Albert Johnson of Washington, long an enemy of local Wobblies, congressional restrictionists overrode President Wilson’s veto in early 1921 and passed legislation limiting immigration based upon nationality: the number of immigrants per year from one country could
not surpass 3 percent of the total of that nationality resident in the United States in 1910. Three years later the Johnson-Reed Act closed the door to “inferior” peoples. Quotas would now reflect resident populations of 1890; after 1927 immigration would be limited to 150,000 persons annually, and Asians would be excluded. Commerce Secretary Herbert Hoover agreed, suggesting “biological and cultural grounds why there should be no mixture of Oriental and Caucasian blood.” President Calvin Coolidge did not mince words. He noted in signing the bill that “America must be kept American.”

If the Red Scare prevented Americans from adapting to postwar realities, it was not surprising that during the decade after the conflict many citizens wrestled with fundamental social tensions by seeking to revive the attitudes and values of an earlier era. Nativist defenders of an idealized Gemeinschaft (“community”) culture sought to halt the intrusion of modernity. What historian John Higham called the tribal twenties exhibited a retrospective idealism, at once parochial and nationalistic, at war with urbanism, secularism, and ethnic diversity. This cultural strain drove a significant part of the populace to embrace Anglo conformity as its rejoinder to the challenges posed by modern urban-industrial America—not least its liberated women, hot films, and jazz. In the 1920 census, for the first time in the nation’s history, urban residents outnumbered their rural cousins—and there would be no restoration of a preindustrial epoch. Henry Ford epitomized the cultural problem of Americans enjoying the fruits of mass production and postwar technological prowess and lamenting the sociocultural consequences of change. The father of mass production—his assembly line devastated traditional skills and his Model T automobile revolutionized travel (and also provided a bedroom on wheels and means to escape small-town surveillance)—Ford became the most notorious anti-Semite of the interwar era. A scion of the rural Midwest, he organized a “peace ship” in 1915 to halt the European war. Initially supporting Wilson’s League of Nations and dunning intolerant patriots during the Red Scare, Ford met frustration at every turn.

Disillusionment and economic problems in 1920 led to Ford’s espousal of an ideological anti-Semitism that ultimately caught the attention of Adolf Hitler and his Nazis. In the pages of his Dearborn Independent, he came to blame just about every modern problem (and personal peeve) on the Jews. The short list included gamblers, booze and cigarettes, immigrants, Bolsheviks, bankers, and unions, but the underlying peril was a sinister Jewish cabal seeking to dominate the world. The Protocols of the Elders of Zion, a czarist forgery in Russia in 1891, provided Ford documentation for his facile explanation of dismayng cultural trends and a dramatic symbol of the danger posed by international political cooperation.

Similar malice toward immigrants and internationalism colored the discourse of the Ku Klux Klan, reborn in 1915 and peaking eight years later with 2.3 million members. The soul of the organization, splintered into groups reflecting regional nativistic animosities (against blacks in the South, Asians in the West, Catholics in the Midwest, and Jews in the Northeast), lay in America’s urbanizing towns and villages—under siege from modernism, however defined. These were the same venues that gave Henry Ford his major support. Although Klan rhetoric primarily targeted these minorities, actual violence generally fell upon white, Anglo-Saxon apostates who strayed from traditional Protestant moral codes. Bootleggers, feckless husbands, and cheating wives comprised major targets for the Klan, which also prospered in urban centers in the Midwest and Southwest, reflecting demographic change wrought by World War I. Imperial Wizard Hiram W. Evans led the Klan in its “fight for Americanism,” which included, among other items, support for Prohibition, immigration restriction, anti-evolution laws, and family values.

The 1920s included numerous examples of rural-minded, defensive imperialism. Yet as tribal nativists moved to prevent command of the nation’s destiny from passing from Main Street to the metropolis, they affirmed the material benefits of the modernity they so grimly denounced. This contradiction mirrored a similar ambivalence in American foreign relations during the 1920s and 1930s. On one hand, Washington rejected political commitments like the League of Nations and the World Court. On the other, as William Appleman Williams and Emily Rosenberg demonstrate, apart from its protectionist tariffs, the United States proved adept internationally in economic and cultural realms, particularly in its search for markets and influence in Europe, China, Latin America, and the Middle East. Being in the world, but not of it, hearkened back to the original reason why English Puritans settled in the New World in the
early seventeenth century. Now, however, this quest for what Warren I. Cohen deemed “an empire without tears” confirmed the superior morality of Americans, but did not prepare them for constructive global action in case of crisis.

Nevertheless, nativism as an organized movement triumphed with passage of the National Origins Act of 1924. The law produced a sharp decrease in the volume of European and Asian newcomers and hastened the Americanization of newcomers already present in the United States. The Great Depression that began in 1929 also advanced the assimilation process, for economic difficulties blurred cultural distinctions between ethnic groups as it sharpened class feelings in the working population. Franklin D. Roosevelt’s New Deal also diminished the power of immigrant cultural and social groups by making immigrants and natives alike look to government for relief. Developments in mass communication—documentary films, Franklin Roosevelt’s fireside chats and radio itself, Works Progress Administration guidebooks and chronicles—also subjected Americans to unprecedented common experience. Finally, nativist attempts to cleanse the body politic of alien growth in fact shielded minorities by sharply restricting fields open to them. With the advent of economic catastrophe in 1929, Americans directed their bitterness at the establishment—white, Anglo-Saxon, and Protestant.

Even before the depression, social scientists initiated what John Higham termed a “massive assault on racial thinking and ethnocentrism.” American loathing of Nazism during the late 1930s and World War II strengthened this trend and helped prevent the sort of vicious nativism that appeared after 1916. The German-American community also remembered the indignities it encountered, and after a bitter debate on intervention in the European War, the Japanese attack on Pearl Harbor served further to unify the nation. Hence, American anti-German hatred focused not upon German immigrants and their offspring, but upon Hitler, his political hierarchy, and the Nazi doctrine of Aryan supremacy. Official policy made this distinction until the end of the war. Not surprisingly, then, anti-Catholicism and racial nativism became less important, remaining powerful only among dyed-in-the-wool Roosevelt haters.

Indeed, from the 1930s on persons who advocated old-fashioned 100 percent Americanism risked identification with European anti-Semitism and fascism. The Great Depression gave several mass leaders a name and national following. The most famous, Huey Long of Louisiana, was assassinated in 1935, after he helped defeat Washington’s attempt to join the World Court. The others included Father Charles E. Coughlin, the radio priest from Royal Oak, Michigan; the spiritualist William Dudley Pelley, founder of the Silver Shirt Legion; and Fritz Kuhn, leader of the German-American Bund. These men exhibited a curiously inverted form of nativism. Father Coughlin (borrowing from Henry Ford and earlier populists and anticipating the strategy and tactics of Joseph R. McCarthy of Wisconsin) denounced treason within government circles, fingering President Herbert Hoover, Treasury Secretary Andrew W. Mellon, government bureaucrats, and ultimately the entire Roosevelt administration. Here were the real “aliens,” agents of a Judeo-Bolshevik conspiracy that threatened the Republic.

WORLD WAR II AND THE EFFECTS ON NATIVISM

This charge allowed traditional targets of nativists to turn the tables on their historic adversary—the Anglo establishment. As Justus Doenecke notes, disdain for Britain and things British unified a heterogeneous group of Americans who opposed aid to Britain between 1939 and 1941. Coughlin and several other mass leaders, however, copied Hitler’s anti-Semitism and anticommunism. This strategy, combined with their accusation that members of the legitimate political order were the real aliens in the United States, backfired by decade’s end. Their thesis that a cabal of Anglophiles, Democratic politicians, international bankers, and Jews controlled the government gave the Roosevelt administration evidence to proclaim the existence of an internal fascist movement, to link this threat with respectable noninterventionists attempting to prevent American entrance into the war, and to strengthen presidential power over foreign affairs. In September 1941, when famed flier Charles A. Lindbergh blamed the Jews, along with Britain and Roosevelt for the nation’s march toward war, he closed the circle—nativism was now perceived as un-American, and noninterventionists as minions of Hitler.

Yet if World War II did not approach the first in its violation of civil liberties, the second remains far from the “good war” portrayed in
much historiography. Indeed, the racial character of the conflict figured prominently on both sides of the Pacific and revealed anew that the Republic was, in Richard Polenberg’s term, “one nation, divisible.” The war underlined anew the appalling treatment accorded African Americans, yet also led at long last to the postwar integration of the armed forces. The most flagrant blot on wartime civil liberties came with the incarceration of 126,000 Japanese Americans—ripped from their homes on the West Coast and transferred to “relocation” camps in the western interior. This diaspora came shortly after Pearl Harbor, when the federal government embraced the Pacific coast obsession with the Yellow Peril and accepted Lieutenant General John L. DeWitt’s doctrine of “military necessity.” Contrary to DeWitt’s argument and popular belief, the Japanese Americans were not spies and saboteurs but a hard-working and prosperous people whose virtues did justice to Horatio Alger.

This mass relocation marked a new chapter in the history of American nativism. The Japanese Americans, who gained an official apology and partial redress in 1988 for their tribulations, were not tarred and feathered or forced to kiss the flag. For the first time, the federal government efficiently rounded them up and shipped them off to concentration camps, where—having lost their property, their jobs, and their civil and legal rights—they sat out the war behind barbed wire. The threat of Japanese-American betrayal, which girded relocation, drew support from President Roosevelt in Executive Order 9066, secured approval from Congress, and was upheld by the Supreme Court. The incarceration had unintended consequences as Japanese Americans moved eastward, and shifted their occupational emphasis from agriculture to business and the professions.

Nativism declined in importance after 1945, reflecting eroded foundations of ethnic group loyalty and changes in the basic structure of society after 1945. Religious affiliation supplanted ethnic origin as the basic means of achieving self-identity and promoting group loyalty. The memory of the Holocaust—and of the taudiness of the United States and other Allies in dealing with it—contributed in 1948 to passage of the Displaced Persons Act, which opened the gates to 400,000 Europeans. Moreover, the onset of the Cold War enabled immigrants and refugees from central and eastern Europe to move within the national consensus. Czechs, Hungarians, and Poles could be as good—or better—Americans than the white, Anglo-Saxon Protestant establishment, especially the perjured traitor, Alger Hiss, and his key character witness, Dean Acheson. In its ire against Anglophiles and intellectuals, McCarthyism both reflected and intensified the patriotism of these anticommunist Europeans.

Nativism did not disappear, however, and in the last quarter of the twentieth century antiforeign sentiment erupted during periods of economic duress, especially in areas in which these groups settled and in contexts where political candidates like Pat Buchanan courted voters with antiforeign themes. Residents of the postindustrial rust belt seemed most sensitive to antiforeign ideas, which often emerged with antigovernment tones. For example, the downturn in the American automotive market negatively affected Asian Americans. The Ku Klux Klan and other survivalist and hate groups still sputtered along, erupting occasionally, as an unhappy underside of multicultural reality. Defenders of an older America denounced nonwhite newcomers, as their predecessors denounced immigrants in the 1840s, 1890s, and 1920s. But the nostalgic nativism at the beginning of the twenty-first century—never more than a minority position—did not hide the point that newcomers since the 1970s had often done the
kinds of work that native-born Americans choose not to do. In this way newcomers continued to reap the promise of what was still the most powerful force on earth—the American dream. The terrorist plane crash into the Pentagon and the destruction of the New York World Trade Center towers on 11 September 2001, however, heralded a new chapter in nativism. Americans of Middle Eastern descent now faced uncertainty as the Republic gathered its resources to meet a new kind of threat to its national security.

BIBLIOGRAPHY

DeConde, Alexander. Ethnicity, Race, and American Foreign Policy: A History. Boston, 1992. Focuses on the rise, place, and slow decline in power of the Anglo-American majority and argues that historians often minimize the importance of British immigrants and their role in fomenting nativism against other groups. A good starting place for those wishing to further assess nativism's place in the context of foreign relations; it also has the advantage of assessing the development of racism as an integral part of the American establishment.

Ribuffo, Leo P. *The Old Christian Right: The Protestant Far Right from the Great Depression to the Cold War*. Philadelphia, 1983. Presents perhaps the most skillful synthesis of nativist theory, historiography, domestic culture and foreign relations.

The history of American naval diplomacy may be divided into three periods that correspond to technical developments in naval warfare and with the changing situation of the United States in world affairs. During the first century of the nation’s history, when the United States enjoyed considerable security provided by the oceans separating it from Europe and Asia, its naval forces were largely directed toward protecting American merchants, missionaries, and government officials in Africa, Asia, and Latin America. This involved showing the flag to induce non-European peoples to treat Americans according to European and American conceptions of civilized practice. During the period from 1890 to 1945, the diplomatic role of the navy was revolutionized by the emergence of the United States as one of the great naval powers. To its earlier responsibilities of police and protection, the “new navy” of steam and steel added the strategic objective of defending the Western Hemisphere and a good part of the Pacific against intrusion by the European powers and Japan. After 1945 the navy joined with the air and land arms to provide the element of force behind American global diplomacy when the great military powers were reduced initially to two and finally to one, the United States.

THE FIRST PERIOD: 1790–1890

To protect Americans as they moved across the seas during the early days of the Republic, the navy eventually followed the example of the British Royal Navy by establishing ships on distant stations in the Mediterranean, the Far East, the Caribbean, the southern Atlantic, the Pacific, and Africa. The ships on each station, rarely more than three to six, were too few to meet all the calls from ministers, consuls, and citizens for a show of force. Only on exceptional occasions did the navy organize a squadron for impressive display, such as the Japan expedition of 1853–1854. The station commanders were both itinerant diplomats and administrative officers who kept their ships moving individually from port to port, reported on conditions in their areas, and watched over enlistments, supplies, and ships’ fitness. Before the rank of rear admiral was introduced during the Civil War, they usually were accorded the courtesy rank of commodore.

Since the Navy Department was unable to undertake detailed direction of the distant stations before the advent of electrical communications, the station commanders enjoyed broad discretion within their domains. Their instructions were generally to protect American commerce and to heed the appeals from Americans to the best of their ability. Only rarely was a navy man placed under direction of a State Department official. Indeed, in a day when American consuls were commonly merchants—and even foreigners—and when ministers were usually political appointees, naval officers were often the most reliable officials serving the United States abroad. In contrast with the independence of naval men overseas, the Navy Department in Washington was under pressure to follow the State Department’s wishes. Introduction of cable and radio by the time of World War I ended most of the autonomy enjoyed by flag officers abroad.

The Mediterranean  The roots of the distant-stations policy extend to the late eighteenth century, when Americans sailing to the Mediterranean were overhauled by corsairs from Algiers, Tunis, and Tripoli. The Barbary pirates assumed that non-Muslims were subject to capture and enslavement unless they were protected by treaties involving tribute payments. In response to Algerine depredations, Congress resorted to naval diplomacy in 1794 by voting to construct six frigates for a navy. Within three years, Algiers, Tunis, and Tripoli had agreed to call off their corsairs in return for monetary considerations. There-
after, however, the navy was diverted from chastising North African potentates by the Quasi-War with France (1798–1800) and by differences with Great Britain that culminated in the War of 1812.

Once peace with Britain was restored in 1815, Congress voted for further war against the Algerine corsairs, and Commodore Stephen Decatur quickly forced a treaty on Algiers that ended tribute payments. Decatur's decisive action halted Barbary depredations, and the Navy Department provided against further outbreaks by establishing a permanent squadron in the Mediterranean. Before 1845 its ships were based at Port Mahon, Minorca.

The navy's cruising range in the Mediterranean extended eastward to Turkey, where in 1800 the frigate *George Washington* (captained by William Bainbridge) was the first American warship to call at Constantinople. After the destruction of the Turkish-Egyptian fleet at Navarino during the Greek War of Independence (1827), the Sublime Porte in 1830 finally signed a treaty of commerce with Captain James Biddle and two American commissioners that included a "separate and secret" article providing for American assistance in rebuilding the Turkish navy. Although the Senate rejected the article, President Andrew Jackson overrode the Senate's veto by sending Commodore David Porter, the first resident American representative, to Turkey with instructions to help the Turkish navy.

The Mediterranean Squadron was also a symbol of American sympathy for the liberal movements in Christian Europe. After the revolutions of 1848, American and European liberals rejoiced when the steam frigate *Mississippi* conveyed the Hungarian hero Lajos Kossuth and fifty other refugees safely to freedom. The squadron, like other distant stations, was practically disbanded during the Civil War. After it was revived in 1865 as the European Squadron, with expanded area, it provided amiable social billets for naval officers as they watched the Mediterranean and Africa fall under an order dominated by Europe.

**Asia** Although the American China trade dated from the sailing of the *Empress of China* from New York for Canton in 1784, the East India Squadron gradually took shape only during some nine cruises to Asia between 1800 and 1839, six by single ships and three in pairs. Initially, the navy dispatched ships to the East Indies to protect American merchantmen on the high seas and to transport public officials such as Edmund Roberts, who negotiated treaties with Siam and Muscat in 1833. In the conflicts between China and the West that destroyed the traditional Chinese tribute system in East Asian relations, it was the diplomatic mission of the U.S. Navy to support the claims by Americans to the various rights that Britain, and later France, gained for their nationals by war. During the first Opium War between China and Britain (1839–1842), Commodore Lawrence Kearney on the frigate *Constitution* won from the governor-general at Canton what amounted to a promise of most-favored-nation treatment for Americans in China. This principle, anticipating the U.S. Open Door policy toward China, was written into the Treaty of Wanghia (1844) secured by Caleb Cushing with support from the East India Squadron. Once China was opened under the "unequal treaties," the American navy's ships on the renamed Asiatic Station, including the famed Yangtze Patrol, were important props for the vast system of interlocking foreign treaty rights, including extraterritoriality, that Chinese nationalists bitterly resented.

The most spectacular demonstration of American naval diplomacy in the nineteenth century was the expedition led by Commodore Matthew Calbraith Perry to reopen Japan after two centuries of seclusion. Planning his expedition to impress the Japanese with the wealth and power of the United States, Perry first moved up Edo (Tokyo) Bay in July 1853 with a squadron of two steam frigates towing two sloops to present letters from President Millard Fillmore and himself urging the Japanese to modify their closed-country policy. Returning seven months later with a more impressive squadron, he induced the decrepit Tokugawa shogunate to sign the Treaty of Kanagawa, which met American demands for limited intercourse. Quite unwittingly, Perry proved to be the catalyst that unleashed a furious struggle within Japan, which led within fifteen years to the full reopening of the country, the overthrow of the Tokugawa, and the great changes of the Meiji Restoration.

To Commodore Robert W. Shufeldt fell the honor of opening the hermit kingdom of Korea to Americans. Korea was historically a Chinese tributary without desire for other intercourse. The expansionist Shufeldt embarked in 1878 on a much-publicized cruise to the Far East on the USS *Ticonderoga*, during which he mediated differences between Liberia and its neighbors, investigated sites for coaling stations in Africa, negotiated with the rulers of Madagascar and Johanna (Anjouan), and introduced the U.S. Navy to the Persian Gulf.
Shufeldt's ultimate objective was to open Korea, which he sought unsuccessfully to do through the good offices of Japan. On a return trip to the Far East, he finally negotiated a Korean treaty with China's leading scholar-official, Li Hung-chang, which the Koreans signed in 1882. Although the treaty established relations between the United States and Korea, it also proved to be a further blow to the Chinese tribute system without winning secure independence for Korea.

**The Americas** The U.S. Navy established stations embracing waters of the Americas where, in addition to showing the flag in support of trade, it watched for alien intrusions into the hemisphere and occasionally intervened in its troubled lands. The West Indies Station, created in 1821 to run down pirates infesting the area, was expanded to form the Home Station in 1841 (the North Atlantic Station after 1865), when strained relations with Great Britain reminded the navy that American coastal shipping was defenseless against raids from overseas. The navy operated its ships in the Caribbean throughout the nineteenth century in the presence of the more powerful British navy. The Monroe Doctrine of 1823, proclaiming the American continent closed to further colonization, was initially rendered effective by tacit support from the Royal Navy. By the Clayton-Bulwer Treaty of 1850, the United States won from Great Britain the right to participate on equal terms with the latter in building an isthmian canal at a time when the U.S. Navy was not yet dominant in the Caribbean.

South of the Caribbean was the Brazil Station, established in 1826 primarily to extend protection to Americans in feuding Brazil, Argentina, and the states of the Rio de la Plata. Usually numbering from two to six ships except during a crisis with Paraguay in 1858, the Brazil Station after 1843 included some 17 million square miles north from Cape Horn to the Amazon, eastward to Cape Negro, and then south along the African coast to the Cape of Good Hope. The station was reconstituted after the Civil War as the South Atlantic Station.

Largest and probably least well defined of the stations was the Pacific Station, dating from 1818. During the early years, the few ships on station tended to cruise between Callao, Peru, and Valparaiso, Chile, with occasional runs to Panama and to the Pacific islands: the Marquesas, Tahiti, Hawaii, and others. After the cession of California by Mexico in 1848, the focus of the station shifted northward, with San Francisco serving as home port. Although it was involved in spectacular crises with Chile in 1891, when Chilean sailors clashed with sailors from the USS Baltimore at Valparaiso, and with Germany over Samoa in 1889 and 1899, after the Civil War the navy's primary concern on the Pacific Station was the fate of the Hawaiian Islands. It habitually kept a ship at Honolulu, gave moral support to white planters against the native monarchy, acquired naval base rights at Pearl Harbor in 1887, and provided protective cover for the movement that led to American annexation of the islands in 1898.

**Africa** Most lonely of the distant stations was the African Station, created in 1843 after the United States agreed in the Webster-Ashburton Treaty (1842) to cooperate with Britain in suppressing the slave trade. Whereas the Royal Navy seized 594 ships suspected of slave running between 1840 and 1848, the few American ships on station captured but nineteen suspected runners between 1843 and 1857. Moreover, since before the Civil War the United States denied British warships even a limited right to visit American merchantmen, the illicit trade found shelter under the American flag.

**THE SECOND PERIOD: 1890–1945**

The “old navy” of wooden ships distributed to distant stations gave way in the late nineteenth century to the “new navy” of steel that operated in a world of great powers competing for empire. Men of the new navy strove to build fleets sufficiently powerful to guarantee the United States control of the sea within an American sphere that eventually embraced most of the Western Hemisphere and the Pacific. The period from about 1890 to 1945 also embraced the navy's battleship age, during which most American naval men and many civilians looked to a fleet of battleships (capital ships) as the key instrument for assuring the hegemony of the United States within its sphere and for promoting American diplomacy. From the appearance of his first major volume on sea power in 1890, Alfred Thayer Mahan was preeminently the American naval writer who conceptualized a theory of sea power for the battleship age. Mahan was an economic determinist who held that national power derives from the flow of commerce through key maritime arteries protected by naval power. In emulation of the

531
British Empire, Mahan and his disciples conceived of an American naval line of empire protected by battle fleets and extending from the western Atlantic through the Caribbean and an isthmian canal to the Pacific and west.

Conspicuously absent during the battleship age was formal institutional provision for integrating American naval and diplomatic policies. President Theodore Roosevelt might himself serve as a one-man National Security Council, but the Navy Department and the State Department tended to plot their own courses with a minimum of exchange. Important for developing the naval officers' appreciation of their role in the world were such institutions as the Office of Naval Intelligence (1882), the Naval War College (1884), and the General Board (1900). Under the presidency of Admiral George Dewey, the General Board advised the secretary of the navy on a wide range of policies that touched foreign relations. The board's influence, however, gradually declined after the establishment in 1916 of the Office of Naval Operations, the navy's approach to a naval general staff. A step toward improved cooperation with the army was the creation in 1903 of the Joint Army and Navy Board, the often-ineffectual predecessor of the Joint Chiefs of Staff.

Dewey's May Day victory at the outset of the Spanish-American War (1898) was perhaps inadvertently the navy's most significant act that contributed to American political commitment in the western Pacific. By the peace with Spain, the United States gained possession of the key positions of Puerto Rico, Guam, and the Philippines, as well as control over Cuba. These island territories, together with Hawaii, Samoa, and the Panama Canal Zone (acquired in 1898, 1899, and 1903, respectively), included the prime sites for overseas bases that naval men wanted to support their imperial strategy up to World War II.

After the Spanish-American War, the navy followed a modified distant-stations policy in the Americas and the Far East while assembling its battle forces in the Atlantic and on the Asiatic Station. Although American naval men feared German aggression in the Caribbean, "the American Mediterranean," they also wanted a fleet in the Far East to support the Open Door in China. In 1906, however, all U.S. battleships were concentrated in a single battle fleet in the Atlantic, the area of the nation's greatest interests and of its vulnerability to German attack. It became a naval axiom that until the opening of the Panama Canal, the battlefleet fleet should be concentrated in one ocean so that its divided squadrons could not be defeated separately.

**Spanish-American War to the 1920s** From 1898 to World War I, the navy's Atlantic and Caribbean policies were to build a fortified isthmian canal under exclusive American control, to acquire bases for the canal's protection, and to deny the Western Hemisphere to outside aggressors. By the Hay-Pauncefote Treaty of 1901, Britain released the United States to construct a wholly American canal without restriction as to fortifications. When Colombia failed to reach quick agreement on terms for a canal in its Panama territory, the navy in 1903 afforded cover for a revolt in the isthmus. Within fifteen days a new government of independent Panama accorded the United States a ten-mile-wide canal zone in perpetuity. For Caribbean bases, the General Board by 1903 had settled on two sites: Guantánamo Bay, Cuba, close to the Windward Passage, and a lesser base farther east, probably the island of Culebra, off Puerto Rico. While determined to prevent non-American nations from acquiring bases in the region, the board wanted the United States to take no more than the navy could defend. The navy and the marines also intervened in Haiti, Santo Domingo, Cuba, Nicaragua, and elsewhere in the Caribbean in support of the roles of debt collector and policeman that the United States assumed under the Platt Amendment relating to Cuba (1901) and the Roosevelt Corollary to the Monroe Doctrine (1904), in order to obviate interference by others. During the British and German blockade of Venezuela (1902), the United States concentrated in the Caribbean, under Admiral Dewey's command, the most powerful fleet ever assembled for maneuvers, another potent reminder that other nations must keep out.

In the Far East after 1898, American naval men initially conceived of the United States as one of a half-dozen naval powers competing in China. Their planning assumed that the maritime nations (Britain, the United States, and Japan) were committed to the Open Door in China, in opposition to the continental powers (Russia, France, and Germany). In addition to a main fleet base at Subic Bay in the Philippines, the General Board wanted an advanced base on the China coast, within easy steaming range of the European bases in northern Asiatic waters.

After Japan's triumph in the Russo-Japanese War (1904–1905), the American navy's outlook in the Pacific changed radically as Japan moved from
the position of sure friend to that of possible enemy. When Theodore Roosevelt ordered sixteen battleships of the Atlantic Fleet to the Pacific on the first lap of their spectacular world cruise in 1907, he was testing the navy’s capacity to concentrate its power in the Pacific and reminding Japan and the world that the Pacific was an area of American naval responsibility. The navy also decided, in 1908–1909, to build its first major overseas Pacific base at Pearl Harbor rather than at Subic Bay, because the army insisted that it would be unable to hold the Philippine base against Japanese attack until the arrival of the battle fleet from the Atlantic. The navy’s most important war plans on the eve of World War I were its Black Plan for defense of the Western Hemisphere against Germany and its Orange Plan for a war against Japan, precipitated by the immigration question or by Japanese aggression into China or the Philippines. Although the United States had no formal agreement with Britain, still the world’s greatest naval power, there emerged before World War I a wholly informal system of naval power in which Britain built to contain the German navy while the United States strove for naval equality with Germany and decisive superiority over Britain’s east Asian ally, Japan.

The ascent of Woodrow Wilson to the presidency in 1913 brought to the White House a leader determined to preserve civilian control over the conduct of foreign affairs but willing to employ the navy in war and diplomacy with utmost vigor. After the outbreak of World War I in 1914, the Wilson administration was involved in acrimonious debates with Britain and Germany in defense of the cherished American principle of freedom of the seas. The tension of the war also moved the president to support the Naval Act of 1916, directed toward a navy second to none through the construction of ten battleships and six battle cruisers. This program would provide the United States with a powerful voice in diplomacy, whatever the outcome of the war.

Upon American entry into the war, the navy joined the Allies in a coalition wholly unpremeditated in its Black Plan and Orange Plan or its building programs. Conservatives in the navy, especially on the General Board, were reluctant to halt construction of capital ships so that American shipbuilding facilities could be devoted to building desperately needed antisubmarine and merchant craft. In addition to fearing that the United States might face greatly strengthened German and Japanese navies should the allies suffer defeat, these naval conservatives apparently were uncertain what policies Britain might adopt should the allies triumph too completely. It was to allay such anxieties, and thus to promote full U.S. naval participation in the war, that President Wilson’s intimate adviser, Colonel Edward M. House, unsuccessfully sought from Britain an option on five British capital ships to meet postwar contingencies. The Navy Department finally halted its capital ship program in order to provide ways for submarine destroyers, and it reached an accord with the Japanese whereby the Imperial Japanese Navy watched the Pacific while the U.S. Navy concentrated on war in the Atlantic.

The allies’ naval jealousies, subdued during the war, surfaced during the Paris Peace Conference in 1919. British leaders saw President Wilson’s call for freedom of the seas as a threat to the British Empire, and they strove unsuccessfully to prevent a resumption of building of American capital ships that might relegate the Royal Navy to second place. The naval advisers to the American delegation, on the other hand, opposed any division of the German navy likely to perpetuate British naval supremacy. For the American navy, however, the most significant act by the peace conference was its decision to award Germany’s Pacific islands north of the equator to Japan as unfortified mandates of the League of Nations. Unfortified in Japanese hands, the islands would be open to a superior American fleet in a campaign against Japan. At the close of the war, U.S. naval representatives were prominent in the allied interventions in Russia and at Constantinople during the resurgence of Turkey under Mustafa Kemal.

The 1920s Britain, the United States, and Japan emerged from World War I as the three great naval powers. Whereas American naval authorities watched for any new evidence that Britain might attempt to retain its naval supremacy, they held as an article of faith that any new naval construction by Britain’s ally Japan was directed against the United States. The General Board stated in 1921 that the United States should maintain a navy equal to the British and twice the Japanese. If the Anglo-Japanese alliance remained, however, the board wanted a navy equal to the combined British and Japanese navies. While the navy stationed the most powerful battle forces in the United States Fleet in the Pacific to guard against Orange (Japan), the estimates of naval war planners from 1919 to 1931 also dealt with possible wars against Red (Britain) or against a Red-Orange (Anglo-Japanese) coalition.
In 1921 civilian leaders in the United States, Britain, and Japan were united in their desire to avoid a ruinous naval race and to settle numerous Pacific questions unresolved by the Paris Peace Conference. At the nine-power Washington Conference called by the United States in 1921 to consider these issues, Secretary of State Charles Evans Hughes proposed a naval holiday and a limitation on the American, British, and Japanese navies at just half the levels recommended by the General Board. Hughes’s plan was incorporated in the Five-Power Naval Treaty, which limited capital ships and aircraft carriers allowed the United States, Britain, Japan, France, and Italy at a ratio of 5:5:3:1.67:1.67. At Japan’s insistence, the three great naval powers also undertook, in article XIX of the treaty, to refrain from building new bases and fortifications from which their fleets could menace each other’s vital territories in the Pacific. The United States thus abandoned new naval shore construction west of Hawaii, such as the proposed base on Guam that could serve the fleet in operations against Japan. The Washington naval agreements were part of a package settlement that included the Four-Power Treaty to maintain the status quo in the Pacific, the Nine-Power Treaty relating to China, and the abrogation of the Anglo-Japanese alliance.

The statesmen at Washington sought a new naval order that would provide security for the United States in the Western Hemisphere, the British Empire from the United Kingdom to Singapore, and Japan in the western Pacific. The Five-Power Naval Treaty, however, failed to limit lesser naval categories: cruisers, destroyers, and submarines. The three-power Geneva Naval Conference of 1927 broke down when British and American naval men were unable to agree on cruisers. Japan and Britain, meanwhile, built ships in the unrestricted classes more rapidly than did the United States; and Japanese naval men at the London Naval Conference of 1930 demanded a 10:10:7 ratio rather than a 10:10:6 (5:5:3) ratio in cruisers. As at Washington, the delegations at London overrode vigorous opposition from their services; and the resulting naval treaty in theory preserved the 10:10:6 ratio in heavy cruisers but in substance promised Japan higher ratios in the lesser classes through the life of the naval treaties (1936). The bitterness provoked in the Japanese navy contributed significantly to the collapse of naval limitation after 1931.

The 1930s  The Washington naval system crumbled after Japan occupied Manchuria in 1931–1932. While the American and British governments were unprepared to halt Japan by force, Secretary of State Henry L. Stimson looked to the navy to deter Japanese aggression. After Japanese naval forces landed at Shanghai in 1932, Stimson publicly warned that since the Washington agreements were interdependent, a violation of a political accord, such as the Nine-Power Treaty relating to China, would nullify other Washington agreements, such as the American promise to desist from building bases in the Western Pacific. The U.S. Fleet was concentrated for maneuvers off Hawaii in 1932, and Stimson induced President Herbert Hoover thereafter to retain the entire fleet in the Pacific as a warning to Japan.

Stimson’s gestures proved futile. The ratio of American and Japanese naval strength in the early 1930s probably approximated 10:8, rather than 10:6, and the “fleet faction” in the Japanese navy forced the Tokyo government in 1934 to seek a common upper limit (naval parity) with the United States and Britain. The intransigent Japanese stand drove the Americans and the British to unite in defense of the 10:10:6 ratio at the preliminary and main London Naval Conferences called in 1934 and 1935 to review the naval treaties. The Japanese left the second conference, and effective naval limitation ended with the expiration of the treaties in 1936.

During the London conferences, British and U.S. naval officers established cordial relations that paved the way for increasing intimacy between their services as they faced the rising threats from Germany and Italy in Europe and from Japan after the outbreak of the China incident in 1937. Only days after Japanese aircraft sank the USS *Panay* in December 1937, President Franklin D. Roosevelt sent the navy’s war plans director to London for consultations with the Admiralty during which a plan was drawn for possible joint action against Japan by an American fleet operating from Hawaii and a British fleet based in Singapore. This scheme was modified in 1939, when Britain was prevented by the Axis menace in Europe from undertaking powerful action against Japan. Admiral William D. Leahy, American chief of naval operations, then volunteered that, should a war break out in Europe to which the United States was not a party, the U.S. Fleet would assemble at Pearl Harbor to deter Japan. Should the United States be associated with Britain in war against the Axis and Japan, Leahy expected the American navy to care for the Pacific while the British navy would be responsi-
ble for the Atlantic. When war broke out in Europe in September 1939, the Joint Army and Navy Board had already begun work on five Rainbow Plans for war situations involving the United States and the European democracies against the Axis powers and Japan.

**World War II** After the fall of France in June 1940, the U.S. Navy was party to a succession of measures short of war to prevent the collapse of Britain, to prepare for war in two oceans either alone or in association with the British Empire, to deter Japan in the Pacific, and to enlist Canada and the Latin American states in Western Hemisphere defense. In September 1940, Britain and the United States concluded an arrangement by which Britain granted the United States bases in British possessions in the western Atlantic in return for fifty American destroyers to be used against German submarines. This limited American naval assistance to Britain swelled in 1941, after Congress approved the lend-lease bill, American navy yards were open to British warships for repair, and the navy began patrolling the western Atlantic against German submarines.

In August 1940 representatives from the Navy Department and the Admiralty entered into urgent consultations on how the navy could best help in the war. After Japan, Germany, and Italy concluded the Berlin Pact in September 1940, the chief of naval operations, Admiral Harold R. Stark, prepared his famous Plan Dog memorandum for a two-ocean war in which British and U.S. forces would seek victory over the Axis in the Atlantic before turning to defeat Japan in the Pacific. This memorandum was the basis for the detailed ABC-1 Plan, drawn up during Anglo-American staff talks at Washington in February and March 1941. In line with this plan, the United States shifted about one-third of its battleships to the Atlantic in order to release British units for service in the Far East.

It was with gravely weakened naval forces in the Pacific that the Roosevelt administration in July 1941 finally turned to halt Japanese aggression by enlisting Britain and the Netherlands to freeze Japanese assets under their control, thereby terminating Japanese trade with the world outside East Asia. The United States and its associates thus sought to bring Japan to terms by cutting off the flow of oil and other materials vital to the Japanese economy through a distant blockade supported by naval forces divided and inferior to those of the Japanese. Facing the immobilization of their forces as their supplies ran out, Japanese leaders, including those of the Japanese navy, opted for war that closed the battleship age.

During the immediate prewar and war years, Franklin Roosevelt, as had his cousin Theodore, drew the integration of naval and diplomatic policies into his own hands. The State-War-Navy Liaison Committee established in 1938 was largely confined to Latin American affairs and lesser matters. After the president moved the Joint Army and Navy Board into the new executive offices in 1939, the military chiefs increasingly participated in foreign affairs without necessary reference to their service secretaries or even the State Department. Indeed, during World War II, the State Department repeatedly bowed to service interests; naval officers and other military men negotiated directly with foreign governments; and the military chiefs accompanied the president to summit meetings to which the secretary of state was not invited. It was only a year before the war’s end that the State Department was restored somewhat to decision making in foreign affairs with the establishment of the State-War-Navy Coordinating Committee to prepare for peace. In 1942 the chief of naval operations joined with American army and air force chiefs in the Joint Chiefs of Staff, which provided institutional partners for the British chiefs in the Combined Chiefs of Staff, who determined war strategy under the watchful eyes of President Roosevelt and of British Prime Minister Winston Churchill. Cooperation with the British in coalition war was important preparation for naval men when they turned to work for what amounted to a coalition peace.

**1945–1975**

The thirty years following the end of World War II in 1945 witnessed political, institutional, and technological changes that revolutionized the navy’s role in diplomacy. In 1945 American naval officers had not yet devised a strategy geared to the atomic bomb, to a divided world in which the United States was for a time without a naval rival, and to the passing of battleship fleets as a measure of naval and national power. Insofar as they had speculated on the postwar world, they tended to assume a return to a division of responsibility in which the U.S. Navy would dominate the western Atlantic and the Pacific while the British navy would remain supreme in Eastern Hemisphere waters: the eastern Atlantic, the Mediterranean,
and the Indian Ocean. The navy's one clear objective during the war was to secure the Pacific islands that Japan had held since World War I as League of Nations mandates. The navy was soon confronted, however, by the Cold War with the Soviet Union, the Chinese communist victory on the Asian mainland in 1949, and the steady retreat by Britain to Europe that left the United States increasingly alone to deal with the supposed global menace of the Soviet Union and its allies. Moreover, whereas the navy had been the strong arm of American diplomacy through most of the nation's history, the air force emerged at the dawn of the atomic age to claim for the bombers of its Strategic Air Command the preponderant responsibility for deterring war.

The period from 1945 to 1950 was a critical one for the navy, during which the service sought meaningful roles in response to claims made by the air force in the course of the movement to organize a single Defense Department. The navy survived the unification struggle as one part of the new national security structure in which the State Department and the Defense Department were institutional equals. Under the National Defense Act of 1947 and amendments of 1949, the chief of naval operations became but one of five members of the Joint Chiefs of Staff, whose chairman conveys the chiefs' collective advice to the president, the secretary of defense, and the National Security Council. When the service secretaries lost their cabinet rank in 1949, the navy was denied separate representation on the National Security Council, the key institution responsible for integrating diplomacy and defense into national security policies. The civilian secretary of defense thereafter represented all the services in the council: the army, the navy, the air force, and, after 1978, the marines. Nevertheless, naval officers after 1945 served in unprecedented numbers in politico-military bodies concerned with foreign affairs.

While the navy thus lost its proud position as the leading force behind American diplomacy, it fought for programs of balanced defense against the claims by the air force that the threat of massive retaliation by the Strategic Air Command constituted the most effective deterrent to Soviet aggression. The navy's arguments for a variety of weapons were fully vindicated after the outbreak of the Korean War in 1950 demonstrated the effectiveness of carrier-based air and other capabilities in a limited war unsuited to massive retaliation with atomic bombs. This was a war provoked by an attack by communist North Korea on noncommunist South Korea. It was a war fought by Americans, Koreans, and allied forces under the auspices of the United Nations without a formal declaration of war. It also halted the spread of communism in Northeast Asia. The glamour of massive retaliation faded still more as the Soviet Union successfully tested an atomic device in 1949, achieved a thermonuclear explosion five years later, fired the first intercontinental ballistic missile in 1957, and launched the first artificial satellite (Sputnik) two months later.

To support friends and allies as well as to deter the Soviet Union, naval planners developed a transoceanic naval strategy to project the navy's power over the land and to keep the sea-lanes open. The fleets of the transoceanic navy, like the task forces of World War II, were commonly mixed forces that included two or three carriers, an amphibious marine force, and antisubmarine units. Most spectacular for display were the supercarriers, numbering fifteen in the 1960s and ranging up to 100,000 tons, whose versatile weapons could deal with local outbreaks or convey nuclear destruction to the heart of the Eurasian landmass. Responding to the Soviet Union's missile capability, the navy after 1960 also completed forty-one nuclear-powered submarines armed with Polaris and improved long-range Poseidon and Trident missiles carrying atomic warheads. The navy claimed that its mobile, seaborne forces were far more secure against Soviet attack than the land-based bombers and missiles of the air force.

Together with the army and air force, the transoceanic navy provided the American commitment of force to the multilateral regional pacts, bilateral alliances, and other arrangements through which the United States sought to organize the nations of the free world. Since western Europe seemed the most vital area to save from Soviet domination, the North Atlantic Treaty Organization (NATO), formed in 1949, assumed prime importance in American strategic planning. Through NATO the navy sought to expand its earlier “special relationship” with the British navy into a multilateral association in which the American navy provided important leadership and the largest commitment of naval force to retain control of the Atlantic and the Mediterranean. The NATO supreme commander for the Atlantic is the commander in chief of the U.S. Atlantic Fleet, based with his NATO staff at Norfolk, Virginia. The NATO powers preserve independent control of their most important naval forces, from which

536
they contribute elements for NATO maneuvers and for a small standing force. In the Far East, when concluding peace with Japan in 1951, the United States also signed with Japan a mutual defense pact, which assured a base of operations in the western Pacific. Unlike the navies of Europe, however, the Japanese Defense Force was committed strictly to the defense of Japan.

The most visible American naval contribution to European security was the Sixth Fleet, established in the Mediterranean since 1948. In addition to its earlier role as a major segment in the maritime artery between Europe and Asia, the Mediterranean gained significance after 1945 as a deep inlet into which the United States could move naval power 2,000 miles eastward from the Atlantic, to within striking distance of the Russian homeland. It was also a sea from which the navy could support friends and allies on NATO's southern flank and in the Middle East, as well as a moat separating Europe from Africa. The United States first restored a naval presence in the Mediterranean in 1946–1947, when the Soviet Union pressed Turkey to open the Dardanelles to free movement by Soviet ships and when President Harry Truman extended assistance to Greece under the Truman Doctrine. The Sixth Fleet has commonly numbered more than fifty ships, including two supercarriers organized to meet the needs of a transoceanic navy. Its position in the Mediterranean became increasingly lonely; however, with the withdrawal of British naval power after the Suez Crisis of 1956, the spectacular buildup of Soviet naval forces in the 1960s, and the growing hostility among the Arab states that looked for Soviet aid to counter American support of Israel. In 1958, the Sixth Fleet, in response to a request from the president of Lebanon, landed a force in Beirut, which seemed to be threatened by domestic insurgency and foreign invasion.

The Seventh Fleet became the navy’s Far East counterpart to the Sixth Fleet. At the close of World War II, the navy and the marines helped the Chinese Nationalists surrender in eastern China, but U.S. forces withdrew from the Chinese mainland in advance of the communist victory in 1949. In January 1950, Secretary of State Dean Acheson, voicing recommendations from the Joint Chiefs of Staff, outlined an American defense perimeter in the western Pacific, extending from Alaska through Japan, for whose defense the Seventh Fleet would assume major responsibility. Acheson’s omission of Korea, Taiwan, and Southeast Asia suggested that the United States was disengaging from the Asian mainland. American participation in the Korean War in 1950, however, demonstrated that the U.S. government would employ its naval and other forces to counter aggression on the mainland that threatened a key area on the American defense perimeter such as Japan, which after 1949 replaced China as the most important U.S. partner in East Asia.

The Korean War also brought the first public American commitment to the Chinese Nationalists on Taiwan, when President Truman in 1950 ordered the Seventh Fleet to interpose its power between Taiwan and the mainland, to neutralize the Taiwan Strait, and to prevent the Chinese communists and the nationalists from attacking each other across the strait. After the United States and the Chinese Nationalists signed a mutual defense treaty in 1954, the Seventh Fleet provided massive cover in 1954 for the Nationalist evacuation from the Tachen Islands and again in 1958 for Nationalist logistic operations to sustain their garrisons defending the islands of Quemoy and Matsu against Chinese communist bombardments. During the relatively placid year of 1961, the Seventh Fleet included some 125 ships and 650 aircraft based at Subic Bay, Okinawa, and Japan. When formal relations were established with the communist government in Peking in 1979, relations between Taiwan and the United States were maintained quietly on an extradiplomatic basis. The United States provided Taiwan with arms and ships, and the Seventh Fleet remained an important presence in the western Pacific. South of Taiwan lay a former colony and ally, the Philippine Islands, where the United States retained its important naval base at Subic Bay until all American naval and military facilities were returned to the Philippines in 1992.

Although the Seventh Fleet’s commitments to the Southeast Asia Treaty Organization under the Manila Treaty of 1954 were unclear, the United States in 1962 landed marines in Thailand to deter communist infiltration from neighboring Laos. The fleet also fought in the Vietnam War after Congress, in the Tonkin Gulf Resolution (1964), authorized the president to employ American armed forces in defense of freedom in southeast Asia. With the winding down of the war after 1969, the Seventh Fleet resumed its station in defense of a western Pacific perimeter.

Between the normal cruising ranges of the Sixth Fleet and the Seventh Fleet, the Indian Ocean area, including the oil-rich Persian Gulf, remained free of a significant American naval presence after
1945. Responding to growing Soviet naval forces in the ocean during the 1960s, however, the navy occasionally dispatched units from the Seventh Fleet to show the flag and to participate in Central Treaty Organization maneuvers. After 1966 the navy also joined with Britain to construct a communications station, landing fields, and other amenities on the British island of Diego Garcia.

Three decades after World War II, the navy was again adjusting to major world changes as the Cold War confrontations gave way to bitter rivalry between the Soviet and Chinese communist camps, détente between the United States and the Soviet Union, and accommodations between Washington and Peking. Even as the United States and the Soviet Union moved to limit their atomic arsenals, including their seaborne missile forces, through accords at the Strategic Arms Limitation Talks, however, American naval men watched the emergence of the Soviet navy as a contender on the high seas and the spread of Soviet and Chinese influence in the Middle East, Africa, and elsewhere. The modest easing of tensions between the United States and the communist world, therefore, was followed by no lowering of the American naval guard. Indeed, the thaw in the Cold War was overshadowed in many areas of the world by the emergence of strong regional sentiment hostile to the United States and to any American naval presence. While the navy still strove to provide global force sufficient to honor security arrangements negotiated two decades earlier, when conditions were very different, it was increasingly regarded in Africa, Asia, Latin America, and even Europe as an agent of outside interference rather than as a protection.

The navy’s responsibility during the Cold War, however, was not confined to the Old World. In the Western Hemisphere, Fidel Castro, after winning power in Cuba, threatened to export communism to his Latin American neighbors. President John F. Kennedy in 1961 inherited from the Eisenhower administration a Central Intelligence Agency project to support an invasion of Cuba by Cuban refugees. The consequence was the so-called Bay of Pigs incident, which was a humiliating failure, at least in part because the administration was unwilling to provide the refugees with necessary naval and air support. This was followed the next year by discovery that the Soviet Union had built in Cuba some forty-two launching pads for intermediate ballistic missiles with striking range of more than 1,000 miles. President Kennedy immediately responded by ordering the navy to establish a blockade of Cuba, described as a “quarantine,” to halt arms shipments to Cuba and demanding that the Russians withdraw all missiles from the island. It seemed that nuclear war was at hand, but the Russians bowed to the president’s demand in return for a promise to withdraw American missiles from Turkey.

Close on the heels of the Cuban missile crisis came war in Vietnam. There, following the withdrawal of the French from their former colony, the Americans became increasingly concerned that noncommunist South Vietnam would fall to communist North Vietnam. When President Kennedy was assassinated in November 1963, U.S. “military advisers” numbered 16,700. Large-scale U.S. intervention was sparked the following year by a clash between the American destroyer Maddox and several North Vietnamese torpedo boats in the Gulf of Tonkin. The U.S. Congress forthwith adopted the Tonkin Gulf Resolution, which authorized President Lyndon Johnson to take “all necessary measures to repel armed attacks against the armed forces of the United States and to prevent further aggression.” The Vietnam War was an undeclared war fought without United Nations support and subject to increasing public criticism in the United States and abroad. It was also a war limited by American unwillingness to provoke serious intervention by China or the Soviet Union. Task Force 77, composed of carrier forces attached to Yankee Station in the Tonkin Gulf and Dixie Station off South Vietnam, sent strikes against North Vietnam and supported ground forces in the south. Search patrols along the southern coast sought to interrupt movement of supplies from the north to insurgent Vietcong in the south, and numerous small boats of a “brown water” patrol moved through the Mekong Delta and along other inland waters to apprehend the Vietcong. The Vietcong Tet Offensive in 1968, although itself a failure, was followed a year later by President Richard Nixon’s decision to “Vietnamize” the war. The last Americans and numerous Vietnamese refugees were airlifted out of Saigon in 1975, thereby ending perhaps the most humiliating war in American history.

In 1970, when Admiral Elmo R. Zumwalt, Jr., was called from Vietnam to Washington to serve as the youngest chief of naval operations in history, the navy was in poor shape to meet the possible challenges ahead. The nation’s resources had been expended on the Vietnam War, while the Soviet navy, under the leadership of Admiral Sergei G. Gorshkov, had been expanded to establish awesome capacity to operate in multiple seas.
Moreover, three years earlier, Britain had abandoned its imperial responsibilities east of Suez. To meet this situation, Zumwalt proposed a “high-low mix” by which the navy would build large numbers of less expensive “low” ships to assure “sea control” of areas where expensive “high” ships were unnecessary or would be in danger. For instance, he proposed to build a patrol frigate, half the cost and size of a destroyer, and a 17,000-ton sea control ship that would be far less expensive than the 100,000-ton supercarriers. His proposals were vigorously opposed by Admiral Hyman Rickover, the promoter of nuclear submarines and other high-tech ships, and Zumwalt’s sea control ship was eventually rejected by Congress. The navy may also have suffered from the diversions that attended the resignation of President Nixon following the Watergate scandal. The decade ended with the embarrassing capture of the U.S. embassy in Tehran, Iran, by Islamic radicals and the Soviet naval ships operating out of Cam Rahn Bay in Vietnam.

1975–2000

The outlook for the navy and naval diplomacy improved with the arrival of President Ronald Reagan’s energetic young secretary of the navy, John F. Lehman, Jr., who with forceful chiefs of naval operations (Admirals Thomas Hayward and James Watkins) pressed for an aggressive “maritime strategy” supported by a 600-ship navy composed of fifteen supercarriers, four battleships called back into service, 100 attack submarines, a powerful marine amphibious force, and numerous lesser craft. The program would increase by 20 percent the navy’s combat ships over those in 1980. This aggressive strategy, however, did not rule out lesser actions to keep the Third World in proper order, such as the capture of the small island of Grenada (1983), a disastrous landing in Lebanon that ended with the bombing of the marine barracks in Beirut (1982–1983), clearing mines from the Red Sea, protecting Kuwaiti tankers in the Persian Gulf, denying with naval air Colonel Muammar Qaddafi’s attempt to close the Gulf of Sidra (1986), the capture of Panamanian strongman General Manuel A. Noriega on charges of drug trafficking, and much more.

The decade of the 1990s was as revolutionary for the navy and naval diplomacy as had been the 1890s following the publication of Alfred Thayer Mahan’s The Influence of Sea Power on History and the shift of the navy from wood and sail to steel and steam. The 1990s opened with the breakup of the Soviet Union, the freeing of the nations of Eastern Europe to join the Western powers, and the disappearance of the Soviet navy as a serious challenge to the U.S. Navy on the high seas. At the dawn of the twenty-first century, this left the United States claiming to be the sole superpower, NATO deprived of much of its original reason for being, and the navy in need of either a greatly revised strategy or a wholly new strategy. All this and more can be summed up by the statement that the Cold War had ended. It ended as the navy was adding such high-tech innovations as the Aegis air defense system, new Ticonderoga-class cruisers that carry long-range Tomahawk missiles, Ohio-class submarines mounting improved Trident missiles, and much more.

The navy’s new strategy substituted “power from the sea” for the older “control of the sea” or “sea control.” Since the majority of the world’s population lives within fifty miles of the sea, the navy developed a littoral mission by which it would mount “power from the sea” to control the world’s coasts as well as dispatch terrible destruction deep into the interior. The new strategy assumed that the oceans were safe and that the navy, by attacking the land “from the sea” would prepare for unopposed amphibious landings by the marines and the army.

The new era opened in early 1991 with the outbreak of the Gulf War in which Iraq attempted to annex the neighboring Persian Gulf state of Kuwait, a move that threatened the stability of the strategically vital, oil-producing region of the Middle East. Like the Korean War, the Gulf War sparked a United Nations response in which the United States provided by far the largest land and sea forces. At the height of the conflict, 130 American naval ships were joined by 50 allied ships in a multinational naval force. The marines contributed 92,000 officers and service personnel, the largest marine operation in history. The United States initially reacted by concentrating six supercarriers in the Red Sea and the Persian Gulf and enough marines to afford protection for Saudi Arabia until the arrival of reinforcements, largely army, to turn the tide and drive the Iraqis from Kuwait. The navy and the marines also assembled an amphibious force in the gulf to prevent the Iraqis from evacuating Kuwait and joining the main battle of Operation Desert Storm. After the war the navy provided forces to enforce UN punitive sanctions against Iraq.
The vital importance of this region that holds 70 percent of the world’s oil reserves was reorganized in 1994 by the establishment of a new Fifth Fleet whose water areas included the Red Sea, the Persian Gulf, and the Arabian Gulf. The Fifth Fleet was subject to the Central Command, located in Tampa, Florida, whose theater of operations extended inland to Central Asia. The fleet in January 2001 comprised seventeen ships, including a carrier group, and 7,700 marines with support facilities at Bahrain within the Persian Gulf and at Diego Garcia in the Indian Ocean. The bombing of the destroyer Cole in Yemen in 2000 was a very sharp reminder of the religious, drug, and other terrorist groups that the navy works with others to oppose.

By far the most powerful of the American fleets on distant stations at the turn of the twenty-first century was the Seventh Fleet, whose area embraced the western Pacific, especially East Asia, and the Indian Ocean. Notwithstanding the practical disappearance of Russian naval power, the Seventh Fleet in 2001 numbered fifty-one ships, including two carriers, and 29,000 sailors and marines mostly operating out of Japanese home ports. China was probably the most unpredictable major power in the area, and the troubled relations between China and Taiwan remained potentially dangerous. The Seventh Fleet lost important shore support with the return of the Subic Bay naval base to the Philippines and British restoration of Hong Kong to China. Numerous exchanges between the American and Chinese high commands to promote understanding were seriously jeopardized by Chinese outrage following the American bombing of the Chinese embassy in Belgrade during the war in Kosovo. A port call by the U.S. cruiser Chancellorsville at Tsingtao in August 2000 brought public expressions from both sides that seemed to be evidence of a desire to return to stability.

With the passing of the Soviet Union, the Sixth Fleet in the Mediterranean lost one of its principal justifications. Its ships in January 2001 were down to fifteen, with no carrier representation. The eastern Mediterranean in particular included a number of potential trouble spots within the range of the navy’s littoral strategy. Among these was the disintegrating Yugoslav state, which was a NATO concern, and therefore an American one. The ethnic feuds climaxed in the Kosovo war of 1999, during which American carrier air provided perhaps 50 percent of the guidance and support missions for the air force.

From 1794, when Congress voted for the construction of the first six frigates, the United States Navy was a prime support for American diplomacy as the nation’s interests changed and expanded. During the nineteenth century, the navy was employed principally to show the flag on distant stations where pirates and potentates were not always respectful toward American missionaries and merchants. After 1890, as the United States came to claim the rank of a great power, the navy concentrated on building fleets to dominate the western Atlantic and the Pacific. The battleship age ended with World War II, from which the United States, Great Britain, and the Soviet Union emerged as victors. After 1945, as the British Empire gradually came to an end, the U.S. Navy’s role in the Cold War was dictated by the American determination to halt the spread of Soviet power and communism. The demise of the Soviet Union left the United States and the navy committed to helping in the solution of regional problems throughout the world. The United States, as in the nineteenth century, continued to follow a sort of distant-stations policy. Although Americans would deny that they aimed to form an American empire, American power inevitably provoked such protesting acts at the end of the twentieth century as the attack on the USS Cole off Yemen, the demands of Okinawans that U.S. forces withdraw, and New Zealand’s quest for a nuclear-free South Pacific.

The term “neutralism” is not new to the lexicon of international relations, but in the Cold War world, divided into two competing blocs, this word assumed new meaning. For its first century and a half as a nation, the United States, under the guise of isolationism, practiced its own form of neutralism, shunning political and military involvement with the European powers and invoking its neutrality according to international law in wartime. The appeal of neutrality persisted into the 1930s, as the United States anticipated possible involvement in World War II. But those were different times. There was no Cold War, and the United States was not a superpower. While America's earlier neutralism bore a resemblance to the Cold War variety, some important distinctions set the two apart.

The Cold War, defined not only in terms of a political rivalry between the United States and Soviet Union but also in terms of a conflict between Soviet communism and Western democratic capitalism, provided the context for this new form of neutralism. This ideological rivalry dated to the time of the 1917 Russian Revolution, but during World War II, the United States and the Soviet Union put aside their ideological differences and joined in a common cause to defeat Hitler. In the aftermath of that conflict, the animosity soon resurfaced as disputes over the postwar settlement escalated. The two powers ultimately abandoned cooperation and turned to consolidating control within their respective spheres. By 1947, containment defined America's postwar policy toward the Soviet Union. The North Atlantic Treaty (1949), an alliance intended to thwart Soviet aggression, institutionalized this containment and defined the western bloc. Meanwhile, the Soviet Union was consolidating its control over the eastern bloc.

Not all European states, however, presumed that their national interests would be served by associating with this alliance system. Sweden, situated on Europe's strategically important northern flank, and Austria, bordering the Soviet bloc, are notable examples. To them, neutralism had a definite appeal. Their decision to assume an independent position created complications for U.S. foreign relations. Policymakers in Washington particularly worried that neutralism might tempt America's allies and erode the solidarity of the Atlantic alliance.

Compounding their apprehension were developments in the Third World. As the former European colonial empires slowly crumbled, many newly independent states opted for non-alignment, often with the intention of exploiting the Soviet-American rivalry to secure economic assistance from both sides. The 1955 gathering of twenty-nine nonaligned nations at Bandung, Indonesia, combined with a concerted effort by the Soviet Union to curry favor with these states, underlined the necessity for the United States to follow a well-considered approach to neutralism.

In the years after World War II, an understanding of the causes, intentions, and goals of neutralism slowly evolved within policymaking circles that would guide America's relationship with these states. The administration of President Harry Truman initially resisted neutralism, considering it a hindrance to western security. Only reluctantly, after officials realized that the neutrals would not be dissuaded from their chosen course, did Washington begin to pursue an accommodation with neutralism. The administration of President Dwight Eisenhower, despite its inflammatory rhetoric, grasped the advantages and drawbacks of this third force and endeavored to implement a policy toward neutralism that would benefit Western interests. But often Cold War considerations intruded to muddle relations with the neutrals, particularly in the Third World. Despite the more sophisticated worldview of President John F. Kennedy and his advisers, and their appreciation of the unique circum-
stances faced by the Third World, in practice they deviated little from the approach of their predecessors. The framework for the U.S.-neutral relationship that would survive through the Cold War was in place by the 1960s.

U.S. policy toward neutralism met with mixed results. In western Europe, the neutral states, despite their aversion to alliances, shared a common political, social, and economic heritage with the United States and its European allies. U.S. policy thus successfully fostered a relationship that to a great extent accommodated neutral interests while furthering America’s Cold War goals. In the case of the Soviet bloc, Yugoslavia’s adoption of neutralism offered an opportunity to weaken Soviet control within its own orbit. But contrary to the hopes of policymakers, neutralism did not spread further in the Soviet bloc. Finally, Washington often misunderstood the forces of nationalism in the Third World. America’s ties to many of the former colonial powers created friction with the newly independent states and opened opportunities for the Soviet Union. The United States encouraged neutralism when it fit American interests, but opposed it when it went counter to these interests. Often, this opposition was counterproductive. It antagonized Third World nationalism and drove these states closer to the Soviet Union.

By the time the expanding conflict in Vietnam consumed America’s attention in the mid-1960s, neutralism had established itself as a force to be reckoned with. As Washington struggled to extricate itself from that costly Asian war and then as it tried to reduce Cold War tensions through a détente policy, the neutrals had to be factored into the equation. The neutrals exerted an important influence, often serving as political or diplomatic bridges between the competing Cold War blocs. They recognized that it was in their interest to work toward a solution to the Cold War.

DEFINING COLD WAR NEUTRALISM

At a June 1956 news conference, when the topic of neutralism came up, President Dwight D. Eisenhower responded by noting that for 150 years the United States itself had been neutral. He then declared that “neutral” now meant avoiding any attachment to military alliances, and that “this [did] not necessarily mean . . . neutral as between right and wrong or between decay and decency.” In equating America’s past tradition with the neutral stance of 1956, the president exhibited a sympathy and understanding of this “third force” not always associated with his administration. The 150-year commitment to which he referred evoked two distinct but interrelated facets of how the United States defined its neutrality in the past—first, the legal status of a neutral state in time of war, and, second, the response to George Washington’s admonition in his Farewell Address to “avoid entangling alliances.” The traditional legal concept of neutrality, which had evolved in international law during the past century through treaty, court cases, and precedent, was codified in the Hague Conventions of 1907. These conventions recognized the legal status of a nonbelligerent state in time of war and prescribed the rights and obligations of a nation in its relations with belligerent states. During its formative years, the United States adhered to—indeed, became a champion of—these principles of neutrality. The principles of freedom of the seas and the right to trade with belligerents in time of war appealed to a fledgling nation focused on establishing its economic stability, which was so important to ensuring its viability as a nation. Even as the United States was becoming a major power in the twentieth century, it was hesitant to abandon neutrality. For three years before its 1917 entry into World War I, President Woodrow Wilson asserted America’s neutral rights. And during the 1930s, encouraged particularly by a Congress and a public intent upon staying out of another conflict emerging in Europe, once again the United States declared its neutrality until events inexorably brought the country into the conflict at the end of 1941.

Besides this neutrality defined by international law, Eisenhower in his remarks also referred to another aspect of America’s earlier policies that was more akin to postwar neutralism. In 1796, President George Washington in his Farewell Address warned Americans to avoid entangling alliances. At the time, war threatened to engulf Europe. The United States, which had signed an alliance with France in 1778, feared being drawn into a European conflict that did not serve its national interests. It abrogated that treaty by 1800, and for a century and a half thereafter assiduously avoided political and military entanglements with Europe.

In international affairs, America entered a period of what many historians describe as isolationism. In effect, the United States assumed a
Neutralism presented an appealing option for those who had misgivings about subordinating their nation’s sovereignty to the policies of the United States or the Soviet Union. Concern that the North Atlantic Treaty might just lead to such an eventuality at times fueled an attraction to neutralism even among some of America’s traditionally closest allies. As late as 1948, political factions in Great Britain considered pursuing a “third way,” which they defined as a bloc of western European states and their former colonies that would assume an independent position between the United States and the Soviet Union, to reduce British dependence on the United States. The term “neutralism” itself first came into vogue in the late 1940s in France, where it signified a state of mind that questioned whether French national interests would be served by subordinating French independence to American leadership.

The desire for U.S. economic assistance and a growing apprehension about the Soviet political and military threat ultimately trumped neutralism’s appeal in Britain and France. But some of Europe’s smaller states did embrace neutralism. Each of these states constructed its own distinct style of neutralism, defined in terms that served its own national interests. Switzerland and Sweden had a long tradition of neutrality that they had maintained throughout World War II and firmly guarded in the Cold War. Finland and Austria to differing degrees represented neutralism coerced. Finland, defeated and forced to deal with its victorious Soviet neighbor, tried to preserve as much of its independence as possible by signing the 1948 Treaty of Friendship, Cooperation, and Mutual Assistance, which bound it to resist any attack on the Soviet Union. Austria, like Germany occupied by the Allies after World War II, accepted the status of neutrality as a prerequisite for the 1955 Austrian State Treaty that ended the occupation of its territory and restored its autonomy.

The Soviet bloc was not immune to the appeal of neutralism. Josip Broz Tito established a communist regime in Yugoslavia, but bristled at Stalinist interference in the internal affairs of his country. When Yugoslavia was expelled from the Cominform in 1948, Tito charted a course independent of both blocs.

As neutralism took root in Europe, the dissolution of Europe’s colonial empires in Africa and Asia gave rise to newly independent nations, many of which adopted a policy of nonalignment. In certain respects, nonalignment was synonymous with neutralism, for the nonaligned states
eschewed commitments to either of the global power centers. But not all members of the non-aligned movement took a neutral position vis-à-vis the two blocs. Many of the twenty-nine states that attended the first meeting of the nonaligned at Bandung in 1955 tilted to one side or the other. B. K. Shrivastava, in a 1982 article titled “The United States and the Non-Aligned Movement,” identified three categories of nonaligned states that had become clearly delineated by 1970: the extremists, consisting largely of Marxist and pro-Soviet countries; the conservative friends of the United States and the West; and the moderates, who wanted to maintain their distance from both the United States and the Soviet Union. Moderates, such as India and Egypt, wary both of the Soviet Union and of Western capitalist powers, their former colonial overlords, represented the true neutrals of the Third World.

As neutralism established itself in Europe and spread to Asia and Africa, U.S. policymakers had to decide whether to oppose or to pursue accommodation with that movement. Certain aspects of this phenomenon, from their viewpoint, were clearly contrary to American interests, especially the tendency for neutralism to impede the establishment of a unified opposition to Soviet advances. But neutrals, in their distrust of Soviet doctrine, also offered opportunities.

**U.S. POLICY AND WESTERN EUROPEAN NEUTRALISM**

After World War II, the Truman administration faced a deteriorating relationship with the Soviet Union and a Europe in dire economic straits that made it vulnerable to communist blandishments and powerless to resist potential Soviet aggression. In central Europe, the failure to establish a cooperative framework for the occupation of Germany was leading to a permanently divided German state. When the United States responded to these developments with a containment policy, it soon became clear that neutralism had the potential to undermine the unity of purpose the Truman administration deemed necessary to repel Soviet advances.

West Germany was a key factor in American policymakers’ response to neutralism. With the creation of the Federal Republic in 1949 in the wake of the Berlin airlift, West Germany quickly emerged as an important component of the western European alliance, and a divided Germany became an accepted part of the Cold War landscape. To many Germans intent upon reuniting their country, however, neutralism often surfaced as a means of accomplishing this reunification. Through the years, this solution even had prominent advocates in the United States. The noted American diplomat and historian George F. Kennan, in his 1957 Reith Lectures over the BBC, called for the superpowers to disengage from Germany, which would be united and demilitarized. Throughout the Cold War, Washington consistently resisted such solutions, fearing that this would weaken Western resolve to resist the Soviet threat.

The traditional neutrals, Switzerland and Sweden, along with Finland, were particular obstacles to Western solidarity. Neutrals were more than willing to participate in postwar economic programs such as the Marshall Plan. (Finland was the notable exception. As it tried to construct a relationship with its Soviet neighbor that would preserve its national autonomy, Helsinki opted against participation so as not to antagonize the Kremlin.) Economic ties were as far as they would go, however. Political and military bonds were out of the question.

The Truman administration initially viewed neutralism with suspicion and even hostility. The advice that Secretary of State George Marshall offered to the president on the occasion of a 1948 visit by the crown prince of Sweden was typical. Marshall argued that Sweden’s adherence to neutrality had “been more benefit to the Soviet Union than to the Western countries” and urged Truman to “avoid any expression of approval of the neutrality policy,” since such a policy that “reveal[ed] a division among the free nations of the world [could] only serve to invite aggression.”

Gradually, however, officials grudgingly conceded that it was futile to try to dissuade these neutrals and that neutralism had to be accommodated for the foreseeable future. They thus concentrated on finding a way at least indirectly to turn neutralism to the West’s benefit. Washington curtailed efforts to pressure neutrals to choose between the two competing camps and moved toward a consistent, pragmatic plan to bind Europe’s neutrals closer to the West, thus strengthening rather than weakening the emerging collective security.

The Eisenhower administration, despite its more confrontational public stance and expressions of intolerance for neutralism—Secretary of State John Foster Dulles called neutrality “obso-
In the mid-1950s, Eisenhower administration public pronouncements on the issue of neutralism sometimes gave conflicting signals. Secretary of State John Foster Dulles, the administration’s principal foreign policy spokesman, was consistently critical. In October 1955, speaking before an American Legion convention in Miami, he stubbornly declared that “except under very exceptional circumstances, neutrality today is an immoral and shortsighted conception.” But several months later, at a June 1956 news conference, President Eisenhower took a more tolerant position. He observed that for 150 years the United States had been neutral, that in 1956 neutrality meant avoiding attachment to military alliances, and that “this does not necessarily mean . . . neutral as between right and wrong or between decay and decency.” He concluded his appraisal by referring the reporters to a speech Dulles was scheduled to give the following week at Iowa State University. There, however, Dulles did not revise his assessment of neutralism but rather reiterated his intolerant stance. Dulles’s hostility has been explained in different ways. It may have reflected his personal belief that there was a stark contrast between communism and democracy, and that, therefore, to take a neutral position was tantamount to choosing the former. H. W. Brands, in The Specter of Neutralism, offered another explanation, politics: “The secretary’s sermonizing was designed to please conservatives, Republicans for the most part, who distrusted neutralists and continually threatened to block administration initiatives toward countries of the Third World.” But what about Eisenhower’s contrasting expression of tolerance for neutralism? The answer may lie in the behind-the-scenes deliberations of the administration. The National Security Council, responding to Nikita Khrushchev’s “peaceful coexistence” campaign, was reexamining neutralism and all of its ramifications in order to construct a coherent policy toward these neutral states.
hot war.” Even though this new neutralism eschewed commitments to both the Soviet Union and the United States, it was more threatening to the West’s interests. Soviet strategy could exploit it.

The report proceeded to list several explanations for the appeal of this new neutralist sentiment in Europe: fear of nuclear war, nationalism, negative reactions to U.S. leadership, a desire to achieve security without responsibility, pacifism, pursuit of special interests, and economic motivations. It further emphasized that this new neutralism, more than the legal government policy of neutrality or even the neutralist position some European states assumed in the Cold War, was what threatened American interests most. A government’s declaring itself to be neutral, the study stressed, did not automatically mean that nation was infected with that troublesome neutralism.

This cautionary insight was fundamental to the evolution of America’s relations with the neutral states. From the U.S. perspective, the litmus test for beneficial neutrality was a strong ideological identification with the West, demonstration of “solid resistance to Communist blandishments,” and maintenance of a strong national defense establishment. The key neutrals in Europe fulfilled these criteria. Each for its own reasons had adopted a neutral position, but this did not necessarily translate to that damaging neutralism that threatened to undermine relations with the West. Indeed, the State Department study identified neutralist sentiment as stronger among some of America’s allies than among the neutral states. These insights led the United States to understand the distinct interests and positions of the individual states.

**Switzerland** Switzerland, the purest of the neutrals, dated its neutrality to the sixteenth century. Its status was reinforced in the early nineteenth century by provisions of the Congress of Vienna, and it carefully maintained its neutral stance throughout World War II. After the war, Switzerland even eschewed membership in the United Nations because it determined that membership in this international organization might compromise its neutrality. Despite Switzerland’s stubborn refusal to cooperate, U.S. officials took solace in the fact that Switzerland practiced an armed neutrality. There was no doubt that it would defend its territory in time of conflict. Bordering France and Italy, Switzerland, of the four major European neutral states, was of least concern to the United States.

**Sweden** Sweden dated its neutrality to the Napoleonic wars at the beginning of the nineteenth century and maintained this status throughout World War II. After the war, it defined its position to be neutral in war and nonaligned in peacetime. When the United States began planning for the security for Europe, Sweden presented a particular problem. As a significant military force on Europe’s northern flank, it was important to continental defense. U.S. officials understood the advantages of convincing Sweden to participate in Western defense arrangements. But as Washington negotiated the North Atlantic Treaty, Stockholm, rather than cooperating, attempted to exclude the Cold War from the Nordic region by proposing a league of armed neutrality, a Nordic Union, with its Scandinavian neighbors, Denmark and Norway. This scheme ultimately failed, and Denmark and Norway signed the North Atlantic Treaty. Sweden continued to refuse to associate itself with the Western military alliance.

Sweden’s actions caused some tension with the United States, but relations improved by the early 1950s. A 1952 National Security Council policy paper on Scandinavia and Finland (NSC 121) admitted that in the near future the United States would have to accept Sweden’s determination to avoid military alliances and calculate the best means to increase Sweden’s contribution to Western defense. Subsequently, Sweden became an important centerpiece of a “Nordic Balance” that secured the North Atlantic alliance’s northern flank. Its neutrality, furthermore, contributed to Finland’s success in maintaining its neutral position.

**Finland** In contrast to these established neutrals, the United States confronted in Finland’s situation a neutrality created out of necessity. Precariously situated on the border of the Soviet Union, the Helsinki government struggled to preserve its independence by building a relationship premised on the belief that the Kremlin’s interest in Finland was strategic, not ideological. After signing a punitive peace treaty in 1947 that imposed devastating reparations and took away 11 percent of its territory, Finland agreed to a ten-year Treaty of Friendship, Cooperation, and Mutual Assistance in 1948 that required it to resist any attack on the Soviet Union through Finnish territory by Germany or any nation allied with Germany, to consult with the Soviet Union on an
appropriate response in the event of attack, and to refrain from joining any alliance aimed at the Soviet Union. Finland subsequently tried to interpret and apply this pact in such a way that it could move more to a neutral position between the two blocs. Washington ultimately appreciated that Finland lacked alternatives to its chosen course, and was careful not to disrupt the delicate balance.

At times during the Eisenhower years, as Finland’s economic situation improved and its independence became more secure, Washington considered the possibility that the solution crafted by Finland might serve as a model for other states bordering the Soviet Union. Secretary of State John Foster Dulles at the 1955 Geneva summit meeting between Khrushchev and Eisenhower suggested to Soviet Premier Nikolai A. Bulganin that Finland exemplified the relationship that might be acceptable to the United States for the Soviet-dominated nations of Eastern Europe. A 1959 National Security Council report titled “U.S. Policy Toward Finland” (NSC 5914/1) mirrored this suggestion when it asserted that “If Finland is able to preserve its present neutral status . . . it could serve as an example of what the United States might like to see achieved by the Soviet-dominated nations of Eastern Europe.”

This appreciation of the benefits of Finnish neutralism for American foreign policy goals contrasted with later scathing assessments of the Finnish example. In a 1977 article titled “Europe: The Specter of Finlandization,” the scholar Walter Laqueur coined the term “Finlandization,” which from his perspective bore the negative connotation of a country willing to sacrifice its sovereignty for the sake of preserving felicitous relations with the Soviet Union. Laqueur feared that other European states might succumb to the temptation to follow Finland's example. Yet here, years before Laqueur's criticism, Dulles was offering the Finnish style of neutralism as a means of diminishing rather than enhancing Soviet control in its own sphere. Even if the Finnish situation was in no way analogous to that of the satellite states in Eastern Europe, the mere presence of this small nation resisting Soviet domination was useful as a propaganda tool for the United States.

Austria In 1955 neutral representation in western Europe expanded further as Austria joined this “third force.” Austria, occupied by the Allies after the war's end, suffered through occupation and protracted treaty negotiations as the Cold War rift widened. By late 1953, Austrian officials were ready to accept neutralization as the price for regaining sovereignty. Soviet negotiators endorsed this solution at the foreign ministers' conference at Berlin in 1954, but the proposal was tabled, the victim of the continuing dispute over the status of Germany, because the neutralization of Austria could be linked to a similar solution for Germany. This was particularly unacceptable to the United States. Although Washington was willing to respect Austria's decision if it chose neutrality, Dulles articulated Washington's misgivings when he asserted that it was one thing for a nation to choose neutrality and another to have neutrality forcibly imposed. Under such circumstances, a nation could not be truly independent and sovereign.

West Germany's incorporation into NATO in 1955 removed this obstacle to a neutralized Austria. (The Soviet Union responded to West Germany's new status with the Warsaw Pact, which further solidified its control of the eastern bloc.) Austrian officials traveled to Moscow and negotiated the terms of the State Treaty of May 1955, agreeing that Austria would join no military alliances, would permit no military bases on its territory, and would practice a form of neutrality along the lines of the Swiss model. France and Britain endorsed this arrangement; the United States reluctantly agreed.

**Economic and Military Assistance** Each of these states traversed a different path to neutralism, and each defined its neutralism in its own distinct terms. Nevertheless, all shared an affinity with western values. This reassured U.S. officials, who employed several tactics to strengthen these ties. Economic measures figured prominently in American plans. European integration, furthermore, provided a vehicle to tie the neutrals to the West. Finally, in response to Sweden's efforts to improve its military capabilities and shore up its defensive position, covert military arrangements developed between Sweden and the United States and its NATO allies.

Economic assistance in the form of trade, loans, and credits was a particularly useful method of fostering a beneficial relationship. But economic assistance was not unrestricted; it had to address the West's Cold War interests. Switzerland and Sweden were economically sound and had healthy trade relations with the West. The United States continued to encourage this trade, but it feared the possible transfer of strategically important materials and technology by these neutrals to the Soviet bloc. In 1949, the United States and its allies had
reached an agreement to restrict the transfer of strategic goods. In ongoing negotiations parallel with the establishment of the Marshall Plan, U.S. officials pressured both Switzerland and Sweden to adhere to these export controls. Both countries, reluctant to compromise their neutral status, nevertheless by 1951 informally agreed to adhere to parts of the export controls. Reflecting Sweden's strategic importance in the Nordic region, its adherence to these controls led the United States in 1952 to begin to allow Sweden to purchase selected military equipment and supplies. This made Sweden eligible for military equipment otherwise restricted to America's allies. The United States went even further in 1956 when it agreed to share some nuclear technology for peaceful purposes.

U.S. aid to Austria between 1945 and 1955, prior to the restoration of its sovereignty, amounted to an estimated $1.25 billion. Assistance continued after the State Treaty was signed in order to strengthen Austria's armed neutrality. In relations with Finland, Washington assiduously pursued an essentially hands-off political posture, intended to minimize antagonizing the Soviet Union, combined with measured economic assistance to strengthen the Finnish economy and orient it more firmly toward the west. This assistance included the sale of surplus agricultural goods as well as loans, the latter conflicting with the 1951 Battle Act, which prohibited loans to nations exporting strategic goods to the communist bloc. In the late 1950s, Eisenhower cited overriding foreign policy considerations to bypass Battle Act restrictions and ensure millions of dollars in loans to Finland. As a result, by the late 1950s, Finnish exports to and imports from the east bloc declined in relation to exports to and imports from the West.

In tandem with these economic measures, the United States exploited the steady evolution toward European integration to draw the neutrals further from the Soviet orbit, so as to reinforce rather than weaken the Western security system. Aside from any benefit integration could provide for its neutral policy, the United States recognized the value of a more tightly integrated Europe, both economically and politically. It therefore consistently encouraged Europe's movement toward cooperation, beginning with the Organization for European Economic Cooperation (OEEC), established in 1948 to coordinate Marshall Plan aid; proceeding to the European Coal and Steel Community and then the European Economic Community (EEC), which portended the possibility of a truly effective union; and refusing to rebuff the European Free Trade Association (EFTA), a tariff union created by states excluded from the EEC. Despite its interest in integration with truly effective supranational authority, the United States continued to encourage institutions like the OEEC and EFTA, which lacked that desired supranational authority, in part because these organizations provided a niche for the neutrals in the Western system. The OEEC included Sweden, Switzerland, and Austria. And when the EFTA was negotiated in 1958, U.S. officials hesitated to repudiate it, largely because it offered a haven for these three neutrals. Also, as Finland became more secure in its relationship with the Soviet Union, it began negotiations in 1959 that culminated in associate membership in this customs union in 1961.

In addition to these efforts aimed at all the neutrals, the United States and its NATO allies engaged Sweden in a covert military relationship that theoretically contradicted that nation's non-aligned posture. Soon after the promulgation of the North Atlantic Treaty, Sweden began to meet with Denmark and Norway to coordinate military cooperation and planning. These secret meetings eventually expanded to include the United States and Great Britain, and led to other areas of cooperation. Sweden in effect became an unofficial member of the Western alliance system.

The Kennedy Years  John F Kennedy was the willing heir to this relationship with Europe's neutrals. Mirroring the findings of the 1955 neutralism study, a State Department study released in 1961 admitted that there were many variants of neutralism arising from “unique, indigenous conditions.” The new administration was reassured by the fact that the European neutrals were stable nations that had proved impervious to communist influence, so Washington was content to let these favorable trends mature.

Illustrative of Kennedy's approach was his response to a visit to Washington in the fall of 1961 by Finland's President Urho Kekkonen and the subsequent “note crisis” provoked by Moscow. Finland's effort to associate with EFTA was only one of a series of cautious steps that nation had taken since 1955 to carefully establish its independence from Soviet control. On his visit to Washington, Kekkonen met with Kennedy and received a public endorsement for his country's neutral course. Soon thereafter, alarmed by Finland's expanding outreach to the West, Khrushchev sent an official note to Helsinki invoking the con-
sultation clause of the Treaty of Friendship, Cooperation, and Mutual Assistance, a move that potentially threatened Finland's sovereignty. Although concerned about this development, Washington reacted cautiously. Bowing to Finnish wishes, Washington remained in the background and avoided escalating this incident into a Cold War confrontation. The U.S. ambassador to Finland privately reassured the Finns of America's support, then bowed to Helsinki's wish to address the crisis in its own way. After a visit to the Soviet Union, Kekkonen succeeded in defusing the crisis with Finland's independence still intact.

Britain and the EEC Despite this appreciation of neutralism, however, when neutral interests conflicted with more pressing priorities of America's Cold War policies, neutrals were the losers. A case in point was the U.S. response to Prime Minister Harold Macmillan's announcement in the spring of 1961 that Great Britain intended to apply for EEC membership. Washington encouraged Macmillan because Britain was an important force in European economic and political affairs, and would provide an Atlantic link between the European Union and the United States. But to the dismay of American officials, Macmillan also pressed for membership, either full or associate, for Britain's fellow EFTA members, including the neutrals Austria, Switzerland, and Sweden (as well as associated Finland). Although Macmillan's proposal potentially would have drawn the neutrals closer to western Europe, Washington opposed his plan because these neutrals were unwilling to accept the full political commitments required of EEC members. Their participation, therefore, would erode the supranational authority necessary for a strong union. Washington encouraged Britain's application, but pressed London to postpone its efforts on behalf of fellow EFTA members. This decision was not encouraging for the U.S.-neutrals relationship. The issue ultimately became moot when the EEC, led by France, rejected Britain's application in January 1963. Nevertheless, these events illustrated the limits of America's willingness to accommodate the interests of these neutrals.

Neutralism Beyond Western Europe

The pragmatism evident in western Europe extended as well to U.S. policy toward neutralism worldwide, but with mixed results. In The Specter of Neutralism, an important study of America's early postwar relations with Yugoslavia, India, and Egypt, H. W. Brands concluded that actual American policy during the Truman and Eisenhower years, as distinct from public rhetoric, "demonstrated a pragmatic ability to deal with neutralism on its own merits. If the neutralist actions of a particular country worked to the advantage of the United States, that country deserved, and usually received, American support. If a neutralist challenged American interests, opposition was the rule." The American advantages and interests to which Brands referred were inevitably defined by the geopolitical rivalry with communism and often lacked a sophisticated understanding of the interests of the Third World states.

Although Brands's study was restricted to the Truman-Eisenhower period, his insight could for the most part extend to the Kennedy years as well. Kennedy administration pragmatism was informed by a more sophisticated understanding of Third World issues, yet Cold War interests still prevailed and affected American tolerance for neutrals. Washington offered economic assistance and encouraged social reform as means to guide these states toward democracy and, it hoped, to counter the allure of communism. Policymakers were committed to resisting Soviet influence and preferred that these countries commit to the West, but when necessary, they were willing to use neutralism as an alternative to communist expansion. Notable in this regard were the Southeast Asia states of Cambodia and Laos. In the late 1950s, as the United States slowly increased its involvement in that area of the world, these two nations, recently independent from French control, embraced neutralism in an ultimately futile attempt to keep out of the emerging conflict. While the United States preferred a Laos and Cambodia committed to the anticommunist cause, it grudgingly accepted their neutralism. Kennedy, furthermore, during his 1961 Vienna summit meeting with Khrushchev supported the neutralization of Laos.

From the end of World War II to the 1960s, neutralism brought opportunities and challenges outside western Europe. In the Soviet bloc, the United States encouraged Yugoslavia's neutralism, even in the face of congressional opposition, because this was a chance to discreetly undermine Soviet dominance. The flowering of neutralism in the Third World dictated that the United States adapt its policies, which it did with varying
degrees of success, as relations with the key neutrals, India and Egypt, illustrate. In South Asia, a region on the periphery of American interests, India, the quintessential Third World neutral, vexed policymakers. Resistant to U.S. efforts to draw it into entanglements with the West, India stubbornly followed a truly independent course. But while south Asia was not critical to U.S. security interests, the Middle East with its oil and strategic geographic position was. Here, U.S.–Egyptian relations proved particularly trying.

**Yugoslavia** John Gaddis, in _The Long Peace_, a retrospective look at four decades of the Cold War, argues that from as early as the middle of 1947, the United States had pursued a “multifaceted strategy aimed at driving a wedge between Moscow and its ideological allies throughout the world.” Nowhere was this wedge strategy more evident than in relations with Yugoslavia. After World War II, Josip Broz Tito had imposed a Marxist regime. But, although committed to building a communist regime internally, he chafed under Stalin’s attempts to impose tighter control over the eastern bloc. Stalin could not tolerate Tito’s separate road to communism because Tito’s neutralism conflicted with Soviet domination of the communist movement. Their dispute culminated with Stalin labeling Tito a deviationist and expelling Yugoslavia from the Cominform in June 1948. Without abandoning his commitment to communism, Tito then adopted nonalignment to address his nation’s best interests.

The break left Yugoslavia desperate for economic assistance. The United States, quick to recognize the opportunity Tito’s defection offered, stepped in to fill the vacuum left by his former Soviet benefactor. U.S. officials anticipated that, if successful, Tito’s independent brand of communism might spread not only in Eastern Europe but also among communist states elsewhere, perhaps even China. Of added benefit was Yugoslavia’s military strength. Tito commanded a force of thirty divisions that could potentially be turned against the Soviet Union in case of attack. In pursuit of these ends, the Truman administration adopted a low-key public approach, both to divert congressional opposition to support of a communist regime and to avoid the impression that the United States was responsible for Tito’s defection, thus lending credence to Stalin’s charges that Tito was selling out to the West. The United States extended aid and credits, including a $20 million loan from the Export-Import Bank, and lifted trade restrictions on many items, including some munitions. In the aftermath of North Korea’s invasion of South Korea in 1950, Washington offered further military assistance through the Mutual Defense Assistance Act.

As its defection became more permanent, Yugoslavia also figured in plans for the military containment of the Soviet Union. In February 1953, negotiations between Yugoslavia and Greece and Turkey, endorsed by the United States, resulted in the Balkan Pact, a friendship treaty providing for consultation and coordination of defense planning. Within a year, this pact evolved into a military alliance. The agreement enhanced Tito’s international standing, but it never fulfilled expectations of closer collaboration with the West. For Tito, carefully guarding his nonaligned position, never abandoned the option of resuming relations with the Soviet Union. Following Stalin’s death, formal relations were restored in 1955, after Khrushchev recognized Yugoslavia’s independent road to communism. In that same year, Tito enhanced his neutral credentials by joining India and Egypt as a principal sponsor of the Bandung Conference. Despite Tito’s machinations, the Eisenhower administration continued America’s cautious support for Yugoslavia throughout the 1950s, seeing his independence as a beneficial break in the monolithic control that the Soviet Union exerted over the eastern bloc.

The Kennedy administration likewise willingly accepted Yugoslavia’s neutralism as an alternative to Soviet influence. It tolerated Tito’s independent initiatives even when they challenged Western interests. In September 1961, for example, Tito hosted a conference of nonaligned states in Belgrade. There, he played a leading role in pressing the nonaligned agenda that promoted, among other things, peaceful coexistence and condemnation of colonialism. His tilt toward the Soviet Union on certain issues addressed at this meeting irritated U.S. officials, especially when he failed to condemn the recent Soviet decision to resume nuclear testing, but blamed the capitalist bloc for the recent crisis in Germany surrounding the construction of the Berlin Wall. But Washington still pursued amicable relations.

**The Third World** If the advantages of a neutral heretic in the Soviet bloc seemed obvious and led to a straightforward policy, appropriately addressing nonalignment among the former European colonies proved more problematic. The 1955 neutralism study commissioned by Eisenhower’s
National Security Council had also examined the phenomenon of neutralism in the Near East and Far East. Like European neutrals, Third World neutrals wanted to remain independent of the competing power blocs. But the study stressed that in the developing world anticolonialism and nationalism were closely intertwined with neutralism, creating a more complex set of circumstances. Furthermore, these newly independent nations had little international experience and had very little power in international relations. However pragmatic and insightful these observations were, in application U.S. policy was less effective in the Third World. Cold War concerns often gave priority to global considerations, which tended to obfuscate officials' interpretations of the motives and actions taken by these nonaligned neutrals. Strained relations often resulted.

World War II hastened the demise of the former colonial empires. During the war, the U.S. government had signaled some sympathy for the plight of these colonies. The Atlantic Charter (1941), a statement of wartime aims signed by President Franklin Roosevelt and British Prime Minister Winston Churchill, had called for self-determination of all people, a reference in part to peoples under colonial rule. But political developments after the war soon complicated America’s relationship with these former colonial possessions. As one former colony after another achieved independence, the United States was distracted by events in Europe. By the time the communist victory in China and, more significantly, the outbreak of the Korean War finally compelled America to turn its attention to the Third World, it encountered a rising tide of nationalism, resentful of years of colonial domination and determined to establish an independent position. Marxism appealed to many Third World nationalists, and the Soviet Union and People’s Republic of China competed for influence. On one level, Khrushchev’s call for “peaceful coexistence” was a blatant attempt to associate the Soviet Union with the cause of these newly independent states. The United States thus found itself in an awkward position. Not only were the former colonial powers some of its most valued European allies, but communism’s appeal in the Third World aroused fears of the expansion of Soviet influence. The two prominent Third World neutrals, India and Egypt, illustrate the problems the United States faced in forging a successful relationship under these circumstances.

After India achieved independence in 1947, its first prime minister, Jawaharlal Nehru, crafted a foreign policy designed to steer clear of military involvements and to maintain an independent role in international affairs. Nehru’s India was a democratic state that adopted the Marxist model of economic reform, thereby triggering suspicion among some policymakers. In contrast to Washington’s global perspective, Nehru’s outlook was decidedly regional. Given India’s desperate economic state, his first priority was to improve the lot of his people. To accomplish this, he was open to economic assistance regardless of whether it came from the East or the West.

The Truman administration from the start encouraged India’s effort to establish itself as a viable independent state. As Dennis Merrill notes in *Bread and the Ballot: The United States and India’s Economic Development, 1947–1963*, “United States policy toward India abounded with contradictions.” But, according to Merrill, it was guided by several goals: to prevent India from succumbing to communism and the increasing influence of the Soviet Union; to draw India into the Western alliance, tap its raw materials, and make it a reliable military ally; and to make India a model for noncommunist development in the Third World and an Asian “counterweight” to the People’s Republic of China.

India, which from the beginning not only espoused neutralism but also acted in a neutral fashion, confounded American officials. Nehru’s criticism of American policies, including Washington’s refusal to recognize Communist China and its support for what he characterized as French aggression in Indochina, created friction. When the Korean War broke out, India supported early UN resolutions condemning the invasion and sanctioning UN actions to repulse the North Korean forces, at the same time that it strove to mediate an end to the conflict. By the latter stages of the war, the United States found it convenient to use Indian diplomats as a conduit to convey its positions to the Soviet Union. After the armistice was signed, India chaired the Neutral Nations Repatriation Committee.

India’s marginal importance to America’s global strategy partially explained both America’s measured response to its nonalignment policies even when they were detrimental to U.S. interests, and also why economic assistance to this poor country was slow in coming. But once it began, it steadily expanded during the Eisenhower years and reached its zenith during the Kennedy administration, peaking in 1962 at $465.5 million.
Good relations engendered by this aid, however, were often negated by the incompatibility of Washington's global goals with India's more regional interests. Nowhere was this more evident than in New Delhi's reaction to U.S. relations with Pakistan, a Muslim state established in 1947, at the time of India's independence, and a state engaged in an ongoing conflict with India over control of the state of Kashmir. In contrast to India's neutralism, Pakistan became a willing participant in America's containment efforts, which led the Eisenhower administration to view Pakistan as a barrier to Soviet expansion in the Middle East and as a potential bridge to Muslim populations there. In 1954, Washington concluded a mutual defense assistance agreement with Pakistan. Soon thereafter, Pakistan became a member of the Southeast Asia Treaty Organization. (Washington had previously tried to persuade India to join, but was rebuffed.) Then, in 1955, Pakistan joined NATO members Turkey and Great Britain in the Baghdad Pact (in 1959 renamed the Central Treaty Organization). While these maneuvers served America's global interests, they strained relations with India. Nehru not only was wary of bringing the Cold War rivalry to the Asian continent, but he feared the advantage American military assistance gave to his regional foe.

The Kennedy administration, more sensitive to India's interests, appointed the prominent economist and confidant of the president, John Kenneth Galbraith, as ambassador in 1961, signaling an interest in improving relations. Galbraith promoted expanded assistance to India and counseled acceptance of its nonaligned foreign policy. When the People's Republic of China attacked India in 1962 over disputed border areas, the United States provided India with necessary military aid. The United States now saw India as a counterweight to the growing influence of Communist China in that area of the world. India accepted U.S. assistance, but still resisted any commitment that would draw it into the Cold War. Washington continued to pursue improved relations, but India never achieved priority status.

In contrast to India, Egypt, located in the Middle East, a region rich in oil and strategically situated in the eastern Mediterranean, became a serious concern for American policy. Gamal Abdel Nasser rose to power in 1954, two years after a military coup had deposed King Farouk. Nasser rapidly established himself as a leader of the nonaligned movement and became a hero to the cause of Arab nationalism. Prior to the early 1950s, the Middle East seemed safely in the Western camp. And for a time after the coup, U.S. relations with Egypt were cordial. Washington promoted an Anglo-Egyptian base treaty that ended British occupation of the Suez Canal zone and expressed willingness to provide Cairo with both economic and military aid. But relations gradually deteriorated. U.S. commitments to Israel and its determination to deter the advance of Soviet influence in the region proved increasingly incompatible with the course Nasser chose to follow.

Nasser, whose country for years had endured British rule, adopted a form of neutralism intent on preventing domination by both the West and the Soviet Union. He resisted Western influence and rebuffed U.S. attempts to get Egypt to join a Middle East Defense Organization, an effort to expand the Western alliance system into the eastern Mediterranean. At the same time, while he willingly cooperated with the Soviet Union when it served his purposes, he guarded against letting this cooperation turn to subservience. To Nasser and fellow Arab neutralists, opposition to the State of Israel was part and parcel of this policy. They opposed Zionism not only because Israel occupied Arab lands, but also because the former imperial powers supported Zionism. They saw Zionism as a tool of Western imperialism.

The neutral Nasser, like Nehru, willingly accepted aid from both the Soviet Union and the United States. He recognized that the West was a more reliable source of aid, but he was wary of any assistance that threatened his independence of action. Thus, his independent neutralism increasingly ran counter to American interests. Nasser refused to join the Baghdad Pact in 1955, so Washington turned to Iraq, long one of Egypt's adversaries. Later, when Nasser requested military supplies after some serious border skirmishes with the Israelis in the Gaza Strip, Washington rejected his request. In response, Nasser turned to Czechoslovakia for arms, evoking vehement objections from Washington. While his actions were consistent with his neutral strategy, Secretary of State John Foster Dulles condemned him for opening opportunities for the expansion of Soviet influence.

Dulles's handling of the Aswan Dam project antagonized Nasser even further. In 1955, the United States, Great Britain, and the World Bank offered a financial package to fund this ambitious project intended to provide irrigation and other benefits for Egypt's economic improvement. However, Dulles made this offer contingent on Egypt's abandoning closer ties with the Soviet Union.
When Nasser continued to negotiate with the Kremlin for a better offer to build the dam, refused to rescind his arms deal with Czechoslovakia, and then extended diplomatic recognition to the People's Republic of China in 1956, Dulles rescinded his offer, prompting Nasser to nationalize the Suez Canal in order to use the fees collected to finance the dam.

Dulles created a self-fulfilling prophecy. The United States worried that neutralism provided opportunities for the Soviet Union in the Middle East. Washington's response to Nasser's neutralism resulted in the spread of Soviet influence and damaged American prestige. In October 1956, when Israel invaded Egypt, and Britain and France in a coordinated move occupied the Suez Canal under the pretext of protecting it, the United States found itself at odds with its major allies in Europe. The United States was forced to join with the Soviet Union in calling for a cease-fire and the withdrawal of all foreign forces from Egypt.

Washington added to the damage by suspending aid to Egypt and freezing Egyptian assets. U.S. officials could not shake the fear that Nasser was a pawn of the Soviet Union. The 1957 Eisenhower Doctrine, which assured American support for Middle Eastern nations threatened by external aggression, was intended to contain the spread of Soviet communism. But Arab allies of Nasser interpreted it as an attempt to contain his nationalist movement. In 1958, Nasser accepted Soviet aid for the construction of the Aswan Dam and welcomed Soviet advisers, who remained in Egypt until Nasser's successor, Anwar Sadat, expelled them in 1972.

Beginning in 1959, relations improved as Eisenhower once more made Egypt eligible for food aid. By 1960, the United States provided two-thirds of Egypt's grain imports. And in October 1962, the Kennedy administration reached a $432 million aid deal with Egypt. But these steps could not totally mend the damage done to U.S. prestige by the events of the mid-1950s. Uneasy relations with Nasser continued, especially after he signed another arms agreement with the Soviet Union in June 1963.

THE UNITED NATIONS, VIETNAM, AND DÉTENTE

By the mid-1960s, Cold War neutralism had matured as a distinct force in international affairs. As the Vietnam conflict monopolized America's attention, neutral states both in Europe and in the Third World became more assertive and outspoken. The two blocs that defined the Cold War ever so slowly succumbed to a new international order. The appeal of neutralism threatened to challenge America's control over the western bloc at the same time that the Soviet Union met with only limited success in wooing the neutrals. Harto Hakovirta, in an article titled "The Soviet Union and the Varieties of Neutrality in Western Europe," observed that "at the height of the Cold War in the 1940s and 1950s, a tendency toward absolute alliance was dominant; but, starting roughly in 1963, the direction seemed to reverse itself. Cold-war structures began to crumble, and the United States gradually lost control over its West European partners."

The United Nations provided a major forum for neutrals to voice their concerns. The composition of that organization changed significantly in the years after the end of World War II as its membership expanded to include newly independent Asian and African states, many of which embraced nonalignment. In 1964, these states formed a caucus, the Group of Seventy-seven (the number of members would increase in subsequent years), that, constituting a two-thirds majority, could effectively control the General Assembly. Although these new states resisted Soviet efforts to assume a role of leadership, they could often count on Soviet support. In contrast to the immediate postwar years, the United States no longer dominated the United Nations, and faced criticism and opposition from the membership.

Neutrals in the United Nations became increasingly outspoken on many issues—the need to reduce Cold War tensions, colonialism, and, importantly, nuclear proliferation. As early as 1961, neutrals took up the cause of nuclear disarmament. In that year, Swedish Foreign Minister Bo Osten Unden, addressing the General Assembly, called upon the nonnuclear members to band together to pressure the nuclear powers to reduce their armaments. Later, in a noteworthy success in the crusade to reduce the spread of nuclear weapons, neutral states played a role in the promulgation of the 1968 Nuclear Non-Proliferation Treaty. The terms of this treaty, after initially being negotiated by the Soviet Union and the United States, were revised and then submitted to the UN General Assembly by an eighteen-nation disarmament committee. In addition to five representatives each from the Western and Eastern blocs, eight neutral states were represented on this committee.
While the United States welcomed support for attempts to curtail the arms race, on some issues its interests were pitted against the neutral position. America's strong support for Israel and its intervention in Vietnam are prominent examples. Vietnam particularly exposed the United States to charges of being an imperialist power bent on pursuing its own ends, with no consideration for the Third World countries trying to overcome their years under colonialism. As opposition to American involvement grew, Sweden and India stood out among critics of that war.

By words and deeds, Sweden made its opposition known. In 1966, citing its commitment to freedom of speech and assembly, the Swedish government ignored Washington's protests and permitted the Bertrand Russell War Crimes Tribunal, made up of a long list of prominent critics of American policy, to meet in Stockholm. Sweden also granted asylum to draft dodgers and military deserters. The numbers seeking safe haven grew significantly in the late 1960s. Prime Minister Olof Palme further strained U.S.–Swedish relations when in December 1972 he likened the massive Christmas bombing of North Vietnam to past Nazi atrocities. Most damaging to U.S.–Swedish relations, in 1969 Sweden became the first Western nation to extend full diplomatic recognition to North Vietnam. Presidents Lyndon Johnson and Richard Nixon both threatened, but did not follow through on, economic sanctions.

Prime Minister Indira Gandhi of India incurred the wrath of the Johnson administration in 1966 when she publicly condemned U.S. bombing of North Vietnam, prompting Washington to postpone needed agricultural aid to her country. This, combined with the continued U.S. support for Pakistan, put a real strain on U.S.–Indian relations.

In Europe, the United States feared a weakening of the Western alliance and a drift toward neutralism among its allies. Following the 1962 Cuban missile crisis, the United States, chastened by the possibility of nuclear annihilation, gradually adopted détente to reduce tensions with the Soviet bloc. Beginning in 1969, President Richard Nixon and his national security adviser (and later secretary of state), Henry Kissinger, made détente the cornerstone of their foreign policy. As their efforts probed the possibility that the divide between the two superpowers might be narrowed, Willy Brandt, foreign minister of West Germany from 1966 to 1969 and chancellor from 1969 to 1974, pursued his own form of détente, Ostpolitik, an independent effort by West Germany to resolve the differences with East Germany and the Soviet Union. Between 1970 and 1972, his diplomatic efforts led to treaties with Poland and the Soviet Union, and ultimately normalization of relations with East Germany.

Brandt's Ostpolitik in many respects coincided with Nixon's quest to improve relations with the Soviet Union. But Kissinger feared that Ostpolitik represented a drift toward neutralism and the possible resurgence of German nationalism. He worried that it might create fissures in the Western alliance, give the advantage to the Soviet Union, and consequently hinder the détente at the superpower level that he and Nixon were so intent upon pursuing. While the United States could not oppose Ostpolitik, its support for these initiatives was lukewarm.

As détente changed the dynamics of the Cold War, neutral states in Europe willingly assumed a role as bridge-builders between the competing blocs. They helped facilitate the resolution of Cold War disputes. Beginning in 1969, Helsinki and Vienna provided the settings for arms control negotiations that resulted in the first Strategic Arms Limitations Treaty in 1972. More significant, Finland played a prominent role in encouraging negotiations in the Conference on Security and Cooperation in Europe (1975). Jussi Hanhimaki, in his study Scandinavia and the United States: An Insecure Friendship, characterized the role of Finland, along with its Scandinavian neighbors including Sweden, as that of "midwives, providing the services and the medium needed for the conclusion of the agreements." He conceded that the agreements would not have come about without Brandt's Ostpolitik, Nixon's efforts at détente, and the Soviet desire for recognition of the postwar borders. But with its commitment to bridge-building, neutral Finland was a valuable vehicle for fostering and moving these negotiations forward.

By the 1980s, great strides had been made in narrowing the chasm created by the Cold War. Although this trend would experience setbacks during the early years of Ronald Reagan's presidency, when Reagan returned to confrontational politics of the earlier Cold War, and although consequently the U.S.–neutral relationship would decline, with Mikhail Gorbachev's rise to power in the Soviet Union, the momentum spawned by détente resumed in the late 1980s. Likewise, the interest of neutrals in reducing nuclear armaments and easing East-West tensions increasingly
coincided with Reagan administration policy. Washington welcomed neutral support. Through the Conference on Security and Cooperation in Europe and other means, neutrals worked to maintain the momentum of improving relations between the two superpowers. Just as the neutrals had played a role in the events of the era of détente, so as bridge builders they served America's policy interests and facilitated the exchanges leading to the end of the Cold War.

With the end of the Cold War, neutralism effectively became an anachronism. Nevertheless, for nearly five decades, it was a third force that American policy had with varying degrees of success addressed in its rivalry with the Soviet Union. U.S. policy that became established during the first two decades of the Cold War for the most part successfully steered a course that, with relatively few exceptions, preserved a good relationship with Europe's neutrals—if not promoting, at least not hindering—America's Cold War goals. This success to a large extent was attributable to the fact that Europe's neutrals shared political, economic, and cultural values and interests with the United States. Relations with Third World neutrals were more troublesome. Anticolonial feelings and the growing tide of nationalism that U.S. policymakers often misunderstood and resisted, strained relationships and opened opportunities for the Soviet Union. Cold War perspectives and global concerns regularly obfuscated policymakers' appreciation of the Third World neutral position, and the Soviet Union often stepped in to exploit the situation.

The term “neutrality” is generally used to designate the legal status under international law of a sovereign state that seeks to avoid involvement in an armed conflict between belligerent states, protect its rights, and exercise its responsibilities as a neutral. Consequently, a neutral state under international law or practice asserts that it has the right to remain at peace and prohibit sovereign acts by belligerents within its jurisdiction, and also a responsibility to treat belligerents impartially. Customary international law, treaties, and relevant domestic legislation confirm such rights and responsibilities. A nation's sovereignty extends to its territory, its ships on the high seas, and the air space above its territory. These principles were, for the most part, reconfirmed in the late twentieth century by the Third United Nations Conference on the Law of the Sea (UNCLOS III) from 1972 to 1982. After reviewing the entire historical body of law related to maritime issues, the conference produced the UN Convention on the Law of the Sea. Among other things, the convention established the breadth of territorial seas and economic zones and guaranteed traditional rights of navigation on the high seas as well as overflight.

Neutral states may engage in all legal international intercourse; therefore, neutrality is not synonymous with isolation, nor should it be confused with neutralism or nonalignment, terms that refer to peacetime foreign policies of nations desiring to remain detached from conflicting interests of other nations or power groups. This concept of neutrality has its origins in western Europe after the rise of independent states following the Peace of Westphalia at the close of the Thirty Years’ War in 1648.

Respect for, and acceptance of, neutrality as having any bearing in international law or practice developed slowly during the seventeenth and eighteenth centuries. At the time, Europe was in a state of anarchy and neutrals’ rights were limited to what was acceptable to belligerents. The little advancement that did occur was largely the result of rivalry among states for trade and territory in the New World. Spain and Portugal’s attempts to divide the New World between themselves, establish a monopoly of trade and colonization there, and close the seas to other nations was soon challenged by early writers on international law. In 1608 Hugo Grotius advanced the doctrine that since the seas could not be occupied, they could not become the property of any person or nation. Like the air, the seas were therefore the common property of all men. Although Spain and Portugal accepted this doctrine somewhat begrudgingly, it was firmly established by the end of the seventeenth century, and the notion of neutrality started to evolve among nations.

In general, restraints on trade revolved around the laws of blockade, the definition of contraband of war, the principle that free ships make free goods, and the right of neutrals to trade between the ports of belligerents. In all of these situations, the restraints on neutrals resulted from the obvious desire of belligerents to prevent their enemies from receiving war materials or other goods that may be needed in war. The law of blockade was an outgrowth of the law of siege in land warfare. Governments acknowledged the practice that a city or a place effectively besieged could be legally cut off from all outside help. When this principle was applied to ports, a blockade had to be effective in order for it to be legal; however, it was difficult, particularly during the age of sail, to seal a port completely. No precise definition of effectiveness was ever found, although an attempt was made in some commercial treaties to establish that a blockaded port had to be sufficiently guarded so as to render a ship “in imminent danger of capture” if it attempted to run the blockade.

The laws governing contraband of war have a long history. Under a late medieval code, Conso-
lato del Mare, all goods destined for an enemy, in belligerent or other ships, were subject to seizure. Early in the seventeenth century, commercial treaties started to distinguish between contraband and noncontraband. The earliest example of this was the Anglo-Dutch Treaty of Southampton in 1625. Ordinarily, such treaties contained lists of goods under both categories, but uniformity in such lists was difficult, except that obvious materials of war were always considered contraband. The idea that free ships make free goods was associated with the issue of contraband. In essence, the concept meant that a ship's nationality determined the status of its cargo, and that enemy goods on a neutral ship, excepting contraband, would not be subject to capture on the high seas.

THE EIGHTEENTH CENTURY

By the time of the American Revolution, a considerable body of customary law existed relative to the rights of neutrals, derived from European commercial treaties and the writings of jurists. Although the law was quite nebulous because it lacked uniformity in practice or means of enforcement, it nonetheless provided a basis for American policy.

A basic tenet of early American foreign policy was to remain free from European conflicts. Known as the Doctrine of the Two Spheres, the Massachusetts Bay Colony had indirectly asserted it in 1644. There were two aspects to this doctrine. One was that a European nation might restrict the trade of its colonials to the mother country although allowing trade between its metropolitan citizens and other metropolitan areas. The other was that wars in Europe between colonial powers would not extend to their colonies and, conversely, those conflicts between their colonies would not spread to Europe. The doctrine failed, for all practical purposes, under the pressures of colonial wars, but the Doctrine of the Two Spheres (the belief that the United States' destiny could be separate from Europe's) was advanced in the Continental Congress's debates over the question of independence. Clearly, this argument is evident in Thomas Paine's influential pamphlet *Common Sense* (1776) Americans saw themselves as victims of British mercantile policy. As long as the colonies were linked to the mother country, they would be drawn inevitably into Britain's wars, ones in which the colonies had no real interest. If they had been allowed to trade freely without restrictions, they would have flourished.

In June 1776 the Continental Congress appointed a committee to draft a declaration of independence and one to develop a plan of government, while also appointing a third committee, chaired by John Adams, to pen a model treaty for the conduct of foreign relations. The committee that worked on the model treaty studied the commercial treaties of Europe and drew from them the provisions on neutral rights that were most likely to be accepted by European nations in commercial relations with the United States.

The Model Treaty of 1776 represented a liberal interpretation of neutral rights. The list of contraband was restricted and short. The treaty called for free trade between countries at war and acceptance of the principle that free ships make free goods. The subsequent treaty of amity and commerce with France, a companion to the treaty of alliance of 1778, contained provisions that Americans had espoused in the model treaty. The United States then sought to make similar treaties with other European nations. When Catherine the Great of Russia issued a declaration of the rights of neutrals in 1780 and called for the formation of the Armed Neutrality to enforce those rights, Americans were optimistic. Although in principle Spain, Holland, and other neutral nations accepted the tenets of the declaration, Holland was the only other country with whom the United States signed a formal treaty during the Revolutionary War. Following the end of the war, the United States signed treaties of amity and commerce with Sweden in 1783, Prussia in 1785, and Morocco in 1787.

Although the United States signed commercial treaties with several nations following the Treaty of Paris (1783), it did not succeed in concluding similar treaties with Britain or Spain, two major maritime powers. Under the terms of the Treaty of Paris, Britain had recognized the independence of the United States, even though she treated the fledgling nation with disdain and did not even fully respect the commercial provisions of the treaty to which she had agreed. Although subjected at times to inconveniences, annoyances, and insults, American trade with Great Britain was nonetheless lucrative. No serious problems arose until the outbreak of war between Britain and France in 1793. The wars of the French Revolution and Napoleon would seriously threaten America's ability to remain neutral, although the United States sought measures to ensure against becoming involved militarily while at the same time promoting its commercial interests.
The American desire to remain free from European affairs and to stay neutral in European wars was associated with the goal of protecting American neutral rights. One of the reasons for the establishment of a stronger central government under the Constitution of 1787 was a desire to retaliate against British restrictions on American trade. This desire increased as Britain seized enemy goods on American ships and impressed sailors, alleged to be British citizens, serving on American merchant and naval vessels. Both practices violated the principle of free ships make free goods, that a nation’s sovereignty applied also to its ships on the high seas. The official nationality of an impressed seaman was irrelevant. The fact that Congress would most likely retaliate against high-handed British measures in defense of national honor alarmed many who felt that the United States might be drawn into the war on the side of revolutionary France.

The American position during the French revolutionary wars was complicated by the fact that the United States had treaties of commerce and alliance with France dating back to 1778. In a technical sense, these treaties violated the Doctrine of the Two Spheres, as well as the principle of impartial treatment of a neutral toward a belligerent. However, the treaties had been consummated during the desperate days of the American Revolution, when doctrine was expendable if necessary to gain alliances that might help secure independence from Great Britain. Under the treaty of alliance, the United States guaranteed to France its territories in America, a provision that the French might invoke if their possessions were attacked. Under the treaty of commerce, the United States would allow French warships and privateers to enter American ports and sell their prizes, something denied to France’s enemies. From the French perspective, this enabled them to outfit privateers in American ports. Concerned that the terms of the French alliance might drag the fledgling republic into the European conflagration, President George Washington, with the encouragement of his anti-French secretary of the treasury, Alexander Hamilton, sought to pursue a neutral course. This was much to the chagrin of the president’s pro-French and anti-British secretary of state, Thomas Jefferson. On 22 April 1793 the president issued his Neutrality Proclamation. In doing so, Washington advised that the United States should “with sincerity and good faith adopt and pursue a conduct friendly and impartial toward the belligerent powers.” Although the federal courts already had jurisdiction under an act of 24 September 1789 to deal with cases involving international law, Congress nonetheless passed the Neutrality Act of 5 June 1794, giving the courts additional authority.

A test of the terms of the Franco-American treaties came in 1793, when “Citizen” Edmond Genêt, minister to the United States of the French Girondin revolutionary government, arrived in the country in April and was warmly received by the American people. Genêt’s activities, however, soon caused the Washington administration considerable consternation. The terms of the 1778 treaty with France, Genêt argued, allowed for the outfitting of French privateers in American ports in order to prey upon British merchant ships. Having arrived in the United States with little money, Genêt also had been instructed to prevail upon the Washington administration for repayment of the American revolutionary war debt owed to France. This money would be used in recruiting American sailors and in funding privateering operations against British shipping. Washington and Hamilton both opposed payment and viewed the outfitting of French privateers as a violation of American neutrality. Even Jefferson, while sympathetic to the French, believed that the United States had to prohibit them from using American ports for hostile purposes.

Ultimately, Genêt’s activities convinced Washington to request his recall, and in February 1794 Genêt’s successor, Joseph Fauchet, arrived in Philadelphia. A change in the French government that brought the Jacobins into power caused Genêt, who would probably have been executed upon his return to France, to request political asylum from Washington, who granted it. Washington’s demand for Genêt’s recall had prompted the French government to ask for the corresponding recall of the American minister to France, Gouverneur Morris, whose involvement in French politics had irritated the French revolutionary government. Washington had sent U.S. Supreme Court chief justice John Jay on a special mission to England, causing the French to fear an Anglo-American rapprochement in spite of the 1778 Franco-American treaty. In an attempt to allay French fears and suspicions, Washington appointed James Monroe of Virginia, a well-known pro-French Jeffersonian, to replace Morris as American minister to France.

In seeking to reduce tensions between the United States and Great Britain, Jay’s mission to London secured a treaty of commerce and naviga-
tion. Jay's Treaty of 19 November 1794 was, in some ways, more remarkable for what it did not contain than what it included. For the first time, Great Britain had signed a commercial treaty, though limited in scope, with an independent United States. Most lacking in the treaty, however, was any reference to the British practice of impressing American seamen. On the principle that free ships make free goods, Jay conceded an important neutral point. When terms of the treaty leaked out, Americans, especially Jeffersonian Republicans, denounced it. To many, including the French, the treaty was viewed as a betrayal of the French alliance and a pro-British move by a Federalist administration. In response, the French renewed their seizure of American merchant vessels, intervened in American politics, and laid the groundwork for the reestablishment of a French empire in North America. Despite the treaty's limitations, and with mixed feelings, President Washington signed it. One of the indirect consequences of the treaty was a new settlement with Spain in the form of Pinckney's Treaty of October 1795. Fearing that Jay's Treaty foreshadowed an Anglo-American alliance that would threaten Spanish territories in North America, Spain acquiesced to most American demands. It agreed to a narrowed list of contraband, the right to trade with belligerents except under conditions of an effective blockade, and acceptance of the principle that free ships make free goods.

Jay's Treaty not only had a significant impact on American foreign relations, it was also important to American domestic politics. Reaction to the treaty contributed to the development of formal political parties in the United States: Republicans, who were basically pro-French, and Federalists, who were basically pro-British. When details of Jay's Treaty became known to the French, they were convinced that the Federalist administration was pro-British and was repudiating its obligations to its revolutionary war ally. On 2 July 1796 the French government announced that it would treat neutral powers the way the British treated them; namely, France would renew its seizure of American merchant vessels. When Republican James Monroe, who had replaced Gouverneur Morris as minister to France, suggested that Federalists like Washington and Adams would be thrown out of office in the election of 1796, the president recalled him. The Directory, the new French government, determined that it would not receive another American minister plenipotentiary until its grievances had been resolved.

Efforts to resolve the issues between the two countries produced the notorious XYZ Affair, in which French officials sought to bribe an American delegation for the mere privilege of meeting with them. In response to this perceived insult Congress, during the summer of 1798, declared all treaties with France abrogated. President John Adams, who had succeeded George Washington, was authorized to employ the navy to protect American merchant ships from French spoliation in the Atlantic Ocean. Additionally, American merchant vessels were authorized to arm themselves for defensive purposes and to seize French armed vessels if attacked. On 2 March 1799, Congress created the Department of the Navy.

THE NINETEENTH CENTURY
The so-called Quasi-War with France lasted until 1801. President Adams wisely took advantage of a change in the French government and negotiated the Convention of 1800, destroying his chances at reelection in 1796. Many Federalists, including Hamilton, who sought a war with France and an Anglo-American rapprochement, felt betrayed by Adams. The convention abrogated the 1778 alliance with France, but retained the commercial provisions and liberal definition of neutral rights characteristic of the earlier commercial treaty. This agreement, together with the Peace of Amiens (1802) that temporarily ended the European war, enabled the United States to pursue a course independent of the European conflict while at the same time maintaining its neutral rights. Under the provisions of the Convention of 1800, the interdiction on American trade pertaining to all countries except Great Britain and France was removed, and the president was authorized to permit trade with the two great powers if they should cease violating the neutral trade of the United States. However, with the resumption of war between Great Britain and France, and its expansion by 1805 with the formation of the Third Coalition against Napoleon, each side sought to gain advantage by shutting off the other's trade. In this deadly duel between the leading belligerents, neutral rights were once again neither recognized or respected.

In 1805, in the case of the Essex, a British admiralty court ruled that the practice by which American ships carried goods from French colonies to France, with only a brief stop in an American port, did not constitute a broken voy-
age but, in reality, was a continuous voyage. Thus, French goods were not neutralized and were therefore subject to seizure. Consequently, Britain passed a series of orders in council designed to impose a blockade of all ports controlled by France, thereby forcing American vessels to go first to Great Britain, pay fees, and allow their goods to be subject to search and seizure. France retaliated with its Berlin and Milan Decrees, placing an embargo on all trade with Britain, and ordering the seizure of all ships that had paid the fees demanded by the Orders in Council, arguing that neutral vessels which did so were no longer neutral but British, and thus liable to seizure. Subsequent decrees also allowed for the arrest of American ships in ports controlled by France and the confiscation of their cargoes. These and subsequent acts and other retaliatory measures by both belligerents, although primarily directed toward each other, nonetheless violated American rights and severely threatened American trade with Europe and its colonies. Lacking effective military and naval power to protect its shipping, the United States attempted through negotiations with Britain, and peaceable economic coercion directed at both Britain and France, to force both belligerents to respect American neutral rights. The Monroe-Pinkney Treaty (1806) with Britain failed to achieve guarantees for American neutral rights. In fact, so unsatisfactory was the treaty that President Thomas Jefferson refused even to submit it to the Senate for ratification.

Calculating that American trade was essential to the British, and to a lesser extent to the French, the United States employed coercive measures, beginning with the Non-Importation Act of 1806. This measure prohibited certain British manufactures from being exported to the United States. In 1807 Jefferson imposed the Embargo Act, a measure that prohibited American ships from leaving American ports. Although many American merchant vessels failed to adhere to the embargo, particularly as time elapsed and it failed to achieve its objectives, the embargo still severely restricted American trade, caused a depression, and produced intense political and sectional feelings in the country. In 1809 British minister David Erskine negotiated the Erskine Agreement with the United States, and President Madison prematurely lifted the embargo. When the treaty reached England, it was repudiated by the British government and Madison, somewhat humiliated, was forced to reimpose the embargo.

In 1809, under severe economic and political pressures, the Madison administration replaced the Embargo and the Non-Importation Act with a watered-down version of the embargo known as the Non-Intercourse Act. This measure opened trade to the world, except for Britain, France, and their possessions. In 1810 the Non-Intercourse Act was replaced by Macon’s Bill No. 2, which reopened trade with even Britain and France, but stipulated that if one belligerent rescinded its restrictive measures, the United States would then impose nonintercourse against the other. When Napoleon’s government implied that it was rescinding the Continental Decrees against American commerce, Madison jumped at the promise on face value when, in reality, France continued to seize American ships and cargoes. As Britain refused to rescind its orders in council when evidence confirmed that France had not actually stopped violating American neutral rights, Madison issued a proclamation, backed by the Non-Importation Act of 1811, prohibiting British goods from being imported into the United States.

Although the United States resented both Great Britain and France, the issues with the British were more long-standing and had greater impact. Many factors contributed to the War of 1812 with Britain, but certainly violation of American neutral rights, impressment of American seamen, and defense of national honor were major contributing factors. The war ended with neither belligerent achieving its expressed purposes. However, the establishment of peace and the conclusion of an Anglo-American treaty of commerce, as well as an agreement to limit naval armaments on the Great Lakes and to settle boundary and fisheries disputes, launched a new relationship between the two nations. After the Treaty of Ghent of 1814, which ended the war with Britain, and the conclusion of the Napoleonic Wars in 1815, there were no major maritime wars for the rest of the century. Thus ended an epoch in the American struggle for neutral rights.

A new phase in the American policy of neutrality was brought about by revolutions in the colonies of Spanish America. Officially, the United States did not play a role in these revolutions and was not particularly concerned about them until such time as any had established permanent governments and therefore warranted recognition as independent states. However, when it looked like one or more European powers might assist Spain in restoring its American empire, President James
Monroe in 1823 issued a message to Congress, largely written by Secretary of State John Quincy Adams, that came to be known as the Monroe Doctrine. In essence, Monroe’s message was a reaffirmation of the Doctrine of the Two Spheres. It also announced that while the United States would refrain from involvement in European affairs, it opposed any further European colonization of the Western Hemisphere, an extension of Europe’s political systems to American states, or efforts to interfere in their internal affairs. Although Congress did not confirm the Monroe Doctrine and there was no occasion that developed immediately to test it, it became a cornerstone of American foreign policy and a justification for future acts that attempted to establish U.S. hegemony in the Western Hemisphere in the decades to follow.

From 1823 until the American Civil War, the United States had no serious problems regarding neutrality. It officially maintained a neutral position during the Texas War for Independence (1835–1836) and the Canadian Uprising of 1837. During the Mexican War (1846–1848) the United States was able to establish an effective, and therefore legal, blockade of Mexican ports. When the Crimean War broke out in 1854, Britain and France agreed to a set of principles that were later codified and proclaimed by the leading European nations as the Declaration of Paris of 1856. This declaration acknowledged the long-standing American position that free ships make free goods, and that a blockade must be effective to be legal. It also contained the principles that noncontraband goods on enemy ships should be free from capture and that privateers should not be commissioned. As the United States was unwilling to surrender its right to commission privateers, and as it hoped to secure an additional agreement that all private property except contraband would be free, it failed to endorse the declaration. Ironically, after the outbreak of the American Civil War in 1861, the United States agreed to adhere to the declaration if its provisions were applied to the Confederacy. This offer was rejected by such nations as Britain and France.

The beginning of the Civil War saw the United States in an anomalous situation regarding its position on neutrality. War was not declared against the Confederacy, nor was belligerent status accorded it. Rather, the administration of Abraham Lincoln considered Union military operations to be a police action against rebellious citizens. Given this view, when Lincoln proclaimed a blockade of Confederate ports on 19 April 1861, it was a domestic action and did not have to be effective in order to be legal. However, when Britain declared neutrality on 13 May 1861, it in effect granted the Confederacy belligerent status that, among other things, meant Britain would consider a blockade of Confederate ports subject to the usual rules of international law.

Since the United States did not have sufficient naval power to make the blockade effective until later in the war, the Confederate government, while also pursuing diplomatic recognition, hoped that European nations would challenge the blockade’s legality. This did not occur, however, largely because Great Britain concluded that its long-term interests would be best served by accepting the Union interpretation of a blockade’s effectiveness. Before the end of the war, Confederate trade with Europe was almost completely stifled because of superior Union naval strength and the capture of major Confederate ports.

In addition to its position on blockade, the United States adopted the doctrine of continuous voyage, a principle taken from British prize law: a ship carrying contraband goods for a belligerent could be captured on the high seas in voyage from a neutral port to another neutral port whenever such a port was only a way station and not the ultimate destination of the cargo. The adoption and use of this doctrine by the United States established a precedent in American policy that was useful to Britain and the Allies in their conflict with the Central Powers when the United States was still a neutral state prior to its entry into World War I.

One incident occurred during the Civil War that caused the British to assert their rights as a neutral. This was the Trent affair of 8 November 1861, when an American naval vessel on the high seas stopped a British mail steamer, the Trent. On board were two Confederate diplomats on their way to England. The ship was boarded and the two diplomats were arrested and sent to prison in Boston. News of this violation of British neutral rights produced an immediate response from the British government, which demanded the release of the Confederates and an apology. For a short time there was even talk of war as the British undertook preparations. On the American side, with no desire for war with Britain given its preoccupation with the challenges of civil war, Secretary of State William H. Seward acquiesced to British demands and conflict was averted.
Aside from the Trent affair, the most significant conflict over neutral rights and duties during the Civil War was the construction and outfitting of warships (designed to be commerce raiders). This was significant primarily in relations between the United States and Britain, whose laws permitted—as did international law—the sale of merchant ships to belligerents, but prohibited the sale of warships. The Confederacy sought to circumvent this prohibition by having vessels built ostensibly as merchant ships, but constructed in such a way so as to be easily converted into warships at sea or in a Confederate port. The most notorious case, albeit not the only one, was the Confederate cruiser Alabama. The United States contended that Great Britain had failed to live up to its obligations as a neutral by allowing the Alabama to leave British waters. The British government asserted that the Alabama was a merchant vessel until it was significantly altered and equipped with naval armament in a Confederate port. This controversy continued throughout the Civil War, and was not resolved until the Treaty of Washington in 1871. In addition to the United States being awarded $15.5 million by an international tribunal, the significance of the treaty was in the concession by Great Britain that a neutral had an obligation to use “due diligence” in preventing a ship from being built “in whole or in part” as a warship for a belligerent. Although only signatories were bound by the treaty, the principle was subsequently incorporated in a convention on the rights and duties of neutrals at the Second Hague Conference (1907), the difference being that the imprecise rule of “due diligence” was changed to the obligation of a neutral to use the “means at its disposal.”

THE TWENTIETH CENTURY

During the years between the American Civil War and the outbreak of World War I, the United States experienced no serious problems connected with its own neutral rights. While promoting its strategic interests, the United States failed in one situation to adhere strictly to its obligations as a neutral nation and to live up to its treaty obligations. During the Panamanian Revolution of 1903, the United States departed from its neutral position by preventing the landing in Panama of Colombian troops attempting to suppress the revolution. In the same action, the United States violated its treaty obligations with Colombia in a 1846 treaty that pledged the United States to guarantee the “rights of sovereignty and property” of Colombia over the Isthmus of Panama. In 1921 the United States compensated Colombia for its loss of Panama.

At the Second Hague Conference, the United States sought to secure an agreement on the rights and duties of neutrals that included the principle that had been advocated by the United States since 1784: that noncontraband neutral private property was exempt from capture. Although the conference adopted a convention on neutral rights, so many significant issues remained unresolved, such as the one of private property, that a separate meeting of the major maritime powers was organized to consider those issues. They met in London in 1908, and the following year issued the Declaration of London. The declaration provided for the most extensive and, as far as neutrals were concerned, the most liberal rules governing neutral trade that had ever been achieved. Although they did not prohibit the capture of private property, they did enumerate an extensive list of free goods and limited the principle of continuous voyage to absolute contraband. Universal acceptance of the declaration would have benefited neutral trade with belligerents, and it would have assisted those belligerents who would have profited from such trade. However, it would have restricted other belligerents in the exercise of rights previously recognized under generally acceptable rules of international law. Consequently, Britain rejected the Declaration of London, and as universal ratification was not achieved, the United States did not ratify the treaty, although the Senate had consented to it.

When World War I began the United States, under President Woodrow Wilson, issued a declaration of neutrality on 4 August 1914. Issues concerning American neutral rights arose most seriously with Britain and Germany. The British did not establish a traditional close blockade of German ports. Rather, it gradually expanded the contraband list to include goods that could be used to manufacture war materials and those that would be of significant value to the German war effort. The British also made extensive use of the doctrine of continuous voyage. The United States protested British maritime practices; however, Britain possessed a basis in international law for its policies. No precise lists of contraband had ever been universally accepted. The idea that some materials on a free list might become contraband had been a feature of treaties since the
seventeenth century. During the American Civil War, the United States had added naval stores and “articles of like character with those specifically enumerated” to the contraband list. The doctrine of continuous voyage was also firmly based in international practice and had been sanctioned by the United States during the Civil War. Even under the Declaration of London (1909), in which the principle of continuous voyage was limited to absolute contraband, the legal extension of such contraband was admitted. Although the United States might have protested the extremes to which Britain carried its maritime policies, it had no solid basis in international law to deny their validity, nor did it grant to the Allies rights prohibited to the Central Powers. General American sympathy for the Allied cause, plus ties of culture and economics, precluded the United States from forcefully defending its neutral rights, or engaging in retaliation as it had during the Napoleonic Wars. Furthermore, Germany's reliance upon the submarine, which caused not only property damage but also the loss of lives, came for most Americans to overshadow any actions by Great Britain.

The conflict between the United States and Germany stemmed largely from German insistence upon the use of unrestricted submarine warfare. The United States did not oppose a German blockade of Allied ports if the blockade were proclaimed and effective, nor did it deny the right of Germany to stop neutral ships on the high seas and to seize both the cargo and the ship if it carried contraband. In an attempt to break the tightening of the British blockade and deny the British supplies from across the Atlantic, Germany—in a proclamation of 4 February 1915—declared a war zone in the waters around Britain, including the English Channel. Germany threatened to sink all merchant vessels, including neutrals, without warning or providing for the safety of passengers and crew. The United States replied on 10 March 1915 that if American ships were so destroyed or American lives lost, this would be “an indefensible violation of neutral rights” and that it would “take any steps it might be necessary to take to safeguard American lives and property.”

Although early attacks on American ships prompted protests from the United States, it was not until the sinking of the British liner Lusitania on 7 May 1915, with the loss of 1,198 lives, including 128 Americans, that the American government vehemently protested. In the first Lusitania note from the Wilson government to Germany, the United States insisted that German submarines stop firing on merchant vessels. In a second Lusitania note, the United States threatened direct action if Germany did not stop its unrestricted use of the submarine against merchant vessels. In a conciliatory reply and an offer for compensation, Germany sought to defuse the situation with the United States. However, on 19 August 1915 the British liner Arabic was sunk, claiming two Americans. To stave off possible American retaliation, Germany issued the so-called Arabic Pledge, a promise that submarines would not attack passenger ships without providing warning and making provisions to rescue passengers and crews. In March 1916 a German submarine torpedoed the French liner Sussex, resulting in the injury of two Americans. From the American perspective, this appeared to be a violation of the Arabic Pledge and Wilson threatened to break off diplomatic relations. The German government once again tried to assuage the Americans by reaffirming the Arabic Pledge.

Germany had failed to achieve military victory by the summer of 1916. With serious political and social problems developing at home, and the German high command concerned about the will of the German people to continue the war, a last major all-out offensive on the western front was planned for the spring of 1917. In a desperate gamble designed to deprive the Allies of vital foodstuffs and materials, the German government resumed unrestricted submarine warfare on 1 February 1917, fully aware that this was likely to bring the United States into the war on the side of the Allies. The United States broke off diplomatic relations with Germany. Following the sinking of several U.S. ships by German submarines in March, the United States declared war on Germany on 6 April 1917. Several factors contributed to American entry into the war, but preservation of neutral rights was a key one.

By the end of World War I, President Wilson had determined that in the interests of humanity, as well as national security, a new approach to world peace was necessary. He was able to convince most of the major statesmen in the world to accept this need and the Covenant of the League of Nations was the outcome. The signatories to the covenant agreed “to preserve as against external aggression the territorial integrity and existing political independence of all Members of the League.” If a member of the league resorted to war in disregard of its obligations under the covenant, then members of the league would prohibit all
trade and financial relations with the covenant-violating state. Furthermore, nonmembers of the league would also be required to abide by these sanctions. Thus, the traditional rights of neutrals to trade with belligerents would be prohibited. However, when Japan violated the Covenant in 1931 by invading Manchuria, and Italy followed in 1935 with its invasion of Abyssinia, the league failed to impose sanctions at all in the first case, and only partially and ineffectively in the second. The league system of collective security collapsed. The extent to which American refusal to join the league contributed to the failure of the League of Nations failure is debatable.

In the twenty years after World War I, the United States rejected the League of Nations, pursued nationalistic economic policies, promoted naval arms limitations, and signed feeble and useless pacts, such as the Kellogg-Briand Pact of 1928 and the London Naval Treaties of 1930 and 1936. At the same time it focused overwhelmingly on domestic affairs and displayed apparent indifference to the moral and political disintegration of world order. When the specter of another world war arose, the nation naively sought to isolate itself from world affairs and pursued safety in the abandonment of its once-cherished neutral rights, for which it had fought two foreign wars. American neutrality had never meant simply non-involvement in world affairs. Rather, it meant the determination to support the rights of its people under rules of international law that, in turn, would contribute to the civilized conduct of nations.

This reversal of America's traditional policy was accomplished through a series of congressional neutrality acts commencing in 1935 and reaching their most comprehensive form in the Neutrality Act of 1937. Believing that American insistence upon its historical defense of neutral rights, along with the greed of bankers and arms merchants, had helped to suck the United States into World War I, Congress passed legislation that in essence repudiated traditional American views of neutral rights. Under these acts, if the president determined that a “state of war” existed among two or more foreign states, American citizens were prohibited from exporting arms, munitions, or implements of war to belligerents or to neutrals for transshipment to belligerents, or to a state where civil strife existed. The selling of securities or making of loans was prohibited, as was travel by American citizens on belligerent ships. American merchant vessels were not to be armed, and they were prohibited from carrying materials of war. Nonprohibited goods could be sold to belligerents, provided the title to them was transferred before being transported abroad. By renouncing its historical interpretation of neutral rights, so the thinking went, the United States could hope to escape being drawn into another foreign war.

Commensurate with this “new neutrality” policy, the United States moved to strengthen relations with Latin American nations. The Neutrality Act of 1937 specifically exempted Latin American states from its application in case of war between one or more of them and a non-American state. In a series of conferences between the United States and Latin America, beginning at Buenos Aires in 1936, the American republics agreed to preserve their neutrality and to act in concert in the event of any threat to their safety or independence. However, when war broke out in Europe and the United States began to alter its neutrality policies, it acted independently of its Latin American neighbors. During World War II some Latin American states that remained neutral referred to their status as “nonbelligerency,” a term without precise meaning in international law, but in reality an extension of commercial rights to the United States not accorded to other belligerents.

The “new neutrality” policy failed for many reasons. In actuality, under President Franklin D. Roosevelt the United States was not about to stand idly by and let the world be dominated by the aggressors who had signed the Tripartite Pact. Presidential acts as well as congressional measures eroded the new policy. President Roosevelt refused to recognize that a state of war existed between Japan and China, or between Russia and Finland. In the destroyers-for-bases deal of 1940, he sold or traded World War I–vintage warships to Great Britain, and extended the Monroe Doctrine to include the mid-Atlantic. In 1939 Congress repealed the arms embargo provisions of the Neutrality Act of 1937, cut trade with Japan, and passed the Lend-Lease Act of 1941, which in effect made the United States an unofficial ally of the nations opposing the Axis. By the end of October 1941, a virtual state of war existed between Germany and the United States, with President Roosevelt convinced that formal war would break out over some incident in the Atlantic between the two countries. However, as Japan was bent upon establishing its “greater East Asia co-prosperity sphere,” Roosevelt—in an effort to pressure the
Japanese to relinquish their conquests in China and Southeast Asia—ultimately cut off all exports to Japan. Convinced that the United States meant to strangle Japan, its government in 1941 undertook plans to attack and, if possible, destroy the American Pacific fleet. When the attack on Pearl Harbor came on 7 December 1941, followed in quick succession with an American declaration of war on the Japanese Empire and German and Italian declarations of war on the United States, history witnessed the end of the United States as a neutral nation, at least in a traditional sense.

Prior to the formal conclusion of World War II, the United States reversed its traditional policy for the second time since 1920 by playing the leading role in establishing the United Nations. While the Charter of the United Nations differed significantly from the Covenant of the League of Nations, its impact on the concept of neutrality was basically the same. The Security Council of the United Nations was assigned the primary responsibility for world peace and for taking action against a state deemed to have threatened the peace of the world. Such action could be in the form of economic sanctions, which have had the effect of eroding the historical rights of neutrals.

Because of the preeminent political, economic, and military position of the United States in world affairs since the end of World War II, the nation was involved in numerous armed conflicts, some of which, like Vietnam, were protracted, even though war was never declared. The United States intervened, covertly and overtly, throughout the world where it felt its interests, or its vision of a desirable world order, was threatened, with little regard to concepts of neutral rights. In other situations, such as in the Korean War or the Persian Gulf War, the United States operated under the umbrella of the United Nations. Neutrality, a cornerstone of American foreign policy since before the establishment of the republic, was no longer relevant. Although there were some in the United States who hoped the country could once again return to an independent, neutral position in the world, President Harry S. Truman and other policymakers pursued international economic and military policies that were essential for the promotion of international trade, expansion of democratic ideals, prevention of another postwar depression, and stopping the spread of communism.

The wartime conferences at Yalta and Potsdam, followed by a series of Council of Foreign Ministers’ meetings, were characterized by mutual suspicion and mistrust, and foreshadowed the rivalry that would come to be called the Cold War. Although the Western powers were already skeptical of Soviet intentions in territories they had liberated in Eastern Europe, the issue over Iran gave cause for Western alarm. In late 1945 a communist-orchestrated revolution broke out in the oil-rich region of Azerbaijan in northern Iran, particularly when the Soviets sent troops and arms to assist the revolutionaries. In addition, the Soviets failed to pull out of Iran in March 1946, as they had agreed previously. Although the Soviets withdrew in May after receiving minor concessions from Iran, their actions in the Near East, commensurate with increasing tensions in Eastern Europe, helped convince Truman that Soviet leader Joseph Stalin meant no good. Winston Churchill’s Iron Curtain speech in March 1946, a United States decision against a loan to the Soviets, the termination of German reparations to the USSR from the American occupation zone in Germany; American promotion of the Baruch Plan to control atomic weapons testing and development, and other issues concerning Germany heightened the feelings of mistrust between the Western powers and the Soviets.

The United States was anything but neutral in the Greek civil war and was extremely concerned about Soviet pressure on Turkey. If successful there, the Soviets would gain access to the Persian Gulf, the Mediterranean, and the oil-rich Middle East. Western Europe would most likely collapse and the British Mediterranean barrier to Soviet expansion and influence would be breached if Greece and Turkey fell. Fighting had broken out in Greece in December 1944 between rightists, who tended to support the return of the monarchist government in exile, and communists. Under the terms of an uneasy truce reached at Varkiza in February 1946, an election was to be held to determine the form of government, and then another election was to take place for a constituent assembly. However, in the days before the election the conservative government repressed the opposition to the monarchy. By the time the election was to occur in March, both the British and the Americans had reneged on the procedures agreed to at Varkiza. Although a general election and plebiscite were held, the communists boycotted them. The results seemingly indicated support for the return of the king. These actions set off a civil war that was largely internal in origin. Many Americans, however, assumed it was Soviet coordinated, and by the spring of 1947 the situation seemed critical.
The gravity of the Greek situation, coinciding as it did with Soviet demands on Turkey and the notification by Britain in the fall of 1947 that it could no longer afford to maintain its commitments to Greece and Turkey, compelled President Truman to act. The result was what became known as the Truman Doctrine, the provisions of which were enumerated before a joint session of Congress on 12 March 1947. In addressing Congress, Truman stated “that it must be the policy of the United States to support free peoples who are resisting attempted subjugation by armed minorities or by outside pressures.” The Truman Doctrine, although initially directed at Greece and Turkey, had as its primary goal the “containment” of communism. The Truman Doctrine represented a watershed in American history. This policy it represented became the justification for American intervention, covertly and overtly, in the internal affairs of nations throughout the world, and it formed the basis for the establishment of regional security treaties that were directed against the Soviet Union and its perceived allies. The United States sought to contain communism in Europe through such measures as the Truman Doctrine, the Marshall Plan, and the formation of NATO, and virtually every other part of the world witnessed American interventions calculated to stop communism’s spread.

In Asia the United States’ major concern was China. As World War II came to an end, civil war in China between the nationalist armies under Chiang Kai-shek, and the communists under Mao Zedong, resumed. Each side hoped to secure territory and supplies by accepting the surrender of Japanese troops in China and Manchuria. Although outwardly encouraging talks between the two rival factions, the United States nonetheless moved its troops and transported nationalist soldiers into key eastern and northern Chinese cities in order to accept the Japanese surrender. In northern China and Manchuria, fighting broke out between the two groups. The communists were assisted by the Soviets in Manchuria, and the nationalists were assisted by the Americans. Although American lend-lease assistance to its other allies had ended, it was continued in the case of China. In January 1946 it seemed that there was a glimmer of hope when President Truman sent General George C. Marshall to China as a special envoy to get the two sides to talk. The truce, however, proved illusory as each side maneuvered to gain the upper hand. The resulting civil war was one of the most bitter and devastat-
sion in 1961, then with the Cuban Missile Crisis of October 1962, which saw the world come to the brink of nuclear war as the Americans and Soviets stared down each other.

In the last decades of the twentieth century, the United States did not hesitate to continue intervening in the internal affairs of numerous nations around the world. However, there have been occasions where it sought to maintain the outward appearance of neutrality, particularly in the case of the Iran-Iraq War (1980–1988). This war threatened to drag in other nations in a geopolitically sensitive part of the world. Passage through the Persian Gulf was threatened, which in turn posed a serious threat to oil interests. While the Soviet Union shrewdly tried to cater to both sides, the United States claimed it was neutral in the conflict. Clearly there was no love lost with Iran, what with the Iran hostage crisis still fresh in Americans’ minds, and relations with Iraq had only recently improved after the State Department removed Iraq from the official list of nations that sanctioned terrorism. Although publicly opposed to arms sales to Iraq, the United States nonetheless sent a large quantity of arms and supplies to Iraq’s ruler, Saddam Hussein. As the administration of President Ronald Reagan became more involved in the Middle East, its preference for Iraq over Iran became evident. Ironically, in the subsequent Gulf War of 1991, the United States under President George H. W. Bush put together a United Nations coalition of forty-eight countries against Hussein.

It may be premature to suggest that the concept of neutrality has come full circle since the Treaty of Westphalia and that the historical rights of neutrals under international law no longer exist. Conceivably, a war could take place in which the United Nations would not interfere and belligerents and neutrals would assert their traditional rights. However, given the realities of the modern world, particularly since the end of World War II, and the proliferation of nuclear weapons, this does not seem to be a likely prospect. In the years since 1941, the traditional concept of American neutrality seems to have been irreversibly transformed.

The North Atlantic Treaty Organization (NATO) was founded on 4 April 1949 in Washington, D.C. On behalf of the United States, the North Atlantic Treaty was signed by Dean Acheson, secretary of state throughout President Harry S. Truman's second term. The founding members of the Atlantic alliance consisted of the United States, United Kingdom, France, Canada, Norway, Denmark, Iceland, Belgium, the Netherlands, Luxembourg, Portugal, and Italy. The U.S. Senate ratified the treaty on 21 July 1949 by a vote of 82 to 13; it entered into force on 14 August 1949. By joining the North Atlantic pact, the Truman administration turned its back on the many voices in the American political establishment and the country at large that favored a return to the political isolationism of the interwar years. After all, isolationists were able to go as far back as George Washington's Farewell Address, in which he admonished his fellow Americans to beware of the Europeans and "to have with them as little political connection as possible." But U.S. membership in the United Nations in 1945 had indicated that the country intended to stay involved in international political affairs. Subsequently, the 1947–1948 Marshall Plan made clear that the United States felt it was in its national interest to use its massive economic and financial resources to help in the reconstruction of Europe. This, it was hoped, would stabilize the old continent, prevent it from becoming once again a hotbed of nationalist fervor and civil war and, not least, make it immune to the forces of international communism. But even after the European Recovery Program (ERP) had been announced, it was still a major step to enter into a close military association. By committing the United States to NATO and thus to a formal and long-lasting entangling military alliance in peacetime, the North Atlantic Treaty of April 1949 marked, as Lawrence Kaplan put it, a "radical transformation in American foreign policy."

It is unlikely that this almost revolutionary development in U.S. political thinking would have come about without the Cold War and the global ideological and political power struggle with the Soviet Union. With the signing of the North Atlantic Treaty the United States indicated its willingness—after much prodding by the United Kingdom and other leading European nations—to accede to the role of protector of western Europe. The Truman administration clearly hoped that with the help of both the Marshall Plan and NATO, U.S. influence, and indeed its example, would help the countries of the old continent to integrate their political and above all economic and military systems in a peaceful and stabilizing way. It was expected that eventually a united and federally organized Europe would evolve in a manner similar to the development of the United States 150 years previously.

One should not credit the leading U.S. politicians of the day and organs like the State Department's Policy Planning Staff too much with a visionary long-term strategy: much came about by default and by means of ad hoc reactions to unexpected developments. Still, quite a few elements of a coherent and well-considered strategy can be detected in American foreign policy after World War II. Much thought was for example dedicated to the perennial German question. It was hoped that the unification of the European continent would defuse the German problem by incorporating this large and potentially still powerful and economically important country into a peaceful and fully integrated European system.

In view of the perceived military threat from the Soviet Union and the weakness of the Western world in terms of conventional warfare capabilities, America's unrivaled nuclear security umbrella was initially gladly accepted by all members. In fact, possession of the atomic bomb and Washington's apparent willingness to use this weapon if necessary in response to an attack on any NATO member was the basis for Washington's hegemonic position in the Atlantic alliance. NATO
allowed the United States to carve out a clear sphere of interest for itself. Washington's overwhelming military and also economic and political strength as well as its supremacy within NATO and the Western alliance enabled the United States to form what in the 1960s came to be called bluntly “the American Empire.” In the 1970s and 1980s, when Europe's important role in the early Cold War and the creation of NATO was belatedly recognized, many historians began to refer to Washington's dominance somewhat more benevolently as an “empire by invitation.” Yet the existence of American hegemony was disputed by very few European observers. Americans, however, often tended to regard their country's superiority in the Western alliance as the realization of Thomas Jefferson's well-meaning “empire of liberty.” While to some extent Washington's role as a benign but still vastly powerful and at times quite autocratic leader rested on its economic strength and its political influence, primarily it was American dominance of NATO that furnished it with formidable global importance.

This explains why both the Bush and the Clinton administrations strongly objected to any thoughts of abandoning NATO after the end of the Cold War in 1989–1991. The largely unchallenged American dominance of NATO was the most important and most powerful tool at the disposal of the United States to maintain its influence in Europe and beyond. More than a decade later this was still the case. In view of the increasingly frequent economic and trade as well as political and strategic disagreements in transatlantic relations in the early twenty-first century, Washington's efforts to bolster NATO and turn it into one of its main pillars of influence in the contemporary world was hardly surprising. NATO still provided the United States with a crucial instrument of global leadership. Moreover, in the aftermath of the entirely unexpected terrorist bombing of the World Trade Center in New York City and the Pentagon in Washington, D.C., in September 2001, NATO would also serve as the instrument that was able to provide the United States with crucial military and logistic help and indeed much needed political and moral support in the war against international terrorism.

**CREATION OF NATO**

The establishment of NATO in April 1949 rested upon a European and in particular a British initiative. As John Lewis Gaddis has written, it was “as explicit an invitation as has ever been extended from smaller powers to a great power to construct an empire and include them within it.” However, in the circumstances of the times, considerations about American empire building and American dominance played a rather minor role. The Europeans were looking for military protection and economic and military aid to ensure their survival as democratic states. Some American observers have therefore concluded that the western Europeans deviously “entrapped” the United States. This is unjustified. The American political establishment of the time—both the Democratic administration and, until the election of 1948, the Republican leadership of Congress—realized very well that putting a stop to Soviet expansionist encroachments and maintaining democratic states with a liberal economic order on the European continent were very much in the national interest of the United States.

Yet, admittedly, without strenuous European attempts to persuade the Truman administration to come to the rescue of the European nations, American involvement might never have come about. What proved to be decisive for American support in both the economic and military sphere was evidence of European willingness to help themselves. This was Washington's condition for providing financial aid under the Marshall Plan and joining the European nations in talks about setting up a North Atlantic defensive alliance.

In the immediate aftermath of World War II, American policymakers, and in particular Secretary of State James Byrnes, were hopeful that some kind of modus vivendi could be found with Stalin's Soviet Union. Yet, this soon proved to be impossible. In March 1946, in Fulton, Missouri, Winston Churchill spoke of the iron curtain that was descending “from Stettin in the Baltic to Trieste in the Adriatic.” A month before this well-publicized event, the U.S. diplomat George Kennan had already sent his influential Long Telegram from the Moscow embassy to Washington warning about Soviet expansionist intentions. As a result of these efforts, in the course of 1946 the foreign policy elite in Washington and American public opinion were becoming rather critical of Stalin's activities. It was a slow process, however, and the turning point only came in 1947. The tightening of Moscow's grip on the states of Eastern Europe, frequent difficulties with Moscow's ambitions in Turkey, Greece, and else-
where, and increasingly tense East-West relations in occupied Germany made many contemporaries slowly aware of the apparently irreconcilable nature of Soviet and Western political aims. Of great importance was the ever more apparent economic weakness of Britain and the unsustainable nature of the country's long-standing imperial role. Crucially significant also was the state of near starvation and the considerable political and economic instability of much of western Europe. This propelled the United States into action.

In the Truman Doctrine of 12 March 1947, the United States declared that it would respond to the British request to assume responsibility for the support of the anticommunist forces in Greece and Turkey. Moreover, much less to Britain's liking, Truman also promised American support for the worldwide fight against international communism. Three months later, Secretary of State George Marshall, Acheson's predecessor, announced the European Recovery Program (ERP) in his speech at Harvard University on 5 June. The Marshall Plan was meant to provide economic assistance to the states of western Europe to enable them to withstand the onslaught of communist fifth columns. Otherwise communism's ideological temptations might well have held a tremendous attraction for the peoples of Europe who lacked food, housing, and heating fuel.

It was Washington's intention to stabilize and reconstruct the continent with the help of generous economic and financial aid. American policymakers recognized that only a united western Europe at peace with itself would be able to create a common front against the military and ideological threat from the Soviet Union. Only such a Europe would ensure the reconciliation of Germany with the countries of the Western world while avoiding tendencies toward neutralism and defeatism. Underlying America's postwar vision was the assumption that only a fully integrated, stable, and economically viable Europe would develop into a peaceful and democratic continent. The lessons from America's own past as well as the country's federalist structure were to serve as the model to achieve a single European market. This would prevent economic nationalism, lead to European prosperity, and form a truly free and multilateral transatlantic economic system.

It also was expected that in due course this strategy would have the advantage of making unnecessary the continuation of American economic aid to western Europe. Active American governmental support and interference were always regarded as temporary. It was hoped that European reconstruction would close the dollar gap, permit the convertibility of European currencies, allow the Europeans to export to the United States, and, not least, create a huge market for U.S. exporters. The latter would be important in avoiding the predicted domestic American recession. Washington therefore stipulated that most of the goods purchased with Marshall Plan aid had to be bought in the United States.

In his speech at Harvard, Marshall had spelled out that while the United States would give generous economic aid, the initiative for proposals on how best to make use of this aid for reconstruction and economic revival had to come from the Europeans themselves. British foreign secretary Ernest Bevin realized this; he regarded Marshall's offer as "a life-line to sinking men" to avert "the looming shadow of catastrophe" over western Europe. Together with his French counterpart Georges Bidault, he organized an international conference in Paris in June and July 1947. The conference led to the formation of the Committee of European Economic Cooperation and to the acceptance of decisive American economic and political involvement in the internal affairs of the countries of western Europe. Eventually, in April 1948, the European Recovery Program was set up and a new European Payments Union and the Organization for European Economic Cooperation (OEEC) were established. The latter was the organ responsible for the distribution of Marshall Plan aid to sixteen European nations and the western zones of Germany. Due to European disagreements and contrary to its original intention, Washington decided to become a direct participant in the running of the OEEC.

The Soviet Union, however, declined to accept the liberal-capitalist economic conditions Washington imposed as a precondition for participation in the ERP. Moreover, Moscow prevented Eastern European states like Poland and Czechoslovakia from accepting U.S. aid. According to some historians, the Soviet Union's self-exclusion may well have been a result secretly hoped for in Washington, as the United States had no interest in using American taxpayers' money to support the economic reconstruction of the communist world. Be this as it may, the nonparticipation of Eastern Europe meant that the Marshall Plan and the OEEC contributed to the widening of the economic, ideological, and political gulf in postwar Europe.

Although Marshall's speech was received with a great deal of hope in Europe, throughout
1947 and most of 1948 fear of a military invasion from the East stalked the western part of the continent. The spirit of the times was characterized by despondency and fatalism. Not only were Greece, France, and Italy, with their large communist parties, on the brink of civil war, but East-West relations in Germany, with the eastern zone firmly controlled by Stalin’s lieutenants, were becoming ever icier. Questions such as reparations, four-power control of Germany’s industrial heartland (the Ruhr Valley), and the desirability of the reestablishment of a central and united state were among the most contested.

It was the collapse of the London foreign ministers conference in December 1947 over disagreements regarding the future of Germany and the February 1948 communist coup and subsequent purges in Czechoslovakia that were decisive. These moved the United States toward participation in an Atlantic defense organization. In early 1948 both Ernest Bevin and Georges Bidault impressed on American leaders the urgency of the situation. Ever since he had become British foreign secretary in July 1945, it had been Bevin’s primary aim to persuade the United States to remain committed to the security and well-being of the European continent. But in the absence of a lasting U.S. commitment to Europe, Bevin, in response to a French initiative, had signed the Treaty of Dunkirk on 4 March 1947. It established an Anglo-French bilateral military alliance with an anticipated duration of fifty years; the formal aim of the treaty was the prevention of renewed German militarism. Yet for both Britain and France the Dunkirk treaty represented merely a second-best solution as it did not involve the United States.

Shortly after the collapse of the foreign ministers conference, Bevin explained his idea of a Western union to Marshall and Bidault, who both heartily endorsed a new political and defensive agreement among Britain, France, and the Benelux countries. Bevin insisted, however, on the need for American assistance and participation in a loose and flexible “spiritual federation of the West.” He told Marshall that the “salvation of the West depends on the formation of some form of union, formal or informal in character, in Western Europe, backed by the United States and the [British] Dominions.” During an impressive speech in the House of Commons on 22 January 1948, Bevin officially proposed the establishment of a western European union; he did not hesitate to spell out that such a treaty would be directed against the threat posed to western Europe by the Soviet Union. The impact of the communist coup in Czechoslovakia in February and increasing Soviet intransigence over Berlin, which by June had led to the Berlin blockade crisis, confirmed the importance of Bevin’s pronouncements.

On 17 March 1948 a treaty for European economic, political, cultural, and military cooperation with a duration of fifty years was signed in Brussels. Participants of this multilateral treaty, the anti-German tone of which was much milder than that of the Dunkirk treaty, were Britain, France, and the three Benelux countries. Unlike the Dunkirk treaty arrangements, the Brussels Treaty Organization (BTO) could be enlarged to include other members. The values of self-help and cooperation were emphasized in the treaty to impress the United States and, indeed, President Truman warmly welcomed the new organization. Nevertheless, the United States still needed to be persuaded to accept a European security commitment. Truman’s enthusiastic welcome of the BTO and his unusual decision to maintain conscription in time of peace were hopeful signs.

Almost immediately after the Brussels treaty was concluded, top-secret Pentagon talks between Britain and the United States and Canada about the setting up of a North Atlantic defense organization took place. It is unlikely that these talks would have taken place without the prior formation of the BTO. However, the establishment of transatlantic military cooperation was still viewed in terms of cooperation between the BTO and the United States; neither American membership in the BTO nor the creation of a new treaty organization was yet envisaged.

Shortly after the Pentagon talks, from July 1948 to March 1949 the BTO and the United States and Canada entered into drawn-out negotiations for the establishment of some sort of Atlantic security organization. The aim of the talks was the achievement of a unanimous decision rather than merely a majority vote. Still, the Truman administration remained cautious. As Lawrence Kaplan has explained, opposition to the establishment of a joint American-European military alliance came from three major camps in the United States.

First, there was the still formidable opposition from isolationists who suspected that America was being asked to pull the European chestnuts out of the fire. These largely emotional and psychological pressures were difficult to satisfy. The administration, and in particular Secre-
tary Acheson, embarked on a major effort of persuasion to win over as many isolationists in Congress as possible by, for example, emphasizing the harmony of interests between the UN Charter and the NATO treaty. But due to congressional pressure, and much to the dislike of the Europeans, Article 5 of the North Atlantic charter, in which an attack on one member was regarded as an attack on all and would lead to a joint war effort, had to be expressed much more vaguely than originally anticipated. Thus, not the Soviet Union or any other potential enemy but the U.S. Congress would in fact decide whether or not the United States would become involved in a war. Essentially, this was the result of the Vandenberg Resolution passed by the Senate in early June 1948. On the whole, however, the compromise achieved by Arthur Vandenberg, the influential Republican senator and chairman of the Senate Foreign Relations Committee, only slightly diluted the North Atlantic Treaty. However, when article 5 was invoked for the very first time after the terrorist bombing of the World Trade Center and the Pentagon on 11 September 2001, it occurred in an entirely unforeseen way and for a totally unexpected reason. During the Cold War it had always been expected that the United States would have to come to the aid of European countries to defend them against a Soviet invasion. But in September 2001, article 5 was invoked by NATO Secretary General Lord Robertson and the North Atlantic Council on the request of the U.S. administration to obtain NATO’s political and military support in the fight against international terrorism.

Secondly, the Joint Chiefs of Staff and the U.S. military in general were more than doubtful whether the country had the resources to build up a transatlantic military alliance. Indeed, the Joint Chiefs feared that the resources Congress would be able to make available to the American military services would be greatly reduced if Washington decided to rearm the Europeans. Whether or not European rearmament went ahead, in view of Stalin’s conventional superiority, the West would be helpless if faced with a Soviet invasion of Europe. Eventually, however, the Joint Chiefs realized that the proposed Mutual Defense Assistance Program would actually enable them to enlarge and modernize the equipment available to the army, navy, and air force. Moreover, the administration’s willingness to listen to the military and to agree to rule out the right of any of the future NATO members to automatic military assistance greatly pleased the Joint Chiefs. Instead, bilateral agreements with each member were made the precondition for offering U.S. military aid to western Europe.

Thirdly, supporters of the United Nations and Roosevelt’s “one world” concept feared that an “entangling alliance” would revive the despised and dangerous balance-of-power concept of pre–World War II days. Although they recognized that the Soviet Union’s veto in the Security Council made any use of the United Nations for Western defense purposes difficult, if not impossible, the envisaged alliance appeared to ignore the United Nations altogether. This was a poor precedent that might well threaten to undermine the United Nations fatally. The Truman administration therefore invoked the UN Charter as much as possible in the articles of the North Atlantic Treaty, although they realized, as Kaplan writes, “that there was a basic incompatibility between the treaty and the charter.” During the strenuous efforts to sell the North Atlantic Treaty to the country, the administration pretended that NATO was a regional organization of the United Nations (chapter 8, article 53). Wisely, however, no reference to this effect was included in the text of the treaty. After all, regional organizations were obliged to report to the UN Security Council, which would have given Moscow an unacceptable element of influence on NATO.

During the many months of negotiations between the Brussels Treaty Organization and the United States and Canada many other issues became controversial. For example, the question of whether the new organization should be only a strategic or also a political alliance was contentious. In the end, and largely on the insistence of Canada, the envisaged organization was also given a political and ideological role rather than a mere military function. Thus, article 2 emphasized the necessity of economic and social cooperation between the member states, and article 8 stated that no member state should enter into any obligations that conflicted with NATO—in other words, no member state was allowed to go communist. Also, the role of Germany, and how to restrain and integrate Germany into the Western world, was extensively and successfully discussed. At the London conference in the spring of 1948, the three Western allies were therefore able to agree on the radical step of setting up a separate West German state.

Of particular importance were questions of NATO membership, coverage, and duration. Eventually it was decided that there should be no
different categories of membership; countries were either participants or not. For strategic and political reasons it was decided to interpret the term “North Atlantic” loosely. For example, the Algerian departments of France were accepted as being covered by NATO, and countries such as Italy and Portugal (and later Greece and Turkey) were of such strategic importance that they needed to become involved. This meant for example that Antonio Salazar’s Portugal, which was hardly a democratic country, was allowed to join. Yet, Spain only became a member in 1982, after the death of fascist dictator Francisco Franco. For largely strategic reasons, Portugal (including the Portuguese Azores) and Italy as well as Norway, Denmark (including Danish Greenland), and Iceland were allowed to accede to NATO in April 1949. They had not participated in the negotiations between the BTO, the United States, and Canada.

By September–October 1948 it had become clear that a new unified alliance would be created rather than a defensive agreement between the Brussels Treaty Organization and a North American organization, as had been envisaged in the Pentagon talks. Most importantly, at around the same time it became obvious that the United States would be a definite member of the new North Atlantic alliance. While the Europeans expected above all to benefit from NATO by means of American protection and military aid, Washington hoped that the existence of NATO would convince the Soviet Union to restrain its expansionist ambitions. Not least the United States expected that due to American participation, the North Atlantic alliance would help to overcome the outdated balance-of-power concept that had dominated European politics for centuries. NATO was therefore meant to contribute decisively to the establishment of a peaceful, stable, and prosperous continent.

**NATO CONSTRUCTION AND REARMAMENT**

After the establishment of the North Atlantic alliance in 1949, almost immediately two important organs for the running of NATO were set up under article 9 of the treaty: the North Atlantic Council and the Defense Committee. The first council meeting in September 1949 in Washington and the subsequent meetings in late 1949 and early 1950 decided that for the time being the organizational structure of the Brussels Treaty Organization was to be adopted for NATO’s use. In addition, the establishment of a united command with a supreme commander and Council of Deputies was also agreed upon. The most important NATO institutions for the next few years were the five regional planning groups (including the Western European Regional Planning Group consisting of the five BTO nations); the Military Committee, consisting of the chiefs of staff of the member states with a standing group based in the Pentagon; and a general three-nation standing group of NATO’s most crucial members, the United States, Britain, and France. Thus by 1950 a relatively well-integrated alliance structure was taking shape.

It was much more difficult, however, to design a strategic and military concept that would turn NATO from a paper tiger into a real collaborative transatlantic alliance. NATO’s first strategic concept was adopted in January 1950, with the United States being mostly responsible for strategic bombing issues, the United Kingdom for naval warfare matters, and the continental Europeans for tactical air warfare issues and the provision of ground troops. However, differences soon surfaced regarding American ideas about the defense of Europe. During the first few years of NATO the U.S. Joint Chiefs of Staff were so pessimistic about the availability of Western military resources that the American defense plans for Europe essentially consisted of the withdrawal of U.S. troops to the Pyrenees and Britain. It was hoped that it might be possible to reconquer the continent at a later stage. Not surprisingly, the Europeans were less than impressed; they insisted on a defense of Europe at the Rhine or ideally at the Elbe. Thus, in May 1950 the Medium Term Defense Plan (MTDP) that took European sensitivities into account was agreed upon. Still, the plan was based largely on the optimistic prognosis that more than ninety divisions and eight thousand planes would be available by 1954. This was highly unrealistic but NATO essentially believed that no Soviet invasion was to be expected in the foreseeable future (1954 was regarded as the danger year). Further, it was assumed that the American atomic monopoly would provide immunity from attack, whatever the availability and readiness of Western conventional forces on the continent. There was great fear that any strenuous rearmament effort by the Europeans would irreparably damage the economic and social reconstruction of the continent.

The explosion of an atomic bomb by the Soviet Union in August 1949 undermined this
confident belief in the American atomic umbrella. After all, the Western alliance had expected that Moscow would not be able to develop atomic weapons for a considerable number of years. Yet, much to the consternation of politicians in Washington, by mid-September firm scientific evidence was available that a Soviet explosion had indeed taken place. Britain was only able to embark on its first atomic test explosion in 1952, and it took France until 1960 to develop an atomic device. Although it was considered unlikely that the Soviet Union would be able to rival Washington's growing atomic arsenal for a significant period of time, the Truman administration decided to go ahead with the building of a hydrogen bomb.

In the course of 1950 the U.S. government began to doubt whether the resources allocated to the defense of the Western world were sufficient. The result was the controversial document NSC 68, which reflected the increasing militarization of the Cold War. Subsequently, Washington's belief in the necessity of making more radical efforts to rearm the countries of western Europe (including the new West German state) and to expand and modernize America's conventional and nuclear forces was strengthened by the outbreak of war in Korea, which was regarded as another Western failure in Asia after the loss of China to the communists in 1949. In June 1950 communist North Korean forces invaded South Korea, the American protectorate. Parallels were drawn with the precarious position of divided Germany in Europe. It was clear that the envisaged MTDP program was grossly inadequate. Under the impact of the Korean War the huge American and allied rearmament program called for by NSC 68 was signed into law by President Truman. In addition, and despite strong French opposition during the Western head of government conference in September 1950 in Washington, the United States firmly insisted on the rearmament of the new West German state. West German forces as well as the territory of West Germany were needed for the forward defense of the European continent.

Eventually, a compromise was achieved by means of the Pleven Plan, which was based on the recently conceived European Coal and Steel Community (ECSC) for the integration of the French and German coal and steel industries. Both plans were the brainchild of the influential French businessman and civil servant Jean Monnet. Instead of an independent German army, navy, air force, and general staff, French Prime Minister René Pleven proposed the creation of a multinational European army under the umbrella of a European Defense Community (EDC), which, as Acheson expressed it, would be closely “interlocked” with (and presumably subordinate to) NATO. Approximately ten German divisions would be integrated with other countries' forces at the regimental level to form mixed European divisions that would remain under the command of non-German EDC member states. To make the difficult task of rearming the Germans more palatable to West German Chancellor Konrad Adenauer, who would face enormous domestic opposition, he was offered sovereignty for the Federal Republic as a reward. The EDC solution also envisaged the establishment of a European minister of defense, an assembly, and a council of ministers as well as a common defense budget. The persuasive skills of NATO's first allied supreme commander and World War II hero Dwight D. Eisenhower helped to convince the Truman administration that the EDC project was a sensible way of obtaining West German rearmament without antagonizing the other European countries too much. Fears of the reestablishment of Hitler's Wehrmacht were still widespread. Consequently, Washington regarded the realization of the EDC as of vital importance. It was believed that the European army would cement the Western alliance and lead to the establishment of lasting Franco-German friendship, thus strengthening NATO's coherence and preventing future European civil wars.

Although the EDC treaty was signed in May 1952, ratification was a difficult affair. President Eisenhower and Secretary of State John Foster Dulles, who succeeded Truman and Acheson in January 1953, were unable to pressure Paris into ratifying the treaty. Ultimately, in the absence of Britain, which was prepared to cooperate with the EDC but not to join it, fear of German dominance of the EDC led the French parliament not to go ahead with the ratification of the EDC treaty in late August 1954. With the exception of the outbreak of the Korean War, this was the most severe crisis of the Atlantic alliance to date. NATO was thrown into turmoil. Washington was particularly shocked. After all, the U.S. administration had hoped that the establishment of the EDC might enable Washington to reduce both its financial and troop commitments to Europe. Instead, the rearmament and sovereignty of the Federal Republic of Germany, as well as the European integration process and the coherence and military buildup of NATO, had to be reconsidered from scratch.
The British managed to come to the rescue. During two rapidly convened conferences in London and Paris in September and October 1954, and by way of an earlier whirlwind journey through the European capitals, Foreign Secretary Anthony Eden was able to convince his partners to agree to West German membership in NATO on a nondiscriminatory basis. Eventually, French agreement was won after the negotiation of Bonn’s prior admission to the Western European Union (WEU). This was the renamed Brussels Treaty Organization of 1948. By way of West German WEU membership, France and the other member states were to receive a veto over the rearmament and arms procurement activities of the Federal Republic. Eden had also announced during the London conference that despite British sovereignty concerns, his country would not withdraw its Rhine army and tactical air force based in West Germany without the agreement of its WEU partners. As long as U.S. troops remained on the continent, the British would also be prepared to make a European commitment. The “great debate” of 1951 in Washington between the administration and isolationists in Congress about further troop commitments in Europe had already resulted in the dispatch of four additional American divisions to Europe.

Thus, the WEU solution to control German rearmament and London and Washington's commitment to continue deploying troops on the European continent were decisive in persuading France to cease its opposition to West German membership in NATO. Both German rearmament and the unity of the Western alliance had been preserved. Yet the WEU never developed a life of its own. It is fair to say that the development of a European defense identity and a European pillar of NATO—as had been envisaged with the EDC—therefore did not commence before the 1980s and 1990s. With the exception of France and despite the occasional crisis in transatlantic security relations, throughout most of the Cold War the western Europeans placidly accepted American predominance in NATO and thus the buildup of the American empire. While Britain believed it could rely on the “special relationship” with the United States to maintain its influence, the West Germans, at the front line of the Cold War, felt too dependent on the American security umbrella to oppose this strongly. Only the French were prepared to challenge American hegemony in Europe.

At the Lisbon North Atlantic Council conference in February 1952, agreement had been reached on a substantial military and political reorganization of NATO. That structure was largely still in place in the early twenty-first century. With regard to the military organization of the alliance, most of the regional planning groups were abolished. Instead, the standing group of the Military Committee would oversee SHAPE (Supreme Headquarters Allied Powers Europe), commanded by SACEUR (Supreme Allied Command Europe). An Atlantic command (Supreme Allied Command Atlantic, SACLANT) and an English Channel command were established on the same level of responsibility, which included planning issues. SHAPE, which was essentially modeled on the Brussels Treaty Organization headquarters near Paris and took over many of its administrative units, was clearly the most important command. It was subdivided into four geographical commands: Northern Europe, Central Europe, Southern Europe, and the Mediterranean. While the supreme commanders for Europe and the Atlantic were Americans, the Channel Command was headed by a Briton; all the command posts reported directly to the standing group in Washington. Unlike the failed European Defense Community, in NATO the vast majority of troops were national forces; NATO only mixed nationalities at the various command headquarters.

The Lisbon conference also approved a new political structure. A civilian secretary general (who would always be a European) was to be appointed. The secretary general was to be responsible to the Council of Ministers and in charge of an international secretariat that had responsibility for financial and economic planning and for military production issues. The Council of Deputies was to be replaced by permanent representatives at the ambassadorial level who assumed responsibility when the Council of Ministers was not sitting; their meetings would be chaired by the secretary general. Moreover, despite British protests it was decided to move NATO headquarters from London to outside Paris where it would be closer to SHAPE.

The conference also approved the first enlargement of NATO, which led to the admission of Greece and Turkey in 1952. Both countries were of great strategic importance to NATO's southern rim and contributed more than twenty-five valuable divisions. The western Europeans reiterated their willingness to make huge rearmament efforts in the conventional field so that
ninety-six well-equipped divisions (including the West German contingents) would be available by 1954. However, economic and financial realities in western Europe would prevent the achievement of these ambitious and quite unrealistic military goals. With respect to domestic opinion and the obvious limits on the tax burden that could be imposed, no country was willing to adhere to the Lisbon goals.

Still, by 1955 NATO had already expanded its membership twice, had become a much more integrated military alliance with a clear political dimension, and had also seriously attempted to tackle its military weakness. However, it was still in no position to rival the forces at the disposal of the Soviet Union.

**CONSOLIDATION**

After the Austrian peace treaty in April and the admission of West Germany to NATO in May 1955, the Geneva Four-Power Summit in July inaugurated the first thaw in East-West relations. Although neither the summit conference nor the subsequent Geneva foreign ministers’ conference managed to solve any of the many outstanding Cold War problems, the two meetings led to a more relaxed international climate. It appeared to be possible to contain the Cold War in Europe peacefully and agree to disagree, something that was soon called “peaceful coexistence.”

Although East-West relations deteriorated temporarily when the Soviet Union invaded Hungary in late 1956, the almost simultaneous Anglo-French-Israeli attack on Egypt to reverse nationalization of the Suez Canal shook the Western alliance to its foundations. American anger at not having been consulted and Washington’s fear that the British-French action would open the doors of the Middle East to the Soviet Union (as it did) led to the first occasion when the United States and the Soviet Union sided against two western European countries. An American-inspired run on the pound sterling and the effective imposition of an oil embargo on Britain by President Eisenhower had the desired result. Britain gave notice to the French that they would have to withdraw from Egypt, an action that caused a great deal of anti-British resentment in Paris. The Suez crisis made it clear that Britain and France, who still retained a good deal of global influence, were not able to embark on independent international action without the approval and support of the United States. Thus the crisis symbolized the decline of western Europe to the status of a mere satellite continent.

After the Suez crisis American preponderance within the Western alliance, both in its political and strategic dimension, could no longer be doubted. The Europeans increasingly became reactive members who criticized and complained while most constructive initiatives originated in Washington. This was evident during the long Berlin crisis of 1958–1963, which led to a quite unexpected escalation of the Cold War and to the building of the Berlin Wall in August 1961. The Berlin crisis and in particular the October 1962 Cuban missile crisis brought the world close to nuclear war. The August 1963 limited test ban treaty between the United States, the United Kingdom, the Soviet Union, and any other state that wished to join was one of the lessons drawn from the missile crisis. Another was the installation of a “hot line” between Washington and Moscow.

Despite the increasing Cold War marginalization of Europe in the second half of the 1950s and during the 1960s, European alliance members played a subordinate but still significant role with regard to the development of NATO’s strategic concepts. However, most initiatives came from the United States. Shortly after taking office the Eisenhower administration realized that the conventional force goals as agreed at Lisbon would either remain unrealistic or, if implemented, would undermine American and European economic competitiveness and social well-being. Thus, Washington invented vague concepts with names such as “long haul,” “massive retaliation,” and “new look,” which would obscure the fact that the alliance was unable to develop as quickly and as intensively as originally envisaged.

Although the European alliance members were very critical of the increased reliance on nuclear containment, there was very little they could do. While always prepared to criticize American proposals, NATO’s European members were not prepared to put more of their own scarce resources into developing their conventional forces. The only concept they partially agreed with was the “long haul” idea, which essentially consisted of the insight that the frantic rearmament efforts of the Korean War and Lisbon conference era could not be sustained for financial and psychological reasons; the plan was therefore to be stretched out over a longer period of time. However, “massive retaliation” and the “new look,” as first outlined in NSC document 162/2 in
late 1953, were very different matters. Because the envisaged conventional rearmament goals were unrealistic and because the production of atomic weapons appeared to be a lot cheaper than conventional warfare methods, the Eisenhower administration intended to focus NATO's strategy on nuclear containment. U.S. officials argued that fear of an American atomic response would prevent any Soviet attack on the countries of the Western alliance. Moreover, getting “greater bang for the buck,” as Eisenhower’s secretary of defense expressed it, would ensure the maintenance of healthy Western economies and budgets.

The increasing reliance on nuclear diplomacy meant that NATO would have no choice but to respond with atomic weapons if, for example, the Soviet Union invaded West Germany. NATO was all but incapable of retaliating to a communist attack with conventional weapons. Instead it would rely on the so-called “trip-wire” idea: once the Soviet Union attacked Europe and the U.S. soldiers stationed there, Washington’s Strategic Air Command would be activated. The implications of such a scenario were most disconcerting for the West Germans and their European neighbors. The Joint Chiefs of Staff Admiral William Radford’s 1956 suggestion, as leaked to the New York Times, that the United States needed to reduce U.S. troops in Europe to two million by the withdrawal of 800,000 soldiers from the continent, gave rise to great concern. Moreover, the greater the arsenal of intercontinental nuclear weapons at the disposal of the Soviet Union, the greater the arsenal of intercontinental nuclear weapons the host nations had to give their

NORTh ATLANTIC TREATY ORGANIZATION

A new strategic concept, “flexible response,” was eventually adopted in 1967. It was meant to allow NATO to respond to an invasion by the Soviet Union with a range of escalating options: use of conventional weapons, use of small tactical atomic weapons, and only finally initiation of a full-scale nuclear war. But this also was a controversial concept. The European NATO allies generally feared that a Soviet and eastern European attack at multiple locations and by multiple means would still give the Western alliance no option but to embark on escalating the conflict into a nuclear counterattack. Moreover, the question remained: Who would decide the use of nuclear weapons by NATO and would the European members be able to influence Washington’s decision? As Ian Thomas has recognized, the issues were “command and control” of NATO’s nuclear forces. A compromise solution had already been found with the so-called dual key arrangements for the use of intercontinental ballistic missiles; the host nations had to give their
agreement to the use of these weapons. However, Britain and other European nations were concerned about whether in a sudden emergency the United States would wait for the agreement of the Europeans. After all, despite the looming threat of a global nuclear war during the Cuban missile crisis, the Americans had not bothered to consult with the Europeans; even the British had hardly been informed. Thus, the anxieties of the Europeans that they might be dragged into a nuclear confrontation with the Soviet Union against their will dominated the early to mid-1960s.

American ideas about the establishment of a multilateral force (MLF), put forth in early 1963, were a reaction to this. Although originally developed during the Eisenhower years, the Kennedy administration argued that the MLF would lead to greater alliance cooperation and transatlantic military transparency. It would create an integrated nuclear force similar to the existing integrated conventional forces and thus increase NATO military efficiency. Washington also hoped to integrate British and French nuclear forces into the MLF and thereby defuse the discussion about the creation of German-owned nuclear forces and Germany's participation in nuclear decision making.

The MLF was to consist of twenty-five ships, to be jointly owned, financed, controlled, and manned by the entire alliance; each ship would be equipped with eight Polaris missiles. In military circles it was technologically and organizationally a very controversial concept, and many experts doubted its military usefulness. However, the Kennedy administration appeared to believe that the MLF could be used to overcome the deep dissatisfaction within the alliance with regard to NATO's nuclear strategy. It would continue full American control over the deployment and use of nuclear weapons while giving the Europeans the impression that they were participating in nuclear decision making. At the same time, the MLF concept had the advantage of preventing the further proliferation of nuclear weapons within the alliance. Despite strong German support for the MLF (and strong French and British opposition; London even proposed its own equally flawed Atlantic Nuclear Force concept), by 1965 the Johnson administration had withdrawn the idea. Instead, Washington was now in favor of creating a nuclear planning group within NATO.

By then France's increasing uneasiness about American dominance of and strategy for the alliance was rapidly posing a severe threat to the unity and coherence of NATO. Paris doubted the U.S. commitment to nuclear deterrence if America's own national interest (that is, U.S. territory) was not threatened. Moreover, many in France argued that multilateral nuclear deterrence would contribute to the prevention of nuclear war. Thus, for French nuclear strategy the existence of NATO was counterproductive and not necessary at all. In addition, De Gaulle viewed American predominance in NATO and talk of an Atlantic community with ever greater suspicion. Not without justification he believed that Washington intended to prevent the development of independent nuclear forces within NATO and to keep individual alliance members as subordinate as possible.

In early March 1966 President Lyndon Johnson was informed that France would leave NATO's Integrated Military Command (IMC) and that all NATO forces and NATO headquarters had to depart France by April 1967. This led to another severe crisis within NATO, yet by late 1967 the alliance had resettled in Brussels, and no lasting damage to the unity of the remaining NATO IMC members had occurred.

**NATO AND DÉTENTE**

After the Cuban missile crisis in 1962, East-West détente was widely seen as the only option to ensure the world's long-term survival. Washington became increasingly interested in East-West détente and pushed NATO in the same direction. As early as May 1964, President Johnson had spoken of the need for "building bridges," and in October 1966 he advanced the idea of "peaceful engagement" with the countries of the Eastern bloc. The Harmel Report, approved by NATO member states in December 1967, spoke explicitly of the Western aim "to further a détente in East-West relations." However, it was made clear that any détente would have to be based on NATO's and the West's cherished policy of strength. During the NATO Council of Ministers meeting in Reykjavik in June 1968, all NATO members emphasized their willingness to embark upon East-West negotiations regarding troop reductions in Europe. In fact, Washington hoped that NATO would become one of the instruments driving détente; in an era of lessening threat perception it would help to give the Atlantic alliance a new sense of purpose. It would also discourage the European allies from pursuing bilateral policies of détente, as for example the French and especially the West Germans were doing.
Washington’s readiness in the late 1960s and early 1970s to use NATO as a vehicle for embarking upon détente with the Soviet Union, thus giving in to European calls for a relaxation of the Cold War, was strongly influenced by American economic and financial problems. Some commentators began speaking of relative American decline and the end of the American century. This was symbolized by Richard Nixon’s termination in 1971 of the 1944 Bretton Woods economic system by his sudden suspension of the dollar’s convertibility into gold, which resulted in the free floating of international currencies and an effective devaluation of the dollar. Simultaneously, the president imposed a 10 percent protective tariff on imported goods. These measures were solely dictated by domestic economic requirements in the United States, and any negative economic consequences for its European allies were disregarded. America’s problems were largely due to the costs of the Vietnam War, the lingering burden of financing the domestic Great Society programs of the 1960s, and the relative overvaluation of the dollar, which helped European and Japanese exports. The European Community’s imposition of quotas, exchange controls, and import licenses on goods from outside the community as well as its protectionist common agricultural policy (CAP), inaugurated in 1966 also, contributed to America’s ever-larger budget deficit. The United States had not only accumulated a considerable balance-of-payments deficit, but from 1971 it also had a considerable trade deficit as well as inflationary problems, rising unemployment, and almost stagnant wages; further, the position of the dollar, the world’s leading reserve currency, was weakening. Transatlantic relations were becoming increasingly difficult, and this included relations within NATO.

America’s relative economic and financial decline, in combination with global détente and the accompanying perception that the military threat from the Warsaw Pact was receding, decisively contributed to undermining the Nixon administration’s commitment to the European continent and, to some extent, to NATO. Congress had also grown increasingly skeptical about the benefits of America’s involvement in Europe. During the 1970s, Senator Mike Mansfield introduced eight amendments for U.S. troop reductions in Europe. Within the administration, it was the national security adviser Henry Kissinger, a keen student of nineteenth-century European power politics, who insisted on basing America’s relations with its western European allies on a purely bilateral nation-state basis within the Atlantic framework. Establishing a united and federal Europe, as the creators of NATO originally had envisaged, was now seen as counterproductive for Washington’s hegemony in the Western world. In Kissinger’s realist worldview, it was unlikely that “Europe would unite in order to share our burdens or that it would be content with a subordinate role once it had the means to implement its own views.” Kissinger even recognized that once “Europe had grown economically strong and politically united, Atlantic cooperation could not be an American enterprise in which consultations elaborated primarily American designs.”

However, as far as public rhetoric was concerned, the Nixon administration continued speaking out in favor of a united federal Europe with a large single market, fully integrated into the Atlantic system. It was still assumed in Washington that a united Europe would share “the burdens and obligations of world leadership” with the United States. In particular, the Nixon White House favored the envisaged expansion of the European Community. It hoped that Britain’s entry and the revival of the Anglo-American “special relationship” would lead to an improvement in transatlantic relations and within NATO. Yet on the whole Nixon and Kissinger were not prepared to accept the growing maturity of Europe and the realities of a more pluralistic and interdependent world. The Nixon administration still expected a largely docile Europe. As far as East-West relations and the NATO alliance were concerned, Washington certainly wished to be in full control. Ostpolitik, West Germany’s fairly independent variant of détente, was therefore only grudgingly accepted by the U.S. administration. Nixon and Kissinger disliked the independence and confidence with which the West Germans proceeded with Ostpolitik and competed with Washington’s own strategy of superpower détente.

By 1973 Kissinger realized that transatlantic relations were in urgent need of revision and repair. To the anger of the European Community countries who had not been consulted, he grandly announced the “Year of Europe.” The Nixon administration had been largely occupied with the Vietnam War and the development of détente with China and the Soviet Union during its first years in office, and the “Year of Europe” was Kissinger’s attempt to improve U.S.–EC relations inside and outside NATO while safeguarding Washington’s leadership role. Kissinger proposed
a new Atlantic Charter and did not hesitate to emphasize that the United States had global responsibilities while the EC countries only had to deal with regional problems. Moreover, he insisted on a greater degree of military burden-sharing, arguing that only Europe's economic contribution would guarantee the continued functioning of America's security umbrella. The so-called Nixon Doctrine of 1970 had emphasized that America's allies ought to assume more of the burden of defending themselves.

The linkage between economic and security concerns led to severe difficulties between Washington and the western Europeans. Kissinger, however, managed to persuade the Europeans to agree to a clause in the new Atlantic Declaration, signed in June 1974, stating that Washington should be consulted before the EC countries arrived at important decisions that impacted on transatlantic issues. Thus, American ideas of the nature of the transatlantic relationship had largely won the day. In practice, however, allied relations remained tense. Severe friction occurred during the Yom Kippur War of October 1973 when Washington wholeheartedly backed Israel and many European countries hesitated to do so. The European Community was much more dependent on Middle Eastern oil than the United States, and many countries (like France, the United Kingdom, and West Germany) had strong economic links with the Arab countries in the region. Thus the war and the energy question were closely connected with both security and economic prosperity.

American-European differences with respect to the Year of Europe and the Yom Kippur War pushed the European Community into developing more sophisticated processes of cooperation, not least in order to resist pressure to fall in line with American wishes. The 1973 Declaration on European Identity was influential in gradually leading to a tentative common European foreign policy. It encouraged EC members to use the instrument of European Political Cooperation (EPC), created in 1970, to ensure that foreign policy positions would be coordinated among all EC countries. In 1968 the informal Eurogroup of EC defense ministers had been founded to discuss European defense cooperation. In late 1970 this led to the launch of the European Defense Improvement Program (EDIP) to build up NATO's infrastructure and national European forces. But as some authors have argued, this may have been less a demonstration of European independence in defense matters than an attempt to impress the United States with Europeans' willingness to help themselves. Thus, most authors view the 1970s as a "dark age" for both transatlantic relations and European integration. The two oil crises and the accompanying economic recession (best characterized by the term "stagflation"), as well as the expansion of the European Community from six to nine countries with the addition of the United Kingdom, Ireland, and Denmark on 1 January 1973, caused a severe, long-lasting crisis of adaptation within Europe.

It certainly weakened the ability of the European member states of NATO to embark on any decisive initiatives to reform the problem-ridden alliance. However, "the disarray of Europe" worked to the benefit of the United States. Washington was able to insist on the importance of the Atlantic framework and regain, as Alfred Grosser says, "its position as the leading power among the partners who were unified only when under its direction." Still, under Nixon and Kissinger an important reevaluation of U.S.–EC relations inside and outside NATO had taken place. Washington had begun to look after its own economic and political interests much more than before. It was no longer prepared to accept unilateral disadvantages in the hope of obtaining vaguely defined benefits in the long run. But it was still not prepared to accept western European emancipation from American tutelage.

The rising tide of Eurocommunism in southern Europe (particularly in Italy, France, and Spain) worried the United States much more than it did the Europeans. Despite the Eurocommunists' independence from Moscow and their ambition to democratize their party structures, Washington feared that NATO might not survive the international developments of the 1970s. Greece withdrew from NATO in August 1974 in view of the West's ambiguous attitude toward the Turkish invasion of Cyprus after the Greek-inspired coup. The ruling military regime in Athens had hoped to unite the island with Greece and thus improve their plummeting domestic popularity.

From the mid- to late 1970s the western and eastern Europeans cautiously began to diverge from the policies pursued by their masters in Moscow and Washington. With hindsight it seems that the European nations became gradually aware again of their common European identity and their shared interests in world affairs. In fact, the greater the respective difficulties with Washington and Moscow appeared, the more
united the European countries became. Serious problems in superpower cooperation in the mid-1970s—for example, the prolonged MBFR arms control talks regarding conventional armaments in Geneva and Vienna beginning in 1972 and the SALT II negotiations during the Carter administration—as well as the strengthening of the American neoconservative movement in the 1970s appeared to foreshadow a new hostile phase in the Cold War. European public opinion and many western European politicians refused to go along with this. Yet European politicians also felt the need to ensure that the United States remained committed to Europe. They were torn between opposition to a policy of renewed East-West tension and the awareness that the American security umbrella was still vital for the protection of the European continent.

TENSION, DÉTENTE, AND THE END OF THE COLD WAR

Détente climaxed in the first half of the 1970s. Nixon’s visits to Moscow and Beijing, the Berlin Treaty of 1971–1972, the 1972 Basic Treaty between the two German states, and the Helsinki Accord of 1975 appeared to prove the vitality of East-West détente. But there was increasing domestic American opposition to détente; the growing number of neoconservatives were firmly opposed, for example, to the Helsinki conference. Many on the right of the political spectrum in the United States viewed Western acceptance of the postwar borders in Europe by means of the Helsinki Final Act as a substantial defeat of the West. Soviet ratification of the human rights accord, an element that may well have contributed to the unraveling of the Soviet empire a decade later, was seen as unimportant.

When President Jimmy Carter took office in 1977, he embarked on a human rights crusade. He viewed NATO as more than just a military and political alliance; to him NATO ought to contribute to a more humane development of international politics and create a more just world. This antagonized the Soviet Union and led to much increased tension in East-West relations. When the Soviets invaded Afghanistan in December 1979, détente was all but over. Carter turned into a full-blown cold warrior, not least in order to increase his chances for reelection in 1980. The U.S. government boycotted the Olympic Games in Moscow in 1980 and the president refused to let the SALT II Treaty proceed for ratification in the Senate (where it probably would have been defeated).

However, in 1977 Carter made three important proposals that were accepted by NATO at the North Atlantic Council meeting in May 1978 and indicated the alliance’s enduring mistrust of Moscow. The first proposal argued that Western policy should continue to be based on the Harmel Report: détente had to be pursued on the basis of strength. The second proposal referred to the standardization of military equipment and to the necessity of making further progress with integrating NATO at the operational level. The third proposal, which developed into the Long-Term Defense Program (LTDP), indicated that détente had not overcome the arms race. In view of continued Soviet expansion of its offensive capabilities, NATO’s defenses also needed to be strengthened, particularly in the area of conventional weapons. NATO’s long-term nuclear needs were to be discussed by the Nuclear Planning Group. Although most European countries wholeheartedly approved of the LTDP, the renewed outbreak of Cold War tension after the Afghanistan invasion worried the Europeans. The simultaneous continuation of détente in Europe became a serious problem for the coherence of NATO and America’s dominant position within the alliance.

Soon the belief, widespread in the United States, that the Soviet Union was in fact attempting to obtain military and nuclear superiority under the guise of arms control agreements also began to worry a number of European NATO countries such as West Germany and Britain. It eventually led to NATO’s “dual track” rearmament decision of December 1979. The dual track strategy consisted of the attempt to negotiate with Moscow for the reduction or even elimination of the Kremlin’s intermediate-range SS-20 missiles, which were targeted at western Europe, by 1983. If this should prove impossible, as was in fact the case, equivalent U.S. weapons (464 cruise missiles and 108 Pershing missiles) would be deployed in western European countries: the Pershings in West Germany and the cruise missiles in the United Kingdom, Italy, Holland, and Belgium. Among the European peoples this decision was severely criticized. In Bonn it contributed to the downfall of the Helmut Schmidt government and its replacement by the center-right government of Helmut Kohl in 1982. It also caused many domestic upheavals in France and Italy and led to the rapid development of a European-wide peace movement. The latter largely benefited the new North Atlantic Treaty Organization
left-leaning, pacifist, and environmental Green parties across western Europe, which were particularly strong in West Germany, France, and the Benelux countries. After all, while European countries had to agree to the deployment of the new nuclear missiles in their countries, negotiations with the Soviet Union, if they were to take place, would be a bilateral affair between Moscow and Washington. It would exclude the Europeans—including the United Kingdom and France, whose nuclear weapons might also be affected by any negotiated solution—from having any input.

By the early 1980s America’s political elite was increasingly dominated by anticommunist ideology, which eventually culminated in the election of President Ronald Reagan in late 1980. Reagan did not hesitate to go back to the days of intensive Cold War first experienced in the 1950s and early 1960s. However, Washington habitually failed to consult or even inform its European allies.

When Ronald Reagan entered the White House he was intent on reimposing America’s leadership on transatlantic relations. The European Community’s much stronger economic position and greater political confidence as well as the era of détente with the Soviet Union were simply ignored by Reagan as if these developments had never taken place. Thus, under Reagan, even more so than under Carter, economic as well as security issues and severely differing perceptions regarding the East-West conflict affected the transatlantic alliance. Reagan went on the offensive to implement NATO’s “dual track” decision and undermine the European peace movements by attempting to sell the alliance as a harbinger of peace. At the same time, the reassertion of America’s leadership of NATO and the concurrent effort to increase America’s global prestige were at the heart of Reagan’s foreign policy. Reagan also did not hesitate to employ anticommunist rhetoric. Much to the despair of the European NATO allies, Reagan did not appear to be interested in rescuing what was left of East-West détente.

Among European leaders only British Prime Minister Margaret Thatcher supported Reagan’s hard-line approach.

Reagan, like Thatcher, was not interested in supporting the creation of a supranational Europe. In fact, his new policy of strength toward Moscow precluded a reassessment of Washington’s relations with its allies. With regard to Reagan’s policy toward the Soviet Union, however, it is useful to differentiate between his first and second terms in office; from 1984 to 1985 the president embarked upon a less hard-line approach toward the USSR. Although this helped to improve Washington’s relations with its allies to a considerable degree, Reagan still expected the Europeans to follow America’s hegemonic lead without questioning any of its policies. Thus, in terms of transatlantic relations, a deliberate policy of arrogant rather than benign neglect can be observed throughout Reagan’s terms in office.

Early in his presidency, for example, the administration talked casually of developing capabilities for fighting nuclear war and the possibility of entering into tactical nuclear exchanges with the Soviet Union. Such exchanges would of course have taken place over European territory, destroying much of the continent in the process. The same apparent willingness to distance himself from European security concerns appeared to apply to the president’s enthusiasm regarding the development of the Strategic Defense Initiative (SDI). If this project ever were to come to fruition it purportedly would make the United States immune to nuclear attacks by the Soviet Union, while in all likelihood such protection would not be available to the Europeans.

Reagan’s negotiations with Soviet secretary general Mikhail Gorbachev in Reykjavik in October 1986 almost led to the elimination of all ballistic missiles in East and West and the tabling of plans for the eradication of all nuclear weapons in the foreseeable future. Although such a development would have dramatically affected the future of the European continent, the president never consulted the Europeans but drew the lesson that only a united NATO front would convince the Soviets to make concessions. The same unilateral approach was applied when Gorbachev surprised Western leaders by accepting the United States’ “zero-zero” INF proposal in December 1987, which foresaw the removal of all intermediate-range missiles from Europe. Reagan’s 1988 proposal to modernize NATO’s short-range nuclear Lance missiles in Europe to counter Moscow’s still existing conventional strength in Europe also occurred without much consultation with America’s NATO allies.

The Reagan administration’s disinterest in consulting the Europeans can also be observed with respect to economic issues. The European Community’s, and in particular West Germany and France’s, increasing trade with East Germany, the Soviet Union, the developing world, and certain Arab nations was viewed with a combination of suspicion and envy in Washington. Reagan
attempted to restrain the competition of the EC countries, and he did not hesitate to explain the rationale of American trade policy with the help of NATO and transatlantic security arguments, which usually resulted in the development of severe economic conflicts. Such crises emerged, for example, in connection with the proposed European gas pipeline deal with Moscow. Reagan's controversial trade sanctions on the Soviet Union in the wake of the declaration of martial law in Poland in December 1981 ensured that transatlantic relations deteriorated further.

As usual, the European Community was ready to compromise as far as security and political issues were concerned, fully realizing that reasonable transatlantic relations and a functioning NATO alliance were still the indispensable pillars of the Cold War world. From November 1983, after the negotiations with Moscow within NATO's dual track framework had failed, most EC countries went along with the deployment of new intermediate-range missiles in the face of very hostile peace movements in many countries. Indeed, the deployment of the missiles even reassured some European governments that the Reagan administration did not intend to "decouple" from the European continent. Eventually the EC countries compromised over SDI and agreed to the imposition of sanctions (though largely symbolic ones) on Moscow after the Polish crisis of late 1981.

With regard to important economic issues the European Community was much less disposed to compromise. Regarding the envisaged gas pipeline to Moscow, the EC countries were adamant in their refusal to be browbeaten by the American attempt to undermine the deal; for example, they forbade the employment of American companies and technology in the construction of the pipeline. Reagan's attempts to impose what in effect amounted to extraterritorial sanctions on European companies who were willing to participate led to an outcry. Eventually Reagan had no option but to quietly give in.

Overall, Reagan's economic and financial policies showed yet again that the European Community was helpless in the face of unilateral American policies, forced to react to decisions that had been taken in Washington. Thus, as John Peterson has argued, "the precarious dependence of European economies on decisions taken by a fundamentally unsympathetic U.S. administration pushed the EC countries towards closer co-operation." The European Community under commission president Jacques Delors began developing plans for a Single European Market (SEM) to liberate itself from overwhelming American influence on western Europe's economic and financial fate. It intended to develop a fully free and integrated internal European market by 1992 and to design a common European currency system for implementation shortly thereafter. The French-led, though rather short-lived, revival of the Western European Union (WEU) in 1984 helped to contribute to the development of new ideas for creating a genuine common European foreign and defense policy, as later articulated in the Maastricht Treaty of 1991. In 1988 a Franco-German brigade was founded. This was expanded to corps level three years later; it had the dual purpose of making sure that Germany would remain committed to European integration and of strengthening Europe's military capacities. America's economic and financial predicament, made worse by a rapid decline of the dollar's value in the second half of the 1980s, seemed to indicate the possibility of U.S. troop withdrawals from Europe for financial reasons. The unilateral actions of Gorbachev regarding the reduction of nuclear and conventional armaments and the winding down of the Cold War also appeared to make this a distinct possibility for political reasons.

The Reagan administration viewed these moves toward an economically and politically more integrated and independent Europe with great suspicion. Despite its own protectionist and discriminatory trade policies, it did not hesitate to speak of a "Fortress Europe" and was deeply disturbed by European protectionist measures. By the end of the Reagan years it appeared that not much was left of America's vision for the European continent as it had been developed in the late 1940s and 1950s. The Reagan administration certainly had not been willing to deal constructively with the attempt of its European allies to emancipate themselves a little from American preponderance.

NATO AND THE POST–COLD WAR WORLD

By the late 1980s it became clear that the Cold War was about to end. In April 1988 Gorbachev announced the Soviet Union's withdrawal from Afghanistan. In December, speaking before the UN General Assembly, he offered to withdraw half a million troops and thousands of tanks from eastern Europe, which subsequently he did. Gor-
bachev's wide-reaching proposals—his domestic reform policy, his suggestion for a strategic arms reduction treaty (START) and a ban on chemical weapons as well as his agreement to the INF treaty—turned him into an immensely popular person in western Europe. NATO leaders were confused and feared for the relevance of the Western alliance. The North Atlantic Council summit in Brussels in May 1989, NATO's fortieth anniversary, therefore reiterated the common values and interests among all NATO members and announced a "Design for Cooperation."

One of the alliance's earliest tasks had been the reconciliation of France and Germany, and now NATO was meant to become the forum for overcoming the division of Europe, creating a free and united Europe, and integrating the eastern Europeans under a common European roof. Under American leadership this was NATO's counteroffensive to Gorbachev's talk about overcoming the Cold War by creating a common European house. This conception appealed to the Europeans and worried the United States. After all, it seemed to indicate that Washington's participation in a new post–Cold War framework for Europe was not really required. In more practical terms, the Brussels summit also envisaged the creation of a European security identity and the strengthening of transatlantic ties. Thus, NATO intended to remain relevant for the dialogue within the Western alliance. In view of Soviet disarmament moves, the modernization of the Lance missiles was postponed to 1992 and ultimately shelved. NATO also made proposals for the radical scaling down of conventional and short-range missiles on both sides of the Iron Curtain. President George H. W. Bush believed that the alliance should go "beyond containment."

Thanks in considerable part to Bush, Western triumphalism was avoided when the Berlin Wall was breached in November 1989. It was also Bush and his secretary of state, James Baker, who attempted to support Gorbachev and his increasingly beleaguered position in Russian domestic politics. In close cooperation with West German Chancellor Kohl and his foreign minister, Hans-Dietrich Genscher, Washington skillfully used the "two-plus-four" talks in 1990 and subtle diplomacy with Gorbachev to ensure that a unified Germany would remain a member of NATO. This was also the desire, if not the condition, of Thatcher and French President François Mitterrand, who both had initially attempted to prevent unification. By the time of German unification in October 1990 the issue had been resolved. The newly united state was both a member of NATO and the European Community, and a compromise had been reached for the position of East Germany. Until the last Russian troops had left the former German Democratic Republic by the summer of 1994, no NATO troops were to be based there. Large amounts of money went to the former Soviet Union to pay for the rehousing of the soldiers as the Russian government claimed officially. The all-German army was to be reduced to 350,000 (the old West German army consisted of just under 500,000 troops).

During NATO's first two post–Cold War summits, in London in May 1990 and in Rome in November 1991, the alliance attempted to devise a new strategic concept and ensure that NATO would be relevant after the East-West conflict had come to an end. It was emphasized that NATO's role was based on mutual values and trust and was meant to improve peace and cooperation. During the Cold War, NATO still did not exclude a nuclear first strike if necessary. Now the importance of nuclear weapons was scaled down. The alliance announced the elimination of all short-range nuclear forces. Henceforth NATO would focus on a more flexible approach to crisis management at a much lower level; during the London summit the NATO Rapid Reaction Corps (RRC) was created. It was recognized that NATO would no longer have to concentrate on repulsing a sweeping Soviet invasion of the European mainland but would have to focus on much lower-scale emergency situations. Thus, a wider role for NATO was found that would ensure that the alliance remained relevant for the crises of the post–Cold War world.

This new and already fairly open-ended conception was expanded further at the Rome summit. NATO expressed the desire to be at the center of all major European institutions—the European Community, the Western European Union, the Conference on Security and Cooperation in Europe, and the Council of Europe—to ensure transatlantic unity as well as intra-European cooperation. The alliance also expressed the opinion that it felt responsible for the security of the eastern part of the continent, its former enemies. Thus by late 1991, NATO had turned itself into a global crisis management instrument for the post–Cold War era. At the same time, it continued emphasizing its key role for solving conflicts among NATO members and with regard to transatlantic relations in a wider sense.
Perhaps one of the most important decisions at the Rome summit was the establishment of the North Atlantic Cooperation Council (NACC), which was a forum of consultation of the defense and foreign ministers of the eastern European states, including the Soviet successor states. It would enable them to participate in strategic planning, disarmament, and crisis management discussions with the alliance. With the help of the NACC, NATO also believed that it was called upon to contribute to the democratization processes in eastern Europe. The January 1994 “Partnership for Peace” ( PfP ) concept built on the NACC. While the former Warsaw Pact countries were not (yet) allowed to join NATO, the vague and wide-ranging Partnership for Peace as well as the 1997 political cooperation agreement were clearly regarded as stepping stones to NATO membership for many eastern European countries, though not for Russia. Indeed, the April 1999 admission of the former Warsaw Pact members Poland, Hungary, and the Czech Republic was greatly resented in Moscow. The intention to grant NATO membership to former parts of the Soviet Union like the Baltic states, Russia’s so-called “near abroad,” was perceived as even more humiliating and a severe potential threat to Russia’s national security. While attempting to placate Russia as much as possible, however, NATO was unwilling to give Moscow an effective veto over its enlargement process.

The decisive event that convinced the world that NATO was still relevant to the post–Cold War era was the Gulf War of 1991. NATO itself was not a participant in the war, caused by Iraq’s invasion of Kuwait, but U.S., British, and French contingents drew on NATO operational resources. In view of the failure of western European countries to provide an effective and united response to the crisis, the successful reversal of the conquest of Kuwait appeared to justify NATO’s military and political crisis management techniques. It also meant that NATO members, and the Western public, became gradually used to the out-of-area activities of the alliance.

In response to the dire European performance during the Gulf War, at the Maastricht summit in late 1991 the EC countries decided to further develop the Western European Union in order to build up a Common Foreign and Security Policy. In early 1992 the Eurocorps (initially called the Franco-German corps) was meant to be the core of a new European army. This awakened American anxieties about whether or not the European Union was in the process of building up a serious rival to NATO. It also appeared to challenge the long-term future of America’s engagement on the European continent. However, it was soon revealed that this was not the case. The European role in the wars in the former Yugoslavia was frequently characterized by military incompetence and political disunity, as well as financial and political unwillingness to assume a more prominent role in the Balkans. Thus, NATO’s activities in the former Yugoslavia relied on American resources. Initially, NATO’s performance (in the form of the Implementation Force, IFOR) was less than impressive during the wars of succession in Yugoslavia that began in 1991. In the war in Bosnia it was characterized by much hesitation and exaggerated caution. But in 1995–1996 the alliance embarked on its largest military operation ever and excelled in its effective cooperation. The Dayton Peace Agreement of November–December 1995 was largely due to NATO’s belated but ultimately successful bombing campaign against the Serbs. NATO, it appeared, was still greatly relevant. In the absence of any united European military effort and an effective United Nations, NATO was indeed the only organization available to achieve such a task. Moreover, it was the United States that had contributed overwhelmingly to the alliance’s military effort and provided it with forceful leadership.

This was also the case in the Kosovo war of 1999. After a hesitant and often ill-conceived strategy to oppose Slobodan Milosevic’s ethnic cleansing of the Serbian province, only the employment of NATO’s (and Washington’s) overwhelming resources and a forceful American-led bombing campaign seemed to impress the Serbian leader. But it may well have been the threat to employ ground troops, which the Europeans had been pressing for against strong opposition by the Clinton administration, that convinced Milosevic to withdraw from Kosovo. However, NATO’s bombing campaign led to the deterioration of relations with Russia and China, and even NATO countries like Greece were less than impressed by NATO’s activities in the Kosovo war, which had not been sanctioned by the United Nations.

NATO’s involvement in the wars in the Balkans at the turn of the century and the alliance’s careful crisis management and disarmament role in Macedonia in 2001 decisively contributed to NATO’s new confidence and rediscovered sense of importance. While NATO
took the credit for the defeat of Serbia in Kosovo, the poor performance of the European NATO allies catapulted France, the United Kingdom, and other countries into making renewed efforts to build up a European military force. By late 2001 these efforts, though not the intention, had largely petered out. The economic difficulties of the global recession of 2001 and a persistent high rate of unemployment in Europe were welcome excuses for not dedicating an increased share of the national budgets to build up military resources and capabilities. Washington resented this but did appreciate that a European rival to NATO was no longer on the horizon. Even the right-wing administration of George W. Bush had no intention of returning to isolationism and leaving the European continent. In fact, in 2001, as in 1949, NATO was still the most important American instrument for maintaining Washington's involvement in European affairs. This in turn contributed significantly to the ability of the United States to continue playing such a dominant global role.

At the beginning of the twenty-first century, there was widespread perception among both Western politicians and Western public opinion that NATO was still of great relevance. While in the years immediately after the end of the Cold War and German reunification many critical voices could be heard that questioned the necessity of NATO's further existence once the Soviet threat had disappeared, in the course of the 1990s this strand of thinking lost support. NATO's on-the-whole not unsuccessful peacemaking activities in the former Yugoslavia decisively contributed to this. In view of an ineffective and divided United Nations, it was increasingly NATO that was seen as a factor of stability in the post–Cold War world. Although the presence of American NATO troops on the European continent was regarded as much less crucial after the disappearance of the Soviet Union than during the Cold War, on the whole, both Washington and the various European countries still viewed them as a constructive force for good. They still gave the United States an important political and military voice in intra-European squabbles and contributed an element of psychological security to latent French fears about the rise of a too powerful Germany. For the United States, its troops in Europe made global military activities in the Balkans and elsewhere logistically easier. But perhaps most important, they provided Washington with a crucial, albeit expensive, symbol of its global reach and world-wide power and influence. Perhaps surprisingly, most European countries were keen on the continuation of America's military presence in Europe. By the early years of the twenty-first century, the Western public's hostility to NATO, which could be frequently observed during the Cold War, had almost disappeared, and most eastern European nations were keen on joining NATO as soon as possible. Even Russia indicated that it would like to become a member. While this posed the question of whether NATO would make itself redundant once most of Europe had joined the alliance, this was not the way it was viewed in Brussels or indeed in Washington and most European capitals. NATO, it was argued, was the primary factor of stability in the post–Cold War world. The alliance appeared to be here to stay for a significant period of time.

Yet NATO was also faced with a great number of new challenges. There were increasingly heated transatlantic difficulties in political, military, and, perhaps most importantly, economic and trade areas. NATO's crisis management capability was persistently challenged by the enduring civil wars in the former Yugoslavia and elsewhere. The enlargement of the alliance posed further serious problems, antagonizing Russia and also the countries who would be left outside. Increasing the number of NATO members also complicated organizational, operational, and indeed financial dimensions of NATO. George W. Bush's declaration to develop a missile defense shield to protect the United States (and perhaps its allies) from nuclear attacks by so-called rogue states, a scheme similar to Reagan's ultimately unrealistic SDI program, exposed great rifts within NATO. Most European NATO members strongly opposed Bush's scheme; it was regarded as technologically untested and prohibitively expensive. The missile defense scheme also appeared to be politically destabilizing as it threatened to undermine relations with countries such as Russia and China and to lead to a new arms race. The terrorist attack on America's financial and political centers in New York and Washington, D.C., in September 2001 demonstrated however that unprecedented terrorist attacks that could not be prevented by even the most sophisticated antimissile scheme were to be feared more than attacks from foreign states. It threatened to undermine relations with countries such as Russia and China and to lead to a new arms race.

Despite these problems, it was thought that for the foreseeable future reasonable transatlantic...
relations would be maintained. In all likelihood European Union member states would reluctantly agree to continue accepting American predominance within NATO. Ultimately, however, the latter will be influenced by American flexibility and willingness to enter into a constructive dialogue with its allies. During the Cold War, American unilateralism always caused great resentment and proved damaging to the alliance. In the post–Cold War world Washington’s European NATO allies were even more unlikely than before to accept this. Yet, American unilateralism may well have been profoundly undermined by the terrorist bombing of American cities in September 2001. Asking for the invocation of article 5 of the NATO treaty was an indication that the Bush administration hoped to fight the war against terrorism with the help of multilateralism and close cooperation with the NATO allies. While the United States will still, and quite justifiably in view of its powerful military and economic potential, demand a clear leadership role, it can be expected that this new kind of war can only be successfully fought with the help of a common cooperative effort.

On 6 August 1945 a single atomic bomb (A-bomb) dropped from an American B-29 bomber, named Enola Gay after the pilot's mother, leveled the Japanese city of Hiroshima and killed well over 80,000 residents. Three days later a second bomb smashed Nagasaki, exterminating 60,000 inhabitants. Emperor Hirohito forced the Supreme War Council to allow the government to sue for peace. Although World War II ended in the convulsive birth of the atomic age, the fiery climax failed to validate the putative war-winning efficacy of "strategic bombing." On 8 August the Soviet Union had broken its neutrality in the Pacific and declared war against Japan. News that the Red Army was sweeping across Manchuria caused greater alarm in official Japan than the latest episodes in a relentless American aerial campaign that in previous months included the fire-bombing of Japanese cities at the cost of more than 300,000 lives.

President Harry S. Truman justified history's first use of an atomic weapon on the grounds of military necessity. By the middle of 1945 the United States had dismembered Japan's overseas empire, blockaded its home islands, and razed a total of 178 square miles in sixty-six cities targeted with incendiary bombs. Still, Japan had refused to meet the long-standing American demand for unconditional surrender, a stipulation reiterated in July 1945 at the Potsdam Conference of Allied chiefs of state. Thus, short of some dei ex machina, an American invasion of Japan proper seemed inescapable. Its advocates, the strategic planners of the U.S. Army, recognized that fatalistic and suicidal Japanese resistance would "make the invasion of their homeland a horrendously costly endeavor." The disputed estimates of potential U.S. Army and Marine Corps casualties have ranged from the tens of thousands to more than 500,000. These figures do not reflect the inevitably heavy naval losses to kamikaze and midget submarine suicide attacks. Truman understandably chose to seek a cheaper victory through the shock of atomic bombing.

Devastating though it was to Japan, the atomic bombing of Hiroshima and Nagasaki had more significance for the future than for ending World War II. By 1945 twentieth-century warfare had witnessed the introduction of several revolutionary weapons systems characterized by horrifying destructiveness—the machine gun, the tank, the strategic bomber, and the submarine—but none of these remotely approached the nuclear bomb in transforming strategy and diplomacy. In the nuclear age, for the first time in history, armies and navies were no longer the principal objects at immediate risk in warfare. With their soldiers untouched and still waiting to engage the enemy, nations now could be obliterated in their entirety—populations, cities, societies. In his magisterial book The American Way of War (1973), Russell Weigley observed, "A strong strategy of annihilation could now be so complete that the use of . . . atomic weapons could no longer serve 'for the object of war,' unless the object of war was to transform the enemy's country into a desert." After August 1945, it therefore became the prime objective of the statesmen of the great powers to repudiate Carl von Clausewitz's famous dictum that war is merely "a continuation of policy by other means." The "other means" no longer could include the unlimited warfare symbolized by the American Civil War and the eastern front of World War II.

Despite fundamentally opposed political philosophies and almost universal pessimistic expectation, the leaders of the United States and Soviet Union grimly and steadfastly refrained from using the ultimate weapons in their arsenals during the half century between Hiroshima and the sociopolitical implosion of the USSR in 1991. Time and again, Soviet and American heads of state substituted statecraft for warfare as they patched together agreements aimed at curtailing
the enlargement of one another's stockpiles of nuclear weapons. Time and again, after seeming to establish a numerical ceiling, one or the other superpower—usually the United States—would make an "end run" around the existing agreements with a technological breakthrough in delivery vehicles or nuclear warheads. Then the game began again. Amid mutual recriminations, Soviet and American negotiators stitched together another diplomatic limit governing the nature and quantity of weapons in their arsenals. The number grew to uncountable thousands, but not one nuclear weapon was ever actually launched at the opponent and detonated in anger.

The noted Cold War historian John L. Gaddis has described the Soviet-American era of nuclear restraint as "The Long Peace," and Arthur M. Schlesinger, Jr., has suggested that "nukes" be awarded the Nobel Peace Prize. Gaddis falls somewhat short of the mark, and Schlesinger seems facetious, but each was trying to encapsulate the magnitude of a phenomenal achievement, one without precedent and probably without sequel. The sobering reality is that in the 1990s nuclear strategy and diplomacy entered a new epoch, one in which the inexorable proliferation of "weapons of mass destruction" among second- and third-tier states posed unforeseen and highly complex challenges to the major powers' desire to avoid actual use of such weapons in combat.

THE FUTILE STRATEGY OF ATOMIC MONOPOLY

Historians today agree that ending World War II dominated the president's thinking in the summer of 1945. However, for many years "revisionists" contended that Truman's desire to practice what the scholar Gar Alperovitz aptly called "atomic diplomacy" strongly affected his decision to authorize the nuclear attack on Japan. According to this thesis, Truman sought to influence Soviet policy by dramatically proving that the United States possessed an unprecedentedly destructive weapon that American leaders were willing to use against an enemy. With one awesome stroke Truman could show his mettle as a tough warrior, end the war, depreciate the Soviet Union's claim to share in the occupation of Japan, and discourage Soviet communism's expansion into Europe and Asia. Oversated though it was, the Alperovitz thesis described one very real rationale for dropping the atomic bombs on Japan, and Truman certainly anticipated that a great geopolitical advantage would accrue to the United States from its atomic monopoly. What he did not foresee was the vehement reaction of Soviet Premier Joseph Stalin, who interpreted the atomic bombing as an anti-Soviet action disruptive to the postwar balance of power. No matter how unrealistic it was in the first place, any lingering hope of Soviet-American harmony in the early postwar world was doomed on 6 August 1945.

In a radio address delivered the day Nagasaki was bombed, President Truman elaborated the fundamental tenet of his postwar nuclear policy. Because the atomic bomb "is too dangerous to be loose in a lawless world," he warned, "Great Britain and the United States, who have the secret of its production, do not intend to reveal the secret until means have been found to control the bomb so as to protect ourselves and the rest of the world from the danger of total destruction." It soon became obvious that in the minds of American policymakers, "control" connoted some kind of global inspection system.

At first, prospects for negotiating the international regulation of atomic weapons appeared deceptively bright. In December 1945 the foreign ministers of the United States, Great Britain, and the Soviet Union met in Moscow. They jointly proposed the creation of an atomic energy commission responsible to the United Nations Security Council, where a veto precluded any action abhorrent to one of the five permanent members. The guidelines for the proposed commission also included the inspections demanded by President Truman.

On 24 January 1946 the General Assembly voted unanimously to form the UN Atomic Energy Commission (UNAEC) precisely as envisioned by the three foreign ministers. In June the commis-
sion met to forge the machinery for controlling atomic weapons. The American delegate, Bernard Baruch, immediately derailed the negotiations by introducing the concept of an International Atomic Development Authority that would operate independently of the Security Council. This autonomous body would have the power to punish, possibly by atomic attack, any nation that violated its pledge not to construct nuclear weapons. In a single sentence that broke the Moscow agreement, Baruch tersely explained the American rejection of the Security Council as the ultimate punitive agency of the United Nations: “There must be no veto to protect those who violate their solemn agreements not to develop or use atomic energy for destructive purposes.”

Baruch’s astringent tone reflected the views of a president increasingly worried by the deterioration of American relations with the Soviet Union. During the spring of 1946 the Soviet Union and the United States had failed to agree about the admission of Soviet satellite states to the United Nations, the composition of the Security Council’s military arm, and the future of Germany. Moreover, Truman was upset by Soviet penetration of Iran and Manchuria, the latter an area of historic interest to the United States. According to the official historians of the U.S. Atomic Energy Commission, the president recalled the Manchurian crisis of 1931 and 1932, reasoning that if Secretary of State Henry L. Stimson had been able to threaten the use of force at that time, World War II would have been avoided. For all of these reasons, Truman decided that the veto rendered the Security Council impotent against any transgression by the Soviet Union.

By the middle of 1946 the Soviet Union had also shifted its position on the international regulation of nuclear weapons. Five days after Baruch spoke, the Soviet delegate, Andrei Gromyko, addressed the UN Atomic Energy Commission. Ignoring the American’s remarks, Gromyko proposed a multilateral treaty binding the signatories to destroy “all stocks of atomic weapons whether in a finished or unfinished condition” within three months. The Russian made no provision for inspections to ensure compliance, thus rendering his proposal utterly unacceptable to an American president who refused to “throw away our gun until we are sure the rest of the world can’t arm against us.”

Truman was not the only senior American to favor the threatening metaphor of a gun. In September 1945, at a reception held during a London meeting of the foreign ministers of the United States, Soviet Union, and England, Secretary of State James F. Byrnes chided Soviet Foreign Minister Vyacheslav M. Molotov, “If you don’t cut all this stalling and let us get down to work, I am going to pull an atomic bomb out of my hip pocket and let you have it.” This crude sortie into atomic diplomacy led to what the historian Gregg Herkin has described as Molotov’s “reverse atomic psychology.” The durable old Bolshevik made several dismissive jokes of his own, the import of which was to let the United States know that Byrnes “could not use the threat of the bomb to gain political concessions from the Soviet Union.”

As hope for the international control of atomic weapons waned at the United Nations, the Truman administration began to shape a coherent nationalist nuclear policy. The domestic political impediments were formidable. Congress was demanding sharply reduced postwar military expenditures and rapid demobilization of all branches of the armed forces. The army, for example, shrank from more than eight million men to fewer than two million in nine months. In this postwar environment, Truman won approval only for establishment of the Strategic Air Command (SAC) in March 1946 and a test of the effectiveness of atomic weapons against ships at Bikini atoll later in the year.

Watchful waiting characterized American foreign policy immediately after the failure of the Baruch plan. Then, beginning in February 1947, a series of crises swept the noncommunist world. Britain’s announcement of its inability to continue to sustain anticommmunist forces in Greece and Turkey elicited an immediate promise of aid from President Truman, the first formal step toward the policy of containment. For sixteen months international tension mounted; in June 1948 it reached a peak with a Soviet blockade of land routes to West Berlin.

American nuclear diplomacy during that year and a half focused more directly on Great Britain than on the Soviet Union. In highly secret wartime agreements, Prime Minister Winston Churchill and President Franklin D. Roosevelt, with the approval of the Belgian government-in-exile, had apportioned the rich Belgian Congo (Democratic Republic of Congo) uranium ore reserves to Britain and the United States on an equal basis. At Quebec, in 1943, they also had agreed that neither nation would use atomic weapons in war without the consent of the other. By mid-1947 policymakers in Washington viewed
these two agreements as detrimental to the United States. In order to enlarge its nuclear arsenal, the United States needed more than half of the annual supply of the Congo’s ore. To exercise full control over its own foreign and military policies, Washington had to eliminate London’s voice in the use of atomic weapons. Britain finally agreed to these American demands in December 1947, receiving in exchange the promise of technical aid in the search for peaceful uses for atomic energy.

The military facet of Anglo-American nuclear interdependence manifested itself in the early weeks of the Berlin blockade (June 1948–May 1949), when the British permitted the newly autonomous U.S. Air Force to deploy to England three squadrons of B-29 bombers, which may have been modified to carry atomic bombs. This deployment was the first forward staging of American strategic airpower since World War II. It complemented the growing emphasis on military aviation within the United States, as evidenced by appointment of the aggressive General Curtis E. LeMay to head SAC, accelerated development of long-range atomic bombers, and agitation in Congress and the new Department of Defense for a seventy-combat-group air force. The American search for overseas air bases to encircle the Soviet Union and threaten it with nuclear attack began in earnest with the creation of the North Atlantic Treaty Organization (NATO) in 1949.

In August 1949 the Soviet Union successfully detonated an atomic bomb, ending the American nuclear monopoly fifteen years earlier than anticipated by Washington. Secretary of State Dean Acheson, Secretary of Defense Louis Johnson, and members of the powerful Congressional Joint Committee on Atomic Energy pleaded with President Truman to counter the Soviet technological surge by building a hydrogen bomb. The outgoing chairman of the Atomic Energy Commission (AEC), David Lilienthal, openly expressed the fear of such scientists as J. Robert Oppenheimer that it was morally wrong for the United States to base its foreign policy on “a weapon of genocide.” But other equally prominent scientists, notably the nuclear physicists Ernest O. Lawrence and Edward Teller, argued the Soviet Union would surely try to outflank the American preponderance in fission weapons by developing a fusion weapon, or H-bomb, as quickly as possible. The only way for the United States to retain overall predominance in nuclear weapons technology was through creation of the hydrogen bomb, which Truman ordered in January 1950. He simultaneously directed a thoroughgoing reassessment of American foreign and military policy by the State Department, Department of Defense, and National Security Council (NSC). By April, Paul Nitze of the State Department had written NSC 68, a blueprint for the future that Truman approved in September.

NSC 68 was a stark document whose authors attributed to Moscow a “fundamental design” of completely subverting or forcibly destroying the governments and societies of the non-Soviet world and replacing them with “an apparatus and structure subservient to and controlled from the Kremlin.” Only the United States had the potential to thwart Russian expansionism and ultimately “foster a fundamental change in the nature of the Soviet system.” But successful containment would require that America increase its own political, economic, and military power and aid its allies in strengthening themselves. To ensure maximum American strength, NSC 68 discouraged seeking a negotiated control of atomic energy because agreement “would result in a relatively greater disarmament of the United States than of the Soviet Union.” Looking ahead to 1954, when the Soviet Union presumably would possess a substantial atomic stockpile of its own, NSC 68 postulated a time of maximum danger during which the Soviet Union could lay waste the British Isles, destroy the communications centers of western Europe, or devastate “certain vital centers of the United States and Canada.”

This suspicious and bellicose attitude permeated the highest levels of the executive branch when the advent of the Korean War in June 1950 loosened congressional constraints on massive military expenditures. President Truman immediately sought and obtained supplemental appropriations for the defense budget. By 1952 he had nearly quadrupled annual military spending, which had averaged about $15 billion since 1946. Although the president allocated a great deal of the hugely expanded sum to Korea and the buildup of conventional forces for NATO, the increase also made possible an exponential enlargement of the American capacity to wage nuclear war.

Truman moved on several fronts. First, he accelerated production of a hydrogen bomb. In theory, H-bombs can have unlimited explosive power, and their deadly radiation effects vastly exceed those of atomic, or fission, bombs such as those unleashed on Hiroshima and Nagasaki. The Atomic Energy Commission successfully tested a
fusion device on 1 November 1952. A viable hydrogen bomb was added to the American stockpile in 1956, a year after the Soviets had developed their own practicable H-bomb. The second most important item on President Truman’s atomic agenda was multiplication of fission weapons. Discovery of rich uranium deposits in the American Southwest and construction of several plutonium-producing reactors contributed to this atomic proliferation, but the big breakthrough in sources came with the determination in 1951 that the amount of fissionable material required for a bomb could be cut in half by surrounding the nuclear core with a neutron shield. The new abundance of fissionable substances permitted a third advance, the creation of “tactical” nuclear weapons. General Omar N. Bradley, chairman of the Joint Chiefs of Staff, had publicly advocated this step in October 1949. Speaking as a soldier challenging the congressional popularity of the Strategic Air Command, Bradley argued that wars were won on battlefields, not by destruction of cities and factories. If Soviet armies massed to invade western Europe, tactical nuclear weapons could devastate them. Only in that manner could the thin divisions of NATO defeat a numerically superior foe.

Bradley won the endorsement of key nuclear physicists and congressmen. By the fall of 1951, Representative Henry Jackson of Washington State, a member of the Joint Committee on Atomic Energy, was urging an annual expenditure of between $6 and $10 billion for tactical nuclear weapons. Under this pressure, the Atomic Energy Commission moved energetically. In March 1953 it exploded a fifteen-kiloton device amid simulated battlefield conditions. Two months earlier, at President Dwight D. Eisenhower’s inaugural parade, the army had displayed a cannon capable of firing nuclear projectiles.

The Truman administration and Congress created many highly sophisticated delivery systems for new weapons. The very high-altitude, all-jet B-52 Stratofortress bomber with a range of 7,000 miles was beginning to take shape as the principal strategic aircraft of the future. As a stopgap measure, to replace the piston-driven B-29 strategic bomber of World War II, Truman acquired bases from America’s allies for the intermediate-range, six-jet-engine Boeing B-47. Congress allotted funds for the first aircraft carrier capable of launching jet-powered nuclear bombers, the Forrestal-class supercarrier with a flight deck nearly 1,000 feet long. The Atomic Energy Commission and Westinghouse designed a reactor to fuel some of the new aircraft carriers, but nuclear propulsion of submarines had the navy’s highest priority thanks to the unrelenting vigor of one naval officer, Hyman G. Rickover. In June 1952 the keel was laid for a nuclear-propelled prototype, the USS Nautilus (SSN-571). It would signal “underway on nuclear power” on 17 January 1955.

At a rapid pace, the U.S. Navy fashioned and deployed two distinct types of nuclear-powered submarines. The “attack boat,” or SSN, came first. It was intended for the classic submarine role of striking ships or other submarines with torpedoes. Five years after Truman left office, Chief of Naval Operations Arleigh E. Burke prodded Congress to fund the first nuclear-driven, ballistic-missile-launching submarine (SSBN). Armed with ballistic missiles of ever-increasing range—first Polaris (1,200 nautical miles), later Poseidon (2,500 nm), finally Trident (4,000 nm)—this truly revolutionary weapons system aimed warheads at cities and other targets deep inland. It guaranteed the navy a permanent place in the strategic or nuclear “triad” of weaponry intended to deter Soviet attacks on the United States, or to launch a devastating retaliatory strike if deterrence failed.

Truman did not intend these weapons for limited war, but of necessity he had to consider the employment of atomic weaponry in the darkest days of the Korean War. On 30 November 1950, as Chinese troops swept General Douglas MacArthur’s vastly outnumbered soldiers and marines south from the Yalu River, the president held a press conference. In answering a question about possibly dropping the atomic bomb on North Korea or China, he said, “There has always been active consideration of its use.” He immediately added, “I don’t want to see it used. It is a terrible weapon, and it should not be used on innocent men, women, and children who have nothing to do with this military aggression.” But the doomsday alarm had been sounded. John Hersey, author of the widely read book Hiroshima, wrote, “There were glaring headlines in Paris. . . . Big headlines in Finland gave the impression that MacArthur had already received the go-ahead. In Vienna, the story had the lead in all the morning papers except the Soviet army sheet.”

A thoroughly aroused House of Commons dispatched Prime Minister Clement Attlee to Washington to determine exactly what Truman was contemplating. At an extended series of high-
level meetings in early December, the president attempted to mollify the Briton with the prayer that “world conditions would never call for the use of the atomic bomb.” But he would not categorically rule out use of the bomb if the UN position deteriorated radically and MacArthur was in danger of being driven off the Korean peninsula. As it was, the UN forces stemmed the tide and the front was gradually stabilized roughly along the thirty-eighth parallel of north latitude, the original dividing line between North and South Korea.

General MacArthur has been popularly condemned for advocating the use of atomic weapons, as indeed he did. In December 1952 he told his former protégé, president-elect Dwight D. Eisenhower, “I would have dropped between 30 and 50 atomic bombs.” But contemplation of a nuclear war in Korea was widespread in Washington between 1950 and 1953. The Joint Chiefs of Staff fantasized about implanting a cordon sanitaire north of the Yalu River with cobalt 60, a highly radioactive residue derived from reprocessed plutonium. Always eager to be involved in a bombing campaign, General Curtis LeMay, head of SAC, thought his airmen were well qualified to drop nuclear bombs because of their “intimate knowledge” of atomic weaponry. He almost got his chance. According to the historian Stanley Sandler, B-36s armed with nuclear weapons were deployed to Okinawa in June 1952 to induce the Chinese to sign an armistice. Across town from the Joint Chiefs of Staff, Representative Albert Gore, Sr., a member of the Joint Committee on Atomic Energy, believed radiating a large strip of the Chinese-Korean border was “morally justifiable” since Korea had become “a meat grinder of American manhood.” In the supercharged atmosphere of early Cold War Washington, there was abundant domestic support for a nuclear war in Korea. The “buck” stopped with the president, as Harry Truman said it always did.

The American commander in chief refrained from authorizing atomic warfare against Korea or China partly out of belief that the Korean War was a Soviet feint and that the real communist attack would come in Europe, in which case the United States would need all of its nearly 300 atomic warheads. Moreover, by using atomic weapons the United States could spark North Korean retaliation against Pusan or other South Korean cities with Soviet-supplied atomic bombs. British disapproval and the racist implications of again employing the ultimate weapon against an Asian people contributed to Truman’s restraint. Atomic diplomacy also helped stay his hand. In the opinion of one veteran of the Korean War, the historian Stanley Weintraub, Truman realized that if the bomb were used in Korea without producing “decisive results, it would lose credibility as a Cold War deterrent.” The president therefore accepted a stalemate in conventional warfare in Korea while simultaneously fathering what Atomic Energy Commission chairman Gordon Dean described in September 1952 as “a complete ‘family’ of atomic weapons, for use not only by strategic bombers, but also by ground support aircraft, armies, and navies.”

A STRATEGY OF OVERKILL

Dwight D. Eisenhower, who succeeded Truman in January 1953, warmly embraced this monstrous “family.” The new Republican president’s conservative economic advisers demanded a balanced budget, and reduction of swollen defense expenditures was an obvious step in that direction. Complementing this fiscal orthodoxy was Eisenhower’s conviction that Soviet leaders hoped their military challenge would force the United States into what he called “an unbearable security burden leading to economic disaster. . . . Communist guns, in this sense, have been aiming at an economic target no less than a military target.” He abandoned NSC 68’s conception of a time of maximum danger and began planning a less costly strategy for the “long haul.” Throughout his two terms (1953–1961), Eisenhower limited annual defense spending to about $40 billion. He sought to deter communist aggression with an array of nuclear weapons rather than a large army. His strategic mainstay was SAC, supplemented by the navy’s carrier-based atomic bombers and its new fleet of submarines (SSBNs) armed with the Polaris ballistic missile. By the late 1950s, SAC was flying 1,500 intermediate-range B-47 jet bombers from domestic and foreign air bases, and the intercontinental B-52 heavy bomber became operational, the first of a final total of 500. If deterrence or tactical nuclear weapons failed to prevent a Red Army sweep through western Europe—or if the Soviet air force dropped nuclear bombs on the United States—Eisenhower would employ his strategic airpower to destroy Soviet Russia.

Until 1957, when the Soviet Union demonstrated its technological sophistication by launching the Sputnik satellite and an intercontinental ballistic missile (ICBM) with a range of about
3,500 nautical miles, American policymakers generally considered a Soviet ground attack upon western Europe the most likely form of overt aggression. To cope with a Red Army advance in Europe, or a communist military offensive anywhere else, the Eisenhower administration adopted an asymmetrical strategy. On 12 January 1954, in a speech before the Council on Foreign Relations in New York, Secretary of State John Foster Dulles stated that to meet communist aggression the United States would “depend primarily upon a great capacity to retaliate, instantly, by means and at places of our choosing.” This public pronouncement of the doctrine of “massive retaliation” capped an intensive high-level review of American strategy begun the previous May. As early as October 1953, Eisenhower had approved NSC 162/2, a paper attempting to reconcile deterrence with reduced defense spending. The solution, labeled the “New Look,” was to equip U.S. troops in Europe with tactical nuclear weapons whose destructiveness would permit him to reduce “the big, expensive army he had inherited from Truman.”

To preclude bankrupting the U.S. economy with military spending, Eisenhower planned to shrink the army from twenty to fourteen combat divisions by mid-1957. He would arm this leaner army with atomic artillery and short-range, air-breathing missiles carrying nuclear warheads. In February 1954 he induced Congress to amend the Atomic Energy Act to permit divulging information about operational characteristics of American nuclear weapons to NATO allies. By December 1954 he had persuaded NATO strategists to assume that tactical nuclear weapons would be used in any future conflict with the Red Army. American General Lauris Norstad, NATO’s supreme commander, succinctly summarized the new strategy in January 1956. The threat to use tactical nuclear weapons would “link the lowest and highest levels of violence and reinforce the credibility of the Western deterrent.”

Although the rhetoric of massive retaliation usually did not discriminate between geographic areas, Eisenhower did have a different plan to meet aggression beyond Europe and the Western Hemisphere. If a noncommunist Asian nation were attacked, he intended to place the primary burden of defense upon that country’s ground troops. The U.S. Navy’s fiercely mobile aircraft carriers could be rushed into the arena, and in extreme cases the marines might be landed for finite periods. Nuclear airpower conceivably might be brought to bear, but only selectively. As Secretary of State Dulles said in a news conference on 18 July 1956, “In the case of a brush-fire war, we need not drop atomic bombs over vast populated areas.” It might suffice merely to vaporize key military and industrial installations.

Abstract bombast about massive retaliation notwithstanding, in only three instances did Eisenhower actually warn other governments that the United States was prepared to launch a nuclear attack if its demands were not met. In April 1953 the Korean armistice talks between the communist Chinese and Americans had bogged down over the question of exchanging prisoners of war. At Dulles’s behest, neutral India cautioned China that if peace did not come soon, the United States would resort to nuclear warfare. The two sides quickly agreed on international supervision of the repatriation of captured troops. Shortly thereafter, as the French position in Indochina disintegrated, Washington warned Beijing that direct military intervention in support of the communist Vietminh would be met with an American atomic attack on China. Finally, on 20 March 1955, as the communist Chinese bombarded the Nationalist-held islands of Quemoy and Matsu, Dulles publicly speculated about possible American use of “new and powerful weapons of precision, which can utterly destroy military targets without endangering unrelated civilian centers.” This foolhardy boast sent shiv-
ers around the world, especially throughout Asia, where national leaders recalled ruefully that the only atomic bombs dropped so far had fallen on an Asian people. Eisenhower, who was privately determined to defend the islands with nuclear weapons if necessary, gradually realized that he could not rattle the nuclear sword without arousing global apprehension. According to the scholar Gordon H. Chang, communist China’s conciliation had contributed significantly to ending the crisis, but at the cost of Beijing’s realization that it would have to build a nuclear force to counter modern-day American gunboat diplomacy in the western Pacific.

The Soviets at the same time were providing additional stimulus for American reconsideration of the doctrine of limited nuclear warfare. They had detonated a hydrogen device in August 1953, unveiled the intercontinental turboprop Bear bomber (Tu-95) in 1954, and displayed the all-jet, long-range Bison bomber (M-4) in 1955. That year they also added a functional hydrogen bomb to their arsenal. Eisenhower’s response was to build an extensive radar network and multiply the air force’s interceptor wings. But the successful Soviet test of an intercontinental ballistic missile in the summer of 1957, coupled with the October Sputnik satellite launch, made these defenses prematurely obsolescent. The United States suddenly was exposed to a potential Soviet thermonuclear delivery system against which existing countermeasures were powerless. For the first time, all-out nuclear war would inevitably entail widespread death and destruction within the United States. Since it was impossible to ensure that escalation could be avoided once nuclear weapons of any sort were used anywhere in the world, the threat to use them thereafter must be restricted to crises involving areas absolutely essential to the United States: noncommunist Europe and the Western Hemisphere.

The stage was set for a policy of containment resting on conventional forces that the next president would adopt under the slogan of “flexible response.” But Eisenhower’s reluctance to spend large sums on defense prevented him from rebuilding or enlarging the army. For the same reasons of fiscal prudence, he also steadfastly resisted public and congressional pressure to disperse SAC aircraft more widely, to begin a crash program of ballistic missile development, or to spend tens of billions of dollars on fallout shelters. In August 1958, when the Department of Defense and some scientists warned him that discontinuation of nuclear testing would endanger further evolution of American tactical nuclear weapons, Eisenhower overrode their objections and announced a moratorium on atmospheric testing.

The sophistication of American aviation technology made restraint possible. Beginning in August 1955, the United States regularly flew extremely high-altitude reconnaissance aircraft over the Soviet Union. Dubbed U-2s, these glider-like jets soared above the reach of Soviet air defenses. They returned with photographs proving that the Soviet Union had not built a massive offensive nuclear striking force, despite the technological capacity to do so. The sluggishness of Soviet production permitted Eisenhower to proceed at a measured pace with deployment of ICBMs and intermediate-range ballistic missiles (IRBMs), including the submarine-launched Polaris. Eisenhower also could accurately describe Democratic presidential candidate John Kennedy’s alleged “missile gap” as a “fiction.” What Eisenhower could not do was win Soviet acquiescence to any form of inspections. Negotiations in the United Nations for the limitation of nuclear armaments therefore remained deadlocked throughout his presidency.

AT THE GATES OF ARMAGEDDON

President John F. Kennedy may have been perpetrating what one observer called a “pure election fraud,” but it is more likely that as a candidate he decried the fictitious and nonexistent missile gap because he agreed with the militant representatives
and senators in the Democratic Party who disliked Eisenhower's tightly controlled defense spending. In any event, upon becoming president in January 1961, Kennedy admitted that a gap in nuclear weapons indeed existed, but it was favorable to the United States. At that time the United States possessed at least 200 operational strategic missiles of varying range, while the Soviet Union probably had no more than sixteen. Despite this substantial nuclear advantage in missiles alone, in February 1961 Kennedy requested congressional permission to strengthen America's deterrent forces by accelerating the acquisition of second-generation, solid-propellant, land-based ICBMs and nuclear-powered submarines armed with longer-range Polaris ballistic missiles. In a clear reversal of Eisenhower's fiscal conservatism, Kennedy decided to "develop the force structure necessary to our military requirements without regard to arbitrary or predetermined budget ceilings."

The new president also reversed his predecessor by enlarging the nonnuclear, or conventional, forces of the United States. In the summer of 1961, Kennedy seized on Soviet Premier Nikita Khrushchev's bellicosity about the American presence in Berlin to extract from Congress a $3.2 billion supplement to the defense budget. With these funds he increased the armed services by 300,000 men and sent 40,000 more troops to Europe. This deployment underscored Kennedy's commitment to "flexible response," a strategy resting largely on nonnuclear weaponry. He refined the electronic "fail-safe" devices designed to prevent accidental firing of tactical nuclear weapons, discouraged planning that envisioned the use of such weapons, and retarded their technological evolution. These restrictions hampered NATO, which remained numerically inferior to the Red Army, by denying to the alliance the equalizing potential of clean and extremely low-yield tactical nuclear weapons. Thus, massive retaliation remained the only real deterrent to a Soviet military thrust into western Europe; and as the Soviets enhanced their ability to devastate the United States in any strategic nuclear exchange, the ghoulish doctrine became increasingly less reassuring to the NATO countries and less credible to the Soviet Union.

One reason for the Soviet nuclear buildup of the 1960s was the ambiguity of American strategy. From the beginning of the Kennedy presidency, Secretary of Defense Robert S. McNamara insisted on maintaining clear strategic nuclear superiority over the Soviet Union. With Kennedy's confluence, McNamara increased the number of American ICBMs from about 200 to 1,000, completed the construction of forty-one submarines carrying 656 Polaris missile launchers, oversaw the development of the multiple independently targetable reentry vehicle (MIRV), and kept a large percentage of SAC B-52s in a constant state of alert. Some of these measures, notably the conversion to MIRVs, came late in the decade, but the trend was apparent in 1961. Equally obvious was the possibility that a huge increase in the American stockpile would create a "first strike" capability with which the United States could preemptively attack and destroy the Russian nuclear striking force, thus making Soviet retaliation largely ineffective if not altogether impossible. The Soviets had lived with fears of an American nuclear bombing offensive since 1945, but nuclear-tipped ballistic missiles were virtually impossible to intercept. Kennedy's multiplication of those weapons thus deepened old apprehensions. As if to allay suspicion, on 26 March 1961 the president promised, "Our arms will never be used to strike the first blow in any attack."

Despite Kennedy's reassurance that the United States would not strike first, Khrushchev announced in August 1961 that he was breaking the three-year-old moratorium on nuclear testing in the atmosphere. Worried by the dangers of radioactive fallout, Kennedy at first resorted to underground testing. In April 1962 he resumed atmospheric testing in order to evaluate sophisticated new warheads and to prevent the Soviet Union from scoring a technological breakthrough that would eliminate the American nuclear superiority. Khrushchev then sought a cheap and quick adjustment to the strategic imbalance by placing 900-mile medium-range ballistic missiles (MRBMs) in Cuba. He also hoped to enhance his fading image as a supporter of overseas communist regimes, especially Fidel Castro's Cuban dictatorship, thereby answering hard-liners in Moscow and Beijing who deplored his efforts to ease tensions with the West. In this manner, reinvigoration of the strategic arms race in 1961 led to the Cold War's most dangerous nuclear war scare.

On 14 October 1962, American U-2 reconnaissance aircraft photographed the Cuban missile sites while they were still under construction. For one week the Kennedy administration debated its response, finally settling upon a naval "quarantine" of further shipments of offensive missiles. As he announced his decision to the world on 22 October, President Kennedy also
warned that if ballistic missiles were launched from Cuba against any country in the Western Hemisphere, the United States would counter with a “full retaliatory response upon the Soviet Union.” While massing troops in Florida for a possible invasion of Cuba, the president insisted that the Soviet Union remove the missiles already on the island. The face-off lasted for another week and was highlighted by an intense debate among the president’s most senior advisers over whether to offer a contingent palliative to the Soviet Union: removal of the fifteen American Jupiter IRBMs based in Turkey. Obsolete by the time they became operational in 1962, the Jupiters already “were supposed to be replaced by submarine-launched Polaris missiles.” Moscow nonetheless found their presence on the southern Soviet border extremely provocative and destabilizing. Evan Thomas, a meticulous student of the administration, sums up the situation: “President Kennedy was not inalterably opposed to swapping the Jupiters, but he thought it would be foolish to publicly offer right away to trade them.” His brother, Attorney General Robert F. Kennedy, therefore privately assured Soviet Ambassador Anatoly Dobrynin that once the Cuban crisis passed, the American missiles would be withdrawn. For the rest of his life, Robert Kennedy feared the political repercussions of his intervention. Dobrynin claimed Robert Kennedy told him that “some day—who knows?—he might run for president, and his prospects could be damaged if this secret deal about the missiles in Turkey were to come out.” The dour Robert was as much a political animal as was his glamorous brother.

Khrushchev capitulated and removed the Soviet missiles from Cuba because he feared losing control of the situation. Castro was beseeching the Soviet leader to launch a nuclear attack to stave off an American invasion of Cuba. In Washington, President Kennedy was under equally extreme pressure to take military action. A post-crisis outburst by the air force chief of staff expressed the attitude of the Joint Chiefs of Staff. General Curtis LeMay, who had masterminded the firebombing of Japan and the atomic bombing of Hiroshima and Nagasaki, shouted at the president: “We lost! We ought to just go in there today and knock ‘em off.” The president knew better. He had risked Armageddon because he regarded the Russian MRBMs as an unacceptable challenge to American strategic superiority and an immediate danger to the nation’s security. The missiles were gone; he had achieved his strategic goal, and not incidentally thwarted Republican critics in a congressional election year. Most Americans probably agreed with him in 1962, but with the passage of time the ultimate gamble seems increasingly less defensible. “In retrospect,” the strategic analyst Norman Friedman concluded soon after the Cold War ended, “it is difficult to understand why Soviet weapons in Cuba were worth a global war.”

The Cuban missile crisis reverberated throughout the 1960s. The continental European members of NATO were shaken by the unilateral way in which the United States went to the brink of nuclear conflagration without consulting its allies. French President Charles de Gaulle reaffirmed his determination to reduce European economic and military dependence upon the United States. In January 1963 he vetoed British entry into the Common Market on the grounds that British membership would make the association “appear as a colossal Atlantic community under American domination and direction.” Simultaneously he rejected Kennedy’s plan for a multilateral nuclear force (MLF) as a transparent scheme to give the impression of multinational authority while in fact preserving the American veto over NATO’s nuclear strategy. To end France’s subservience to the United States, De Gaulle gradually immunized his military units from unquestioning subordination to the NATO command, and he ordered the removal of the alliance’s headquarters from French soil as of April 1967. To document great power status in the nuclear age, he forged a French atomic striking force, the force de frappe. Britain at the same time was building its own strategic nuclear arsenal, but because of the special Anglo-American relationship it faced far fewer developmental obstacles. Kennedy simply provided the Royal Navy with Polaris missiles.

The impact of the missile crisis on Soviet-American relations was tragically paradoxical. On the one hand, the humiliating Soviet retreat strengthened the militants in the Kremlin who favored increased defense expenditures. They resolved that in the future the Soviet Union would deal with the United States as a nuclear equal. On the other hand, leaders in both countries were chastened by having faced nuclear annihilation. They installed a Teletype link, or “hot line,” between the White House and the Kremlin to minimize misunderstanding during acute crises. Even in the midst of capitulating, on 29 October 1962, Khrushchev set the tone for further accommodation: “We should like to continue the
exchange of views on the prohibition of atomic and thermonuclear weapons, general disarmament, and other problems relating to the relaxation of international tension.” For some months Kennedy hesitated. Then, on 10 June 1963, in a speech at American University he made a passionate appeal for peace as “the necessary rational end of rational men.” Coupled with various Anglo-American diplomatic initiatives, Kennedy’s speech broke the impasse in superpower negotiations. Within weeks Britain, the Soviet Union, and the United States signed the Limited Test Ban Treaty, which prohibited testing nuclear weapons in outer space, in the atmosphere, or under water. The treaty fell short of Kennedy’s original goal for a comprehensive test ban that would have preserved American technological superiority by slowing or preventing improvements to the Soviet arsenal. Nevertheless, the U.S. arms control and disarmament director, William C. Foster, reminded Congress that half a loaf was better than none. With the limited test ban, he said, “improvements in yield-to-weight ratios would come more slowly through laboratory work alone. Some weapons effects phenomena would remain unsettled or undiscovered by both sides. . . . In general, our present nuclear advantages would last for a considerably longer period.” In September the Senate ratified the Limited Test Ban Treaty by a vote of 80 to 19.

A MAD, MAD WORLD

Two months after Senate ratification of the treaty, on 22 November 1963, President Kennedy was assassinated in Dallas, Texas. The unspeakable tragedy abruptly ended any possibility of subsequent nuclear weapons agreements between himself and Khrushchev. The new president, Lyndon B. Johnson, was focused foremost on ramming through Congress the domestic reforms he advertised as the “Great Society.” For continuity and simplicity he kept Kennedy’s foreign policy and national security advisers in place, including Secretary of Defense McNamara.

McNamara continued to espouse a variant of the old Dulles doctrine of deterring a Soviet attack through the threat of massive retaliation, a strategic premise not wholly shared by Moscow’s leaders. As the secretary of defense explained in his “posture statement” of January 1964, the United States was building a nuclear force of such superiority that it could “ensure the destruction, singly or in combination, of the Soviet Union, communist China, and the communist satellites as national societies.” In addition, it could “destroy their war making capability so as to limit . . . damage to this country and its allies.” The inconsistency of this statement is patent: there can be no need to destroy an enemy’s nuclear arsenal if its entire nation has already been obliterated. But underlying what appeared to be a logical lapse was the dawning and extremely reluctant acknowledgment in Washington of the “difficulties of appreciably limiting damage to the United States and its allies.” By 1964, as the strategic historian John Newhouse observed, “the recognition that the United States was in the autumn of its strategic supremacy had set in.” The immediate upshot was an unresolved debate about whether nuclear missiles should be “counter-force” weapons targeted only against the Soviet Union’s ICBMs and other military assets, or “counter-value” weapons targeted against major Soviet industrial centers and their populations.

A counter-force strategy was preferable for reasons of humanity if nothing else, but the possibility of a counter-value assault by a desperate nuclear power could never be altogether ruled out. The counter-value strategy enjoyed disconcertingly wide theoretical appeal. It lay firmly in the mainstream of the “strategic bombing” doctrines of the Italian theorist Giulio Douhet, who wrote approvingly in 1921, “A complete breakdown of the social structure cannot but take place in a country subjected to this kind of merciless pounding from the air.” The army general William “Billy” Mitchell adapted Douhet to the American experience in the 1920s and 1930s, and in World War II the U.S. Army Air Forces had adopted these draconian concepts of annihilating the enemy and its urban-industrial infrastructure. The theories had helped to rationalize the decision to drop the first atomic bombs on Japan in 1945.

In this confused environment, both the United States and the Soviet Union began to design nuclear weapons and delivery systems that could withstand a nuclear first strike and mount a crushing retaliatory strike. The United States led in deployment of such innovative systems as hardened silos, submarine-launched ballistic missiles (SLBMs) of ever-increasing range, new generations of heavy bombers, and MIRVs (a MIRV consisted of several relatively small but highly accurate warheads atop a single ICBM, each destined for an independently preprogrammed target). Toward the end of the decade the ability to
cripple the Soviet nuclear arsenal in a gargantuan strike seemed to be coming within America’s reach. By 1968 the United States had deployed 1,054 ICBMs to the Soviets’ 858, and the U.S. lead in the other indices of nuclear superiority was equally daunting.

Owing to this preponderance and to the enormous fiscal drain that the Vietnam War levied on defense resources, the pace of the United States buildup of strategic weapons actually began to level off at the height of the arms race in 1965. At the same time, the Soviet Union initiated a massive expansion of its strategic forces in an attempt to achieve parity with the United States. Finally conceding that the goal of limiting damage in a nuclear exchange had become unattainable, strategists in Washington began to use the term “assured destruction” in describing the standoff between the two nuclear powers. McNamara himself became convinced that neither further arms buildups nor the visionary antiballistic missile defense system (ABM) could guarantee Americans the security they craved. He began to search for a new formula for strategic stability. The answer was found in a 1946 book entitled The Absolute Weapon, in which America’s preeminent strategist, Bernard Brodie, argued for nuclear equality between the United States and the Soviet Union. “Neither we nor the Russians,” Brodie and his coauthors presciently wrote, “can expect to feel even reasonably safe unless an atomic attack by one were certain to unleash a devastating atomic counterattack by the other.” McNamara now adopted this proposition, and it became enshrined in a telling acronym unfairly ascribed to him: MAD, for “mutual assured destruction.” The converted secretary made it his mission to proselytize the American and Soviet leadership.

In 1967, U.S. leaders discovered that the Soviet Union was deploying a protective ABM system around Moscow. McNamara anxiously sought to avoid a reactionary massive increase in America’s offensive nuclear forces. He persuaded President Johnson to bring up ABM defenses at the summit meeting with Soviet Prime Minister Alexei Kosygin in June 1967 at Glassboro, New Jersey. When Johnson was unable to convince Kosygin that antiballistic missile defenses would only trigger an offensive nuclear arms race, McNamara tried to explain the administration’s reasoning to the prime minister. The secretary of defense described at length the action-reaction dynamic he foresaw if the Soviet Union persisted in deploying antimissile shields, and he insisted that the only way to prevent an endless arms race was to limit or even eliminate these embryonic protective systems. This reasoning infuriated Kosygin, who found the idea of abandoning defensive weapons in favor of offensive weapons to be irresponsible and immoral. His premises differed fundamentally from McNamara’s. Like other Soviet leaders, Kosygin based his thinking on the cruel lessons of World War II, during which the Soviet Union suffered cataclysmic devastation at the hands of Hitler’s invading armies. The imperative “never again” informed all Soviet military planning. For Kosygin, McNamara’s proposal to abandon missile defenses was a direct invitation to a reprise of national disaster. Kerry Kartchner, an American disarmament negotiator, observed critically, “there is little evidence that McNamara took actual Soviet strategic thinking about nuclear weapons into account, either in determining what was required to deter Soviet leaders, or how the Soviet Union might react to American deployment of ABMs.” McNamara also appeared hypocritical, because as spokesman for the Johnson administration he had testified before Congress in favor of a limited Sentinel ABM system intended to protect cities and ICBM silos from destruction in a Soviet nuclear attack.

By late 1967, McNamara’s days in power were nearing their end. He and others within the Johnson administration were belatedly realizing that the parasitical war in Vietnam was unwinnable, and they soon faced incontrovertible evidence that their strategy for waging limited war had failed. The communist Vietnamese Tet offensive of January 1968 broke America’s will to fight and precipitated McNamara’s resignation as secretary of defense. It also induced Lyndon Johnson to withdraw from the presidential race. In November, Republican Richard M. Nixon was elected president. He inherited only one undeniably positive nuclear policy achievement from the Johnson administration: the multilateral Treaty on the Nonproliferation of Nuclear Weapons (NPT), signed by the Soviet Union and more than fifty other nations in 1968 and ratified by the United States in 1969.

The Nonproliferation Treaty set up a two-tiered “regime” that divided the world into nuclear haves and have-nots. The United States, Soviet Union, France, Britain, and China were designated “nuclear weapons states” by virtue of the fact that they had tested nuclear weapons before 1968. All other parties to the treaty, offi-
cially designated as “non-nuclear weapon states,” joined with the understanding that they would not seek to import or develop nuclear technology or materials for military purposes. The International Atomic Energy Agency (IAEA), which had been founded by the United Nations in 1957, was given the task of verifying treaty compliance through an elaborate inventory procedure including on-site inspections at regular intervals. The five so-called weapons states were exempt from all such controls, but they were expected to honor the regime out of self-interest. Even so, France and China were dissatisfied and did not ratify the accord until 1992.

During the treaty negotiations, India led the nonaligned states in opposing the treaty’s codification of elite status for the weapons states. The principal sop that the five nuclear-armed signatories conceded to the nonnuclear weapon states was the provision to share nonweapon nuclear technology “in good faith.” New Delhi strongly objected to the absence of a provision for the enforcement of this obligation. In the end, several important countries, including India, Pakistan, and Israel, refused to sign the treaty; they remained beyond negotiated global nuclear controls. Such a treaty was a thin reed of hope for nonproliferation, as Richard Nixon well knew.

A COOPERATIVE BALANCE OF TERROR

Unscrupulous and devious in many ways, President Nixon was the consummate realist in foreign policy, especially when guided and prodded by his national security affairs adviser, the German émigré and former Harvard professor Henry A. Kissinger. Upon learning that the Soviets were rapidly approaching nuclear parity with the United States, the new president sensibly abandoned the quixotic search for American superiority in nuclear weapons systems and accepted the concept of parity or “sufficiency.” He simultaneously made the decision to expand ABM defenses in the name of damage limitation, citing not only the danger from the Soviet Union but also from the People’s Republic of China, which recently had joined the special weapons club by testing a nuclear weapon. Unlike Sentinel, however, the new Nixon Safeguard system was designed exclusively to protect Minuteman ICBM silos. The administration made public its decision that, in light of the Soviet Union’s burgeoning offensive nuclear capability, limiting damage to civilian targets no longer was possible. The United States could only hope to preserve a retaliatory capability, the existence of which would deter an opponent from striking first. To further underscore his tough-mindedness and enhance the American retaliatory arsenal, Nixon installed more MIRVs on U.S. ICBMs.

Considering himself to be in a position of diplomatic strength, President Nixon entered into the Strategic Arms Limitation Talks (SALT) negotiations with the Soviet Union in November 1969. The Soviets, for their part, were now willing to negotiate because they were drawing abreast of the United States in numbers of ICBMs, if not in MIRVed warheads. A rough de facto nuclear parity had been achieved, and each side sought to freeze it in order to avoid the astronomical expense of building elaborate ABM systems, which existing technology could not make fully effective. The cost of the Vietnam War was driving American fiscal prudence; the chronic inefficiency of the Soviet economy was inspiring Moscow’s circumspection. The two sides, however, were unable to reach any agreement and the SALT I discussions dragged on until the spring of 1972.

Fruition came at a summit in Moscow on 26 May 1972, when the Soviet Union and the United States agreed by treaty to curtail deployment of ABMs. Delegates of the two superpowers also initiated a five-year interim agreement freezing offensive strategic nuclear weapons systems at their existing levels. In essence, the United States conceded to the Soviet Union an advantage in large missiles with horrifically destructive warheads, and the Soviet Union yielded to the United States the countervailing advantage in MIRVs.

“What are 3,000 MIRVs among friends?” Henry Kissinger joked, but he later regretted that he had not pondered “the implications of a MIRVed world more thoughtfully.”

The ABM Treaty likewise failed to prohibit further development of new delivery systems, such as the supersonic intercontinental B-1 bomber to replace the B-52, longer-range Trident SLBMs to replace the Polaris-Poseidon system, and nuclear-tipped cruise missiles. Maintenance of nuclear parity at the 1972 level, therefore, gave the United States the chance to capitalize on its technological supremacy to make an end run on the Soviets. With characteristic insight and cynicism, Kissinger quipped, “The way to use this freeze is for us to catch up.” The Senate showed its appreciation for the advantages of the ABM
Treaty by approving it with an overwhelming vote: 88 to 2. A joint congressional resolution endorsed the five-year moratorium on development of new offensive strategic nuclear weapons.

Nixon's acceptance of atomic equality did not deter him from relying on nuclear weapons in his conduct of foreign and military policy. For example, during the 1973 Yom Kippur War in the Middle East, he authorized a full alert of American strategic forces to forestall intervention by Soviet airborne troops. Similarly, as he progressively reduced the size of the U.S. Army, he permitted his advisers to revive plans for using tactical, or battlefield, nuclear weapons. In January 1971, when speaking about the American defense posture from 1972 through 1976, Secretary of Defense Melvin B. Laird said: “For those levels in the deterrent spectrum below general nuclear war, the forces to deter Soviet and Chinese adventures clearly must have an adequate war-fighting capability, both in limited nuclear and conventional options.”

THE LIMITS OF DÉTENTE

The new president, Republican Gerald R. Ford, initially retained Kissinger as both secretary of state and national security affairs adviser, but the old diplomatic wizardry had dissipated. The secretary of state and Soviet Ambassador Anatoly Dobrynin met frequently and maneuvered endlessly for an advantage in arms control negotiations, warily proposing to limit weapons in which the other side had superiority while protecting their own favorites. In the interminable horse-trading, the United States claimed that the supersonic Soviet Backfire bomber (Tu-26) should be included in any new limitations agreements; the Soviets demanded inclusion of American nuclear-armed, ground-hugging, nonballistic cruise missiles. Technological strides kept raising the ante: the Soviet Union was perfecting the triple-MIRVed SS-20 IRBM, a terrifying threat to NATO; the United States was readying highly accurate Pershing IRBMs for NATO deployment and completing the Trident SSBN, with ballistic missiles that had a range of 4,000 nautical miles. Since neither side would yield, the dimming hopes for SALT II were bequeathed to the new Democratic administration of James Earl Carter in January 1977. When Carter took office, the U.S. nuclear inventory stood at 8,500 nuclear warheads in comparison with 5,700 in 1972, and the Soviet count had nearly doubled in the same period. If moderation of the nuclear balance of terror was the benchmark, the Nixon-Kissinger policy of détente had failed miserably.

President Jimmy Carter thought détente was worse than a failure. He believed U.S. strategic potency actually had diminished under Republicans Nixon and Ford: “We’ve been outraced in almost every instance.” The Naval Academy graduate and former nuclear submariner was perpetually torn between the “mailed fist” of his hawkish national security affairs adviser, Zbigniew Brzezinski, and the “dove’s coo” of his temperate and cautious secretary of state, Cyrus R. Vance. The president played off China against the Soviet Union, lectured Moscow on its policy toward Jews and dissident intellectuals, and at the same time tried to reignite the stalled SALT II talks. Soviet Ambassador Dobrynin lamented, “President Carter continued to attack us in public, in public, in public. Always in public.”

Two months after Carter’s inauguration, Secretary of State Vance flew to Moscow with a proposal to revive the SALT process by radically reducing the number of deployed ICBMs, not surprisingly the nuclear category in which the Soviets held the lead. Initially rebuffed, Vance persevered until Carter and Soviet President Leonid Brezhnev signed the SALT II treaty at a summit meeting in Vienna in June 1979. For the first time, each superpower accepted numerical equality with the other in total nuclear delivery vehicles. The total number of MIRVed launchers for each side was set at 1,200, and the quantity of MIRVs per missile was also fixed. Moscow and Washington promised to allow on-site verification of compliance by representatives from the other side, an unprecedented step forward. Excluded from the agreement were several new high-technology weapons systems: the American MX (“missile experimental”), an improved ICBM that could deliver ten MIRVs to targets 7,000 miles distant from the launch site; the Trident-II SLBM with MIRVed ballistic missiles almost twice the weight of their predecessors; the nonballistic, nuclear-armed cruise missile; and the...
supersonic Soviet Backfire bomber with a threatening range of 5,500 miles.

This qualified success fell victim to domestic critics and to Soviet-American disputes over hegemony throughout the world. Paul Nitze, the bellicose author of NSC 68, protested against SALT II. He said it was “time for the United States to stand up and not be a patsy.” Senator Henry Jackson, always a patron of the arms industry and an intransigent foe of conciliation, complained that SALT II sanctified an imbalance in which the Soviet Union could destroy American land-based nuclear retaliatory forces in a preemptive first strike. In contrast, doves faulted the treaty because it was not comprehensive enough.

The objectors might have scuttled the pact regardless of international affairs, but in the fall of 1979 they were aided immeasurably by Carter’s accusation that the Soviets were infiltrating a combat brigade into Cuba. The president vainly attempted to placate his critics and to warn the Soviets. He proclaimed a five-year military expansion program focused on European-based intermediate and cruise missiles, and his personal rage at the Soviet invasion of Afghanistan in December of that year led him to withdraw SALT II from the Senate. Discredited by a wide variety of foreign policy failures, most notably the Iranian hostage crisis (1979–1981), Carter lost the 1980 election to Ronald Reagan, a charismatic movie actor and former governor of California.

**TAMING THE EVIL EMPIRE**

Pledging to “make America great again,” President Reagan carried enough Republican candidates on his popular coattails to win control of the Senate for his party. Reelected by a landslide vote in 1984, he was superbly well positioned to maintain a contentious posture vis-à-vis the Soviet Union, which he denounced with ideological fervor as an “evil empire.” He and a kaleidoscopically shifting cast of senior advisers perceived a mortal U.S. disadvantage in strategic armament. The deficit arose primarily from the Soviet Union’s greater aggregate “throw-weight,” that is, the sheer tonnage of destructive power its missiles could deliver to targets in the United States and NATO countries. This simplistic measure of relative capability was used by the Reagan administration to warn of a “window of vulnerability” through which the United States could be devastated by a preemptive Soviet first strike.

To redress the Soviet Union’s ostensible “margin of superiority,” Reagan instructed the Pentagon to disregard budgetary restrictions and request whatever weapons it wanted. He goaded Congress to fund accelerated development and deployment of the B-1 bomber, the neutron bomb, the B-2 “stealth bomber,” the Trident-II SLBM, the MX and cruise missiles, and mobile Minuteman ICBM launching sites. Thus fortified, President Reagan, Secretary of State George P. Shultz, and Secretary of Defense Caspar W. “Cap” Weinberger undertook arms-reduction talks with the Soviet Union. The Reagan cohort would extort Soviet concessions by using the revived arms race to strain the creaking Soviet economy.

The Reagan administration soon was managing several approaches to strategic security in the wake of the inherited SALT II failure: a rapid buildup of strategic and conventional capabilities; negotiations in 1981 to limit intermediate-range nuclear forces (INF); the opening of talks on a Strategic Arms Reduction Treaty (START) in 1982; and research into space-based antiballistic missile defenses. The Strategic Defense Initiative (SDI), announced in March 1983 and derisively dubbed “Star Wars” by its opponents after the hit science-fiction movie, was an ambitious scheme to put laser-firing satellites into low orbit around the earth. These “killer satellites,” assisted by a complex system of ground-based tracking radars, would intercept and destroy ICBMs at the height of their trajectory outside the earth’s atmosphere. The program was projected to cost hundreds of billions of dollars, and it relied on future development of problematical new technologies. Domestic opposition based on cost, feasibility, and SDIs contravention of the ABM Treaty remained strong throughout Reagan’s presidency.

In 1981, Reagan had suggested a “zero sum” option for tactical nuclear weapons that the Soviet Union promptly rejected. The president promised that NATO would refrain from deploying any American cruise missiles if the Soviet Union eliminated the ballistic missiles it had aimed at western Europe, including existing systems that had never been on the negotiating table before. This suggestion that the Soviet Union scrap extant missiles to preclude American deployment of systems that as yet were in the planning stage dumb-founded Soviet leaders. In November 1983 they broke off the INF discussions.

The U.S. arms buildup continued during a two-year hiatus in negotiations, as did NATO’s planning for deployment of intermediate-range
nuclear weapons in Europe. The inhabitants of NATO nations and other European countries did not wholeheartedly accept the alliance's decision to place additional U.S. tactical nuclear forces in Europe as counters to Soviet SS-20s, SS-5s, and SS-4s. Street protests erupted in the Federal Republic of Germany and the Netherlands, while parliaments and citizens across Europe reacted with alarm. Any Soviet attempt to turn these apparent fissures in NATO to negotiating advantage was foredoomed by a rapid succession of top leaders in Moscow. President Brezhnev had died in 1982, his successor, Yuri Andropov, in 1984, and Andropov's heir a year later.

Negotiations based on versions of Reagan's 1981 zero sum languished until Mikhail Gorbachev became the new secretary general of the Communist Party in March 1985. Relatively young at age fifty-four, and refreshingly dynamic in contrast with the typical Soviet apparatchik, Gorbachev was absolutely determined to liberalize the Soviet political system (glasnost), reform the economy (perestroika), and reduce expenditures for arms, especially nuclear missile systems. According to Michael K. Deaver, who served as Ronald Reagan's personal adviser for twenty years, the president sensed in Gorbachev a kindred spirit. "With Gorbachev, Reagan could do business, and business they would do, eliminating entire classes of nuclear weapons and paving the way for the literal collapse of arguably the greatest enemy we have ever faced." In three separate summit meetings between 1985 and 1987, this unique rapport greatly facilitated negotiations—up to a point. At the October 1986 meeting in Reykjavík, Iceland, the two heads of state came tantalizingly close to agreement on sweeping reductions in nuclear armaments and withdrawal of all American IRBMs from Europe. But things came unstuck when Gorbachev told Reagan, "All this depends, of course, on your giving up SDI." The president reacted with extreme defensiveness, and the meeting collapsed.

START was paralyzed, but all was not lost. The less glamorous INF talks had been revived by Reagan and Gorbachev, and in 1987 the two superpowers signed a treaty that for the first time eliminated an entire class of existing weapons. On-site inspections would verify the elimination of all Soviet and American land-based, intermediate-range, nuclear-armed ballistic missiles. There is debate as to how much the treaty actually lowered the nuclear threat. Both the Soviet and American intermediate-range nuclear forces by that time were becoming obsolete, and each side already was working on new systems. The INF treaty's successful conclusion, on the other hand, signaled that the two powers were ready to resume cooperation in arms control, and that they recognized a mutual need to maintain strategic stability. Gorbachev deserves credit for his flexibility and imagination in breaking the stalemate. He understood that he could not hope to match a U.S. arms buildup when his own domestic economy was on the verge of implosion. Reagan, too, deserves plaudits. In May 1988 he won Senate approval of the INF treaty by a vote of 93 to 5. Six months later, Reagan's phenomenal popularity helped elect his understudy to the presidency.

**GENTLY INTO THAT GOOD NIGHT**

A former Central Intelligence Agency director and ambassador to China, Vice President George H. W. Bush succeeded Reagan in January 1989. President Bush's one-term administration inherited a tentatively cooperative relationship with the Soviet Union, the moribund START I negotiations, and a well-funded research and development program for strategic missile defense. Gorbachev, meanwhile, had been proceeding with unprecedented reforms in the Soviet Union and its satellite states. As he cut the Soviet military by 500,000 men and reduced Red Army troop levels in Eastern Europe, public demonstrations demanding freedom from communist rule spread...
from the shipyards of Gdansk to the coffee shops of East Berlin. A totally unpredictable unraveling had begun. In November 1989 the Berlin Wall was literally dismantled by crowds of young people fed up with the economic and political sterility of the communist system. The destruction of the emblem of East-West division shook the Soviet Union to its core, but somehow in the midst of chaos Gorbachev managed to reach out to the new government in Washington. For its part, the Bush administration sharply slowed Reagan's very costly force buildup and began to reconfigure the planned missile defense architecture that had been created to support SDI. Eventually, the president would attempt to modify the ABM Treaty, but first he and Gorbachev sought to revitalize the START process, a casualty of the Reagan-Gorbachev contretemps over SDI. Meeting in Washington, D.C., in June 1990, Bush and Gorbachev initiated a trade pact and opened negotiations for deeper cuts in strategic weapons.

A year later, in July 1991, they met in Moscow to sign the START I treaty. The new accord reduced and limited total numbers of warheads rather than delivery systems. This was a breakthrough for arms control, although a cap of 4,900 ballistic-missile warheads does seem phantasmagorical. The approach had political appeal as a tool for both leaders to demonstrate to their constituents their seriousness about reducing the threat of nuclear war. It is equally true, however, that the dissolution of the Soviet Union and the Warsaw Pact within six months of each other made the enormous size of the U.S. nuclear arsenal a political and economic liability more than a security asset. American strategic planners began to calculate the level of weapons actually needed to ensure the security of the United States in a world order no longer defined by nuclear bipolarity.

START I was Gorbachev's diplomatic swan song. On the evening of 25 December 1991, the hammer and sickle was lowered from the Kremlin's flagstaff for the last time, and the Soviet Union ceased to be. Boris Yeltsin, who had been outmaneuvering Gorbachev for primacy within the Soviet Union, became president of the new Russian Federation. Bush preferred to work with the less volatile Gorbachev, but in a typically pedestrian aside he said, “You dance with who is on the dance floor.” The American pragmatist and the Russian usurper contrived to sign the SALT II agreement just before Bush left office in January 1993. It reduced the total of nuclear warheads to between 3,000 and 3,500 for each side. All MIRVed missiles were to be eliminated by the year 2003.

No matter how comprehensive, Russian-American cooperation was no longer a sufficient guarantee of nuclear security, as both Yeltsin and Bush realized. In the last decade of the twentieth century, Russia and the United States suddenly encountered a new and unprecedented danger of attack by “rogue states” equipped with nuclear missiles. It was common knowledge that Iraq and Iran had used chemical weapons against one another during their eight-year war (1980–1988), and it had been estimated in 1990 that the Iraqis were “perhaps one year away from deploying a nuclear device.” During the Gulf War of 1991, Iraq brazenly launched short-range Scud missiles to terrorize Saudis in Riyadh and Israelis in Tel Aviv, and American-designed Patriot missiles performed marginally as counters to the Scuds. Subsequent arms-elimination inspections by the United Nations exposed an extensive and sophisticated Iraqi network of nuclear, biological, and chemical weapons installations. Iraq and other so-called rogue states could no longer be discounted as insignificant to the international nuclear calculus. Something had to be done to ensure that the American homeland remained invulnerable to missile attack by minor powers possessing weapons of mass destruction.

President Bush reacted to the alarm with a new missile defense concept called Global Protection Against Limited Strikes. Bearing the friendly acronym GPALS, the innovation of 1991 showed that the proponents of Reagan’s “Star Wars” had never really gone away. Like SDI before it, GPALS would take nuclear warfare into space, initially with space-based sensors but eventually to include actual missile interceptors in earth orbit. To allow testing and deployment of these new systems, the administration formally proposed changes to the 1972 ABM Treaty. Suddenly divested of its sacrosanct character, the treaty would remain under siege for the rest of the twentieth century and into the twenty-first.

LOOSE NUKES, SUCCESSOR STATES, ROGUES, AND FRIENDS

Throughout the tenure of Democratic President William Jefferson Clinton, Europe was experiencing a political reordering of a magnitude not witnessed since the signing of the Versailles Treaty in 1919. As a component of the continental recon-
figuration, Clinton inherited from George H. W. Bush a wide array of unresolved nuclear issues. Some of them dated well back into the Cold War. Others were of recent vintage, the by-products of the disappearance of one of the Cold War's two principal protagonists and the global hegemonic ambitions of the self-proclaimed "one remaining superpower." Foremost among these dark bequests was the precipitous proliferation of nuclear weapons.

When the Soviet Union broke up, U.S. strategists were appalled to see the largest foreign nuclear arsenal suddenly scattered among four unstable, economically weak, and potentially antagonistic successor states: Russia, Kazakhstan, Ukraine, and Belarus. Simply by declaring their independence, Ukraine and Kazakhstan became the third- and fourth-largest nuclear powers in the world. Russia, with U.S. concurrence, quickly declared itself the legal heir to the Soviet Union and the inheritor of its treaty obligations. Russia therefore became the only legitimate nuclear weapons power among the four successor states, according to the provisions of the Nonproliferation Treaty of 1968, and it joined the United States in insisting that the other three disarm as soon as possible. Belarus, Ukraine, and Kazakhstan took the first hesitant step in this direction in May 1992 when they signed the Lisbon Protocol to the START I Treaty. This action made them parties to what was originally a bilateral agreement. They further pledged to adhere to the 1968 Nonproliferation Treaty as nonnuclear weapons states, a move that would codify their acquiescence to the global nuclear order and put their civilian nuclear assets under the safeguards of the International Atomic Energy Agency.

The Clinton administration and Congress provided some monetary assistance to the Soviet Union's successor states for their transition to nonnuclear status. One means of aid, the Cooperative Threat Reduction Act (CTR)—also known as Nunn-Lugar—advanced $1.5 billion to the four struggling nations. With this aid, Russia would bring its strategic weapons inventory into compliance with START I limitations; the other three states would dismantle their segments of the former Soviet nuclear arsenal and sequester all weapons materials in Russia for indefinite safekeeping. Under CTR, President Clinton promised to purchase 500 metric tons of highly enriched Russian uranium for $12 billion over a twenty-year period. More immediately, in 1994 American technicians mounted a top-secret operation, code-named "Sapphire," which spirited 600 tons of weapons-grade uranium out of Kazakhstan. The objective was to keep this unprotected stockpile beyond the reach of Iran's nuclear weapons fabricators.

CTR attracted sharp criticism from some members of Congress for failing to focus narrowly on disarmament and for not adequately verifying destruction of nuclear weapons in Russia. Moscow, for its part, complained that most of the CTR money went to pay American contractors rather than to helping Russian firms develop the expertise to eliminate nuclear weapons. However, as one of the act's sponsors, Senator Richard G. Lugar, pointed out, the fact that most of the CTR appropriations remained in the United States was an essential selling point for the American people and Congress: "Eighty-four percent of Nunn-Lugar funds have been awarded to American firms to carry out dismantlement operations in the former Soviet Union. There are no blank checks to Moscow." As with the early Cold War's Marshall Plan, U.S. industry stood to profit from critical European instability.

Clinton supplemented the monetary inducements with diplomacy, but each of the three non-Russian nuclear-armed descendants of the Soviet Union presented unique impediments to the negotiation of nuclear disarmament. Belarus, highly Russified and sporadically ambivalent about independence, was the most readily compliant of the three; it also was the most lightly armed of them. Ukraine and Kazakhstan were tougher nuts to crack.

Bitterness against the former Soviet regime ran deep in Ukraine. Despite repeated assurances to George H. W. Bush's secretary of state, James A. Baker III, and to others concerning their intention to give up their nuclear arsenal, Ukraine's leaders stalled negotiations on assistance and delayed ratification of the Lisbon Protocol. By 1993 it was clear that Ukraine was working to establish positive control—the ability to launch—over its strategic arsenal. Ukrainian technicians already had gained negative control, which meant that President Leonid Kravchuk could prevent a missile launch by Moscow from Ukrainian soil if Russian President Boris Yeltsin should neglect to consult Kiev beforehand. Kiev's negotiators sought three main benefits from any agreement to disarm: attention and respect from the international community, money, and security guarantees from the remaining nuclear weapons states. Their intransigence delayed the Supreme Rada's ratifica-
tion of START I until February 1994, and of the NPT until December of that year. Ultimately, Kiev simply had to acknowledge that it could not afford, either financially or politically, to maintain a nuclear arsenal in the face of intense international pressure.

Kazakhstan trod a path somewhere between the acquiescence of Belarus and the hard line of Ukraine. Security guarantees figured prominently in the negotiations of Alma-Ata (Almaty) with Russia and the West over disarmament. Located at the juncture of Russia, China, India, and the Middle East, Kazakhstan feared losing its nuclear deterrent without acquiring the compensating umbrella of a powerful ally. While the United States stopped short of giving positive guarantees that it would intervene if Kazakhstan were attacked, it did help to alleviate the Kazakhstani parliament's apprehensions when it joined Russia and the other weapons states in guaranteeing Kazakhstan, Ukraine, and Belarus that they would never be attacked with nuclear weapons. After holding out along with Ukraine as long as possible, Kazakhstan reluctantly faced up to the realization that it had neither the fiscal resources nor the expertise to maintain, much less use, its weapons. The Supreme Council of Kazakhstan ratified START I and the Lisbon Protocol on 23 July 1992 and, finally, the Nonproliferation Treaty as a nonnuclear state on 13 December 1993.

With Russia, nuclear matters were more complicated. When Clinton entered office in January 1993, the implementation of START I was under way and ratification of START II seemed imminent, but serious obstacles soon arose on both sides of the Atlantic. American opponents to START II raised the fear that swift action on arms reductions could leave the United States vulnerable if political instability in Russia should lead to a breakdown in bilateral arms control cooperation. An attempted parliamentary coup against President Yeltsin in October 1993 and the gradual deterioration of Yeltsin's ability to govern reinforced these concerns. Aside from the geostrategic relationship, domestic political maneuvering between the Republican-led Congress and the Democratic White House kept START II off the Senate's agenda for the better part of a year, until a quid pro quo on legislative priorities could be worked out between them. The U.S. Senate finally ratified START II by a large margin on 26 January 1996.

Strong opposition to key provisions of the treaty arose in the Russian Duma, whose members were sensitive to the changes in the U.S.–Russian strategic relationship and distressed over Russia's uncertain status as a world power. If Ukraine were to give up its MIRVed warheads, opponents to START II argued, it would be forced to invest in the creation of a new single-warhead ICBM force, an expenditure it could not afford, or lose its superpower status. Others believed that START II already was outdated and that negotiations should move directly to START III, as a means of bringing the U.S. arsenal down to the level at which Russian strategic forces probably would find themselves anyway. START III, it also was hoped, would eliminate objectionable features of START II, such as the provision that the United States would keep half its MIRVed SLBMs while Russia would have to eliminate all its MIRVed ICBMs.

The increase in NATO's membership, first proposed by Clinton in 1994, dealt another serious blow to prospects for the Duma's ratification of START II. Enlargement of the pact would be "the most fateful error of American policy in the entire post–Cold War era," according to George F. Kennan, the "father" of the 1947 containment policy who was still alive and writing in the 1990s. The grand master of American political-strategic thinking predicted that such a move would inflame hard-line nationalism within Russia, damage Russia's nascent democracy, and shift bilateral relations back to a Cold War status. Within Russia, analysts argued that expansion of NATO, juxtaposed with the downsizing of Russia's conventional forces, would force Moscow to rely even more heavily on its strategic arsenal. To calm this apprehension, the Russian Federation and NATO signed the 1997 Founding Act on Mutual Relations, Cooperation, and Security. They promised to build "a lasting and inclusive peace in the Euro-Atlantic area on the principles of democracy and cooperative security," and they proclaimed "the beginning of a fundamentally new relationship between NATO and Russia." While it did not satisfy the concerns of many who opposed expansion, the Founding Act did mitigate the damage enough for Moscow and Washington to continue cooperation on other issues. In 1997 Presidents Yeltsin and Clinton agreed to coordinate the START II and START III processes, with implementation of both to be complete by 31 December 2007.

Ratification of START II, and the START III talks themselves, unfortunately were soon paralyzed by the brouhaha over U.S. national missile defenses and the status of the ABM Treaty. This
canceled Exercise Team Spirit. U.S. public opinion, however, remained strongly opposed to pro-
viding any economic support for the "rogue nation," so financing for the assistance was
arranged through an international consortium of private and governmental agencies from Japan,
South Korea, and the United States. These imposed inhibitions on North Korea's nuclear
aspirations did not last.

On 31 August 1998, North Korea rocketed a three-stage Taep'o-dong ballistic missile over
Japan's main island of Honshu. Western intelligence attributed to the missile a surprising range
of between 3,800 and 5,900 kilometers. This extended reach constituted remarkable progress in
five years for the North Korean missile program, from the 500 kilometer-range Nodong-1 in 1993.
It sparked American fears that North Korea might be working on an intercontinental ballistic missile
to bring the western United States under threat of nuclear attack. More likely, North Korea's motives
for unveiling the Taep'o-dong in such a dramatic fashion had as much to do with political posturing
as with aggressive concepts of national security. Just before the test, North Korea's leaders indi-
cated that they would halt the missile program if the United States lifted economic sanctions and
compensated them for lost missile sales. There also were solid indications that North Korea's
nuclear weapons program, halted under the Agreed Framework, had been put back on track in
reaction to U.S. failure to provide the light-water reactors it promised in 1994.

The Taep'o-dong missile launch was not the only setback to Clinton's hopes for halting the dif-
fusion of nuclear weapons in 1998. In May of that year India announced that it had detonated five
nuclear devices at its testing range in the Thar Desert near Pakistan's border. The subcontinent
had been problematic for the international non-
proliferation regime ever since India's refusal to
sign the Nonproliferation Treaty in 1968. India
had become a de facto, but undeclared, nuclear
power in 1974, when Prime Minister Indira
Gandhi authorized what Indian officials charac-
terized as a "peaceful nuclear explosion." Gover-
nance of India's nuclear program was tightly held
by its civilian leaders, to the almost complete
exclusion of the Indian military. Since 1974, India
had chosen to rely on an ambiguous "existential
deterrent" policy toward its declared enemy, Pak-
istan, and toward its arch-rival, China. Although
India clearly possessed the capability to deploy
warheads, none were placed on delivery vehicles
or deployed at launch sites; nor was their exis-
tence officially conceded.
Upon India’s announcement of the tests in 1998, the United States and the United Nations immediately launched efforts to persuade Pakistan, long suspected of having a rudimentary nuclear capability, not to test in reaction to India. All threats and pleas failed, and Pakistan conducted six tests of its own within a month. With tensions between the two adversaries already soaring due to a chronic Islamic insurgency in Kashmir, world attention swung to the subcontinent as the next possible site for a nuclear war. In this quarter, the United States and United Nations faced a dilemma quite different from that posed by North Korea. The largest democracy in the world and a challenger to China for hegemony in South Asia, India was not constrained by the nonproliferation or safeguards conventions. Moreover, India’s people and their political leaders had in the past proved remarkably resistant to threats or attempts at coercion regarding their nuclear status. Pakistan for its part was able to depend upon a close relationship with China to sustain its nuclear defense program in the face of international opprobrium.

UN Security Council Resolution 1172 of 6 June 1998, which had been sponsored by the five permanent members of the Security Council, demanded an immediate end to testing by New Delhi and Islamabad and called on the two countries to reopen negotiations over disputed territories. It enjoined them to sign the 1996 Comprehensive Test Ban Treaty (CTBT) and the Nonproliferation Treaty of 1968 as nonnuclear weapons states. In the United States, the Glenn Resolution to the Arms Export Control Act of 1998 legally required President Clinton to impose sanctions on both countries in response to the tests. Military and financial aid was restricted, but commercial intercourse continued without impediment.

International opinion was divided on the utility of sanctions as a means to coerce India or Pakistan. Many analysts thought such attempts were more likely to harden than soften the resolve of the two countries’ leaders, given the overwhelming domestic approval of the tests. There was the additional risk of intensifying Pakistan’s political instability by disrupting an already unsteady economy and strengthening the hand of its military in political affairs. Finally, vigorous anti-American factions in both countries resented what they regarded as Washington’s interference in their bilateral affairs, while each state was highly suspicious of the other’s relations with the United States. This atmosphere limited Washington’s ability to influence either government, particularly in the area of arms control. Clinton and the U.S. Congress therefore gradually eased or waived many of the Glenn Resolution’s prohibitions, and the administration’s diplomats continued to encourage nuclear prudence on the part of India and Pakistan. Unfortunately, the Nonproliferation Treaty and International Atomic Energy Agency safeguards regimes made no provision for admitting new weapons states or for safeguarding the nuclear facilities of states that lacked official treaty nonweapon status. This hiatus left Pakistan and India in a nonproliferation limbo, and their civilian nuclear assets remained beyond international oversight.

The dramatic proliferation of nuclear weapons technology and missile arsenals, together with the bombing of the World Trade Center by a group of international terrorists in 1993, the April 1995 Oklahoma City bombing, and simultaneous car bomb attacks on the U.S. embassies in Tanzania and Kenya in August 1998, left Americans feeling uncomfortably vulnerable in an increasingly hostile and unpredictable world. Interest was revived in a total ban on testing nuclear weapons. First broached during the Kennedy presidency, the idea remained moribund until the 1990s, when it again gained currency as the most obvious means to halt nuclear weapons proliferation and arms races. In 1996 the UN General Assembly had formulated the Comprehensive Test Ban Treaty and disseminated it for signature. President Clinton, one of the first heads of state to sign, characterized the treaty as the “longest sought, hardest fought prize in arms control history.” He submitted the treaty to the Senate for approval, confident he would be able to cite its ratification as one of the chief foreign policy victories of his presidency. His confidence was premature. Chairman of the Senate Foreign Relations Committee Jesse Helms, a Republican from North Carolina, with the full support of Republican Majority Leader Trent Lott, saw the treaty as a golden opportunity to thwart Clinton. They let it die in committee without a single hearing. In light of U.S. senatorial obstinacy, other governments began to question the wisdom of forgoing their right to test. By 1998 few countries had ratified the pact, and hope for a comprehensive test ban faded.

In retrospect, the monumental dangers of the Cold War’s bipolar nuclear standoff had been manageable, and decades of arms control negotiations had made the likelihood of war between the
two superpowers appear increasingly remote. In
the afterglow of the Cold War and the disappear-
ance of the Soviet Union, Americans were faced
with a world full of apparent enemies against
whom the tremendous U.S. nuclear deterrent was
impotent. The threat of massive retaliation simply
could not be used to deter terrorists, not only
because their provenance usually was unclear, but
also because it was politically untenable and
morally unjustifiable to carry out such a lopsided
exchange.

The function of the nuclear deterrent in the
post–Cold War world became a subject of intense
concern, and the topical center of gravity within
U.S. security and policymaking circles began to
shift from nonproliferation to counterprolifera-
tion. A search was begun for promising new tech-
nologies to defend U.S. territory and citizens
against possible attack. As the threat of rogue
states armed with weapons of mass destruction
became a favorite subject of national security
debates within Washington, Ronald Reagan’s
“Star Wars” concept began a relentless comeback.

President Clinton gave missile defenses a
lower priority than had George H. W. Bush, but he
continued a modest developmental program. The
Strategic Defense Initiative Organization meta-
morphosed into the Ballistic Missile Defense Orga-
nization, with a much smaller budget than its
predecessor had enjoyed. Drawing lessons from
the Gulf War of 1991, Clinton shifted the pro-
gram’s concentration from strategic to regional or
“theater” defense. Theater missile defenses (TMD)
were seen by critics in both the United States and
Russia as an attempted end run around the ABM
Treaty, even though the treaty did not specifically
cover TMD. Some TMD hardware could easily be
reconfigured to counter strategic as well as tactical
ballistic missiles, opponents argued. They pre-
picted that development of TMD would induce
Russia to build up rather than reduce its strategic
arsenal, thus undoing the historic achievements of
arms control negotiations and agreements. In
1993 the Clinton administration sought to allevi-
ate these concerns by negotiating a “line of demar-
cation” between strategic and theater defenses
based on Article 6 of the ABM Treaty, which for-
bade giving an ABM “capability” to non-ABM
defense systems. This approach met with powerful
opposition from the newly elected Senate Republi-
can majority in 1994. The Republicans insisted
that the Russians should not have a “veto” over
the future of American missile defenses, as they
did under the ABM Treaty.

Caught between these conflicting factions, Clinton worked directly with Yeltsin to fashion
language that would evade both the legal triggers
of the treaty and the political guns of the U.S.
Senate. The result was a joint statement by the
two presidents issued in May 1995. It paved the
way for negotiating a demarcation agreement, rec-
ognized the validity of TMD in principle, and
reaffirmed the importance of the ABM Treaty to
the bilateral relationship. The negotiations them-
selves were complex. The current parties to the
ABM Treaty—the United States, Russia, Belarus,
Ukraine, and Kazakhstan—had to hammer out a
common interpretation of interceptor range and
velocity, flight-testing, space- and land-based sen-
sors, and other arcane technical issues within the
parameters of the treaty before they could reach
agreement on what any signatory actually was
allowed to do with its missile defenses.

Meanwhile, the controversy in the United
States over a national missile defense continued to
evoke strong reactions from powerful international
friends and potential adversaries. China and Russia
were the most vociferous in their condemnation of
what they viewed as a unilaterally destabilizing
course of action. European and Asian allies asked
whether the United States was attempting to with-
draw behind a “Fortress America” defensive bul-
wark that would leave them facing potential threats
without a credible deterrent. Having gotten itself
entangled in some future overseas adventure, their
argument went, the United States could retreat
without fear of reprisal, leaving its allies exposed as
defenseless targets for the missiles of disgruntled
adversaries. The Clinton administration disingenu-
ously countered that, on the contrary, a United
States free from the fear of retaliation would be
more willing, not less, to come to the aid of its allies
in a nuclear emergency. This was a ghostly reprise
of the American assertions that in the early 1960s
had led a skeptical Charles de Gaulle to form a
French nuclear force de frappe and to withdraw
from NATO strategic planning. De Gaulle knew in
the 1960s, as European leaders knew in the 1990s,
that there was only a negative answer to the ques-
tion, “Would the Americans really be willing to
trade Washington for, say, Paris?”

To appease a dubious Russia, the Clinton
administration in 1999 proposed that the two
countries cooperate in the development of
national missile defense systems. Before any real
progress could be made, in December 2000,
Yeltsin abdicated and was succeeded by the for-
mer secret police (KGB) officer Vladimir Putin.
The new Russian president warned Clinton that abrogation of the ABM Treaty would force Russia to reconsider all of its treaty obligations with the United States, including the pending ratification of START II. Clinton vacillated. He had signed the 1999 National Missile Defense Act calling for an effective missile defense system as soon as one was technologically feasible, but he deferred a final decision to deploy one and passed that hot potato to his successor. Putin in the meantime was doing his best to keep the United States committed to bilateral strategic arms control and to salvage the ABM Treaty. Strong lobbying by the Russian president persuaded the Duma to ratify START II in April 2000. The desperate gesture's futility would be demonstrated soon after President Clinton left office.

**YIELDING TO THE NEW ORDER**

George W. Bush, the son of Clinton's predecessor, entered the White House in January 2001 as a strange amalgam of neoisolationist and latter-day cold warrior. Lacking his father's lifetime of exposure to world affairs or to politics beyond Texas, Bush had very rarely traveled overseas. From the first days of his administration he showed an alarming tendency to discount the stabilizing results of a half century's patient negotiation, especially the thirty-year-old ABM Treaty. His most senior advisers were men and women with broad foreign policy expertise and extensive experience in managing the national security apparatus. Richard Cheney, the vice president, had been secretary of defense at the time of the Gulf War; Secretary of Defense Donald Rumsfeld had held the same office under President Reagan; General Colin Powell, the secretary of state, was a former national security adviser who had been chairman of the Joint Chiefs of Staff during the Gulf War. Bush's national security adviser, Condoleezza Rice, was a newcomer to high office but she brought to the Oval Office an intimate academic familiarity with the military and foreign policy of Soviet Russia. On balance, these counselors were aggressive and combative veterans of the Cold War; they were not inclined to dissuade the president from attacking the ABM Treaty as obsolete in a world of nuclear-armed rogue states, or from pushing the eastward expansion of NATO regardless of the objections of Russia.

Bush immediately made it clear that creation of a missile defense system would command his highest priority. At the same time, he began distancing himself from the traditionally close strategic and arms control relationship the United States had maintained with Russia since Nixon's presidency. In the earliest days of his administration Bush warned that if Russia refused to negotiate changes to the ABM Treaty the United States might abrogate the pact. He further suggested that the United States would make future changes to its strategic arsenal on a unilateral basis. This autarchy would free the United States from the need to negotiate missile defenses in tandem with arms reductions, thereby decoupling Russian and American strategic interests for the first time in more than fifty years.

Early in 2001 the éminence grise of the Republican foreign policy establishment, Henry Kissinger, weighed in on the side of the opponents of the ABM Treaty, which had been negotiated when he was President Nixon's national security adviser. In a book entitled *Does America Need a Foreign Policy?* Kissinger quite remarkably traced the treaty's origins to congressional and bureaucratic opposition to an ABM defense system that, he claimed, was what President Nixon had preferred. Kissinger said the opponents of Nixon's antiballistic missile program used the same arguments as were being used in 2001 to discredit President Bush's national and theater missile defense proposals. In Kissinger's version, the Cas-sandras incoherently predicted that a ballistic missile defense program "would not work; that it would work so well as to be destabilizing; that it would weaken the Atlantic Alliance by decoupling the defense of the United States from that of Europe; that it would drive the Soviet Union into intransigence and an arms race."

Kissinger and others who would scrap the ABM Treaty in order to construct antiballistic missile systems postulated that regardless of any treaty, the United States and Russia would not attack one another because each side had far more than enough nuclear weapons to obliter ate its rival. On the other side of the debate was Thomas L. Friedman, the foreign correspondent of the *New York Times*. A strategic thinker who believed that "the information revolution and [economic] globalization" were radically transforming international relations, Friedman vigorously denounced Kissinger and "the Bush team's latest version of a high-tech missile defense shield." It was "an idea that, so far, doesn't work, [and] shows every possibility of unraveling the complex web of arms control and diplomatic initiatives that have kept the peace for 50 years."
President Bush met Vladimir Putin, the president of the Russian Federation, for the first time in Slovenia in June 2001. Bush said he looked his counterpart in the eye, liked what he saw, and invited him to his ranch in Texas. Some naive columnists were quick to herald a breakthrough and a revitalization of Russian-American relations. But prudent skeptics wondered whether real Russian-American harmony could be established or persist given the substantive differences dividing the two countries. Asked about the U.S.–Russian relationship in May 2000, the deputy chairman of the defense committee of the Russian Duma, Alexei Arbatov, replied without hesitation, “There are a lot of very bad feelings, bad expectations, suspicions and mistrust. A lot of those are not justified, some are, unfortunately, justified. Russia sees itself as now being an opponent of the United States. . . . Russia is willing to compete . . . in important areas such as the post-Soviet states, the Balkans, the issue of ballistic missile defenses and strategic offenses [sic].”

Another pertinent question to consider when assessing Russian-American relations in the first decade of the twenty-first century was whether the relationship between the two should really remain the central thread of American nuclear strategy and diplomacy. The United States might bill itself as the “one remaining superpower” in 2001, but the People’s Republic of China was a nascent great power with potentially unlimited geopolitical ambitions and energy. Vociferous in denouncing the Bush administration’s plans to build missile defenses as destabilizing, China shrugged off American accusations that it was benefiting from the ABM Treaty while the United States lay exposed to missile attacks by powers other than Russia. Beijing continued to vilify the United States as a “rogue hegemon” whose self-aggrandizement threatened the security of the rest of the world. At the same time, China modernized its own nuclear and conventional forces and opened mutual defense discussions with Russia. President Putin of Russia, seeking a counterweight to U.S. power, turned eagerly to China, where he found enthusiasm for cooperation in arms and technology transfers. A Sino-Russian voting alliance in the UN Security Council became less and less far-fetched, but this was not the most ominous development. Alexei Arbatov warned, “Russia certainly views China as its present partner. . . . [F]or the nearest and medium-term future, China is perceived as much closer to Russia on international security issues than the United States and the West in general.”

In mid-2001 it was hard to see how the emergence of a Sino-Russian bloc could do other than increase the Bush administration’s resolve to abandon the ABM Treaty and go it alone with nuclear missile defenses. In July of that year a missile-borne “kill vehicle” dramatically intercepted a Minuteman II warhead 144 miles above the Pacific Ocean. The highly orchestrated test convinced credulous proponents of Star Wars “that we can hit a bullet with a bullet.” Less than a week later, at a summit in the Kremlin, the presidents of Russia and China jointly condemned George W. Bush’s national missile defense and his intended abrogation of the ABM Treaty as threats to the security of their countries. For the first time in fifty years, Beijing and Moscow concluded a treaty of friendship and mutual cooperation. This rapprochement between America’s two former major antagonists was a far cry from the benign “new world order” that the first President Bush had proclaimed at the end of the Cold War.

CONCLUSION

The world has turned round many times since Harry S. Truman permitted the U.S. Army Air Forces to drop atomic bombs on Japan. Having borne the full moral responsibility for opening the age of nuclear warfare, he courageously repudiated advisers who would have him repeat the macabre performance in Korea or China. His five-star successor, Dwight D. Eisenhower, constructed a magnificent nuclear armory and resolutely refused to use a single weapon in the inventory, despite the proclivity of his secretary of state for saber-rattling warnings of imminent Armageddon. After the bone-chilling scare of John F. Kennedy’s Cuban missile crisis, a long period of mature Soviet-American nuclear diplomacy and restraint settled over Washington and Moscow. The well-understood rules of the nuclear-diplomatic road did not become obsolescent until the dissolution of the Soviet Union in 1991. Thereafter, the restless new nuclear powers and a freshly assertive China cast the most ominous shadows over the future. It would take extraordinary American statesmanship to steer a safe course through a world of revanchist states armed with weapons of mass destruction. George H. W. Bush, William Jefferson Clinton, and George W. Bush were only the first of a long line of American presidents who would face a challenge for which the Cold War’s nuclear policy offered precious little direct guidance.

ENCYCLOPEDIA
of AMERICAN
FOREIGN POLICY
Oil was an integral part of U.S. foreign policy in the twentieth century, and its influence has shown no sign of diminishing in the twenty-first century. Oil has been and continues to be central to military power and to modern industrial society, and possession of ample domestic oil supplies and control over access to foreign oil reserves is a significant, and often overlooked, element in the power position of the United States relative to its rivals. While demand for oil is worldwide, for most of the twentieth century the major industrial powers, with the significant exceptions of the United States and the Soviet Union, had meager domestic oil production, and, with the same two exceptions, the major oil producers were not industrial powers. Because of this disparity, struggles over access to oil have been an important focus of rivalry among the great powers and a significant source of conflict between oil-consuming industrial countries and oil-producing nonindustrial nations.

Control of oil has been intimately linked to broader political, military, and economic objectives. These larger foreign policy concerns have shaped the issue of control and have, in turn, been shaped by it. For example, all the major postwar doctrines of U.S. foreign policy—the Truman, Eisenhower, Nixon, Carter, and Reagan doctrines—relate, either directly or indirectly, to the Middle East and its oil.

The history of oil and foreign policy also provides important insights into the relationship between private power and public policy that are crucial to understanding the nature and development of U.S. foreign policy in the twentieth century. Finally, the impact of oil use on the environment has become almost as important an issue as access to oil.

**OIL AND WORLD POWER**

The United States dominated world oil production in the first half of the twentieth century. U.S. fields accounted for slightly more than 70 percent of world oil production in 1925, around 63 percent in 1941, and over 50 percent in 1950. The U.S. oil industry operated in a unique regulatory environment that included a permissive legal regime, generous tax treatment, and a cooperative system of national production control centered on the state of Texas, which accounted for almost half of total U.S. production. During the Great Depression, the federal government, several state governments, and the oil companies worked out a control system that placed a ceiling on total output and allocated production so that marginal producers could survive in the face of considerable excess capacity. Although Texas authorities refused to require producers to pool their extractive activities in each oil field, thereby allowing wasteful extractive processes to continue, the system allowed high-cost marginal wells to continue to produce, thus preserving lower-cost fields for future use. Higher prices also somewhat reduced consumption. With the Texas Railroad Commission as a balance wheel, the system remained in place until the early 1970s, when domestic production alone could no longer fill national demand.

In addition to being blessed with a thriving and productive domestic oil industry, five of the seven great oil corporations (the so-called Seven Sisters) that dominated the international oil industry from the 1920s to the 1970s were American companies. U.S. oil companies, along with British firms, dominated the oil industries of the two main producing countries in Latin America, Mexico and Venezuela, and had smaller holdings throughout the region. During the 1920s and early 1930s, the United States successfully supported efforts by U.S. oil companies to gain oil concessions in the Middle East. U.S. companies were also involved in regionally significant oil fields in the Netherlands East Indies. By the eve of World War II, U.S. companies accounted for nearly 40 percent of oil production outside the United States and the Soviet Union.
More importantly, the United States possessed the means to ensure the stability of the producing regions and gain access to their oil. The United States Navy had emerged from World War I second to none, thus providing the United States with the capability of securing access to overseas oil-producing areas. The United States was already firmly entrenched in the oil-rich Gulf of Mexico–Caribbean region before World War I for security reasons that predated oil’s emergence as a strategic commodity. World War II and the Cold War reinforced traditional U.S. determination to maintain an economic and strategic sphere of influence in Latin America. Securing the Persian Gulf, which emerged as the center of the world oil industry following World War II, was more difficult for several reasons, including the region’s distance from the United States, the involvement of rival great powers, and the dynamics of regional politics. Great Britain had emerged as the leading power in the Middle East following World War I. Following World War II, the United States gradually assumed Britain’s role as the main guarantor of Western interests in the Middle East.

Oil became an important element in military power in the decade before World War I when the navies of the great powers, led by Great Britain and the United States, began to switch from coal to oil as their source of power. In addition, the major military innovations of World War I—the submarine, the airplane, the tank, and motorized transport—were all oil-powered. Although the surface fleets of the great powers played a relatively minor part in the fighting, German submarines wreaked havoc on British and French shipping and helped bring the United States into the war. In addition, oil carved out a role in the manufacture of munitions when the British, using a process developed by Royal Dutch/Shell, began extracting toluol, an essential ingredient in the explosive TNT, from oil. Access to oil became more important toward the end of the war with the transition from static trench warfare, with its limited demand for oil-powered machinery, to a more fluid operational environment in which tanks, motorized transport, and aircraft played a larger role.

Britain and France were able to draw on overseas sources of supply from Iran, Mexico, and the United States, while the Germans were limited to oil from Romania. By the last year of the war, the United States was supplying more than 80 percent of Allied oil requirements, and the American navy was playing a key role in supplying and protecting tanker transport of oil to Europe. Although Lord Curzon’s boast that the Allied cause had floated to victory on a wave of oil was an overstatement, severe shortages of oil in 1917 and 1918 threatened to immobilize the Royal Navy and the French army. In both cases, urgent requests to the United States for help led to the provision of the needed supplies. In contrast, without such external assistance, oil shortages hindered German military operations at critical points.

In addition, oil carved out a role in the manufacture of munitions when the British, using a process developed by Royal Dutch/Shell, began extracting toluol, an essential ingredient in the explosive TNT, from oil. Access to oil became more important toward the end of the war with the transition from static trench warfare, with its limited demand for oil-powered machinery, to a more fluid operational environment in which tanks, motorized transport, and aircraft played a larger role.

Britain and France were able to draw on overseas sources of supply from Iran, Mexico, and the United States, while the Germans were limited to oil from Romania. By the last year of the war, the United States was supplying more than 80 percent of Allied oil requirements, and the American navy was playing a key role in supplying and protecting tanker transport of oil to Europe. Although Lord Curzon’s boast that the Allied cause had floated to victory on a wave of oil was an overstatement, severe shortages of oil in 1917 and 1918 threatened to immobilize the Royal Navy and the French army. In both cases, urgent requests to the United States for help led to the provision of the needed supplies. In contrast, without such external assistance, oil shortages hindered German military operations at critical points.

In addition to being a tremendous military asset, access to ample supplies of oil provided the United States with important advantages in the industrial transformation of the first half of the twentieth century. By the 1890s, the United States had overtaken Great Britain as the leading industrial power in the world, and by the 1920s, the U.S. economy was larger than the combined economies of the next six great powers (Great
Cheap and plentiful supplies of oil were a prerequisite for the automobile industry, which played a central role in the U.S. economy from the 1920s to the 1960s. Oil became the fuel of choice in land and sea transport as well as the only fuel for air transport, and challenged coal as the main source of energy for industry. Oil also played an important, if somewhat less crucial, role in heating and electricity generation, but oil-powered machinery became crucial to modern agriculture, and oil became an important feedstock for fertilizers and pesticides. Indeed, with the development of the petrochemical industry, oil reached into almost every area of modern life. Already almost one-fifth of U.S. energy consumption by 1925, oil accounted for around one-third of U.S. energy use by World War II. Outside the United States, in contrast, oil was a secondary fuel reserved mainly for transportation and military uses and accounted for less than 10 percent of energy consumption in western Europe and Japan before World War II.

The Soviet Union was the only other great power that possessed significant quantities of oil within its borders. The Russian empire had been the world's leading oil producer in 1900, accounting for more than half of world production. Soon thereafter a combination of geological and political problems caused output to plummet. Soviet oil production recovered rapidly in the 1920s, and by 1939 the Soviet Union was the second-largest oil producer in the world, far behind the United States and slightly ahead of Venezuela. Although the Soviets reentered exports markets briefly in the late 1920s, by the end of the 1930s almost all Soviet oil production was being devoted to internal uses.

The other great powers (Great Britain, France, Germany, and Japan) lacked indigenous oil reserves and were therefore dependent on foreign sources. Although British companies held concessions in Latin America, the Middle East, and Asia, maintaining access to this oil required stability in the oil-producing areas and control of the sea routes linking the oil-producing areas to Britain. British security policy called for the Mediterranean and the Middle East to be defended because they lay athwart land, sea, and air routes to India, the Far East, and the Pacific dominions. If the Mediterranean were closed, a prospect that seemed increasingly likely as Britain's relative power declined in the 1930s, access to Middle East oil would be very difficult, assuming that the oil fields and other facilities could be defended. Production in the Far East was not great, and access to its oil would be even more difficult to defend in wartime. Wartime access to Western Hemisphere oil would be dependent on the acquiescence and probably the assistance of the United States, to which Britain had conceded regional supremacy shortly after 1900 and whose help would be needed to transport the oil safely across the Atlantic. This dependence on the United States for vital oil supplies was a critical weakness in Great Britain's power position.

During the 1930s, the British government studied the possibility of reducing its reliance on imported oil by using Britain's ample coal supplies as a source of synthetic oil. It rejected this alternative on security grounds, concluding that, given the British position in the major oil-producing areas and the strength of the Royal Navy, reliance on imported oil would be less vulnerable to interdiction than large synthetic oil plants that would be conspicuous targets for air attack.

France's stake in foreign oil was largely limited to a share in Iraqi oil production and a few holdings in Romania. Access to Iraq, which by 1939 supplied almost half of France's oil imports, was dependent on British assistance to keep the Mediterranean open and the Middle East secure. Romania was able to fill only a small portion of French oil requirements, and access to Romanian oil would be unreliable in the event of a conflict with Germany. Access to Western Hemisphere oil, the other source of French imports, was dependent on U.S. goodwill and assistance. The French also explored extracting oil from coal and using alcohol as a motor fuel, but neither alternative provided sufficient supplies to relieve France's dependence on imported oil. France was thus doubly dependent, needing British and U.S. cooperation to ensure access to oil.

German and Japanese oil companies had been shut out of the major foreign oil-producing areas, leaving both nations dependent on foreign companies for necessary supplies and thus vulnerable to economic and political pressure. Moreover, their access to oil in the Middle East and the Western Hemisphere was threatened by British and U.S. control of the oil-producing areas and Anglo-American command of the sea routes to these regions.

Convinced that oil was essential to fuel his ambitions, Nazi leader Adolf Hitler moved to promote the development of a synthetic fuel industry in Germany shortly after taking power in 1933.
By the outbreak of World War II, coal-derived synfuels accounted for nearly half of Germany's peacetime oil needs. The process of extracting oil from coal was complicated and expensive, and the huge installations required massive amounts of steel and were very vulnerable to air attack. Therefore, obtaining access to oil that did not depend on sea routes subject to interdiction by enemies remained an important part of Nazi expansionist strategy.

Germany received large quantities of oil from the Soviet Union under the terms of the 1939 Nazi-Soviet Pact, and in November 1940 gained assured access to Romanian oil when Romania was forced to adhere to the Tripartite Pact. These supplies were inadequate for Germany's needs, leading Hitler to look to the conquest of the rich oil fields of the Caucasus as a way to gain oil for Germany's highly mechanized military machine. Thus, the desire to gain assured access to oil was an important factor in Hitler's decision to invade the Soviet Union in June 1941.

Obtaining access to oil was also a key factor behind Japan's decision to attack the United States. By the end of the 1930s, Japan was dependent on the United States for 80 percent of its oil needs. Most of the rest came from the Netherlands East Indies, where Shell and the Standard-Vacuum Oil Company, a jointly owned subsidiary of Standard Oil (New Jersey) and Socony-Vacuum, controlled production. The Netherlands East Indies possessed the largest reserves in East Asia, and control over its oil would go a long way toward meeting Japan's oil needs. On the other hand, seizing the Netherlands East Indies would lead to conflict with Great Britain and the United States. Nevertheless, the Japanese chose this course after the United States, Britain, and the Netherlands imposed an oil embargo on Japan in the late summer of 1941 in response to Japan's decision to take control of all Indochina.

World War II marked the apogee of oil's direct military importance, and the role of oil-powered weapons systems demonstrated that oil had become the lifeblood of the modern military machine. All the key weapons systems of World War II were oil-powered: surface warships (including aircraft carriers), submarines, airplanes (including long-range bombers), tanks, and a large portion of sea and land transport. Oil continued to play an important role in the manufacture of munitions, and the development of petroleum-based synthetic rubber helped relieve Allied dependence on Southeast Asian natural rubber supplies, most of which were in the hands of the Japanese for much of the war.

The United States entered World War II with a surplus production capacity of over one million barrels per day, almost one-third of U.S. production in 1941. This margin enabled the United States, almost single-handedly, to fuel not only its own war effort but that of its Allies, once the logistics of transporting the oil safely across the Atlantic had been mastered. In addition, U.S. leadership in oil-refining technology provided the U.S. military with such advantages as 100-octane aviation gasoline and specialty lubricants needed for high performance aircraft engines.

The Soviet Union also benefited from having indigenous oil supplies. The Soviets were able to retain control of the vital Caucasian oil fields, and rushed new fields in the Volga-Urals region, safely removed from the fighting, into production. These successes helped Soviet forces attain the mobility necessary to repel the German invaders and go on the offensive.

German and Japanese failure to gain secure access to sufficient oil supplies was an important factor in their defeat. German synthetic fuel production proved barely adequate for wartime requirements, and failure to gain control of the rich oil fields in the Caucasus, coupled with setbacks in the Middle East and North Africa, left the German military vulnerable to oil shortages throughout the war. Indeed, Germany was able to hang on as long as it did only because the absence of a second front until the summer of 1944 kept oil requirements at manageable levels. In the late summer of 1944, the Allied bombing campaign began belatedly targeting synthetic fuel plants. By the end of the war, the German war machine was running on empty.

The Japanese gained control of the Netherlands East Indies in 1942, but many of the oil facilities had been sabotaged and took time to restore to full production. More importantly, transporting oil from the East Indies to Japan proved increasingly difficult owing to the remarkable success of U.S. submarines in interdicting Japanese shipping. By late 1944, Japan faced serious oil shortages, with crippling military consequences.

With the exception of the jet engine, the major military innovations of World War II—radar, ballistic missiles, and the atomic bomb—were not oil-powered. Nevertheless, oil remained central to the mobility of land, sea, and air forces. Despite the development of nuclear-powered warships (mainly aircraft carriers and submarines), most of the
world's warships remained oil-powered, as did aircraft, armor, and transport. In addition, each new generation of weapons required more oil than its predecessors. Thus, while the advent of the atomic age meant that access to oil would not have been a key factor in a full-scale war between the United States and the Soviet Union, which presumably would have been fought primarily with nuclear weapons and ballistic missiles, such conflicts as the wars in Korea, Vietnam, and the Persian Gulf were fought with conventional, largely oil-powered weapons, thus demonstrating the continued centrality of oil-powered forces, and hence oil, to military power.

Oil's economic importance increased after World War II as the United States intensified its embrace of patterns of socioeconomic organization premised on high levels of oil use, and western Europe and Japan made the transition from coal to oil as their main source of energy. U.S. and world oil consumption skyrocketed in the 1950s and 1960s. Between 1950 and 1972, total world energy consumption increased 179 percent, much faster than population growth, resulting in a doubling of per capita energy consumption. Oil accounted for much of this increase, rising from 29 percent of world energy consumption in 1950 to 46 percent in 1972. By 1973, oil accounted for 47 percent of U.S. energy consumption. Western Europe and Japan were even more dependent on oil for meeting their energy needs; by 1973 oil accounted for 64 percent of west European energy consumption and 80 percent of Japanese energy consumption.

Control of oil played a vital role in establishing and maintaining U.S. preeminence in the postwar international system. Adding to its domestic power base, the United States consolidated its control of world oil in the decade following World War II. By the mid-1950s, U.S. oil companies were firmly entrenched in the great oil-producing areas outside the Soviet Union. Equally, if not more important, the United States, as the dominant power in the Western Hemisphere, controlled access to the region's oil, and the United States alone had the economic and military power to secure Western access to Middle East oil.

The Soviet Union also possessed a powerful domestic oil industry, but despite geographical proximity, extensive efforts, and widespread anti-Western sentiment in Iran and the Arab world, the Soviets failed to achieve a secure foothold in the Persian Gulf and had little impact on the region's oil industry. The Soviets had even less influence over the Western Hemisphere's oil producers. Indeed, the U.S.-led economic boycott of Cuba forced the Soviets to supply the one foothold they possessed in the Western Hemisphere with oil at subsidized prices.

The strong position of the United States in world oil provided multiple advantages. In addition to being central to military power and economic prosperity, control of oil gave the United States leverage over its allies and its former and prospective enemies. U.S. policymakers saw economic growth as essential to preventing the recurrence of the divisive ideological and social conflicts of the interwar years. Soviet expansion into eastern and central Europe as a result of World War II left the Soviet Union in control of almost all of Europe's known indigenous oil reserves as well as important sources of coal in Poland and the Soviet zone of Germany. Making matters worse, postwar western Europe faced a coal shortage of alarming proportions owing to wartime overproduction and destruction and postwar food, transportation, and other problems.

To fuel economic recovery and to prevent western Europe from becoming dependent on the Soviets for energy, the United States sought to ensure that this critical area received the oil it needed. Economic growth, in turn, was crucial to mitigating the divisive class conflicts that had divided European and Japanese society in the first half of the century. Economic growth and prosperity undercut the appeal of leftist parties, financed the welfare state, perpetuated the ascendancy of moderate elites, and sustained the cohesion of the Western alliance. By controlling access to essential oil supplies, the United States was able to reconcile its aim of German and Japanese economic recovery and integration into a Western alliance with that of ensuring against the recurrence of German and Japanese aggression.

Economic growth in western Europe and Japan was central to the containment of Soviet power and influence during the Cold War because it helped prevent these areas from falling to communism through internal processes. Finally, for many years after World War II the Soviets lacked sufficient oil to fight a major war. Hit hard by wartime damage, disruption, transportation problems, equipment shortages, and overuse, Soviet oil production dropped after the war, and the Soviet Union was a net importer of oil (mostly from Romania) until 1954. Exclusion of the Soviets from the Middle East retained oil for Western recovery, and kept the Soviets short of oil. In addition, U.S. and British strategic planners
wanted to keep the Soviets out of the Middle East because the region contained the most defensible locations for launching a strategic air offensive against the Soviet Union in the event of a global war. Throughout the Cold War, ensuring Western access to Middle East oil was a basic objective of U.S. foreign policy.

THE ORIGINS OF U.S. FOREIGN OIL POLICY

Access to foreign oil first emerged as an issue in U.S. foreign policy following World War I, because of the growing importance of oil to modern industrial society and modern warfare, fear of exhaustion of U.S. domestic reserves, and the need of U.S. companies with foreign markets for additional sources of supply. Although U.S. oil production quickly rebounded with several new oil finds, culminating in the discovery of the great East Texas oil field in 1930, increasing the presence of U.S. companies in foreign oil fields allowed U.S. companies to supply their foreign markets from overseas sources. Not only was foreign oil usually cheaper to produce and transport, thus boosting company profits, but utilizing overseas oil to meet foreign demand reduced the potential drain on U.S. reserves.

Rejecting such alternatives as government ownership of oil reserves or the division of the world into exclusive spheres of influence, the United States insisted instead on the Open Door policy of equal opportunity for U.S. oil companies to gain access to foreign oil. A clash with the British over access to Middle East oil was averted when the U.S. government threw its support behind private cooperative arrangements between U.S. and British oil corporations. A multinational consortium, the Iraq Petroleum Company, established in 1928, allowed selected U.S. oil companies access to Iraq's oil along with British and French companies. To ensure that the development of the region's oil took place in a cooperative manner, the consortium agreement contained a self-denying ordinance that prohibited its members from engaging in oil development within the area of the old Ottoman Empire, which was marked on a map with a red line. In addition to the Red Line Agreement, the major British and U.S. oil companies sought to manage the world oil economy through a series of agreements between 1928 and 1934 that allocated markets, fixed prices, eliminated competition, and avoided duplication of facilities.

The U.S. government successfully supported subsequent efforts by other U.S. oil companies to gain concessions in the Middle East. In 1930, Standard Oil of California (SOCAL), which had not been party to the cooperative agreements, obtained a concession on the island of Bahrain, off the coast of Saudi Arabia, and in 1933 obtained extensive concession rights in Saudi Arabia. The Texas Company joined forces with SOCAL in Bahrain and Saudi Arabia in 1936. Meanwhile, Gulf Oil Company, in partnership with Anglo-Persian, had gained access to Kuwait, which was not within the Red Line.

U.S. and British companies also worked together to control Latin American oil. U.S. and British oil companies had been active in Mexico since the turn of the century, drawn by the rich deposits along the Gulf of Mexico coast and the generous terms offered by Mexican dictator Porfirio Díaz. Production continued during the revolution (1910–1920), and Mexico was briefly the world's leading oil exporter during World War I and the early 1920s.

One of the chief goals of the Mexican revolution was to reassert national control over the nation's economic life. The revolutionary constitution of 1917 reserved subsoil rights to the state, leading to almost a decade of conflict with the foreign oil companies, who had convinced Díaz to go against Spanish law and grant them ownership of subsoil rights. Private ownership of subsoil rights would make it difficult for Mexico to share in the profits generated by oil exports since the oil companies, as owners of the oil, would not have to pay royalties to the Mexican government. Although the United States and Mexico were able to work out a compromise that protected the position of companies already operating in Mexico, Mexican oil production declined sharply during the 1920s as the major oil companies remained concerned over the course of the revolution and shifted their investment to Venezuela. By the eve of World War II, Venezuela had become the third leading oil producer in the world and the leading exporter.

In March 1938, a labor dispute between the major oil companies and Mexican oil workers resulted in government intervention and the nationalization of the main U.S. and British oil companies operating in Mexico. Not only did the companies lose their properties, but henceforth foreign capital was denied access to a basic sector of the Mexican economy. Moreover, the resource in question was an exportable commodity in great
demand by the developed countries. Thus, the Mexican action challenged not only the position of the international oil companies but also the role of multinational corporations in the economic development of what would become known as the Third World.

The oil companies reacted strongly to nationalization, instituting a boycott of Mexican oil and pressuring oil equipment manufacturers not to sell equipment to Pemex, the state-owned oil company that took over the nationalized properties. Concerned about the impact of nationalization on U.S. investment abroad, the Department of State supported the companies’ demands for full and immediate compensation. Although President Franklin D. Roosevelt softened “immediate” compensation to “prompt,” Mexico could only raise the funds to pay compensation through the long-term operation of the industry. Since the companies, with the support of the U.S. government, were working to prevent Mexico from selling its oil abroad, the demand for full and prompt compensation amounted to denying Mexico the means of carrying out nationalization.

The Mexicans refused to give in, however, and Pemex turned to Germany, Italy, and Japan for markets and equipment. In addition to oil, U.S. economic interests in Mexico included mining, ranching, and manufacturing firms, and the worsening international situation provided further impetus for a shift in U.S. strategy. In November 1941, with war imminent, the U.S. government reached agreement with Mexico on compensation. Contrary to the views of some scholars, the settlement of the oil controversy did not constitute acceptance of nationalization or abandonment of the oil companies. The U.S. government remained opposed to nationalization and viewed settlement of the compensation issue not only as necessary to ensure Mexico’s cooperation in international affairs but also as a way to keep the door open for U.S. companies to return to Mexico in the future. The agreement was limited to the issue of compensation for the expropriated properties and was significantly silent on the question of the future status of foreign participation in the Mexican oil industry. For the rest of the 1940s, the United States sought, albeit unsuccessfully, to convince the Mexican government to reverse nationalization.

Concerned not to repeat the Mexican experience, the U.S. government played a major role in facilitating a settlement between the Venezuelan government and the major oil companies that resulted in a fifty-fifty profit-sharing agreement in early 1943. Although some scholars see the oil settlement as evidence of the subordination of the interests of U.S. corporations to larger foreign policy goals, those goals and the interests of the U.S. oil companies involved did not conflict but were complementary. Both aimed at ensuring the continuation of the companies’ control and continued U.S. and British access to Venezuelan oil. In addition to profit sharing, the settlement included confirmation of the companies’ existing concession rights, their extension for forty years, and the opening of new areas to the companies. Venezuelan oil production increased substantially, and Venezuelan oil played an important role in fueling the British and U.S. war efforts.

Although the United States was able to fuel its own war effort and that of its allies from domestic oil production during World War II, the increased consumption strained U.S. oil reserves. The possibility of running short of oil led to concerns over the long-term adequacy of U.S. reserves. Policymakers in the U.S. government soon focused their attention on the Middle East, especially on Saudi Arabia. The Middle East not only contained one-third of the world’s known reserves; it also offered better geological prospects for the discovery of additional reserves than any other area.

Believing that government ownership was necessary to protect the national interest and to ensure public support for whatever measures might be necessary to secure access to Saudi Arabia’s oil, the Roosevelt administration contemplated creating a government-owned national oil company to take over the concession rights in Saudi Arabia held by the Arabian American Oil Company (ARAMCO), a jointly owned subsidiary of Standard Oil of California and the Texas Company. It also proposed having the U.S. government construct and own an oil pipeline stretching from the Persian Gulf to the Mediterranean as a means of demonstrating and securing the U.S. stake in Middle East oil. By war’s end, the U.S. government had also worked out the text of an oil agreement with Great Britain that called for guarantees of existing concessions, equality of opportunity to compete for new concessions, and a binational petroleum commission to allocate production among the various producing countries in order to integrate Middle East oil into world markets with minimal disruption. Expansion of Middle East production would enhance U.S. security by reducing the drain on U.S. and other Western Hemisphere reserves.
Divisions within the U.S. oil industry, coupled with the strong ideological opposition of American business and politicians to government involvement in corporate affairs, derailed these initiatives. In the case of the plan to purchase ARAMCO, the company's owners, while willing to accept some government involvement to secure their position and provide capital for further development of their potentially rich concession, were not willing to sell out entirely. The rest of the oil industry, ideologically and pragmatically opposed to government involvement in corporate affairs, vigorously opposed the plan, forcing its abandonment.

Similarly, while the companies that would benefit from the proposed pipeline supported the plan, the other major oil companies opposed it because it would give their competitors significant advantages. Domestic producers, fearing that the pipeline would allow Middle East oil to push Venezuelan oil from European markets into the United States, also opposed the plan. Congress, increasingly conservative and ever receptive to appeals cast in terms of defense of free enterprise, joined the opponents to defeat the pipeline plan.

The Anglo-American Oil Agreement was compatible with the interests of the major U.S. oil companies. All the U.S. majors held concessions in the Middle East, and all initially believed that an international allocation mechanism was needed to assimilate growing Middle East production without disrupting markets. The domestic oil industry, on the other hand, had worked out a system of production control in the 1930s, which protected the interests of smaller companies. Domestic producers feared that the proposed petroleum commission would allow cheap foreign oil to flood the U.S. market. While the U.S. government had no intention of destroying the domestic oil industry, it did intend to use the proposed commission to increase Middle East oil production and conserve U.S. oil supplies for future defense needs. The concerns of the independent oil companies were heard in Congress, and the Anglo-American Oil Agreement never came to a vote.

The only foreign oil policy on which all segments of the industry could agree was that the government should limit its involvement in foreign oil matters to providing and maintaining an international environment in which private enterprise could operate with security and profit. Thus, in the end, the United States, as it had in the 1920s, turned to the major oil companies to secure the national interest in foreign sources of oil. Even though oil industry divisions limited some types of government assistance to the major oil companies, reliance on the major oil companies as vehicles of the national interest in foreign oil enhanced the influence of the oil industry and facilitated control of the world oil economy by the most powerful private interests.

In a series of private deals in 1946 and 1947, the major U.S. oil companies managed to secure their position in the Middle East by joining forces with each other and their British counterparts. The centerpiece of the so-called "great oil deals" was the expansion of ARAMCO's ownership to include Standard Oil of New Jersey and Socony-Vacuum. The result was a private system of worldwide production management that facilitated the development of Middle East oil and its integration into world markets, thus reducing the drain on Western Hemisphere reserves. To help consolidate this system, the U.S. government supported fifty-fifty profit-sharing arrangements between the major oil companies and host governments. Owing to provisions in the U.S. tax code granting U.S. corporations credits for taxes paid overseas, this solution to host-country demands for higher revenues transferred the cost of higher payments from the oil companies to the U.S. Treasury.

Utilizing private oil companies as vehicles of the national interest in foreign oil did not mean that the government had no role to play. On the contrary, the policy required the United States to take an active interest in the security and stability of the Middle East. This was especially the case in Iran, where fear of Soviet expansion and determination to maintain access to the region's resources transformed U.S. policy from relative indifference to deep concern for Iranian independence and territorial integrity. To secure Iran's role as a buffer between the Soviet Union and the oil fields of the Persian Gulf, the United States provided economic and military assistance and gradually assumed Britain's role as a barrier to the expansion of Russian influence in the Middle East. U.S. support came at a price, however. During this period, the United States began looking to the shah of Iran as the main guarantor of Western interests in Iran. U.S. support for the shah and the Iranian military was crucial to the young shah in his struggle with internal rivals for power.

Although mention of oil was deliberately deleted from President Harry Truman's address, the Truman Doctrine (1947), with its call for the
global containment of communism, provided a political basis for an active U.S. role in maintaining the security and stability of the Middle East. The Marshall Plan also helped solidify the U.S. position in the region by providing dollars for western Europe to buy oil produced by U.S. companies from their holdings in the Middle East. Fully 10 percent of Marshall Plan aid went to finance oil imports.

U.S. support for a Jewish homeland in Palestine complicated but did not nullify U.S. efforts to maintain access to Middle East oil. The apparent conflict between U.S. economic and strategic interests in Middle East oil on one hand, and its emotional support for a Jewish homeland in Palestine on the other, led the United States to follow a policy of minimal involvement. Although the United States voted for the United Nations resolution calling for the creation of Israel in November 1947 and recognized the new country immediately in May 1948, it refrained from sending troops, arms, or extensive economic assistance to enforce the UN decision for fear of alienating the Arab states and providing an opening for Soviet influence in the Middle East. Ironically, the Palestine problem enhanced the status of the major oil companies as vehicles of the national interest in Middle East oil. While official relations with the Arab states suffered somewhat because of U.S. support for Israel, the oil companies managed to maintain a degree of distance from government policy and thus escaped the burden of Arab displeasure. On the other hand, failure to enforce the UN decision led to the issue being decided through arms, with results that still haunt the region.

The policy of public support for private control of the world’s oil reinforced traditional U.S. opposition to economic nationalism, especially when it affected U.S. companies and threatened to reduce oil production for export to world markets. U.S. security interests called for the rapid and extensive development of Mexico’s nearby reserves, but U.S. assistance to Mexico to achieve that goal could be seen as a reward for nationalization and thus encourage other nations to take over their oil industries. Unable to convince the Mexican government to reverse nationalization, the United States maintained its policy of providing no assistance to Pemex, and, as it had before the war, focused instead on Venezuela. Although

### The History of Oil and Foreign Policy

The history of oil and foreign policy provides many examples of the links between the internal organization of the United States and its external behavior. Oil and the automobile have been potent symbols of the American way of life since the second decade of the twentieth century, and American popular culture has come to equate the private automobile and personal mobility with individual freedom. Thus, when it became clear in the 1940s that U.S. domestic oil production would soon no longer be able to meet domestic demand, American leaders looked abroad for additional sources of oil. The alternative of reducing, or at least slowing, the growth of rapidly rising consumption was not considered.

Remarks by Secretary of Defense James Forrestal in early January 1948 illustrate this tendency to look to external expansion to solve internal problems rather than confronting them directly. Meeting with the head of the Socony-Vacuum Oil Company to discuss the impact of turmoil over Palestine on access to Middle East oil, Forrestal stated that he “was deeply concerned about the future supply of oil for this country, not merely for the possible use in war but for the needs of peace.” He then warned that unless we had access to Middle East oil, American motorcar companies would have to design a four-cylinder motorcar sometime within the next five years. Annual per capita oil consumption in the United States in 1948 was 14.4 barrels. Had U.S. public policy, through the preservation of public transportation, the promotion of efficiency, and other measures (including four-cylinder motorcars), maintained this level of oil use, the United States would have consumed significantly less oil over the following half century, with consequent benefits for the environment, the quality of life, and U.S. oil security. Instead, U.S. oil consumption climbed steadily, reaching an annual per capita level of 31 barrels in 1978. Although it declined sharply for a brief period in the early 1980s, annual per capita oil consumption soon renewed its upward trend, reaching 26.1 barrels in 1999.

Oil and the American Way of Life

The history of oil and foreign policy provides many examples of the links between the internal organization of the United States and its external behavior. Oil and the automobile have been potent symbols of the American way of life since the second decade of the twentieth century, and American popular culture has come to equate the private automobile and personal mobility with individual freedom. Thus, when it became clear in the 1940s that U.S. domestic oil production would soon no longer be able to meet domestic demand, American leaders looked abroad for additional sources of oil. Oil and the American Way of Life

The history of oil and foreign policy provides many examples of the links between the internal organization of the United States and its external behavior. Oil and the automobile have been potent symbols of the American way of life since the second decade of the twentieth century, and American popular culture has come to equate the private automobile and personal mobility with individual freedom. Thus, when it became clear in the 1940s that U.S. domestic oil production would soon no longer be able to meet domestic demand, American leaders looked abroad for additional sources of oil. The alternative of reducing, or at least slowing, the growth of rapidly rising consumption was not considered.

Remarks by Secretary of Defense James Forrestal in early January 1948 illustrate this tendency to look to external expansion to solve internal problems rather than confronting them directly. Meeting with the head of the Socony-Vacuum Oil Company to discuss the impact of turmoil over Palestine on access to Middle East oil, Forrestal stated that he “was deeply concerned about the future supply of oil for this country, not merely for the possible use in war but for the needs of peace.” He then warned that unless we had access to Middle East oil, American motorcar companies would have to design a four-cylinder motorcar sometime within the next five years. Annual per capita oil consumption in the United States in 1948 was 14.4 barrels. Had U.S. public policy, through the preservation of public transportation, the promotion of efficiency, and other measures (including four-cylinder motorcars), maintained this level of oil use, the United States would have consumed significantly less oil over the following half century, with consequent benefits for the environment, the quality of life, and U.S. oil security. Instead, U.S. oil consumption climbed steadily, reaching an annual per capita level of 31 barrels in 1978. Although it declined sharply for a brief period in the early 1980s, annual per capita oil consumption soon renewed its upward trend, reaching 26.1 barrels in 1999.
willing to work with the nationalist government that ruled Venezuela between 1945 and 1948 as long as it did not challenge corporate control of the oil industry, the United States stood by when the democratically elected government was ousted in a November 1948 military coup, and worked closely with the brutal dictatorship that ruled Venezuela for the next decade.

The Truman administration also sought a solution to the problem of oil security by undertaking a large-scale program of synthetic fuel production as a way of obtaining oil from domestic sources. Synthetic fuel production required massive amounts of steel, produced millions of tons of waste products, and cost more than natural petroleum. Although a potential boon to the ailing coal industry, the oil industry opposed the development of competition at public expense, and convinced the Eisenhower administration to cancel the government's synthetic fuel program in 1954.

The U.S. response to the nationalization of the Iranian oil industry highlighted the main elements of U.S. foreign oil policy—opposition to economic nationalism, an activist role in maintaining the stability and Western orientation of the Middle East, and public support for and non-intervention in the operations of the major oil industry. The Iranian crisis of 1951–1954 grew out of Iran's nationalization of the British-owned Anglo-Iranian Oil Company (AIOC) in the spring of 1951. AIOC's Iranian operations were Britain's most valuable overseas asset, and the British feared that if Iran succeeded in taking over the company all of Britain's overseas investments would be jeopardized. Although the United States shared British concerns about the impact of nationalization on foreign investment, it also feared that British use of force to reverse nationalization could result in turmoil in Iran that could undercut the position of the shah, boost the prospects of the pro-Soviet Tudeh party, and might even result in intervention by the Soviets at Iranian invitation. The crisis broke out in the midst of the Korean War, making U.S. policymakers extremely reluctant to risk another confrontation. Therefore, the United States urged the British to try to reach a negotiated settlement that preserved as much of their position as possible. The British, however, preferred to stand on their rights and force Iran to give in by organizing an international boycott of Iranian oil and attempting to manipulate Iranian politics.

U.S. efforts to mediate a settlement failed, as did less public attempts to convince the shah to remove nationalist Prime Minister Mohammad Mossadeq. By 1953 the oil boycott had sharply reduced Iran's export earnings and decimated government revenues, and British and U.S. involvement in Iranian internal affairs had exacerbated the polarization of Iranian politics. Moreover, the end of the Korean War and the completion of the U.S. military buildup allowed a more aggressive posture toward Iran. Fearing that Mossadeq might displace the shah and that Tudeh influence was increasing, the United States and Britain organized, financed, and directed a coup that removed Mossadeq and installed a government willing to reach an oil settlement on Western terms.

Following the coup, the United States enlisted the major U.S. oil companies in an international consortium to run Iran's oil industry. Cooperation of all the majors was necessary in order to fit Iranian oil, which had been shut out of world markets during the crisis, back into world markets without disruptive price wars and destabilizing cutbacks in other oil-producing countries. The antitrust exemption required for this strategy undercut efforts by the Department of Justice to challenge the major oil companies' control of the world oil industry on antitrust grounds and strengthened the hand of the major oil companies, whose cooperation was needed to ensure Western access to the region's oil.

The U.S. role in the coup and the subsequent inclusion of U.S. oil companies in the Iranian consortium mark important milestones in the gradual process by which the United States replaced Great Britain as the main guardian of Western interests in the Middle East. The experience also reinforced the U.S. tendency to see the shah as the best guarantor of Western interests in Iran. U.S. security and economic assistance helped the shah establish a royal dictatorship, ending the progress Iran had been making toward more representative government. Iranian nationalism, in turn, veered from liberalism and secularism, laying the groundwork for the fundamental rupture in Iranian-American relations that followed the Iranian revolution of 1978–1979. Finally, the short-term success of the Iranian model of covert intervention influenced subsequent U.S. actions in the Middle East, Latin America, and Asia.

**COPING WITH CHANGE**

With Mossadeq's fate serving as a warning to those who might challenge the international oil
companies and their sponsors, the 1950s and 1960s were the golden age of the postwar oil regime. At the peak of their influence in the 1950s, the seven major oil companies controlled over 90 percent of the oil reserves and accounted for almost 90 percent of oil production outside the United States, Mexico, and the centrally planned economies. Moreover, they owned almost 75 percent of world refining capacity and provided around 90 percent of the oil traded in international markets.

Despite these strengths, the system contained the seeds of its own demise. The Iranian crisis demonstrated that threats to Western access to Middle East oil could come from within the region. Although the United States did not rule out the possibility of Soviet military intervention in the Middle East, U.S. threat assessments increasingly focused on the decline of British power, instability within the countries of the region, the anti-Western cast of Middle Eastern nationalism, and turmoil resulting from the Arab-Israeli conflict.

The Suez crisis grew out of the nationalization of the British- and French-owned Suez Canal Company by Egyptian nationalist leader Gamal Abdel Nasser in July 1956. The Suez Canal was an important symbol of the Western presence in the Middle East and a major artery of international trade; two-thirds of the oil that went from the Persian Gulf to western Europe traveled through the canal. Viewing Nasser’s action as an intolerable challenge to their position in the region, the British, together with the French, who resented Nasser’s support for the Algerian revolution, and the Israelis, who felt threatened by Egyptian support for guerrilla attacks on their territory, developed a complex scheme to recapture control of the canal and topple Nasser through military action.

The plan, which they put into action in late October, depended on U.S. acquiescence and cooperation in supplying them with oil if the canal were closed. The Egyptians closed the canal by sinking ships in it. In addition, Saudi Arabia embargoed oil shipments to Britain and France, and Syria shut down the oil pipeline from Iraq to the Mediterranean. Incensed by his allies’ deception, concerned about the impact of their actions on the Western position in the Middle East, and embarrassed by the timing of the attack—just before the U.S. presidential election and in the midst of the Soviet suppression of the Hungarian revolt—President Dwight D. Eisenhower put pressure on the British, French, and Israelis to withdraw. The United States refused to provide Britain and France with oil, blocked British attempts to stave off a run on the pound, and threatened to cut off economic aid to Israel. The pressure worked. Following the withdrawal of Anglo-French forces, the U.S. government and the major oil companies cooperated to supply Europe with oil until the canal was reopened and oil shipments from the Middle East to Europe were restored.

In the wake of the Suez crisis, President Eisenhower pledged to protect Middle East states from the Soviet Union and its regional and local allies. In addition, the United States sought to bolster its friends in the region through economic and military assistance. With the exception of Lebanon, where fourteen thousand U.S. troops landed in July 1958 to shore up a pro-Western regime, most of these friends were authoritarian monarchies, demonstrating that despite its rhetoric about democracy, the United States was primarily interested in access to oil. Israel presented the United States with an additional dilemma. On one hand, it was pro-Western and militarily the most powerful country in the region. On the other hand, U.S. support for Israel was a major irritant in relations with the Arab states of the Middle East, including the key oil-producing countries in the Persian Gulf.

The Suez crisis highlighted the growing importance of Middle East oil for western Europe. During the 1950s and the first half of the 1960s, the United States was capable of supplying its oil needs from domestic sources, and Middle East oil went mainly to western Europe and Japan. Some Middle East oil made its way into the United States, and, more importantly, Middle East oil displaced Venezuelan oil from European markets and led to an increase in U.S. oil imports with consequent pressure on prices and high-cost domestic producers.

The question of oil imports presented U.S. policymakers with a strategic dilemma. If what would be needed in an emergency was a rapid increase in production, oil in the ground was of little use, and even proved reserves would not be particularly helpful. The need could only be filled by spare productive capacity. Too high a level of imports would undercut such capacity by driving out all but the lowest cost producers. Moreover, reliance on imports, especially from the Middle East, was risky from a security standpoint because of the chronic instability of the region and its vulnerability to Soviet attack. However, restricting
imports and encouraging the increased use of a nonrenewable resource would eventually undermine the goal of maintaining spare productive capacity and preserving a national defense reserve.

Rising oil imports led to demands by domestic producers and the coal industry for protection against cheaper foreign oil. In contrast, the President's Materials Policy Commission, appointed by President Truman in January 1951 and headed by the chairman of the Columbia Broadcasting System, William S. Paley, had called for a policy of ensuring access to the lowest cost sources of supply wherever located. The commission's report, issued in June 1952, rejected national self-sufficiency in favor of interdependence, arguing that the United States had to be concerned about the needs of its allies for imported raw materials and about the needs of pro-Western less developed countries for markets for their products. Although the commission admitted that self-sufficiency in oil and other vital raw materials was possible, it argued that it would be very expensive, that the controls necessary to make it possible would interfere with trade, that it would undercut the goal of rebuilding and integrating western Europe and Japan under U.S. auspices, and that it would increase instability in the Third World by limiting export earnings.

Nevertheless, after attempts to implement voluntary oil import restrictions failed, the Eisenhower administration, in March 1959, imposed mandatory import quotas, with preferences given to Western Hemisphere sources. Although the Mandatory Oil Import Program (MOIP) seemed to be a victory for advocates of national self-sufficiency, the result, ironically, was to make the United States more dependent on oil imports in the long run because the restrictions meant that increases in U.S. consumption were met mainly by domestic production.

High levels of oil use were built into the U.S. economy in several ways. Following World War II, the U.S. transportation sector was transformed as automobiles, trucks, buses, airplanes, and diesel-powered locomotives replaced steam and electric-powered modes of transportation. Between 1945 and 1973, U.S. car registrations increased from 25 million to over 100 million, and per capita gasoline consumption in the same period skyrocketed as fuel efficiency fell and gas-guzzling car models grew more popular. Neglect of public transportation and dispersed housing patterns fostered by increasing suburbanization further fueled increased automobile use. In addition, the nation's truck population grew from 6 million in 1945 to around 21 million in 1973, and trucks increased their share of intercity freight traffic from 16 percent in 1950 to 21 percent in 1970.

Public policy aided and abetted these changes. Since the early 1930s, the so-called highway lobby had been promoting public expenditures for highway construction. Between 1956 and 1970, the federal government spent approximately $70 billion on highways, as contrasted with less than $1 billion on rail transit.

The dramatic rise in U.S. oil consumption, coupled with a shift in investment to more profitable overseas areas, decimated the U.S. reserve position. By 1965, the U.S. share of world production had fallen to about a quarter and by 1972 to a fifth. The U.S. share of world oil reserves declined even more drastically, from around 46 percent on the eve of World War II to a little more than 6 percent in 1972. With U.S. oil consumption continuing to climb, domestic production was no longer able to meet demand, and oil imports rose from 9 percent of U.S. consumption in 1954 to 36 percent by 1973.

U.S. oil import restrictions also put downward pressure on world oil prices by limiting U.S. demand for foreign oil. Beginning in the mid-1950s, increasing numbers of smaller, mostly U.S.-owned companies challenged the majors' control over the world oil economy by obtaining concessions in Venezuela, the Middle East, and North Africa. Drawn by the lure of high profits, aided by the increasing standardization and diffusion of basic technology and the security provided by the Pax Americana, and unconcerned about reducing the generous profit margins available in international markets, the newcomers cut prices in order to sell their oil. Pressure from the production of these companies, coupled with the reentry of Soviet oil into world markets in the late 1950s, exerted a steady downward pressure on world oil prices.

Declining oil prices led to a resurgence of economic nationalism in the producing countries, whose incomes were reduced. In September 1960, following cuts in posted prices (the price on which government revenues were calculated) by the major oil companies, the oil ministers of Iran, Iraq, Kuwait, Saudi Arabia, and Venezuela met in Baghdad and formed the Organization of the Petroleum Exporting Countries. OPEC was able to prevent further declines in posted prices, and a strong increase in world demand in the 1960s allowed the companies to increase production,
thereby maintaining their overall level of profits. As new sources of African production entered the market later in the decade, however, market prices resumed their downward trend.

Despite falling prices, the spectacular increases in oil consumption enhanced the position of Middle East oil in the world oil economy. At the same time the U.S. oil position was eroding, the Middle East and North Africa were becoming the center of the world oil industry. By 1972 these areas accounted for 41 percent of world oil production and contained almost two-thirds of the world’s proved reserves. Reacting to the changing circumstances, the region’s oil producers, along with other OPEC members, began to pressure the oil companies to gain control of pricing and production decisions.

The profound political, economic, and strategic consequences of the U.S. involvement in the Vietnam War and the overall course of the Cold War reinforced the geological and economic factors that gave Middle East oil increased importance. By the early 1970s, the Soviet Union had achieved rough strategic parity with the United States, which raised the risks involved in U.S. intervention in the Middle East. Moreover, in the midst of the Vietnam War, the British decided to end their military commitments “east of Suez.” To make matters worse, U.S. relations with the Arab oil producers, including Saudi Arabia, were becoming increasingly strained owing to U.S. support for Israel following the 1967 Arab-Israeli war, which left most of Palestine under Israeli control.

When the United States moved to airlift arms to Israel during the 1973 Arab-Israeli War, the Arab members of OPEC imposed an embargo on oil shipments to the United States and the Netherlands and reduced shipments to other countries, depending on their position in the Arab-Israeli dispute. The oil companies carried out the embargo, though they undercut its political purpose by shifting non-Arab oil to the embargoed countries and distributing the cutbacks so that both embargoed and nonembargoed countries had their oil imports cut by about 15 percent. Arab OPEC members unilaterally raised the price of oil by 70 percent in October, and by December the price had quadrupled from its level before the embargo. Although Iran and other non-Arab OPEC members did not join the embargo and cut back production and exports, they were happy to go along with the price increases spurred by the embargo and production cutbacks.

Differences among the United States and its allies on higher oil prices and on the Arab-Israeli conflict undercut attempts at a unified response to the embargo. Although there was some tough talk about military action to regain control of the Middle East oil fields, the reality of the Cold War and fears during the Gulf War of 1991 (later borne out), that use of force would lead to the destruction of the oil fields, prevented such action. U.S. allies, noting that higher international oil prices could provide the United States, which was much less dependent on imported oil than they were, with a means of reversing the decline in its share of world production, doubted the U.S. commitment to lowering oil prices, further complicating a unified response.

The United States sought to salvage the old oil order by organizing the Western consuming nations in a united front against OPEC. In February 1974 the U.S.-initiated Washington Energy Conference laid the groundwork for the establishment later in the year of the International Energy Agency. The IEA called on member states to reduce their reliance on Middle East oil by diversifying their sources of energy and adopting policies promoting reductions in oil consumption.

The United States also moved to shore up its position with the oil-producing countries. In 1969, President Richard Nixon had announced that the United States could no longer intervene directly in all parts of the world, but rather would rely on regional allies, which it would provide with arms and other assistance to carry out their tasks. In the Middle East, the United States looked to Iran and Saudi Arabia as the “twin pillars” of pro-Western stability in the region, and rewarded the two monarchies with almost unlimited access to the latest U.S. military equipment. Between 1970 and 1978, for example, the United States sold Iran over $20 billion worth of military equipment and training. The United States also provided massive military and economic assistance to Israel following the 1973 war, viewing the Jewish state as a strategic asset and counter to Soviet client-states such as Syria and Iraq. Egypt (after 1973) and Turkey also received large amounts of U.S. aid.

The Arab oil embargo had a major economic impact. Higher oil prices intensified the economic problems faced by the United States and the other Western industrial countries in the 1970s, especially inflation, which was now accompanied by stagnation and increased unemployment. Non-oil-producing developing countries were
also hit hard as they had to pay higher prices for products from the developed countries as well as for oil. Many countries borrowed large sums from Western banks to cover their costs, a move that contributed to the Third World debt crisis of the 1980s when the United States sharply raised interest rates in late 1979.

In contrast, higher prices enabled the Soviets, who were in the process of developing new oil and gas fields in Siberia, to increase their export earnings. While allowing the Soviets to import large amounts of Western grain and machinery, most of the exports came from new areas east of the Urals, and the cost of developing the necessary transportation infrastructure drained scarce capital from other sectors of the economy. Oil earnings also tended to mask the Soviet Union’s increasingly severe economic problems and to reduce incentives for undertaking sorely needed structural reforms. The oil crisis may also have contributed to Soviet decisions to increase their involvement in the Third World in the 1970s, decisions that proved costly not only in terms of resources but also in their negative impact on détente.

The first oil shock also accelerated efforts by oil-producing countries to gain control of their oil industries. While the timing and extent of nationalization differed, most OPEC nations effectively nationalized their oil industries during the 1970s. The equity participation of the international oil companies in OPEC production fell from about 94 percent in 1970 to about 12 percent in 1981. Although they lost control of production and their ability to set prices, the major oil companies received generous compensation. In most cases, the companies maintained access to the oil they had previously owned through long-term contracts and were retained to manage the newly nationalized industries. Moreover, higher oil prices provided the major oil companies with windfall profits, easing the pain of losing formal control of their concessions.

Because it was both a major oil producer as well as the leading oil consumer, higher oil prices posed a dilemma for the United States. On one hand, higher prices could provide U.S. domestic producers with incentives for increased exploration and development, making the nation more self-sufficient in oil. On the other hand, higher prices fed inflation and slowed economic growth. The fact that the oil companies profited from higher oil prices and oil shortages prompted suspicions that the companies had colluded with OPEC to produce such an outcome. These suspicions made it impossible for the U.S. government to remove oil price controls, initially imposed in August 1971 as part of a larger package of wage and price controls. Although lower domestic oil prices lessened the impact of the rise in international oil prices on the U.S. economy, they also encouraged consumption and led to increased demand being met mainly by imported oil. When the second oil shock hit in 1979, the United States was more dependent on oil imports than in 1973.

The overthrow of the shah of Iran in early 1979 provoked this second oil shock, disrupting markets and causing prices to double. The fall of the shah and fears of internal unrest in Saudi Arabia convinced U.S. policymakers that the previous policy of reliance on regional surrogates to guard Western interests in the Middle East was no longer viable. While Israel was useful to counter Soviet clients, too great a reliance on Israel could prove counterproductive by alienating the Arab states. Therefore, the United States began to explore the possibility of introducing U.S. military forces into the region. These plans received a boost from the Soviet intervention in Afghanistan in December 1979, which revived fears of direct Soviet encroachment in the region. In addition, the United States was concerned that Soviet and Cuban involvement in the Horn of Africa, an area in the northeast part of the continent close to the Middle East, could threaten Western access to Middle East oil.

The prospect of losing access to Middle East oil led President James Earl Carter to announce in January 1980 that “an attempt by any outside force to gain control of the Persian Gulf region will be regarded as an assault on the vital interests of the United States of America, and such assault will be repelled by any means necessary, including military force.” The Carter administration followed up soon thereafter with steps to create the long-discussed rapid deployment forces for possible use in the region. Planned from the time of the collapse of the shah’s regime, the move reflected U.S. belief that local forces were not sufficient to protect Western interests in the Middle East from either Soviet aggression or internal instability. The Carter administration also sought to strengthen the “special relationship” between the United States and Saudi Arabia by continuing to sell sophisticated arms to the desert kingdom and by allowing the Saudis to buy massive amounts of U.S. Treasury securities outside normal channels.

The administration of Ronald Reagan (1981–1989) built on these initiatives, forging a
foreign oil policy based on market forces and military power. Reagan began by ending oil price controls, allowing U.S. prices to rise to international levels in the hope that this would provide incentives to domestic producers and spur conservation. The Reagan administration continued the buildup of U.S. forces in the Middle East, transforming the Rapid Deployment Force into the Central Command. The Reagan administration also stressed close relations with Saudi Arabia, and worked with the Saudis and other conservative Persian Gulf producers to drive down international oil prices. Lower oil prices would not only help Western consumers but would also cut Soviet oil earnings. Finally, the United States began filling the Strategic Petroleum Reserve (SPR), established in 1977 to reduce the nation’s vulnerability to oil supply interruptions. By 1990 the SPR held almost 600 million barrels of oil, somewhere between eighty and ninety days of net oil imports at then prevailing import levels. The other industrial nations also built up similar, and in some cases higher, levels of strategic reserves. Strategic reserves, although expensive to create and maintain, functioned as a substitute for the spare production capacity that the United States had once possessed.

Higher oil prices worked their way through the economies of the Western industrial nations and Japan to encourage significant increases in energy efficiency. The amount of energy required to produce a dollar of real gross national product declined 26 percent between 1972 and 1986. The gains in efficiency in oil use were even more dramatic: by 1990, 40 percent less oil was used in producing a dollar of real GNP than in 1973. As a result, by 1990 oil played a less significant role in the economies of the Western industrial nations than it had before the two oil shocks of the 1970s.

Higher oil prices also encouraged consumers to switch to other energy sources. While the use of coal and nuclear power increased, both turned out to have significant drawbacks, particularly those relating to the environment, and neither addressed the transportation sector, which accounted for the bulk of oil use. Although U.S. automobile fuel efficiency almost doubled between 1970 and 1990, this gain was partly eroded by a 40 percent rise in total motor vehicle use in the same period. In addition, the number of trucks on U.S. roads tripled between 1970 and 1990, and their fuel consumption doubled.

Higher oil prices also encouraged the development of alternative sources of oil. With higher prices and improving technologies of exploration and development, new sources of oil came on line in Alaska, Mexico, the North Sea, and the Soviet Union. U.S. production increased only briefly, however, and soon leveled off at around seven million barrels a day. Middle East oil production, which had accounted for 41 percent of world output in 1973 and 37 percent in 1977, fell to 19 percent by 1985. In 1986, with supply increasing and demand dropping, oil prices collapsed.

The collapse of oil prices provided a boost to Western economies but it also decimated the U.S. domestic oil industry, forcing the closure of high-cost wells. All producers experienced huge declines in export earnings. The Soviet Union was especially hard hit, and the collapse of oil earnings undercut Soviet leader Mikhail Gorbachev’s hopes to use oil revenues to cushion the shock of economic reform. By the end of the decade, the Soviet oil industry was suffering from the same problems affecting the nation as a whole, and production and exports declined sharply.

Although lower prices led to increased demand for oil, producers in the Middle East captured most of the increase because they controlled the lowest cost fields. By 1990, oil imports were making up nearly half of U.S. oil supply, around 70 percent of western Europe’s oil supply, and over 90 percent of Japan’s oil supply; and 25 percent of U.S. imports, 41 percent of western Europe’s imports, and 68 percent of Japan’s imports originated in the Middle East.

Nevertheless, after rising sharply in the aftermath of the Iraqi invasion of Kuwait in August 1990, oil prices soon returned to preinvasion levels. The IEA contributed to stability by calling on member countries to make simultaneous use of their respective stockpiles. The success of U.S. diplomacy and military forces in the 1991 Gulf War demonstrated that with the end of the Cold War and the resulting retreat of the Soviet Union from a world role, the ability of the United States to intervene in the Middle East had increased significantly.

Low prices prevailed throughout most of the 1990s despite Iraq’s exclusion from world oil markets. Russian oil exports recovered owing to Russia’s need for export earnings and the drastic drop in domestic demand because of widespread deindustrialization. The Asian financial crisis of 1997 also kept demand down despite China’s increasing imports. In the United States, lower oil prices led to increased consumption, as the number of private motor vehicles, especially gas-guzzling sport-utility vehicles and light trucks, continued
to climb. By the end of the decade, the fuel efficiency gains of the 1980s had been lost. Rising consumption and OPEC production cuts led to sharp price increases in 2000 and 2001. What happened in the 1990s may foreshadow a pattern whereby lower prices lead to greater consumption which leads to higher prices which lead to lower consumption which leads to lower prices and the repeat of the cycle. Thus, a foreign oil policy based on market forces and military power has its own set of problems.

THE POLITICAL ECONOMY OF FOREIGN OIL POLICY

Oil has been unique as a vital resource owing to its pervasiveness in the civilian economy and its continuing centrality to military power, and maintaining access to the great oil-producing areas of the world has been a key goal of U.S. foreign policy since World War I. The objective of maintaining access to economically vital overseas areas resonated with the global conception of U.S. national security interests that emerged during World War II and dominated U.S. policy throughout the Cold War. U.S. leaders sought to prevent any power or coalition of powers from dominating Europe and/or Asia, to maintain U.S. strategic supremacy, to fashion an international economic environment open to U.S. trade and investment, and to maintain the integration of the Third World in the world economy.

Control of oil helped the United States contain the Soviet Union, end destructive political, economic, and military competition among the core capitalist states, mitigate class conflict within the capitalist core by promoting economic growth, and retain access to the raw materials, markets, and labor of the periphery in an era of decolonization and national liberation. Moreover, the strategic forces necessary for maintaining access to overseas oil were fungible; that is, they could, and were, used for other purposes in other parts of the world. Likewise, as the Gulf War demonstrated, strategic forces from other parts of the world could be used to help maintain access to oil. Thus, there has been a symbiotic relationship between maintaining power projection capabilities in general and relying on strategic forces to maintain access to overseas oil. In short, control of oil has been a key component of American hegemony.

While national security concerns have been an important source of foreign oil policy, definitions of national security and national interest have not been shaped in isolation from the nature of the society they were designed to defend. Arguments that claim a noncapitalist United States would have followed the same policies, even when sincere, assume no changes in domestic economic, social, and political structures, and thus miss the point entirely. They also ignore the constraints, opportunities, and contradictions that the structure of society, and in particular the operation of the economic system, impose on public policy.

The expansion of U.S. business abroad beginning in the late nineteenth century increasingly linked the health and survival of the U.S. political economy to developments abroad. These concerns were not restricted to fears for the nation’s physical security or to the well-being of specific companies or sectors but rather were linked to concerns about the survival of a broadly defined “American way of life” in what was seen as an increasingly dangerous and hostile world.

U.S. oil companies were among the pioneers in foreign involvement, looking abroad initially for markets and increasingly for sources of oil. The U.S. government facilitated this expansion by insisting on the Open Door policy of equal opportunity for U.S. companies. Although the United States became a net importer of oil in the late 1940s, it was able to meet its oil needs from domestic resources until the late 1960s. Still, U.S. leaders were aware as early as World War II that one day the nation would no longer be able to supply its growing consumption from domestic oil production. This realization led to a determination to maintain access to the great producing areas abroad, especially in the Middle East.

Once the issue was defined in terms of access to additional oil, the interests of the major oil companies, which possessed the means to discover, develop, and deliver this oil, coincided with the national interest. In these circumstances, the major international oil companies have been vehicles of the national interest in foreign oil, not just another interest group. To maintain an international environment in which private corporations could operate with security and profit, the U.S. government became actively involved in maintaining the stability and pro-Western orientation of the Middle East, in containing economic nationalism, and in supporting private arrangements for controlling the world’s oil.

Although there was a broad consensus in favor of policies aimed at ensuring U.S. control of
Even though industry and government divisions effectively blocked some types of government actions, the splits did not reduce the oil industry’s influence on U.S. foreign policy. Almost all segments of the oil industry agreed on policies aimed at creating and maintaining an international environment in which all U.S. companies could operate with security and profit. Thus, the impact of business conflict was not a free hand for government agencies but rather strict limits on government actions and control of the world oil economy by the most powerful private interests.

Foreign oil policy has been shaped not only by the structure of the oil industry, which has changed over time, but also by the privileged position of business in the United States. The oil industry has operated in a political culture that favored private interests and put significant limits on public policy. Thus, the fact that business interests were often divided and that specific business interests at times did not prevail does not mean, as some analysts argue, that the oil industry and other business sectors had little influence on U.S. foreign policy. On the contrary, the overall structure of power within the United States had a profound impact on U.S. foreign oil policy.

Corporate power not only influenced the outcome of specific decisions but more importantly, significantly shaped the definitions of policy objectives. The realization that U.S. oil consumption threatened to outpace domestic production led to plans to ensure access to foreign oil reserves. The alternative of reducing, or at least slowing, the growth of rapidly rising consumption has only rarely been seriously considered.

Part of the reason for a supply side focus has been the obvious strategic and economic advantages of controlling world oil. Nevertheless, the degree to which U.S. public policy has ignored conservation cannot be explained solely by foreign policy considerations. The consideration and adoption of alternative policies limiting the consumption of oil has also clashed with well-organized political and economic interests, deep-seated ideological beliefs, and the structural weight of an economic system in which almost all investment decisions are in private hands.

The oil industry has been one of the most modern and best-organized sectors of the U.S. economy, and both domestic and international companies have opposed policies that reduce the demand for their products. Domestic producers have argued that greater incentives for domestic production are the answer to U.S. oil needs, while...
companies with interests overseas have argued that they can supply U.S. oil needs, provided they receive government protection and support.

Demand-side planning, in contrast, involves end-use and other restrictions that clash with the interests of the oil industry and other industries using oil. Planning for publicly defined purposes, such as limiting demand for oil products, requires a role for public authority—supplanting the market in some areas—that has been unacceptable to the dominant political culture of the United States. In addition, the patterns of social and economic organization, in particular the availability of inexpensive private automobiles, the consequent deterioration of public transportation, and the continuing trend toward increased suburbanization, all of which were premised upon high oil consumption, have been regarded as natural economic processes not subject to conscious control, rather than as the results of identifiable, and reversible, social, economic, and political decisions. Conservation also goes against the ideology of growth and the desire, reinforced by the experiences of depression and war, to escape redistributionist conflicts by expanding production and the absolute size of the economic “pie.” Finally, decisions to look to external expansion to solve internal problems rather than confront them directly has been characteristic of U.S. foreign policy throughout the nation’s existence.

The structure of power within the United States has also deeply affected the U.S. response to the environmental impact of oil use. While abundant oil has helped fuel American power and prosperity, it also helped entrench social and economic patterns dependent on ever-higher levels of energy use. Whether or not these patterns are sustainable on the basis of world oil resources, it has become increasingly clear that they are not sustainable ecologically, either for the United States or as a model of development for the rest of the world.

At the beginning of the twenty-first century, oil accounted for 40 percent of world energy demand, and energy use was the primary source of carbon dioxide, the main greenhouse gas. For this reason, environmental scientists considered air pollution associated with energy use to be the main threat to the earth’s climate. Increased energy demand will only make the situation worse. In short, there are environmental limits to continuing, let alone expanding, the high production–high consumption lifestyle associated with the U.S. model of development. Therefore, the most important question facing the United States in regard to oil in the twenty-first century may not be how to ensure access to oil to meet growing demands, but rather how to move away from what is clearly an unsustainable development path.

A significant number of historians and other commentators have viewed the Open Door Notes of 1899 and 1900 as the culmination of earlier attitudes, objectives, and policies, and as a coherent and decisive formulation of the major forces affecting American diplomacy during the century after 1865. But such people are too different (and too separated in time) to be jumbled together as a school. They are not, for example, defined by the ideological, institutional, personal, generational, and political affinities that characterized the Frankfurt School of Marxist sociologists that flourished from the 1930s through the 1960s and that produced a clearly defined body of analysis and interpretation. Hence, it is more helpful to speak of an Open Door interpretation of American foreign relations that has been advanced, from the 1890s to the present, by a disparate group of policymakers and politicians, bureaucrats, nonacademic intellectuals, and university and college teachers.

That odd assortment of people has nevertheless shared, however obliquely, the conviction that the Open Door policy is the keystone of twentieth-century American diplomacy. Elected policymakers, for example, as well as the bureaucrats they ushered into positions of influence, have used it as the intellectual vantage point from which to view and deal with the world. Such people have defined the policy as the touchstone of their dialogues—and confrontation—with the American public and other countries. The Open Door policy has been their idiom of thought, discourse, and action: it defines American perceptions and objectives, and hence, those who criticize or oppose the policy have been viewed as problems if not enemies. Germany was thus a troublemaker long before Adolf Hitler, Japan long before Hideki Tojo, and Russia long before Joseph Stalin.

Elihu Root and Henry L. Stimson operated within the framework of the Open Door policy when they served as secretaries of war, as well as during their tenures as secretaries of state. William Jennings Bryan thought within that framework prior to World War I just as surely as Charles Evans Hughes, Cordell Hull, and James S. Byrnes did in later years. And Presidents Theodore Roosevelt and Woodrow Wilson (and others) worked within the idiom that had been stated by President William McKinley even before Secretary of State John Hay announced it to the chancelleries and the publics of the world. The historian A. Whitney Griswold made the central point very neatly in his study *The Far Eastern Policy of the United States* (1938): “It is wrong, perhaps, to say that Hughes stole Wilson’s thunder, for Wilson himself had stolen Hay’s.”

The contextual persuasiveness of the Open Door outlook among American bureaucrats becomes apparent during a routine survey of the volumes in the State Department’s published record, as offered in its *Bulletin and Papers Relating to the Foreign Relations of the United States*. Indeed, the student grows weary of the references to the Open Door policy: he or she is inclined to consider it a meaningless ritual save for the seriousness with which it is repeatedly used to explain and justify American actions. Another kind of evidence is provided by the testimony (before congressional committees, as well as in memoirs) of such influential bureaucrats as William S. Culbertson, John Van Antwerp MacMurray, Joseph Clark Grew, and George F. Kennan.

Kennan, an influential foreign service officer and scholar, provides a particularly striking example of the power of the *Weltanschauung* of the Open Door. Writing as a historian in *American Diplomacy: 1900–1950* (1951), he damned the Open Door policy (and its underlying outlook) as idealistic, moralistic, legalistic, unrealistic, and ineffective. But his own zealous proposal to contain, and thereby drastically change, the Soviet Union through the global deployment of American moral, economic, political, and military
power was designed to realize the objectives of Secretary Hay’s original notes: a world open to American ideals and influence. Kennan was initially proposing—whatever his later denials, caveats, and remorse—an exponential escalation of President McKinley’s deployment of American power against the Boxer Rebellion in China.

Because China was the initial subject of the Open Door Notes, the early commentators focused their analyses of the policy upon its operation in Asia. While some observers (and participants) felt that the government ought to act more vigorously against what they considered to be the more restrictive policies of Japan, Russia, and Germany (and even China), they generally agreed that Secretary Hay’s integration of moralism, ideology, political strategy, and economic expansion provided a definitive statement of the need and the wisdom of extending the area of Anglo-American freedom and enlarging the American marketplace without war. Even leading Populists, otherwise bitterly critical of the McKinley administration, admitted that the policy addressed the basic issues. The editors of the Prairie Farmer, for example, urged their readers in 1900 to elect expansionist politicians. And Wallace’s Farmer was enthusiastic about the prospect of using “our moral advantage” to expand a “valuable” trade.

Three very different people—Brooks Adams, Theodore Roosevelt, and Woodrow Wilson—promptly placed the Open Door policy within a broader—and even more dynamic—intellectual context. Adams, the grandson of President John Quincy Adams (and the brother of Charles Francis and Henry Adams), was the most original—and eccentric—of that unusual group. He suffered from those differences in two ways: he never became famous, and his major idea became associated with another person.

From the late 1880s to the publication of The Law of Civilization and Decay in 1894, Adams developed an explanation of world civilization that defined westward expansion as the key to progress, prosperity, and culture. The centers of civilization had moved ever westward until, in the 1890s, the scepter was passing from Paris and London to New York. That meant to Adams that the United States, if it was to seize its hour, had to move westward across the Pacific to dominate Asia. Otherwise Russia or another country would become the next center of world power and civilization. Adams then published a series of magazine articles on foreign policy, collected in 1900 as America’s Economic Supremacy, in which he praised Hay’s Open Door Notes as a basic strategy for the United States and advocated a vigorous imperial policy—including the containment of Russia. In his view, Hay was “the only minister of foreign affairs in the whole world who grasped the situation.”

Adams and his history-on-the-spot exerted a significant influence on Theodore Roosevelt (even though the latter did once remark that he thought Adams was “half-crazy”); but, in the larger arena, Adams lost out to the formulation of a similar idea offered by Frederick Jackson Turner. Adams was a disillusioned and acerbic Boston Brahmin writing history in the petulant frustration of having lost power, while Turner was an excited and romantic midwestern poet-historian who stirred the mind of the public. In December 1893, Turner offered “The Significance of the Frontier in American History,” a dramatic reinterpretation of American history that explained the nation’s democracy and prosperity in terms of westward expansion from Virginia and Boston to Oregon, Alaska, and Hawaii.

Turner was not as openly imperial as Adams. He even seemed sometimes to imply that a native form of socialism was as appropriate to the end of continental frontier expansionism as overseas expansion into Asia and other regions. But his stress on past expansion, and his interpretation of the outward push from 1897 to 1901 as a natural continuation of the earlier rush across the continent, left his readers with the idea that the Open Door policy was the new frontier. Certainly Theodore Roosevelt and Woodrow Wilson read that message in his essays and took that idea from their correspondence and conversations with him.

Roosevelt was primed for Turner by Adams (and by his romantic cowboy interludes in the Dakota Territory), and his role in acquiring the Philippines and Cuba completed this transformation into what a psychologist might call a true believer. American expansion was a crusade for the Open Door virtues of peace, democracy, and prosperity. Roosevelt was sometimes discouraged by the difficulties of implementing the outlook in the face of opposition by other nations, or by the reluctance of the public to support the measures he considered desirable; but his commitment to the Weltanschauung remained firm: “We advocate the ‘open door’ with all that it implies.”

Not only did Roosevelt view the Open Door policy as the extension of the Monroe Doctrine to Asia; he moved in 1905–1906 to extend the policy to Africa. His discussions with Secretary of State
Elihu Root led to one of the clearest expressions of the way in which the open door interpretation guided such policymakers. Seeking to prevent either France or Germany from establishing exclusive control over Morocco, Root advised American negotiators that “here, again, the ‘open door’ seems to be the sound policy to advocate.” He then emphasized that it was vital “that the door, being open, shall lead to something; that the outside world shall benefit by assured opportunities, and that the Moroccan people shall be made in a measure fit and able to profit by the advantages of the proposed reform.”

A very similar view was held and acted upon by President Wilson. During the late 1880s he had met and talked with Turner at Johns Hopkins University, and the results were impressive. As a historian and political scientist on his way to the White House, Wilson used Turner’s frontier thesis to explain much of American history. “All I ever wrote on the subject,” he once commented, “came from him.” That remark qualifies as one of Wilson’s unusual acts of intellectual generosity, and therefore mirrors his usual arrogance by giving Turner too much credit. Wilson was an idealistic missionary crusader on behalf of American virtues and economic supremacy in his own right, and added his particular insights to the American political system.

Even so, Wilson-as-historian leaned very heavily on Turner. “The days of glad expansion are gone, our life grows tense and difficult,” he wrote in 1896 in explaining the crisis of the 1890s. Five years later, after Hay’s Open Door Notes, he considered such expansion a “natural and wholesome impulse.” “Who shall say,” he added, “where it will end?” In 1902 he published the four-volume History of the American People, which made it clear that the historian-as-politician-as-would-be-world-leader viewed economic expansion as the frontier to replace the continent that had been occupied. A section in volume 5 (which reads like a close paraphrase of some essays written by Brooks Adams) recommended increased efficiency in government so that the United States “might command the economic fortunes of the world.” He concluded his analysis by stressing the need for markets—markets “to which diplomacy, and if need be power, must make an open way.”

Wilson classically revealed his involvement with the Open Door Weltanschauung during the 1915 confrontation with Japan over its Twenty-one Demands on China. He explained to Secretary of State William Jennings Bryan that the basic objective was “the maintenance of the policy of an open door to the world.” Thereafter, Bryan periodically reminded various individuals and groups that the president’s policy was to “open the doors of all the weaker countries to an invasion of American capital and enterprise.” The principal importance of these and earlier quotations in this historiographical context lies not in revealing the policy per se but in suggesting how early policymakers were intellectuals developing and applying an Open Door interpretation of American foreign relations.

Moreover, even before Wilson was elected, a few historians and political scientists had recognized the importance of the policy in that sense. Archibald C. Coolidge, for example, in The United States as a World Power (1908), called the Open Door outlook “one of the cardinal principles of American policy.” John A. Hobson, the perceptive English liberal who initiated the critical Western study of imperialism (1902), was the first scholar to recognize the pervasive nature of the Open Door Weltanschauung. Viewing it as the key to American policy, and reacting with a favorable judgment, he argued in an essay in Towards a Lasting Peace (1916) that the policy and its underlying outlook provided the basis for lasting peace and prosperity.

That statement was almost a prediction, for in January 1918 President Wilson presented in his Fourteen Points a program that was clearly a product of the Open Door Weltanschauung. He not only used (consciously or unconsciously) phrases from Hay’s original notes, but the encompassing idiom of what he called “the only possible program” for peace was clearly an Open Door view of the world. The historian-become-policymaker and the historian as analyst-turned-public-commentator had reached an unplanned consensus.

The ensuing debates over Wilson’s program, and the causes of the war and American intervention, buried Hobson’s insight. His approach was ignored and unexplored for many years; and even when it was revived, it was done without any overt recognition of his pioneering effort. That did not mean, however, that the Open Door policy and its underlying outlook were wholly neglected. But that is the essence of the historiographical question: the issue involved whether or not historians (and other commentators) recognized that the Open Door policy was in truth the expression of a broad understanding of America and its relationship with the world.
Defined more formally in philosophical terms, the problem concerned a choice between a Cartesian world and a Spinozan world. Most American historians who came to maturity between 1895 and 1950 were Cartesians; they accepted a world composed of discrete atomistic units, some of which sometimes interacted with each other much as various billiard balls hit this time one ball and next time another ball. This led to what came to be known as the interest-group approach: individual A or P, or association D or S, exerted a determining influence upon decision F or Z.

Such an approach produced in history, as it did in science, some stimulating—if limited—research and analysis. Thus, in *Americans in Eastern Asia* (1922), Tyler Dennett could perceive “the Reassertion of the Open Door Policy” during the McKinley administration, but within a few pages assert that it was all “a purely temporary expedient.” But Alfred L. P. Dennis’s “The Open Door in China,” in his *Adventures in American Diplomacy* (1928), used Dennett to suggest the long-term development of a guiding outlook. He cited Dennett’s summary of the situation in 1898: the United States “desired for its citizens an open door to trade.” Then he, too, retreated to call it all “an expedient.” Revealing the ambivalence of early postwar scholarship, Dennis next quoted a comment that reminds one of Root and Wilson: “The policy of the Open Door . . . is the one and only policy. . . . Neither is it any use keeping the door open without insuring that the room on the other side of the door is in order.”

Dennett was at his best on the broader nature of the Open Door policy a few years later when, in *John Hay: From Poetry to Politics* (1933), he was the first historian to sense the role of Brooks Adams in developing a worldview that guided Hay and other policymakers. But the key figure of the interwar years was Charles Austin Beard. The magnificent study *The Rise of American Civilization* that he and Mary Ritter Beard first published in 1927 talked candidly about the turn-of-the-century expansion as “Imperial America,” and they hinted at the development of an imperial *Weltanschauung* that was crystallized in the Open Door policy.

The Beards perceptively saw the origins of that outlook in Secretary of State William H. Seward’s mid-nineteenth-century vision of a global American empire. Their description of the Open Door policy made the point that it integrated three elements—while “designed with realistic and practical ends in mind, the policy of the open door also had a lofty moral flavor”—but they did not develop it as a *Weltanschauung*. They said nothing of Theodore Roosevelt’s extension of the policy to Africa, for example, and barely mentioned it in dealing with the later diplomacy of Secretary of State Charles Evans Hughes.

That curiously titillating performance can be explained by two considerations: the Beards were writing a sweeping essay rather than a study of foreign policy per se, and Charles Beard was in the process of modifying his theory of knowledge and causation. His early work was grounded in an orthodox scientific-atomistic conception of reality that led him into a sophisticated interest-group analysis of history and politics, as in *The Economic Basis of Politics* (1916) and *An Economic Interpretation of the Constitution* (1913). There is strong evidence, however, that even as those books were being published, Beard was turning away from his methodology. That became apparent between 1928 and 1937, when he wrote a great deal about the problem. Beard had referred to various German antipositivists as early as 1913, and their influence reappeared in *The American Party Battle* (1928), in which he discussed the weaknesses of his earlier theory. He then opened a direct confrontation with the issue in two books and an article in 1934: *The Idea of National Interest*, *The Open Door at Home*, and “Written History as an Act of Faith” (*American Historical Review*).

Beard did not break completely free of the atomistic, interest-group theory of reality in *The Idea of National Interest*, but he did place the conflict between urban and agrarian interests in a much broader context. He spoke most directly about the question near the end of the book, remarking that the danger of the atomistic, Cartesian view of the world was in “limiting the understanding of the whole.” That enriched the meaning of his earlier references to such intellectual heirs of Spinoza as Georg Wilhelm Hegel, Karl Marx, Max Weber, Friedrich Meinecke, Karl Huessi, Karl Mannheim, Wilhelm Dilthey—and even Albert Schweitzer.

The issue was the ongoing dialogue between Descartes and Spinoza: the discrete, atomistic conception of reality versus the view that all things are related to each other. Given the American intellectual environment of those years, Beard was engaged in a lonely, courageous, and difficult task of reexamining his *Weltanschauung* in his middle years (see Lloyd Sorenson, “Charles Beard and German Historiographical Thought,” *Mississippi Valley Historical Review* [September 1955]).
He did not, however, develop and use the new approach in a rigorous manner. The results can be seen in *The Discussion of Human Affairs* (1936), “Currents of Thought in Historiography” (*American Historical Review* [April 1937]), and *The American Spirit* (1942).

Instead, Beard veered off into a quasi-biographical approach, interpreting foreign policy after 1934 as largely the result of Franklin Delano Roosevelt's power drive and inability to deal with the domestic crisis. Those books, *American Foreign Policy in the Making, 1932–1940* (1946) and *President Roosevelt and the Coming of the War* (1948), raised troublesome questions, but Beard's personalizing of policy neglected broader issues. Hence, his methodological explorations were ultimately developed by others who returned to Beard after they had come to the concept of an Open Door Weltanschauung along different lines.

In the meantime, however, the study of the Open Door policy was dominated by A. Whitney Griswold's *The Far Eastern Policy of the United States* (1938). Sensing that the Open Door was more than just a policy, he offered, for example, the suggestion that President Wilson and Secretary of State Charles Evans Hughes had transformed Hay's notes into a way of perceiving and thinking about foreign relations, and indicated that Cordell Hull's dedication to that outlook had more than a little to do with the subsequent confrontations with Germany and Japan. But all he said explicitly was that the Open Door was a "time honored American principle."

The concept of a principle emerging from the pragmatic needs and demands of various interest groups, and then becoming a Weltanschauung, was the analytical and interpretive tool that Beard had tried to forge between 1925 and
1935. Although they did not reveal his consciousness of purpose, three historians did advance that work during the decade after Griswold. Fred Harvey Harrington was the most intelligent and sophisticated interest-group historian of his generation, and if he had remained a historian, he would probably have gone beyond Beard in the application of a more subtle methodology. Harrington, along with William Best Hesseltine, his friend and colleague at the University of Wisconsin, had a genius for integrating biography and policy in a way that implicitly transcended interest-group analysis.

At the end of the war, therefore, Beard's methodological explorations had neither been exploited directly nor reinforced by parallel investigations. The account of what happened next is complicated, as with all intellectual history, but the essentials are reasonably clear. To speak in the idiom of nuclear physics, a highly charged field was penetrated by highly charged particles. The environment was defined primarily by the history department of the University of Wisconsin: a great tradition was reinvigorated by the stimulating and contrasting minds of such scholars as Paul Knaplund, Paul Farmer, Robert Reynolds, and Gaines Post in European history, and Merrill Jensen, Hesseltine, and Harrington in American history. But other scholars in related fields, such as Hans Gerth in sociology and Frederick J. Hoffman in literature, were also a vital part of the ensuing nuclear reaction that was triggered by the arrival in 1946–1947 of hundreds of excited and hungry veterans who wanted to become excellent historians.

An unusually large number of them achieved that objective during the next four years and went on to make important contributions in every field of American history. The major elements involved in the part of that process that produced what came to be known as the Open Door interpretation can be defined as follows: the ongoing intellectual interaction among the professors, among the students, and between those groups; the broad training in European as well as in American history, and in related disciplines; and the particular genius of Harrington. Thus, what emerged is best understood as the result of a true community that flowered for most of two decades.

The story can be told through focus on William Appleman Williams, although he explicitly insists that the result was a communal product and, furthermore, that it involved the work of scholars who are not usually identified as part of the Wisconsin School of diplomatic history. Given his exposure to the history faculty, the vital elements in Williams's development were his previous training in mathematics and science and his work with Gerth. Gerth gave Williams a broad knowledge of the methodology of Weltanschauung (including the serious study of Marx) and helped him to begin developing it as a tool for the study of foreign relations. Williams thus came to Beard twice: first as a beginning graduate student who read him as an interest-group historian and later, educated by Gerth, viewing him as a man struggling briefly with the concept of Weltanschauung.

Williams first experimented with that methodology in *American-Russian Relations, 1784–1947* (1952), as in his discussion of the influence of Brooks Adams; but he was not fully in command of the approach, and the effort to open the orthodox form of the monograph to include such analysis posed severe additional difficulties. The next phase of his work cannot be fully understood outside his friendship with Charles Vevier, a fellow student in Harrington's seminar, for they often did primary research together over the next three years and exchanged notes and ideas on a regular basis. Vevier's *The United States and China, 1906–1913* (1955) interpreted the specific events of those years within the broad framework of a knowing effort by decision makers to act upon the Open Door view of the world.

Also in 1955, Williams provided a clear example of how he was developing and using the concept of Weltanschauung in his study of the way that Frederick Jackson Turner's frontier thesis and John Hay's Open Door Notes were related parts of the same overview (“The Frontier Thesis and American Foreign Policy,” *Pacific Historical Review* [November 1955]). He next used the methodol-
ogy in dealing with contemporary foreign policy ("The American Century: 1941–1957," Nation [November 1957]) and in offering a broad analysis of the revolutionary and early national period ("The Age of Mercantilism: An Interpretation of the American Political Economy," William and Mary Quarterly [October 1958]).

Shortly after he returned to Wisconsin as a member of the faculty, Williams published The Tragedy of American Diplomacy (1959), an interpretive essay on twentieth-century foreign policy. Although it came to be viewed rather narrowly as the basis for the “Open Door interpretation,” and as a critique of policy after 1944, the book actually dealt with the development of a Weltanschauung through the interaction and integration of ideas, interest-group pressures, and the dynamic processes of marketplace capitalism. That more complicated nature of the approach was shortly underscored by Verier, just before he left history to help build the University of Wisconsin at Milwaukee. His “American Continentalism: An Idea to help build the University of Wisconsin at Milwaukee” (1964), seemed more interest-group-oriented than it was: his critique was directed and controlling his seminar in a narrow and orthodox manner, then the subsequent professional discussion (and gossip) about a “Wisconsin School” would have more substance. As it happened, however, the students—and their students—went their own ways. One need only consider the impressive trio who worked with Harrington as well as Williams. Walter LaFeber’s first book, The New Empire: An Interpretation of American Expansion, 1860–1898 (1963), dealt with intellectuals (and other ideamongers) more as an interest group than as craftsmen of a Weltanschauung. In a later study, America, Russia, and the Cold War, 1945–1960 (1967), he further refined that process. But one of his students, David Green (The Containment of Latin America [1971]), did more in the way of using a worldview to explain a regional policy.

As a teacher, Williams was graced with an unusual number of exceptional students, the legacy of the department’s preeminence during the late 1940s and early 1950s. Perhaps his most important contribution was to give them their heads, to encourage them to explore the great resources of the university faculty, and to push them to realize the very best that was within themselves. The way that some of them received and used his version of the methodological tool of Weltanschauung makes the point. Martin J. Sklar, for example, produced the striking essay “Woodrow Wilson and the Political Economy of Modern United States Liberalism” (Studies on the Left [1960]). And James Weinstein, one of Richard Hofstadter’s most perceptive students, who entered and was influenced by the Wisconsin milieu, wrote the excellent The Corporate Ideal in the Liberal State, 1900–1968 (1968).

If Williams had operated more traditionally, directing and controlling his seminar in a narrow and orthodox manner, then the subsequent professional discussion (and gossip) about a “Wisconsin School” would have more substance. As it happened, however, the students—and their students—went their own ways. One need only consider the impressive trio who worked with Harrington as well as Williams. Walter LaFeber’s first book, The New Empire: An Interpretation of American Expansion, 1860–1898 (1963), dealt with intellectuals (and other ideamongers) more as an interest group than as craftsmen of a Weltanschauung. In a later study, America, Russia, and the Cold War, 1945–1960 (1967), he further refined that process. But one of his students, David Green (The Containment of Latin America [1971]), did more in the way of using a worldview to explain a regional policy.

Thomas J. McCormick offered an imaginative marriage, so to speak, of Harrington and Williams in an exquisite study, China Market: America’s Quest for Informal Empire, 1893–1901 (1967). McCormick was deceptively empirical, for while his pages were filled with facts that no one else had uncovered, and his style was almost arid, he nevertheless constructed an account of how an expansionist Weltanschauung (in his own idiom, “informal empire”) came into being at the turn of the century.

Lloyd C. Gardner’s initial study, Economic Aspects of New Deal Diplomacy (1964), seemed more interest-group-oriented than it was: his climactic chapter, “Restoring an Open World,” made the point about the power of Secretary of State
Hull's worldview with an almost fey sense of humor. He quoted Harry Hopkins telling President Roosevelt that Prime Minister Churchill ought to be “disabuse[d]” of the idea that Hull's persistence about the Open Door policy was only “a pet hobby.” In a later and unusually sophisticated volume, Architects of Illusion: Men and Ideas in American Foreign Policy, 1941–1949 (1970), Gardner transcended Beard by using the intellectual biography to explain the development of a worldview shared by many top policymakers. Gardner's students used that approach with great effectiveness in dealing with the various aspects of the origins of the outlook and its later manifestations.

The ahistorical mistake involved in personalizing the Open Door interpretation—and the methodology of Spinoza, Marx, and Dilthey—around Williams is revealed in the work of many other historians. Robert Freeman Smith, for example, demonstrated in What Happened in Cuba (1963) that Harrington produced many students who moved beyond the interest-group methodology. And Stephen E. Ambrose made it clear, in Rise to Globalism: American Foreign Policy, 1938–1970 (1971), that Hesseltine was a key figure in that milieu.

Finally, the approach also attracted younger European historians who knew independently, and perhaps better, the philosophical roots in Spinoza, Marx, Dilthey, George Lukacs, and the Frankfurt School. Perhaps the most stimulating work has been done by Hans-Ulrich Wehler, as in Der Aufsteig des amerikanischen Imperialismus (1974). With enviable finesse he treats the process through which interests, problems, and ideas produce a Weltanschauung.

Given their variations on a theme, and their energy, it is not surprising that the protagonists of the Open Door interpretation have provoked much comment. Many of those who have responded favorably, however, have been as inattentive to the essentials of the methodology as have the critics—who have also overemphasized the influence of Williams and who have not differentiated and discussed the primary issues. An excellent example of the latter failure is provided by Arthur S. Link's commentary (in The Higher Realism of Woodrow Wilson and Other Essays [1971]) on Carl P. Parrini's Heir to Empire: United States Diplomacy, 1916–1923 (1969).

Link acknowledges that Parrini (a member of the Williams seminar) is correct in arguing that Wilson advocated Open Door expansionism, but then comments that Wilson's motives were the best—"the slow and steady improvement of mankind through the spread of a reformed and socially responsible democratic capitalism." Link not only misses the integration of economic and idealistic elements in Wilson's outlook that is stressed by Williams, Sklar, and Parrini, but further confuses their description and analysis of the consequences of that worldview with the attribution of evil motives to Wilson. He also fails to credit Wilson, his own hero, with being a perceptive capitalist who understood the system's need for imperial expansion.

A few scholars have discussed the issues with greater insight and balance. Warren F. Kimball's “The Cold War Warmed Over” (American Historical Review [October 1974]) ranges far beyond his announced subject. And Joan Hoff Wilson's exploration of the subject in Ideology and Economics: United States Relations with the Soviet Union, 1918–1933 (1974) is an example of her discerning insight into the primary problems of post-Beardian historiography. Such keen commentary underscores the judgment of Melvyn Leffler in “The Origins of Republican War Debt Policy, 1921–1923: A Case Study in the Applicability of the Open Door Interpretation” (Journal of American History [December 1972]). Williams and other advocates of his approach have "compelled all diplomatic historians to grapple with a complex set of criteria that heretofore had been frequently minimized."

As he surveyed East Asian affairs in the first months of 1899, Secretary of State John Hay saw few reasons for optimism. America’s main rivals for influence in that part of the world—Russia, Japan, Germany, France, and Great Britain—bristled with imperial ambition as China, weakened by war and rebellion, steadily lost its capacity to resist them. The great powers laid claim to special privileges in various parts of the country, a process that recalled the subjugation of Africa and suggested that China might be similarly partitioned. What worried Hay most was the prospect that the United States would be shut out of this new scramble as the Europeans and Japanese, with strong footholds in the area and a far greater taste for territorial conquest, divided up China and protected their new possessions with impene-trable barriers to American trade. Like many of his contemporaries, Hay imagined China as a vital and nearly limitless market for the burgeoning output of America’s rapidly industrializing economy. By 1899 the United States had made little progress toward realizing that dream, but the vision beckoned powerfully. Preserving access to the China market ranked high on the McKinley administration’s foreign policy agenda even as the prospects seemed to dim.

In a bold move to reverse this alarming trend, Hay dispatched his famous Open Door Notes to the leading imperial powers. Buoyed by his country’s victory over Spain the previous year, Hay demanded that each of the powers respect the principle of equal commercial opportunity in the spheres of influence they were consolidating in China. The notes neither challenged the spheres’ existence nor demanded equal access for American investment. Hay’s dispatches stood firm, however, on the matter about which Americans cared most—the transport and selling of American goods. “Earnestly desirous to remove any cause for irritation,” the United States insisted on “perfect equality of treatment for . . . commerce and navigation with such ‘spheres.’” Washington asked each power to give “formal assurances” that it would charge uniform harbor dues and railway rates and leave the job of levying and collecting import duties to Chinese authorities. The door to trade, in other words, must remain open to everyone who wished to pass through.

Hay’s proclamation of the Open Door policy was a landmark moment in the history of U.S. foreign relations. For one thing, it reflected the rise of the United States as a major power prepared to assert its interests in a distant part of the world where Europeans had reigned supreme. Hay set in motion a process that led ineluctably if fitfully to America’s emergence as the predominant outside power attempting to shape Asia’s economic and political destiny. Hay’s policy also established a pattern of U.S. behavior that had long-term consequences far beyond Asia. With its annexations of Hawaii, Puerto Rico, and the Philippines in 1898, the United States had demonstrated a clear interest in territorial acquisition as the means of satisfying its expansionist impulse. But Hay’s notes indicated a shift toward a different approach: The United States would expand its influence through economic hegemony rather than imperial control. The idea proved to have enormous staying power, partly because it fit with America’s self-conception as a nation founded on the twin principles of anti-colonialism and individual opportunity. Over the following century, Americans scorned the imperial intentions of others even as their own leaders made ambitious efforts to secure economic opportunity abroad. So characteristic was this pattern that some scholars regard it as the dominant attribute of U.S. foreign policy across the twentieth century. Beginning with William Appleman Williams in the late 1950s, a controversial but highly influential group of materialist historians elaborated the “open door interpretation” to explain America’s extraordinary record of international activism since the 1890s. In the view of
these scholars, Hay's initiative epitomized a quintessentially American approach to foreign policy. On the one hand, Hay invoked high-minded principles such as anticolonialism, self-determination, and equal opportunity to advance his proposals. On the other hand, he showed a hardheaded determination to protect the interests of American capitalists by promoting access to overseas markets. Advocates of the open door interpretation argue that a similar blend of proclaimed selflessness and relentless self-interest runs through the history of American diplomacy. From 1899 through the Cold War, these scholars assert, the U.S. government persistently invoked universal principles even as it intervened abroad in an unceasing effort to order the world to serve the interests of American capitalism.

Ironically, for all its indisputable importance as a watershed, an idea, and an interpretive tool, the Open Door policy produced scant results in practice. Through the period of the Open Door policy, the United States never obtained the markets about which late-nineteenth-century politicians and businessmen dreamed. Between 1899 and 1931 exports to China never exceeded 4 percent of the value of America's total annual exports and more often hovered around 1 percent. Nor did the Open Door policy discourage other powers from grabbing new chunks of Chinese territory or excluding American trade. Indeed, international compliance with American demands was always grudging and tenuous at best before collapsing completely in the 1930s as Japan unilaterally shattered Hay's vision. Even during its heyday in the early twenty century, the Open Door proved more an illusion maintained by its promoters than a policy with real force and meaning. Moreover, the Open Door policy failed the United States by fueling resistance against foreign meddling in China. Americans clung devoutly to the belief that their policy, in contrast to European imperialism, would benefit China by preserving its integrity and bringing American know-how to its benighted masses. From the Chinese standpoint, however, the United States was often just another foreign country determined to prevent China from controlling the terms of its relations with the outside world. Chinese leaders sometimes attempted to manipulate the United States to serve their interests but rarely proved willing to play the passive and cooperative role arrogantly scripted for them by Washington.

THE ORIGINS OF THE POLICY

The Open Door policy originated in the treaty port system that emerged in China during the 1840s. For centuries, China had resisted the efforts of Western traders to penetrate the country, restricting their activities to the port of Canton (Guangzhou) and subjecting them to severe punishment for violation of Chinese law. Following Britain’s sweeping military victory over China in the First Opium War from 1839 to 1842, however, the Qing dynasty had no choice but to grant major concessions. The British government forced China to open four new ports to foreign trade: Amoy (Xiamen), Foochow (Fuzhou), Ningpo (Ningbo), and Shanghai. British negotiators also insisted upon two privileges that would become hallmarks of Western imperialism in China. First, they demanded extraterritoriality, the right to subject British offenders to British rather than Chinese law. Second, they demanded most-favored-nation status, meaning that Britain would automatically benefit from concessions that China granted to any other country. In fact, as the historian Warren I. Cohen has observed, this demand for equal opportunity meshed well with Chinese calculations at the time. The imperial government, hoping to garner the goodwill of other Western powers to resist further British pressure, declared that all nations would have equal privileges in the treaty ports. “Now that the English barbarians have been allowed to trade,” declared the Daoguang emperor, “whatever other countries there are, the United States and others, should naturally be permitted to trade without discrimination.” In this way the United States, without firing a shot, came to enjoy the benefits that Britain had extracted through military intervention.

The treaty system became more elaborate in the following years as Qing authority continued to deteriorate amid civil wars and new military humiliations by Britain and France. What had been a trickle of Chinese concessions to the imperial powers grew into a torrent with the Treaties of Tientsin in 1858. Under those agreements China opened eleven new ports and for the first time permitted foreigners to navigate the Yangtze River and to travel throughout China’s interior. The agreements also dictated a low tariff on foreign goods entering China, essentially robbing the Chinese government of the right to set its own trade policy. As in the 1840s, Americans were well placed to benefit from these concessions. The United States maintained a minimal diplomatic
staff in China and had no military presence whatsoever. Yet under most-favored-nation provisions reaffirmed in the new treaties, American merchants received all of the advantages extracted by Britain and France. Historians have labeled Americans “hitchhiking” imperialists or, in a different formulation, “jackals” fattening up thanks to the British lion and other European predators.

The scavenger’s role served American merchants well for half a century. In relative terms, U.S. exports to China remained tiny—just 0.5 percent of all U.S. exports as late as 1895. But American merchants managed to gain a significant toehold in a period when the U.S. government, with its commitment to laissez-faire economic principles, denied them the kind of backing their European rivals received from elaborate diplomatic and military establishments. By the early 1850s Americans operated about twenty-five of the two hundred Western firms doing business in China, and American ships carried one-third of all Western trade with the country. American shipping boomed, especially in Shanghai, the busiest treaty port, where U.S. bottoms carried about one-half of all Western trade. Over time, American merchants obtained important shares of the Chinese market for textiles, oil, metals, and tobacco, all by exploiting what the Europeans made possible.

Two developments in the 1890s—one in the United States, the other in the Far East—drove Washington to seek far more formal assurances of American trading rights. In the United States, the staggering economic collapse of 1893 led to a surge of interest in China as a market for American goods. The depression bankrupted more than fifteen thousand businesses, sent commodity prices plummeting to new lows, and fed unemployment rates as high as 25 percent in many American cities. Most alarming to the political and economic elite, the crisis touched off a wave of strikes and protests that shook the foundations of the free-wheeling Gilded Age economy. Industrialists, politicians, and intellectuals naturally sought to explain the cause of such a cataclysm, and by the mid-1890s most had their answer: overproduction. The United States, they believed, simply produced more than its population could absorb and was choking on the surplus. The closing of the Western frontier left these men with little hope of expanding the domestic market, and none of them entertained demands from organized labor to increase the purchasing power of ordinary Americans. The only solution seemed to lie in exporting more to new markets abroad. “Our manufacturers have outgrown or are outgrowing the home market,” the National Association of Manufacturers proclaimed in a characteristic claim of the day. “Expansion of our foreign trade,” it added, was the “only promise of relief.”

Few potential markets appealed as strongly as China. Since the eighteenth century Americans had commonly imagined China as a vast market peopled by millions of consumers eager for American goods. Along with India, China represented “an extensive field for the enterprise of our merchants and mariners,” Alexander Hamilton wrote as far back as 1791 in his Report on Manufactures, proclaiming the distant Asian lands “an additional outlet for the commodities of the country.” Following the events of 1893, the hyperbole soared to new heights amid a general outpouring of enthusiasm for an expansionist foreign policy. “In China there are 400 millions of people, more than five times as many as exist in the United States,” marveled one business journal. “The wants of those 400 million people are increasing every year. What a market!” Other currents of the time reinforced purely commercial motives for intensified American interest in China. Social Darwinists stressed that China was an ideal stage on which the United States could demonstrate its competitive vigor. “Our geographical position, our wealth, and our energy pre-eminently fit us to enter upon the development of eastern Asia and to reduce it to part of our economic system,” wrote the economic theorist Brooks Adams. Widespread fretting about national stagnation following the end of continental expansion also encouraged Americans to view China as a vast new frontier to absorb American energies. “What was once the old Far East,” asserted one cotton seller, “is now our new Far West.” Missionaries and social reformers, meanwhile, embraced American traders as potentially powerful allies in their efforts to penetrate China and convert its people—a vast inert mass of humanity,” in Secretary of State Walter Gresham’s characteristic phrase—to American ways.

The second event that altered American thinking about China was the Sino-Japanese War of 1894–1895. Tension between China and Japan had mounted for several years amid obvious Japanese designs on Korea, which maintained an ambiguous tributary relationship with the Qing court. A political crisis in Korea sparked war in 1894. Within six months Japan dealt the crumbling Qing dynasty yet another humiliating defeat, destroying the Chinese military on land
and at sea. The lopsided settlement awarded Japan a sphere of influence in Korea and outright possession of Taiwan and the Pescadores, major gains for a rapidly industrializing power that, like the United States, sought new markets and influence abroad. At first many Americans sympathized with Japanese demands, hoping that a badly defeated China would open more treaty ports and seek Western goods and expertise in a desperate attempt at modernization. Before long, however, Americans came to see the Japanese victory in a much different light. By further weakening Chinese authority, the Japanese victory, far from creating new opportunity, set off an intense three-year period of great-power jockeying that threatened to partition China and close off American opportunities once and for all.

With a newly wounded China floundering as never before, the smell of blood was in the water. The sharks—imperial powers hoping to take a bite of Chinese territory—gathered quickly. Russia made the first in a complicated series of moves. The Sino-Japanese War had exposed Japanese designs on Manchuria, where the Russian government also harbored long-standing economic and political ambitions. Playing skillfully on Chinese vulnerabilities, Moscow extracted extensive concessions in a treaty signed in May 1896. In return for a Russian guarantee to aid China against Japanese or other foreign aggression, the Qing rulers granted Russia permission to extend its transcontinental railway through northern Manchuria. Furthermore, China awarded Russia political authority along the rail line, free right of public domain, and a tariff reduction on goods entering China along the railroad. Jealous of Russia's gains, Germany made a far more dramatic move in 1897, seizing the port of Tsingtao (Qingdao) on Kiaochow (Jiaozhou) Bay and demanding exclusive railroad-building and mining rights in Shandong province. China had little choice but to accede, spurring further exactions. Russia moved again, forcing China to concede a leasehold over Port Arthur (Lüshun) and its hinterland on the Liaodong Peninsula in early 1898. In southern China, meanwhile, France extracted a lease for Kwangchow (Guangzhou) Bay on the Leizhou Peninsula.

This feeding frenzy confronted the United States with an ominous situation. With American leaders increasingly convinced of China's importance to the American economy, the country seemed in serious jeopardy of being entirely consumed by the imperial powers. To be sure, few of

the concessions granted to Japan, Russia, Germany, or France immediately infringed upon American commercial privileges; for the moment, at least, the most-favored-nation principle remained intact. But the situation was agonizingly unsettled, and heightened competition for privileges raised the prospect that the imperial powers would soon transform relatively porous spheres of influence into exclusive possessions. Intense concession-hunting also raised the specter of a great-power war in the Far East, another scenario that boded nothing but ill for U.S. interests. American merchants worried especially that imperial rivalries were concentrated in northern China and Manchuria, regions that absorbed a high percentage of U.S. exports to China. With key ports under their control, Germany or Russia could easily impose new tariffs and railroad rates that would discriminate against American goods. But it was not the threat to any particular port or railroad that alarmed Americans so much as the apparent challenge to the whole principle of equal opportunity enshrined in the treaty port system. American industrialists, after all, wished to retain access to all of China on a permanent basis. If this principle collapsed, the United States, with no sphere of its own and no capacity for obtaining one, would be in a dire position.

LAYING DOWN THE POLICY

Two sets of voices insisted that the United States abandon its passive approach in China and take the lead to shore up the principle of equal privilege. One set came from Britain. Although not averse to securing special privileges of its own, it remained the principal great-power champion of the Open Door idea. In fact, the British-controlled Shanghai Chamber of Commerce may have been the first to hit upon the phrase in expressing the view that the whole of China should be opened to foreign trade. In any case, the scramble for concessions precipitated a sense of crisis in Britain, whose dominance in the China trade was threatened just as much as the far smaller U.S. stake. A lengthy debate on the situation took place in the House of Commons in January 1898, during the course of which two government speakers invoked the Open Door by name as the desirable alternative to partition. Three months later the British government proposed a joint Anglo-American declaration calling for equal commercial opportunity in China.
The other voices demanding that Washington take bold action to protect American interests came from within the United States. By 1898, as the historian Thomas J. McCormick has documented, a chorus of trade associations, publications, jingoistic politicians, and activist diplomats urged the McKinley administration to set aside laissez-faire notions and actively defend American interests. “We must make our plans to secure our full share of the great trade which is coming out of the Orient,” the National Association of Manufacturers demanded in 1897. Early the following year, the New York Chamber of Commerce sent McKinley a petition urging “proper steps” for the “preservation and protection of . . . important commercial interest in the [Chinese] Empire.” The press took a similar view. With Moscow apparently threatening to absorb Manchuria into the Russian customs area, the Commercial and Financial Chronicle demanded a “strong representation in favor of keeping open the trade on equal terms to all nations.” Meanwhile the New York Tribune asserted that “commercial interests, which are now great and which promise one day to be enormous,” demanded that the U.S. government be “deeply involved in China.” Activism was essential, it insisted, contending that “without strenuous insistence by this Government the indisputable treaty rights of the United States are likely to be ignored and violated by the more aggressive European powers.”

Washington responded cautiously to this pressure, only gradually accepting the notion that it should play an active role in promoting American economic interests abroad. The possibility clashed with laissez-faire notions of economics and governance, ideas that remained influential with many Americans even in the 1890s. Only the Spanish-American War resolved the issue in favor of the industrialists and others who advocated bold action abroad. Following its crushing victory over Spain in the spring of 1898, the United States became the scene of a vast public debate over whether to annex the Philippines, the former Spanish colony ripe for the taking if the United States was willing to become a colonial power. The debate concerned not only the Philippines themselves, of course, but also the role that the U.S. government would play in the Far East generally, including China. Advocates of annexation argued that possession of the Philippines would greatly facilitate American exploitation of the China market by providing an insular “stepping stone” to the mainland—a coaling station, naval base, cable relay station, and observation post that would enhance America’s capacity to keep the door to China open. Although U.S. behavior in the Philippines smacked of naked colonialism, Americans, including McKinley himself, disavowed any such intention in China. The United States, McKinley said, desired “no advantages in the Orient which are not common to all.” Still, in accepting the administrative and military burdens of empire in the Philippines, the United States signaled a new era of activism on the Asian mainland.

Hay’s Open Door Notes thus formed part of a package of policy decisions taken in 1898 and 1899, the foremost being the Philippines annexation, aimed at promoting American commerce in China. The delay between McKinley’s decision and Hay’s issuing of the notes owed mainly to the secretary of state’s fears that the other powers would reject any U.S. initiative that he did not time carefully. New great-power maneuvering in China during the first months of 1899 kept the notoriously cautious Hay from acting. But imperial rivalries eased in the summer, leading Hay to believe that Britain, Japan, Germany, and probably even Russia would respond favorably to a diplomatic démarche on behalf of the Open Door. Hay ordered his chief adviser on Far Eastern affairs, William W. Rockhill, to prepare a statement of U.S. policy. Rockhill, a champion of the Open Door with a strong sense of the dangers that would flow from China’s disintegration, was only too happy to oblige. With Alfred Hippisley, an English friend who had served in the Chinese customs service, Rockhill prepared the six memoranda that Hay sent to the governments of Britain, Germany, Russia, Japan, Italy, and France beginning on 6 September. With the proclamation of the new U.S. policy, the “scepter of Open Door champion,” in McCormick’s words, passed from Great Britain to the United States.

The Open Door policy appeared a natural course of action for the United States for a variety of reasons. For one thing, proponents were confident that the United States would be the winner on a level commercial playing field. U.S. exports to China in 1899 amounted to a bare 1.1 percent of all U.S. exports, but in absolute terms the China trade was booming, with the value of U.S. goods shipped to China climbing to $14 million from just $6 million five years earlier. American textiles and oil companies especially profited, and further growth seemed certain as the U.S. economy revived in 1897. “In the field of trade and commerce,” Hay proclaimed in 1899, “we shall be
the keen competitors of the richest and greatest powers, and they need no warning to be assured that in that struggle, we shall bring the sweat to their brows.” Banker’s Magazine predicted that “without wars and without military aggression that nation will secure the widest and best markets which can offer the cheapest and best goods”; only British wares, it continued, could rival those of the United States. Some Americans predicted that their exports would balloon to billions of dollars a year if the U.S. government could keep the door open.

If the Open Door suited supposed American commercial supremacy, it also suited U.S. military weakness and aversion to great-power politics. In Central America and the Caribbean, where the United States towered over any potential rival, the United States eagerly pursued exclusive economic privileges. In the Far East, however, the situation was very different. The Spanish-American War signaled the emergence of the United States as a major world power with the capacity to project force as far away as the western Pacific, but it could hardly rival the capabilities of Japan, Russia, and even the European powers already well-ensconced in China. If great-power relations in China developed into a game of coercion and partition, the United States would inevitably lose. The Open Door policy promised to remove force from the equation and to limit competition to fields where the United States would likely prevail. The policy, with its multilateral aspect and emphasis on universal principles, also carried the advantage of keeping the United States clear of international alliances as an alternative method of protecting American interests. Even as the United States emerged as a major power, the vast majority of Americans opposed foreign entanglements, and the McKinley administration saw no reason to risk its popularity. An alliance with Britain, the most likely candidate based on shared interests, was out of the question because of widespread Anglophobia. The other good possibility, Japan, showed an off-putting inconsistency and opportunism in China. The Open Door policy, by contrast, promised to win the cooperation of the other powers without sacrificing the administration’s political standing, reducing American freedom of action, or creating military burdens that Washington was unwilling to assume.

Perhaps most importantly, the Open Door policy suited Americans ideologically by sustaining their traditional aversion to colonialism and their commitment to liberal principles. Although the United States repeatedly violated its own supposed anticolonial commitments in the late nineteenth century and maintained quasi-imperial control over Latin America, a substantial portion
of congressional and public opinion abided by a perception of the United States as a fundamentally anticolonial country. The resistance that the McKinley administration confronted during the debate over Philippine annexation in mid-1898 attested to the strength of anti-imperial opinion. The Open Door offered an ideal solution because it permitted the United States to obtain markets in China while assuming the moral high ground. The notes, in the words of historian Matthew Frye Jacobson, represented "an imperialist economics in the guise of anticolonialism." Both avid expansionists and old-guard devotees of laissez-faire could unite behind the Open Door idea. The policy also appealed because it promised to sustain Chinese unity and give the Chinese access to the most modern goods and ideas that Westerners had to offer. The policy thus meshed well with Americans' self-perception as a force for modernization and enlightenment in backward areas of the world. One of the foremost promoters of the Open Door in the United States, the English author and lecturer Lord Charles Beresford, struck the theme in characteristic terms a few months before Hay's notes. Proclaiming that the Open Door represented a "grand, chivalrous, [and] noble sentiment in regard to what should be done with weaker nations," he asserted that such an approach would not only advance "the interests of trade and commerce, but it will push the interests of humanity and of Christianity."

For all these reasons, the Open Door policy was popular in the United States. In China, however, the policy encountered serious obstacles from the start. The problem was not so much the response of the great powers. Although none of them was particularly pleased with Hay's initiative, they were fearful that partition would lead to war and impressed that Washington demanded nothing more than simple equality of commercial access. One by one they grudgingly went along with Hay's demands—or at least displayed enough ambivalence so that Americans could assume acquiescence. By far the greater problem was mounting resentment among the Chinese people, whose real attitudes contradicted the ethnocentric American fantasy of a docile population that would welcome modernization from the West. The Boxer Rebellion, the most serious antiforeign uprising of the period, broke out in 1898 and grew more serious over the following two years. Armed insurgents slaughtered hundreds of missionaries and thousands of their Chinese converts and destroyed foreign property, including the railways and communication lines integral to Western commerce. In 1900 the Boxers marched on Peking, killing foreign diplomats and missionaries and, for nearly two months, laying siege to the foreign legations. To meet the emergency, the McKinley administration dispatched five thousand U.S. troops from the Philippines to join the international expeditionary force that raised the siege in mid-August.

The fighting threw the Open Door policy into disarray. Not only did the upheaval make a mockery of American insistence that China should be regarded as an integral, sovereign nation, but the intervention of foreign troops also presented the possibility that one or more of the imperial powers would try to exploit the chaotic situation by seizing new parts of China. "Your Open Door is already off its hinges, not six months old," the author Henry Adams complained to Hay as the crisis unfolded. "What kind of door can you rig up?" Hay, once again relying on Rockhill and Hippsley, responded with his second Open Door Note on 3 July. The new circular restated American commitments from the year before and asked the powers to affirm that they supported China's "territorial and administrative integrity." U.S. policy, Hay asserted, "is to seek a solution which may bring about permanent safety and peace to China . . . and safeguard for the world the principle of equal and impartial trade with all parts of the Chinese Empire." Meanwhile, American diplomats went to work shoring up the authority of local rulers in China's center and south to minimize the temptation for any of the great powers to move in on the pretext of restoring order.

As in the previous year, American policy succeeded superficially. In 1901 all the powers withdrew from Peking and, unwilling to risk shattering the status quo, indicated at least tolerance for the Open Door principle. That result came slowly and reluctantly, however, and various developments along the way suggested trouble for the Open Door policy over the long term. First, Russia threatened to exploit the presence of its troops in China to force the Qing to yield further privileges in Manchuria. Then American support for the Open Door policy tottered as President McKinley toyed with the idea of abandoning the policy altogether. Under fierce election-year criticism for his overseas adventures and frustrated with great-power maneuvering, McKinley considered withdrawing U.S. troops from the international force in China, a move that would have destroyed the con-
cert of powers that Washington had worked hard to maintain. As McKinley recognized, the move also would have freed the United States to participate in the partitioning of China by carving out a sphere of its own, a prospect that gained sudden support among a number of policymakers. From Peking, U.S. minister E. H. Conger made a startling proposal to acquire a lease over Zhili province, including apparently the Chinese capital itself. More modest in its aims, the U.S. Navy called for the establishment of a base on the Chinese coast, preferably Samsah (Sansha) Bay in Fujian province. McKinley and even Hay endorsed that proposal, but China, in an unusual gesture of defiance, rejected it out of hand, quoting from America’s own cherished Open Door principles.

Before 1900 was out, the administration had retreated to the Open Door policy. The American flirtation with empire in China ended amid grudging acceptance that exerting influence within the concert of powers—rather than breaking out on its own—remained the best course for the United States. But events left Hay keenly aware of the many problems that beset his policy. There was not, he wrote in late 1900, “a single power we can rely on for our policy of abstention from plunder and the Open Door.” Nor, he recognized, did the United States have the military or moral authority to control events in China if any of the powers chose to oppose American preferences. In a remarkably candid assessment of the limits of U.S. influence, Hay asserted:

The inherent weakness of our position is this: we do not want to rob China ourselves, and our public opinion will not permit us to interfere, with an army, to prevent others from robbing her. Besides, we have no army. The talk of the papers about “our preeminent moral position giving us the authority to dictate to the world” is mere flap-doodle.

American impotence was on display in 1901 as the imperial powers ignored U.S. protests and demanded that China pay a debilitating $300 million indemnity to cover foreign property destroyed in the Boxer uprising. When Japan and the Europeans chose to ignore it, the Open Door policy counted for little.

THREE APPROACHES TO THE OPEN DOOR

The weakness of American policy would be further borne out over the next two decades as three U.S. administrations, each in its own way, struggled to keep the door open. At first, the main challenger to U.S. policy was Russia, which continued to tighten its grip on Manchuria in ways that directly threatened American market access. Although American trade with China remained modest (accounting for less than 1 percent of all U.S. exports in 1904), Manchuria was increasingly critical to American merchants, absorbing about 90 percent of all U.S. exports to China. As the historian Michael H. Hunt has shown, American success resulted partly from Chinese encouragement of American trade as a way to offset Russian domination. The Chinese strategy worked fairly well. The administration of Theodore Roosevelt registered vigorous protests with the Russian government and even threatened to join an emerging military alliance between Japan and Britain if Moscow did not respect American prerogatives. “I wish, in Manchuria, to go to the very limit I think our people will stand,” Roosevelt wrote to Hay. In fact, war in China remained an impossibility for the United States, which was even more averse to military commitments there during the Roosevelt administration than it had been earlier. When Japan proposed cooperation against Russia in 1901, the United States indicated no interest whatsoever. As before, domestic political constraints and sheer lack of military capacity in the Far East left the United States with no alternative but to pursue its goals diplomatically. Washington gave its quiet support to the British-Japanese alliance formed in 1902, practicing the time-honored weak nation’s strategy of putting other nations’ power to work on its behalf.

Japan, by contrast, had enormous interests in Manchuria and military power to match. When Russia refused to permit foreign settlement of newly established treaty ports in Manchuria, Japan declared war in February 1904, smashing the Russian fleet at Tsushima Strait fifteen months later. The overwhelming Japanese victory reverberated around the world, signaling the emergence of a non-Western great power and inspiring a generation of Asian nationalists to challenge Western hegemony. It also dramatically altered the situation in China, catapulting Japan into the role of the most formidable and, from Washington’s standpoint, potentially most threatening power. If the European powers necessarily had “divided interests, divided cares, double burdens” as they looked to their affairs in both Europe and the Far East, Roosevelt recognized that Japan could concentrate entirely on China. It had, as
Roosevelt wrote, “but one care, one interest, one burden.” From that moment forward, the challenge of maintaining the Open Door would be mainly the challenge of managing Japanese power—a task that ultimately proved impossible.

Initially, though, the United States showed little of the alarm that Hay or Rockhill might have displayed a few years earlier. In the years following the Russo-Japanese War, China—and with it the Open Door policy—lost much of its importance for U.S. policymakers. One reason lay in Roosevelt’s basic approach to foreign policy. A realist with a clear sense of the limits of American power, the president opted to appease Japan rather than to risk conflict in a part of the world where he understood Japanese interests and power were vastly superior. U.S.–Japanese tensions already simmered because of violence and discrimination against Japanese immigrants in California, and Roosevelt saw no reason to stir the pot further by insisting upon anything more than minimal toleration of American trade. A bland 1908 agreement, signed by Secretary of State Elihu Root and the Japanese ambassador in Washington, Takahira Kogoro, restated the Open Door principle but contained no new provisions to shore it up. Roosevelt may have believed that conflict with Japan was inevitable, but he was only too happy to postpone the day of reckoning into the indefinite future.

Another reason for declining U.S. interest in actively defending the Open Door was fading American enthusiasm for the China market. Following the burst of American interest in the 1890s, many U.S. businessmen began to lose faith in the vision of vast profits. Chinese nationalists helped dampen American hopes in 1905 by organizing a boycott of U.S. goods to protest Washington’s indefinite extension of an 1882 law barring Chinese laborers from entering the United States. Hay, now out of office, blamed the Chinese for failing to exploit the Open Door to their advantage. “We have done the Chinks a great service which they don’t seem inclined to recognize,” Hay complained in 1903, revealing the scorn beneath supposedly beneficent American policy. If many Chinese lacked the desire for American goods, it also became clear that China lacked the purchasing power and infrastructure to furnish the market about which Americans fantasized. As the U.S. consul general in Hong Kong had written in 1899, “99 percent of China is still closed to the world. When the magazine writer refers in glowing terms to the 400,000,000 inhabitants of China, he forgets that 350,000,000 are a dead letter so far as commerce is concerned.” The statistics sustained that judgment: in the first two decades of the twentieth century, U.S. exports to China continued to hover around a meager 1 percent of the value of all U.S. exports.

China hardly faded away, however, as a matter of American concern. Paradoxically, as policymakers and businessmen lost interest during the Roosevelt years, the Open Door policy became increasingly intertwined with—and sustained by—the powerful reform movement that captured the imagination of Americans as the country struggled to cope with the effects of industrialization, immigration, and other massive social transformations of the preceding quarter century. For decades, of course, Americans had assumed a special responsibility for China and viewed their efforts to exploit the China market in an altruistic light: The United States would profit, Americans believed, but so too would the Chinese, who would gain access to Christianity and modernizing ideas as well as American goods. In the Progressive era, American reformers expanded on this connection between material and moral progress and helped preserve, and even extend, American faith in the Open Door policy as the actual material basis of the policy stagnated. As the historian Jerry Israel demonstrates, Progressives were among the most important advocates of preserving the American access to China and maintaining the integrity of the Chinese state. However disappointing China had proved so far, the reformers held boundless confidence in its potential for both moral and material progress, which were indistinguishable in their minds. For the Progressives, Israel argues, China was an extension of the United States, and to admit failure there would have been tantamount to admitting failure of the reformist vision at home.

Mining engineer Herbert Hoover, Red Cross worker Mabel Boardman, education reformer John Dewey, sociologist Edward A. Ross, and many other leading Progressive figures focused their attention on China at one time or another. Ross’s 1912 book, *The Changing Chinese: The Conflict of Oriental and Western Culture in China*, was typical of the Progressives’ optimism about China’s potential for modernization under Western tutelage. The apparent inertness of Chinese society was not, he wrote, the result of a “horror of the new.” Rather, it resulted from the stultifying weight of millennia-old traditions that needed to be cracked. Among the reforms Ross advocated
were “dropping ancestor worship, dissolving the clan, educating girls, elevating women, postponing marriage, introducing compulsive education, restricting child labor, and otherwise individualizing the members of the family”—all changes that Americans were ideally suited to help bring about. With similar goals, Yale University established Yale-in-China, an overseas philanthropic program for the education and “uplifting of leading Chinese young men toward civilization.” Meanwhile, the Young Men’s Christian Association set itself the multiple purposes of providing living quarters for visiting American businessmen, sponsoring lectures on industrial education, working to ameliorate slum conditions, combating prostitution, and spreading the Christian gospel. In a revealing quip, Mark Twain poked fun at these reformers, with their blend of material and moral objectives, as the “blessings of civilization trust.”

If the door was wide open in the American imagination, William Howard Taft perceived that it was in fact creaking shut because of continued encroachment by the other powers, especially Japan. As he assumed the presidency in 1909, Taft rejected his predecessor’s practice of appeasing Tokyo and advocated a major expansion of American economic activity in the Far East as part of his broader practice of “dollar diplomacy.” The new administration, led by its top Far Eastern specialist, Willard Straight, not only hoped to invigorate U.S. exports but also wished to promote American investment in China, an activity that Washington had not previously emphasized. The response from the other powers indicated that the Open Door policy was becoming a fond illusion. When Taft asked the Chinese government to grant part of a major railroad-construction loan to the United States, he discovered that the decision belonged to Britain, France, and Germany, members of the banking consortium that controlled China’s finances. The consortium grudgingly admitted the United States, but before long Washington’s aspirations ran up against another roadblock when it sought the opportunity to invest in railroad construction in Manchuria. Peking favored the scheme, hoping to use the United States to offset Japanese and Russian influence in the region. But Chinese approval hardly mattered. Faced with great-power hostility, Taft’s secretary of state, Philander Knox, resorted to a proposal that came straight from the heart of the Open Door ideal: all railroads in Manchuria, Knox suggested, should be internationalized, thus easing the competition for concessions and permitting all of the powers equal opportunity. In one fell swoop, the scheme aimed to bolster Chinese autonomy, benefit American investors, and deal a blow against imperialism. Russian indebtedness made Knox optimistic of gaining Moscow’s consent, but Tokyo predictably would have none of it. The scheme died quickly.

Roosevelt and Taft thus offer a study in contrasts in their conceptions of the Open Door policy. While Roosevelt attached a low priority to the policy and chose not to antagonize Japan by insisting on it too strongly, the Taft administration was determined to prop the door open firmly and went further than even Hay had thought wise in promoting U.S. economic activity in China. Woodrow Wilson offered a third alternative when he ascended to the White House in 1913. By that time, the Chinese Revolution of 1911–1912 had toppled the Qing dynasty, an inspiring development for Americans like Wilson who fancied themselves champions of democracy and progress. Wilson and his secretary of state, William Jennings Bryan, immediately distanced the United States from both Roosevelt’s solicitude for power and Taft’s solicitude for bankers, embracing instead a more principled variant of the Open Door based on strict anticolonialism. Far more than either of his predecessors, Wilson had imbibed the moralistic rhetoric about America’s mission in China. First, he withdrew the United States from the international lending consortium in China, an enterprise of Taft’s that, in the new administration’s view, put Washington in league with the imperial powers. China, Wilson believed, should be permitted to obtain financial aid that did not entail dependency on the great powers. Then the administration, in a self-conscious display of support for the principle of self-determination, leaped ahead of the other powers to grant diplomatic recognition to the Republic of China.

Wilson’s gestures of solidarity with America’s “sister republic” were no more successful than earlier U.S. efforts to protect the Open Door policy. The new U.S. approach simply had no capacity to resolve the two problems that plagued American policy: the chronic weakness of Chinese central authority and mounting Japanese ambition. The Chinese Revolution failed to install a central government capable of unifying the country or resisting foreign exactions. Instead, political authority soon fell to an assortment of local politicians and warlords who generally accommodated themselves to the demands of the
great powers. Japan was ideally positioned to profit from this situation, all the more so after the outbreak of World War I. With the other powers preoccupied in Europe, the Japanese government saw a golden opportunity to expand its grip on the mainland with minimal risk of opposition. Japan quickly seized German territories in the Far East, including those in the Shandong Peninsula. But the boldest stroke came in January 1915, when Japan presented the enfeebled Chinese government with the infamous Twenty-One Demands. The document demanded that China regularize Japanese gains in Shandong and elsewhere and surrender new concessions in Manchuria. Still more damagingly, it required that China grant no new leaseholds to other powers along the Chinese coast, allow Japan to control most of China's key natural resources, buy at least half its armaments from Japan, allow Japanese police to operate in various key locations, and accept Japanese advisers in administering domestic affairs—arrangements that would have given Japan a virtual protectorate over China.

The Japanese démarche left American officials stunned and uncertain. Initially, amid major distractions in Europe, Washington had little interest in tangling with Japan in a part of the world that was decidedly of secondary importance. After a few weeks, however, the affair caught Wilson's attention. The president brought U.S. policy back in line with his anticolonial instincts, instructing Bryan to be "as active as the circumstances permit in showing ourselves to be the champions of the sovereign rights of China." Faced with opposition from the United States and even its close ally Britain, Japan backed down on the most extreme of its demands. But Tokyo clearly understood that there was little the Western nations could do in the matter and pressed ahead with all terms that centered on economic privileges. Under the threat of force, China yielded with little delay. U.S. policy had clearly suffered a major blow, although the Wilson administration would not admit it at the time. Bryan put the best face on the episode by declaring that the United States would not recognize any agreement that violated Chinese sovereignty or conflicted with the Open Door.

In an effort to give substance to such pledges, the Wilson administration slid back toward Taft's old approach. In 1916, under the guidance of the U.S. minister in Peking, Paul Reischl, the United States rejoined the banking consortium that Wilson had so brusquely abandoned three years earlier. American investment, the administration concluded, was the only avenue open to Washington for bolstering Chinese unity and checking Japanese influence, which otherwise would go virtually unopposed. Working within the consortium, American thinking went, would enable the United States at least to sit at the table with Japan as equals in discussions of the crucial matter of foreign lending. Wilson also tried direct negotiations with Japan in 1917. Under an agreement signed by Secretary of State Robert Lansing and the Japanese ambassador in Washington, the United States acknowledged Japan's "special interests" in China in exchange for a promise to respect the principles of Chinese sovereignty and the Open Door. These steps changed nothing, however, about the basic problem that confronted the United States in China: if Japan chose not to cooperate, there was nothing Washington could do about it. That underlying reality came to the fore in 1919 at the Versailles Conference, where Wilson, armed with his rhetoric of self-determination, proposed to roll back foreign privileges in China and affirm Chinese sovereignty. Japanese control over Shandong province became the symbolic test case for Wilson's ideas. The president demanded the restoration of Chinese sovereignty; Japan refused. When Japanese representatives threatened to leave the peace conference rather than concede the point, Wilson backed down.

THE END OF THE OPEN DOOR

Wilson's capitulation provoked fierce criticism in China, where irate students took to the streets. It also fed Wilson's growing problems at home with Congress, where opposition to the president's cherished League of Nations mounted amid accusations that the administration had sold out its own principles. But Wilson's calculation was plain: it was better to stay on Japan's good side and ensure the country's participation in the League of Nations, which would inevitably take up the China question later on. Things might, then, turn out well in the long run. Wilson's ambitious vision of an international solution in China came to naught, of course, when Congress rejected the league in 1920. Ironically, however, his successor, the notoriously unambitious Warren Harding, followed Wilson's reasoning quite closely, opting to deal with rivalries in China by gathering all of the great powers together to work
out their differences and establish new principles of conduct in the Far East. The result, the Washington Conference of 1921–1922, was an important diplomatic victory for the United States and a major—if temporary—breath of life for the Open Door policy.

Following World War I, Japanese power in the Far East continued to mount. In the 1920s Japan accounted for about 90 percent of all new foreign investment in China, while a quarter of all Japanese exports went there. In many ways, Japan’s relationship with the mainland resembled the economic and political stranglehold the United States held over the Caribbean and Central America. The Chinese economy was increasingly locked in to Japanese needs, as both recipient of Japanese investment and manufactured goods and as supplier of food and raw materials. The dramatic growth of Japan’s naval power also alarmed American observers by raising the specter of a Japanese challenge to Anglo-American control of Pacific commerce. By 1921 warship construction consumed fully one-third of Japan’s budget. Fearing a naval arms race, Secretary of State Charles Evans Hughes invited the foreign ministers of eight maritime nations to Washington to reduce tensions in the Far East. The Japanese government, content to pursue its aims peacefully, entered into all three of the resulting treaties. A four-power nonaggression pact committed Japan, the United States, Britain, and France to consult in the case of future controversies. Meanwhile, a five-power agreement, which included Italy, checked the naval arms race by fixing limits on the size of each navy. By far the most important treaty for the future of the Open Door policy was the Nine-Power Treaty that called for noninterference in China’s internal affairs and respect for the Open Door principle. In words that John Hay himself might have written, the agreement bound signatories “to respect the sovereignty, the independence, and the territorial and administrative integrity of China.”

The treaty was the most promising assertion of the Open Door policy since Hay’s notes. In contrast to the halting and piecemeal promises of the various powers over the previous two decades to uphold the principle of equal economic opportunity, the Washington agreements solemnly bound all of the principal powers (except the excluded Soviet Union) and even reflected input from a full-fledged Chinese delegation. Moreover, the agreements had the strength of acknowledging, rather than resisting as so often in the past, Japan’s emergence as the dominant power in the Far East. As a strategy for maintaining the Open Door, the international approach outshone Roosevelt’s appeasement, Taft’s dollar diplomacy, or Wilson’s early dedication to principle. To be sure, underlying problems remained. For one thing, the agreements contained no enforcement mechanism. Nor did they challenge the existing Japanese position in China. In fact, Elihu Root assured Japan early in the negotiations that the United States would not challenge Tokyo’s special privileges. All the Chinese government obtained from the powers was permission to raise its import tariff by 5 percent and a promise to study ways of ending extraterritoriality. Most importantly, the agreements held little promise for slowing Japan’s economic penetration of China and preserving a truly fair field for American goods. So strong had Japan’s economic grip over China become that it no longer had much reason to fear American competition. To a considerable degree, Japan had achieved the dominant commercial position in China that Americans believed would naturally fall to them if the door were kept open.

Those underlying problems remained submerged, however, during the hopeful years that followed the Washington Conference. In Tokyo, a relatively democratic and progressive Japanese government abided by the conciliatory stance adopted at the meeting. Although overpopulation, resource shortages, and old dreams of empire on the mainland continued to drive Japanese policy, the government displayed little appetite for bold moves that would arouse the other powers. Meanwhile, U.S.–Japanese relations warmed dramatically amid a burst of American enthusiasm for Japan’s economic efficiency and administrative reliability, which stood in sharp contrast to ongoing chaos in China. World War I had witnessed a vast expansion of U.S.–Japanese commerce, and during the 1920s the United States confirmed its position as Japan’s most important trading partner.

If improved relations with Japan gave Americans reason to think the Open Door policy was safe from its most likely opponent, the shifting situation in China gave them hope that their ultimate dream—a unified China freed from foreign constraints and providing stable access for American goods—might be coming true. After years of political turmoil, the nationalist movement of Sun Yat-sen and Chiang Kai-shek began to make headway in the mid-1920s toward unifying the country under a viable central government. Among the
nationalists' foremost objectives was the abolition of the “unequal treaties” that enshrined foreign privileges on Chinese soil. At first, U.S. officials resisted Chinese pressure to end the privileges it had obtained. Indeed, when Sun overstepped treaty provisions in 1923 by claiming surplus customs receipts, U.S. warships joined an international fleet to deter him. But Americans were hardly unified behind that approach, and an increasing number were horrified by practices that suggested colonial designs against a vigorous young republic. While some diplomats prized U.S. treaty privileges and backed gunboat diplomacy to maintain them, most Americans returned to the old vision of a wholly sovereign and administratively competent China as the key to realizing the bounty of the China market. The latter group gained the upper hand in 1928 after Chiang successfully concluded his Northern Expedition, a moment Americans chose to interpret as signaling the arrival of a united China under Kuomintang rule. On 25 July, the United States unilaterally granted tariff autonomy to China in exchange for a new guarantee of most-favored-nation status.

The American move ended one of the most humiliating aspects of the foreign presence in China and marked a moment of triumph for those Americans who had never lost faith that the United States would be China’s savior. But it also provoked a powerful Japanese response against which the United States was powerless. It is one of the instructive ironies of the Open Door policy that its final downfall followed so closely on the heels of its apparent heyday. Even at its high point, the policy was more illusion than reality, riddled with so many flaws that it could be demolished once Japan decided to act. Japanese policy began to turn in the late 1920s, when Chiang challenged Japanese privileges in Manchuria. That Chiang did so with the clear support of the United States meant that American economic interests would inevitably gain at Japanese expense. As Tokyo feared, Japanese exports dropped by one-half between 1929 and 1931. The threat to Japan’s prestige and its hard-won privileges on the mainland was more than the Japanese military and hard-line nationalists could abide. On 18 September 1931, mid-ranking Japanese army officers acted boldly to reverse this trend, blowing up a section of railway in Manchuria and then blaming Chinese nationalists for the act. The episode, known as the Mukden Incident, became the pretext for Japan to occupy the entire region. Less than a year later, Japan’s Kwantung army succeeded in detaching Manchuria from the rest of China and creating the puppet state of Manchukuo.

The timid U.S. response pointed up the weaknesses that had riddled the Open Door policy since its inception. The Hoover administration answered not with economic sanctions but with an ineffective declaration of “nonrecognition” of Japanese aggression. Secretary of State Henry L. Stimson informed the Japanese government that the United States would not recognize any “treaty or agreement” brought about by force or coercion. The U.S. response partly reflected the administration’s domestic preoccupations and the unwillingness of the American public to take on foreign commitments as the Great Depression worsened. But other deterrents to bold American action had existed long before the global economic crisis. First of all, the United States, just as in 1898, lacked the ability to back up any diplomatic démarche with force. The U.S. Navy was the world’s second largest by 1930, but it still could not hope to challenge Japan in Far Eastern waters. Also discouraging any bold American reply was the longstanding problem, recognized by Theodore Roosevelt two decades before, that China just did not matter very much. Despite all of the hype about the China market and America’s special role, China still played a relatively insignificant role in the U.S. economy. Through the 1920s and 1930s, China accounted for only about 2 percent of total U.S. exports each year. In the same period, by contrast, Japan absorbed between 8 and 10 percent of U.S. exports. There was thus little incentive to challenge Japan on behalf of China.

When exactly the demise of the Open Door policy should be dated is open to debate. Certainly, 1931 qualifies as a leading contender. In that year, after all, the partition of China, the development that the Open Door policy had been designed to avoid, came about with breathtaking decisiveness. Moreover, Japan’s 1932 attack on Shanghai signaled that Tokyo’s ambitions extended far beyond Manchuria. Another possible end point is 1937, the beginning of a full-fledged Sino-Japanese war that quickly resulted in Japanese control over virtually all of the ports, railroads, and other industrial facilities throughout China. A third contender is 1950, when Mao Zedong, having completed the communist conquest of China, slammed the door shut against the United States. Only then, perhaps, did Americans finally give up on the idea that the United
States could reopen the door after Japan's defeat. Indeed, during the mid-1940s U.S. leaders had clearly entertained notions of reestablishing a major American presence, only to see their hopes crushed by a movement that, more than any other, reflected a century of Chinese resentment over foreign intervention. The communists' special wrath for the United States illuminates more clearly than anything else the delusion of exceptionalism that had underpinned American policy for half a century.

THE POLICY AND THE INTERPRETATION

Measured in one way, the Open Door policy might be evaluated as a success. Considering what a weak hand the United States actually held in China between the 1890s and the 1930s, it arguably played the game well, constantly manipulating its rivals into paying at least lip service to American policy and helping to prevent an all-out scramble for China. Even if Americans failed to achieve the market of which they dreamed, 1 or 2 percent of U.S. exports still represented an enormous amount of trade. Measured against the aspirations of its most ardent supporters, however, the Open Door policy rates as a failure. While American businessmen and social reformers elaborated a vision of China as a protégé nation offering boundless opportunity for profit and good deeds, the reality was something else entirely. From the very moment when the Open Door was conceived and identified as a distinctive American policy, powerful forces went to work against it: the treaty port colonialism of the European powers, the rise of a robust Japan eager for control of the mainland, and mounting resistance within China itself.

If these forces destroyed American policy in China, they hardly demolished the idea of the Open Door. On the contrary, the architects of the Open Door policy, whatever their achievements—or lack thereof—in China, helped to establish an attitude toward the non-Western world that would persist powerfully in the Cold War era and beyond. The problem that confronted John Hay in 1899 had called for a decision of epoch-making importance. By what means would the nation extend its reach overseas? The emerging industrial economy seemed to demand bold steps to acquire new markets abroad, but ideological and political traditions made Americans, outside of a brief fascination with territorial acquisition at the time of the Spanish-American War, averse to formal colonialism. The principal contribution of Hay, Rockhill, Knox, Straight, Reinsch, Hughes, and the other guardians of the door was to resolve the dilemma through a formula that enabled the United States to pursue an aggressively expansionist economic policy, while avoiding the taint of political domination and the burdens of territorial administration. It was a clever solution that, whatever its immediate failures in China, established the pattern for many decades of American foreign policy.

William Appleman Williams and his followers recognized the pattern and elaborated an "open door interpretation" of U.S. foreign policy that remains strongly influential more than forty years after Williams published the foundational text The Tragedy of American Diplomacy. In the writings of these scholars, the open door metaphor not only survived its eclipse in the 1930s Far East, it emerged as one of the most enduring interpretive concepts in the study of U.S. foreign relations. The interpretation remains powerful mainly because it provides a persuasive answer to one of the questions at the heart of the study of American foreign relations: How is it that the United States could be the world's most vociferous opponent of colonialism yet also a remarkably interventionist nation that would, in the second half of the twentieth century, control one of the largest empires, albeit of a new and different sort, that the world had ever known? Williams, Walter LaFeber, Thomas McCormick, and others suggest that the promotion of free trade enabled American capitalists to have it both ways. Under the banner of high-minded principles that supposedly enhanced the interests of all nations, they could justify all sorts of political, economic, and military action to prop up a system that in practice enabled the United States to reap more than its proportionate share of the profits.

The open door interpretation remains influential for two additional reasons. First, it provides a neat, totalizing explanation for more than a century of American history stretching back into the period of continental expansion. For advocates of the open door interpretation, the quest for overseas economic opportunity was simply an extension of the westward push that extended the U.S. market to the Pacific Ocean. With the closure of the frontier in the 1890s, the interpretation suggests, U.S. businesses turned their attention to overseas markets and justified the expansion of American influence through the same ideology of open markets and individual opportunity that
had prevailed at home. Constant penetration of new markets was, in this view, essential to the health of an American capitalist system that depended on an ever-expanding economy to preserve social harmony in a nation characterized by vast inequities of wealth. According to the open door interpretation, American expansion in the 1890s, Wilson's appeals for an open global economy, and American determination to prevent the Sovietization of Eastern Europe in the late 1940s all stemmed from the same impulse to find and preserve markets for American industry and preserve domestic tranquility.

Second, the open door interpretation remains influential because it helps explain one of the most salient characteristics of twentieth-century international affairs, the tense relationship between the United States and much of the nonindustrial world. Americans, Williams and other argue, have persistently viewed their liberal principles as conducive to the development of the Third World. In practice, however, free trade has tended to concentrate wealth in industrial nations and to deprive poor countries on the periphery of control over their own economic circumstances. Increasingly, Third World peoples found themselves locked into subordinate roles as suppliers of raw materials and consumers of good manufactured elsewhere. "To many through the world," wrote Williams, "the Open Door Policy appeared to confront them with a door closed to their own progress." When nations attempted to break out of this unfavorable relationship and claim control over their own economies, the open door interpretation suggests, they confronted counterrevolutionary U.S. intervention aimed at restoring them to the integrated international economy dominated by Washington. During the Cold War, the pattern repeated itself in Iran, Guatemala, Cuba, Vietnam, Chile, Nicaragua, and many other places where the United States resisted the emergence of nationalist or leftist governments that threatened American economic privileges. The open door interpretation offers a power explanation for the trail of repression and blood left by American activity across the Third World.

An oft-quoted blue collar worker, questioned about international issues by pollsters in the 1940s, quipped: “Foreign Affairs! That’s for people who don’t have to work for a living.” Given the complexity of the world order that emerged in the aftermath of World War II and the long hours that most working people labored, such sentiments are easy to understand. Yet since the mid-nineteenth century, when national labor unions emerged in the United States, many workers, grassroots labor activists, and trade union leaders have believed that political relations among nation states, transnational economic developments, and international labor migrations should be of vital concern to the American working class. U.S. labor groups and trade unions have sometimes sought to exercise international influence through international labor organizations or by encouraging transnational forms of collective action among workers. At other times, they have focused primarily on influencing U.S. foreign policy and economic expansion. In an effort to wield power in Washington, D.C., labor groups have typically engaged either in traditional forms of interest group lobbying or have participated in evolving corporatist power-sharing arrangements among business, trade union, and government leaders within the executive branch of government. Dominant trade union groups such as the American Federation of Labor and Congress of Industrial Organizations that pursued international influence both by participating in international labor organizations and by trying to forge a corporatist partnership with business and state representatives in promoting U.S. foreign policy goals often discovered that these two avenues to power led in different directions.

THE EARLY LABOR MOVEMENT AND INTERNATIONAL LABOR ORGANIZING

The first systematic efforts to encourage international cooperation between trade unions most likely occurred in Europe in the 1830s and 1840s. Labor leaders there sought to develop alliances with trade unions from other countries for reasons that would be familiar to workers today. In part, suggests Lewis Lorwin in his pioneering work The International Labor Movement (1953), they sought to prevent the importation of strikebreakers from other countries. They also feared competition from foreign sweatshop labor and believed it was in their best interest to try to raise workers’ wages throughout Europe. Some anticipated the increasing concentration of international capital and sought to develop alliances with foreign workers in the same industry so as to prevent international financiers and capitalists from playing workers in one country against those in another. Finally, some unions initiated contacts with unions from other countries for the practical reason that they needed financial assistance for their organizing or strike activities.

Most of these early efforts at international labor cooperation were suppressed by European governments or came to naught. It was only in 1864 that European workers successfully formed the International Working Men’s Association, later known as the First International. Among the most influential members of the organization was Karl Marx, who wrote the preamble and rules, as well as an inaugural address that included the now famous appeal “Workers of all countries, unite!” The organization grew slowly at first, and national delegates expressed a wide variety of viewpoints about questions of capitalism and collective ownership. As the organization expanded, however, it became increasingly dominated by Marxists. Eventually, an internal struggle developed between Marx and the Russian revolutionary and writer Michael Bakunin. After Bakunin was expelled, the First International’s headquarters were transferred to New York City, where it declined rapidly and was finally dissolved at a meeting of the General Council in Philadelphia in 1876.

How American workers responded to these early European efforts at international labor coop-
eration is not entirely clear. The First International boasted some twenty-seven American sections representing several hundred U.S. workers, mostly immigrants. The short-lived National Labor Union, under the leadership of William Sylvis, also announced its attention to affiliate with the First International and to adhere to its principles. But no record has been unearthed of an official relationship between the First International and the more predominant Knights of Labor, which was created in 1869 and reached a peak membership of some 750,000 workers in the mid-1880s. Indeed, some Knights of Labor activists and leaders adopted a hostile attitude toward socialists like those who dominated the First International. Thus, historians have often treated the Knights as a uniquely American organization that developed in relative isolation from the European labor movement. They emphasize the importance of an ideology of labor republicanism within the Knights of Labor that drew on American political traditions rather than on European socialist and Marxist doctrines emphasizing international labor solidarity.

But the Knights may not have been as isolated from European political currents and internationalist activities as previously assumed. Leon Fink and Kim Voss note parallels between the Knights of Labor’s condemnations of wage labor and emphasis on worker cooperatives, and the socialist critiques and programs promoted by European labor activists. They suggest that the Knights’ emphasis on inclusive membership and broad-based, working-class solidarity across nationality lines was similar to that of other industrial labor organizations developing in Britain and France at the time. Eric Foner notes the importance of immigrants within local chapters of the Knights of Labor and illuminates their role in promoting an ethos of international labor solidarity upon which future generations could draw.

Particularly important, suggests Foner, was the influence of Irish-Americans within the Knights of Labor, for they brought with them an interest in the land question in Ireland. When Knights of Labor chapters faced opposition from hostile clergy and local governments in areas such as the anthracite coal regions of Pennsylvania, Knights of Labor activists often met covertly under the guise of local Irish Land League chapters. A creative cross-breeding of Irish nationalist and American labor reform ideas resulted and frequently led workers to conceptualize their local trade union struggles as part of a worldwide struggle between the owning and producing classes. Terence Powderly, Knights of Labor “Grand Master Workman,” embodied the interconnections between class and ethnicity in shaping the international orientation of some Knights of Labor activists. Born in Carbondale, Pennsylvania, of Irish immigrant parents, Powderly became active in both Irish and labor activities as a young man. During his tenure as grand master of the Knights of Labor, Powderly also served as vice president of the Irish Land League Council. Inevitably, the two causes became intertwined as Powderly used Knights conventions to publicize the linkages between the Irish land struggle and the class struggle in the United States. Although Knights of Labor activists advanced few actual international programs and developed few substantial ties with foreign labor movements, they thus sowed fertile ground for future immigrant labor activists who would develop an international labor vision that clashed fundamentally with that of the American Federation of Labor.

**EARLY INTERNATIONAL POLICIES OF THE AMERICAN FEDERATION OF LABOR**

Founded in 1886, the American Federation of Labor (AFL) was comprised predominantly of craft unions—many of whom had fled the Knights of Labor—that emphasized improving economic conditions for workers rather than eliminating or fundamentally transforming industrial capitalism. Although the national organization claimed to represent all workers, many constituent unions were quite exclusionary in practice, primarily made up of skilled, white male workers. Despite its narrow focus and membership base, the fledgling AFL was not opposed to international labor cooperation. When an international conference of labor leaders convened in Paris in 1889 to create the Second International, AFL President Samuel Gompers solicited its support for the AFL’s campaigns on behalf of an eight-hour day. The congress responded favorably and organized May Day labor demonstrations in conjunction with the AFL’s eight-hour-day rallies in the United States. The demonstrations marked the beginning of the international trade union tradition of May Day labor celebrations and rallies.

But in the decade following the Paris Congress, the AFL remained largely aloof from the Second International. In part, the AFL failed to
develop a relationship with the Second International for pragmatic reasons. Still in its infancy, the AFL could not always afford to send delegates to European conferences. The organization was also preoccupied during its early years with strike activity. Perhaps most importantly, both American and European socialists became increasingly critical of the AFL's conservative orientation. When Gompers tried to arrange an international labor conference at the World's Columbian Exposition in Chicago in 1893, only the British Trades Union Congress responded favorably. Gompers subsequently canceled the conference and, while encouraging the exchange of fraternal delegates between the British Trades Union Congress and the AFL, largely eschewed contacts with European socialist and labor leaders.

AFL interest in European labor affairs revived only after 1904, when many individual unions within the AFL began to affiliate with international trade secretariats. These organizations were comprised of national trade unions from the same industry that came together to promote their international interests. For example, miners from France, Germany, and Austria created the International Miners' Federation in 1890. Constituent AFL unions became interested in these secretariats when they realized they could provide valuable information about international conditions in their industries and coordinate activities that would prevent businessmen from importing strikebreakers from other countries. Among the AFL unions that joined secretariats between 1904 and 1908 were the miners, molders, painters, shoemakers, lithographers, bakers, and brewers.

As more AFL unions joined their secretariats, Gompers in turn became more interested in joining the International Secretariat of National Trade Union Centers, which had been formed in 1903 at the behest of leaders of the international secretariats who sought an international trade union organization that would be independent of the Second International. Gompers attended one of its conferences in 1908, and the AFL convention subsequently voted to affiliate with the organization. The AFL was an active member of the International Secretariat of National Trade Union Centers between 1910 and 1913 and successfully promoted an initiative to have the organization’s name changed to the International Federation of Trade Unions (IFTU). After failing in their efforts to use international labor organizations to prevent war in 1914, Gompers and other AFL leaders confidently waited for an end to the conflict, assuming that the AFL would play a predominant role in international labor organizations following the armistice.

The AFL's influence in postwar labor organizations, however, would ultimately be undermined by the corporatist role it had tried to carve for itself in shaping U.S. foreign policy during the previous two decades. The first U.S. foreign policy issue in which the AFL took a systematic interest was the McKinley administration's policies toward the Cuban rebellion against Spain in the 1890s. Like many groups in the United States, the AFL lobbied Congress to recognize Cuban belligerency. A majority of representatives from the constituent unions of the AFL apparently believed it was their responsibility to promote liberty for fellow workingmen. In the minority within the AFL, suggests Delber McKee, were those who warned that labor should avoid committing itself on the question because it might be encouraging a U.S. war with Spain. War, they argued, always disproportionately hurt the workingman, because they were the ones who fought and died. Fewer still were labor leaders like Andrew Furuseth of the Seamen's Union, who questioned whether business and government leaders supporting the Cubans might have imperialist motives of their own. As Furuseth explained, the question over whether to support Cuban belligerency was one of “whether the New York speculator or the Spanish capitalist should skin the Cuban workingman.”

AFL President Gompers, for his part, supported proposals to recognize Cuban belligerency but opposed McKinley's decision to declare war against Spain. Yet the AFL did nothing to oppose U.S. mobilization for war. Instead, Gompers focused on opposing annexation of Spanish territories at war's end. Gompers highlighted his reasons for opposing empire in an article entitled “To Free Cuba, Not to Chineize [sic] America Was the War Begun.” In part, as McKee has demonstrated, Gompers shared the racial assumptions of many white trade unionists of his day and feared that annexing territories would enable “semitribarbaric laborers” to immigrate to the United States and undermine American labor standards. As a former cigar maker, Gompers also sought to prevent goods like cigars produced by sweatshop labor in Cuba and the Philippines from competing with American products in the U.S. market. Finally, the AFL president also hoped to preempt possible American business flight to these low-wage areas by stopping U.S. annexation.
But after the Senate approved a peace treaty with Spain that resulted in the formal annexation of the Philippines, Gompers came to what McKee calls a “tacit compromise” with the State Department. The AFL president toned down his opposition to U.S. imperial policies and even endorsed temporary ward status for the Philippines and Puerto Rico in return for government and business acquiescence in an AFL campaign to build labor unions in these areas. In rationalizing his policies, Gompers argued, “We realized that in order to protect our standards within the states we must help the Island workers to develop their own higher political, social and industrial problems [sic].”

Gompers and the AFL thus began to move away from a policy of opposing government and business imperialism and toward a corporatist partnership between business, labor, and the state in promoting American economic expansion. Gompers and other AFL leaders reasoned that if they could raise labor standards in the new island protectorates, then U.S. imperial control over them might actually benefit U.S. workers. Goods produced there would not undersell those made by U.S. workers for domestic markets and American businessmen would not be tempted to establish low-wage factories on the islands. On the other hand, wealthier island workers might welcome consumer goods from the United States, thereby promoting American economic growth in ways that benefited U.S. business and U.S. workers alike. The islands might also prove to be important strategic outposts for securing access to other markets or raw materials deemed vital to the health of U.S. industry. Lost in such reasoning, of course, were the aspirations of indigenous working-class populations in the islands for economic, political, and cultural independence.

Meanwhile, a more amicable alliance had evolved among labor, business, and state leaders to resolve domestic economic problems during the early twentieth century. In 1900 the National Civic Federation was formed to encourage a “community of interest” among the three groups that would reduce industrial strife and promote the development of a healthy capitalist economic system in the United States. Upon assuming office, President Woodrow Wilson built on the initiatives of the National Civic Federation by creating the Department of Labor and the Commission on Industrial Relations to oversee industrial arbitration and to make recommendations for promoting harmony and efficiency in industry.

But this cooperative agenda—to encourage industrial peace at home and American expansion and hegemony abroad—would fully blossom only during World War I.

WORLD WAR I

For the first several months of the war, the American Federation of Labor—like most of the American public—remained adamantly opposed to U.S. intervention in the conflict. But in 1916, Gompers began to actively support the Wilson administration’s preparedness campaigns. Gompers, like Wilson, was alarmed by Germany’s use of submarine warfare and believed the United States might need to enter the war to stop German aggression. Equally significant, Gompers had watched with fascination the evolving wartime partnership between British labor and the government during the early months of the war. He anticipated that by supporting Wilson’s preparedness policies he might gain a voice for the AFL in executive branch defense councils comparable to that which British labor had won for itself. Gompers’s reasoning proved correct: in 1917 he was appointed to the Council of National Defense, an organization created to prepare the country for possible involvement in the war. Gompers subsequently formed a labor subcommittee within the council that brought together representatives from business, labor, and the government to study questions of industrial coordination and to draw up guidelines on wages, hours, and mediation in war-related industries.

When a U.S. declaration of war against Germany seemed likely in March 1917, Gompers called a special labor assembly of the leaders of the AFL’s constituent unions and secured its support for an AFL pledge to support any future U.S. war effort. The assembly was widely criticized by local AFL activists, socialists, and some members of the syndicalist Industrial Workers of the World, who charged that the labor assembly was not democratically constituted. They demanded that the AFL have a referendum vote of its entire membership to determine if workers actually favored a U.S. declaration of war against Germany. But Gompers ignored such militant proposals and instead used the AFL’s patriotic pledge of support for the government as a bargaining chip to gain more representation for AFL leaders within emerging wartime agencies and councils created to mobilize the country for war. He antic-
ipated that the defense agencies, far from being temporary, would lay the basis for a new bureaucratic order in Washington after the war in which the AFL would play a prominent role.

Gompers also sought to use his new leverage within the Wilson administration to expand the AFL's diplomatic influence. He obtained AFL representation on the Root Commission, a council of emissaries whose purpose was to travel to Russia to encourage it to stay in the war. He also secured the Wilson administration's support for two AFL labor commissions to go to Europe to win support among discontented European labor movements for Wilsonian war aims and to thwart European trade union efforts to plan an interbelligerent labor conference designed to negotiate an early end to the war. The AFL labor missions, as Elizabeth McKillen has shown, were greeted with hostility by European labor leaders who complained that its members behaved "as if their mission was to convince the misguided foreigners how wrong it is to differ with Americans." Labor and socialist leaders, moreover, continued to promote an interbelligerent labor conference despite the AFL's opposition. Although their plans would ultimately be stymied by their own governments, the issue provoked a profound split between the AFL and European labor movements.

That chasm widened during the Paris Peace Conference. Both European labor groups and the AFL at first supported a plan for an international labor congress to be held at the same time and place as the conference. But when France's premier, Georges Clemenceau, refused to allow labor leaders from the defeated countries on French soil, European labor leaders changed the location of their meeting to Bern, Switzerland. Gompers and other AFL leaders boycotted the Bern meeting and instead traveled to Paris to be in close contact with the leaders of the Paris Peace Conference. In return for his loyalty, Wilson appointed Gompers to head the International Labor Legislation Commission, which in turn created the International Labor Organization, a labor adjunct to the League of Nations. The organization clearly bore the imprint of Gompers's corporatist thinking about labor's role in international affairs. Far from being purely an organization of trade union representatives, the International Labor Organization was designed to consist of national delegations comprised of representatives from business, labor, and government. The organization was empowered to create international labor legislation governing such issues as hours, working conditions, and the protection of women and child workers, which individual states could either accept or reject.

Not surprisingly, the Bern labor conference reacted with hostility to the creation of the International Labor Organization and drafted their own international labor charter. However, in an ironic twist of fate, European labor activists became dominant in the International Labor Organization after the U.S. Senate rejected the Treaty of Versailles, thereby preventing U.S. membership in the League of Nations or its adjuncts. Meanwhile, the AFL distanced itself from the newly reconstituted International Federation of Trade Unions, which committed itself to international collective labor action after the war. The AFL also bitterly opposed the activities of the Red International of Trade Unions, created by Russian communists and their allies to promote world revolution. By the early 1920s, Gompers's vision of the AFL as a partner with business and government in promoting U.S. foreign policy had thus produced a seemingly irreconcilable split between American and European labor.

The AFL's diplomatic programs also spurred profound divisions within the ranks of labor at home. The greatest opposition to the AFL's postwar international agenda came not from the Socialist Party or the Industrial Workers of the World, both of which had been greatly weakened by wartime persecution and were ridden with factionalism at war's end, but from militant AFL-affiliated city labor councils and local unions with strong ties to immigrant communities. Leading the rebellion was the Irish immigrant John Fitzpatrick, president of the powerful Chicago Federation of Labor (CFL) and the Labor Bureau of the American Commission on Irish Independence. Following in the tradition of Terence Powderly of the Knights of Labor, Fitzpatrick drew on the intellectual heritages of both the American labor movement and Irish nationalist movement in trying to understand the global condition of workers. In contrast to Gompers, Fitzpatrick bitterly opposed all forms of imperialism, arguing that imperial control by industrially developed countries of underdeveloped hinterlands buoyed the power of the capitalist class at the expense of workers. Fitzpatrick and his colleagues also believed that war was the inevitable by-product of the capitalist quest for markets and natural resources. They energetically opposed U.S. intervention in World War I until 1917, when the AFL's declaration of labor loyalty made continued
agitation strategically unwise. The CFL, however, remained critical of the AFL’s wartime partnership with the Wilson administration, believing it hindered labor’s advancement both at home and abroad, and launched the Farmer-Labor Party movement following the armistice.

Although an electoral failure, the Farmer-Labor movement, as McKillen has shown, served as a haven for AFL dissidents from city labor councils and trade union locals across the country that opposed Gompers’s and Wilson’s international programs. Along with the powerful Chicago Federation of Labor, particularly important in shaping the movement were the Seattle Central Labor Council, New York Labor Union, delegates from locals of the United Mine Workers and the railway brotherhoods, and representatives from a host of small-town labor councils that had created local labor parties in the aftermath of war. In contrast to Gompers and the AFL executive council, party advocates bitterly attacked the Versailles peace treaty, arguing that its terms were dictated by the leading imperialist powers on behalf of international capital. Labor Party leaders opposed the
League of Nations on the grounds that it would “not be satisfied with a league of imperialist governments dominated by an international league of money bosses to cement an international control of industry by a small group of men who manipulate the bulk of the world’s wealth.” Rather than seeking token representation for labor in the league-sponsored International Labor Organization, Labor Party advocates sought representation for workers in international tribunals “in proportion to their numbers in the armies, navies, and workshops of the world.” Representatives from the Farmer-Labor Party also expressed sympathy with the Irish, Mexican, and Russian revolutions and promoted an anti-imperialist agenda for the United States in Latin America and Asia.

Since many of the activists within the Farmer-Labor Party also belonged to immigrant nationalist groups, their ideas received wide circulation and swelled the tide of opposition to the peace treaty and to the Wilson administration. That Gompers viewed such a rebellion within the ranks as a threat to his efforts to promote both a corporatist international role for labor and a Wilsonian blueprint for a new world order was evidenced by the energy he devoted to suppressing the movement. Yet it was not Gompers who succeeded in destroying the movement but communist activists within the Chicago Federation of Labor such as William Z. Foster, who outmaneuvered Fitzpatrick and won control of the executive council of the Farmer-Labor Party. Subsequently, Fitzpatrick and most other local AFL activists disavowed the party and officially renewed their commitment to the AFL’s supposedly nonpartisan politics. With the Farmer-Labor Party died a unique vision of U.S. labor’s international role that emphasized the responsibility of U.S. workers—as heirs to traditions of American labor republicanism and a diverse array of immigrant labor ideologies—to lead in the battle against international capitalism and international organizations that reified imperial forms of control by industrial-creditor nations over their less economically developed counterparts.

**THE INTERWAR YEARS**

With internal critics silenced, Gompers and his successor, William Green, were free to devote the AFL’s international energies in the 1920s to developing a leadership role for U.S. labor in the Western Hemisphere—a renewed interest that in part was inspired by the AFLs alienation from European labor diplomacy. Unable to shape either the International Federation of Trade Unions or International Labor Organization in ways it deemed constructive, the AFL instead chose to concentrate after 1920 on exercising influence over its immediate neighbors. Economic issues also played a role: AFL leaders recognized that American business was expanding rapidly throughout the hemisphere and that immigrants from Canada and Latin America were swelling the U.S. workforce. Since many AFL unions had already established strong footholds in Canada by World War I, AFL leaders primarily focused on encouraging better relations with Latin American labor movements. Their avenue to influence was the Pan American Federation of Labor, created in 1918 with secret financial aid from the Wilson administration. The Pan American Federation sought to raise labor standards in Latin America, curb abuses of labor by international capitalists, and promote the growth of unions in the Americas. Gompers and the AFL also wanted to use the organization to resolve immigration problems between Mexico and the United States and to give legitimacy to corporatist-oriented labor organizations such as the Confederación Regional Obrera Mexicana at the expense of the Industrial Workers of the World and other anarchist, communist, or socialist labor movements and organizations, which were winning converts in Latin America and within the Mexican-American community in the U.S. Southwest.

Although the Pan American Federation and the AFL sometimes condemned U.S. military interventionism within Latin America, AFL delegates often asserted that the U.S. presence in Latin America was primarily a beneficial one. Significant within the Pan American Federation conventions, as Sinclair Snow has shown, were debates over the Monroe Doctrine, with delegates from the AFL defending the doctrine as one that protected Latin American countries from greedy European powers, and many Latin American trade unionists condemning it as an instrument of U.S. imperialism. The AFL’s frequent support for U.S. foreign policy and predominant role in the Pan American Federation fostered much criticism among radical Latin American trade unionists, who came to view it as a tool of U.S. imperialism. The organization declined rapidly as more left-leaning labor organizations gained influence in Mexico and Latin America in the mid- and late 1920s.
Largely isolated from their European and Latin American counterparts, the AFL at first promoted a nationalist response to the Great Depression. The organization resisted Franklin D. Roosevelt's efforts to expand trade through reciprocal agreements with other countries and instead suggested that the best way to end the depression was by implementing a thirty-hour work week. Mandated shorter hours, argued AFL leaders, would force employers to hire unemployed workers and lead to increased spending. To further stimulate the economy, many AFL unions recommended increased tariff protection for some industries and even promoted William Randolph Hearst's "Buy American" campaigns. Yet the AFL's isolationist impulse proved temporary. German and Japanese aggression in the 1930s, as well as challenges from the newly created Congress of Industrial Organizations (CIO), forced the AFL to take a renewed interest in international affairs. In 1933 the AFL instituted a boycott of German goods and supported Roosevelt's ban on strategic materials to Italy. Although AFL leaders continued to support the neutrality laws and to oppose U.S. military involvement overseas throughout the 1930s, it reaffiliated with the International Federation of Trade Unions in 1937. In part, the AFL sought to support antifascist forces in Europe. But equally important it hoped to prevent the organization from admitting either the CIO or labor delegates from the Soviet Union.

The symbolic origins of the CIO lay in United Mine Workers President John L. Lewis's historic right-cross punch to the chin of William Hutcheson of the Carpenters Union during an AFL convention in 1935. The fistfight occurred following a heated debate in which Lewis attacked the AFL for failing to take advantage of the depression and Roosevelt's labor policies to organize the unorganized. Following the 1935 convention, Lewis met with other disaffected leaders to create the Committee for Industrial Organization, which would spawn the Congress of Industrial Organizations. Although the AFL had many semi-industrial unions by the 1930s, leaders of the new CIO objected to the slow rate at which the AFL organized unskilled workers and to the continued dominance of craft unions within the organization. Capitalizing on rank-and-file labor militance in industries like rubber, automobiles, and steel, the CIO organized mass industrial unions that incorporated most grades of workers within particular industries. The CIO became famous for its militant tactics, scored decisive victories for workers in numerous industries, and vied with the AFL for leadership of the American labor movement.

Less well known than the domestic quarrels between the AFL and CIO were their conflicts over foreign policy. In contrast to the AFL's heavy-handed "Monroe Doctrine" for labor, CIO leaders preached nonintervention in the internal affairs of Latin American unions. When pursuing negotiations over labor issues, moreover, the CIO chose to bargain with leftist and often communist-led organizations like the Confederación de Trabajadores de América Latina rather than with AFL-inspired organizations such as the Inter-American Labor Union. Such activities won the CIO much goodwill among Latin American trade unionists, as did its decision to endorse Mexican President Lazaro Cardenas's decision to expropriate British and American oil fields in 1938. By contrast, AFL leaders argued that Cardenas's nationalization programs were a violation of the right to private property. The CIO also parted ways with the AFL in its willingness to envision the Soviet trade union movement as a part of future international labor organizations.

The top leaders of the CIO hierarchy, such as Sidney Hillman, Philip Murray, James Carey, and Walter Reuther, were all noncommunists who had battled communists during their ascent to power. Yet all were willing to work with communists at home when it supported their purposes and to negotiate with communist labor leaders abroad because they believed their support to be critical to the defeat of fascism and to future international labor cooperation. Such sentiments were comparable to those of the European leaders of the International Federation of Trade Unions, who had battled the Red International Labor Union in the 1920s but who saw the need for a popular front against fascism in the 1930s. By contrast, the AFL remained vehemently anticom-
II again led western European and CIO union leaders to speculate about the value of a postwar labor organization that would include the communist world.

WORLD WAR II AND THE WORLD FEDERATION OF TRADE UNIONS

Replicating a pattern that developed during World War I, many European labor movements as well as the AFL and CIO worked closely with their respective governments to promote efficient wartime economic planning and aid their countries’ war efforts. The British Trades Union Congress also sought to promote the war effort (and to preempt British communists) by forming the Anglo-Soviet Trade Union Committee, designed to encourage cooperation and solidarity between unionists in the two countries. The British Trades Union Congress subsequently invited the Americans to join the Anglo-Soviet Trade Union Committee, but these efforts failed because of the unwillingness of the AFL to work with either the Soviets or the CIO. In early 1945, however, the British trade union leaders hosted a labor conference designed to create a new international labor organization that would include the Soviets. The AFL refused to attend, but the CIO eagerly sent delegates, and in October 1945 the new World Federation of Trade Unions (WFTU) was created.

This new federation embodied the hopes of a generation of trade union leaders for a substantive role for labor in international affairs. Most did not foresee for it a revolutionary role comparable to that sometimes espoused by the International Federation of Trade Unions. Rather, suggests Victor Silverman in Imagining Internationalism (2000), the leaders of the World Federation were labor bureaucrats who “envisioned a corporative world—one ruled by global institutions that would represent all elements of society.” Yet the corporatist vision of these leaders differed in important ways from that of Samuel Gompers during World War I. Gompers had envisioned the International Labor Organization comprised of national delegations representing equal numbers of business, labor, and government officials. By contrast, World Federation leaders believed it was vital that labor have its own organization that could speak independently for world labor and represent the world’s working classes within the United Nations.

The drive for a powerful labor international that included all significant elements of world labor was apparently given momentum by an increased spirit of internationalism that pervaded working-class life in the major democracies after 1941. Silverman suggests that in Britain the war fostered a greatly increased awareness and concern for foreign relations among workers and argues that a “vague sympathy for the Soviet ‘experiment’ grew into tremendous enthusiasm for cooperation in reordering the world.” Because the working-class population in the United States was more diverse than that of Britain, it failed to develop a comparable consensus on internationalism or on cooperation with the Soviets. Nonetheless, many American workers had come to feel vaguely sympathetic toward a new labor internationalism by war’s end. As one union carpenter cited in Silverman explained, “We can’t stay on our side of the pond anymore. It’s one world now and we got to go in and do our share. The Union’s taught me that. Workers everywhere want it fair for all.” In contrast to their British counterparts, however, many American workers—especially first- or second-generation immigrants from Eastern Europe—were distrustful of the Soviets. Yet perhaps because of their long experience with red-baiting in the unions, workers were initially slower to embrace the Cold War than wealthier Americans. The lack of a Cold War consensus about America’s postwar role within the working class in turn bought time for CIO leaders to experiment with a reordering of international labor politics within the World Federation.

In addition to supporting the federation’s major efforts to gain a role for itself within the United Nations and to encourage cooperation between communist and noncommunist trade unions, the CIO took the lead in developing the federation’s colonial department. In contrast to many European trade union leaders, the CIO promoted independent trade unions in colonial areas and supported their efforts to gain representation in the federation. Even French communists within the organization, for example, battled CIO representatives over the question of representation for African labor, insisting that the French trade union delegates to the federation already represented workers from French possessions in Africa. Of course, CIO leaders could sometimes be naive about their own country’s imperial record, as when James Carey insisted that U.S. rule in the Philippines had been entirely benevolent and designed to give democracy to the Filipinos. CIO leaders, moreover, embraced a Rooseveltian faith in the virtues of free trade that
sometimes blinded them to the dangers of economic imperialism. Nonetheless, Silverman suggests that the CIO’s defense of colonial rights within the federation earned it popularity in much of the underdeveloped world and offered hope that the new organization might serve the interests of Third World labor.

But several factors ultimately undermined the federation. The AFL’s Free Trade Union Committee collaborated with the State Department to weaken the organization by sowing discord between communist and noncommunist unions in Europe. As Peter Weiler has shown, the AFL also successfully worked to prevent international trade secretariats from affiliating with it. Without the trade secretariats, the task of coordinating labor activities within individual industries proved impossible. Meanwhile, both the CIO and AFL became increasingly vulnerable at home following passage of the Taft-Hartley Act in 1947, which required that all union leaders sign affidavits pledging that they were not Communist Party members. The predominantly noncommunist CIO leadership at first resisted but soon chose to purge communists and communist-led unions from their ranks. Their support for purges was likely motivated both by a desire to consolidate their own leadership positions within their unions and to safeguard their unions from government persecution. Desperate to appear loyal in the face of the anticommunist hysteria sweeping the nation, the CIO also embraced the Marshall Plan and, along with other Western unions, asked the World Federation to endorse it. As Weiler wrote, the “introduction of the Marshall Plan into the WFTU brought the Cold War directly into the international trade union movement.” Predictably, the Soviets opposed an endorsement of the Marshall Plan and instead advocated neutrality on the issue. Leading Western union movements with the exception of the French Confédération Générale du Travail and Italian Confederazione Generale Italiana del Lavoro then withdrew from the federation in 1949 and, in concert with the AFL, created the International Confederation of Free Trade Unions.

COLD WAR IN THE INTERNATIONAL LABOR MOVEMENT

One of the primary goals of the International Confederation of Free Trade Unions (ICFTU) was to support people trying to free themselves from totalitarianism. Silverman has revealed that CIO leaders, in joining the new international, expressed hope that the organization would support neither “Stalin” nor “Standard Oil” but a “broad democratic middle where people may fight to have both bread and freedom.” The CIO placed faith, in particular, in the capacity of the organization to assist in implementing the Marshall Plan in ways that would benefit European workers. True to their New Deal roots, many CIO leaders anticipated that the Keynesian spending fostered by the Marshall Plan would stimulate European economies. The ICFTU, meanwhile, would encourage labor-management cooperation in increasing productivity and presumably both European workers and business owners would benefit.

Workers in many European countries, however, failed to profit from the Marshall Plan to the extent that AFL and CIO leaders envisioned. The activities of the AFL, and to some degree the CIO, in undermining communist-led unions and in encouraging splits within them, helped to weaken the labor movements in many countries and prevented them from claiming an increased share of their nation’s wealth in the postwar era. For example, Ronald Filippelli and Federico Romero have demonstrated that in Italy the AFL worked in collaboration with the U.S. State Department to encourage discord between communists and non-communists within the Confederacion Generale Italiana del Lavoro, or Italian General Confederation of Labor. Subsequently, both the AFL and CIO supported the formation of rival free trade union organizations in Italy that were devoid of communist influence. While some divisiveness within Italian labor circles would likely have occurred regardless of American meddling, the AFL and CIO nonetheless played some role in making the Italian labor movement one of the most faction-ridden and weakest in Europe by the 1950s. Thus, while Italy experienced the miracolo italiano, or the Italian economic miracle, in the aftermath of Marshall Plan spending, Italian workers remained among the lowest paid in the developed world. As European workers became increasingly dissatisfied with the fruits of the Marshall Plan, European trade union leaders within the ICFTU challenged many American initiatives and a greater balance emerged between the Europeans and Americans in the organization. (In 1969, the by-then merged AFL-CIO withdrew from the ICFTU because it believed that Europeans within the organization had become soft on
The AFL-CIO rejoined the ICFTU only in 1984). The AFL and CIO's early Cold War foreign policy activities also produced mixed results in occupied Japan and in Latin America. As Howard Schonberger has demonstrated, American labor officials played an important role in the U.S. occupation of Japan because U.S. policymakers hoped to build a strong AFL-styled union movement there to check the power of traditional business and political elites whom they believed responsible for Japanese aggression during World War II. A powerful Japanese trade union movement, moreover, would force Japanese Zaibatsu corporations to share some of their profits with workers and lead them to redirect some trade exports toward their domestic markets and away from other markets where they might compete with U.S. goods. In 1945 occupation officials sponsored a trade union law that established the legal framework for Japanese workers to organize unions, bargain collectively, and strike. The Japanese labor movement subsequently grew exponentially and by 1949 represented more than half of all Japanese workers.

Charged with directing the growth of the Japanese labor movement in ways the U.S. government deemed constructive was the Labor Division of the occupation bureaucracy. The Labor Division always contained AFL representatives, and in 1947, James Killen, vice president of the International Brotherhood of Pulp, Sulphite, and Paper Mill Workers within the AFL, was appointed chief of the division. Occupation leaders sought Killen's help because they feared the Japanese labor movement was drifting to the left and were concerned about the militant tactics adopted by Japanese unions. Killen sought to counter the influence of communists by establishing anticomunist cells called mindo within Japanese unions. Yet Killen was also critical of the occupation bureaucracy for not stemming the tide of inflation, which undermined any gains workers achieved, and for its decision to remove government workers from the trade union movement. Eventually, convinced that occupation leaders were more concerned with weakening the Japanese labor movement than with eliminating communist influence, Killen resigned, as did several members of his staff.

Nonetheless, AFL and CIO leaders cooperated with occupation officials in 1949 and 1950 in encouraging the development of an anticommunist labor federation in Japan called Sohyo, which they hoped would affiliate with the International Confederation of Free Trade Unions. But much to the chagrin of AFL and CIO leaders, Sohyo did not affiliate with the ICFTU en bloc but instead allowed individual unions to choose whether or not to affiliate. Thus, by 1954 only one-third of Japanese union members belonged to organizations that affiliated with the ICFTU. Even more problematic, Sohyo became one of the leading critics of U.S. foreign policy in Asia. Sohyo leaders, for example, persistently criticized the peace and security treaties proposed by the Americans for terminating the Japanese occupation because they did not include Russia and the People's Republic of China and because they did not remove U.S. military bases from Japan. Sohyo leaders also opposed the Korean War. By the spring of 1953, the AFL's Free Trade Union Committee had concluded that Sohyo was a puppet of the Kremlin.

Although its independent positions on foreign policy issues and increasingly militant tactics won it the admiration of many Japanese workers, Sohyo nonetheless failed to develop into a sufficiently strong and unified organization to act as a formidable counterweight to the power of Japan's large Zaibatsu corporations. Enterprise unions, or unions within one company, continued to flourish, helping to cement the loyalty of permanent workers to their companies. Meanwhile, many temporary workers remained without union representation altogether. The fragmented nature of Japan's labor movement undermined Japanese workers' efforts to gain a larger portion of business profits, thereby undermining domestic consumption and propelling the Japanese economy along an export-driven path. Thus, American labor's goals for postwar Japan were largely frustrated.

The AFL and CIO, meanwhile, also became very active in Latin America during the early Cold War. The interest of AFL and CIO leaders in Latin America stemmed not just from their anticommunist animus but from their belief that Latin America was a vital source of raw materials for the United States and an important market for U.S. industrial products. Thus, despite their early differences on Latin American policy, both AFL and CIO leaders supported a plan proposed by Secretary of State William Clayton in 1945 that called on Latin American nations to lower tariff barriers on U.S. goods in return for greater U.S. investment in extractive and agricultural industries. Ronald Radosh has demonstrated that many Latin American labor leaders, by contrast, opposed the
A plan, which they argued would result in “uncontrolled foreign capital investment in Latin America [which] will cause the deterioration of programs which look to the industrialization of the countries of Latin America, aggravating their great dependence on one crop culture and exports.” AFL and CIO leaders believed that communist labor leaders posed a particular threat to American economic expansion and in 1951 developed a Latin-American affiliate of the ICFTU known as the Inter-American Regional Workers’ Organization (ORIT). This organization was designed to promote anticommunism within the labor force of Latin America and to undermine support for the communist-led Confederation of Latin American Unions.

The AFL and ORIT became particularly involved in Honduras and Guatemala during the early 1950s. The U.S.-based company United Fruit played a dominant role in the economies of both countries. When impoverished Honduran workers struck United Fruit in 1954, demanding a 50 percent wage increase, the AFL and ORIT intervened. According to a Senate study cited by Al Weinrub, they soon “gained the leadership of the strike.” AFL President George Meany encouraged mediation by the State Department and the company quickly chose to settle. Honduran labor activists complained: “After the strike, the AFL-CIO, the U.S. Embassy and ORIT” descended upon them “like a plague,” gaining them special favors with employers in return for embracing AFL principles of collective bargaining. Meanwhile, left-leaning Jacobo Arbenz Guzman was elected president of Guatemala in 1950 and began a process of land reform that involved expropriating hundreds of thousands of acres of unused United Fruit Company land. Arbenz also enacted a generous labor code that gave trade unions unprecedented rights. Yet AFL President Meany protested the Guatemalan leader’s toleration of communists in the labor movement and the AFL and ORIT tried to establish a rival free trade union confederation in Guatemala. Arbenz’s government, however, arrested or deported many of the leaders of the new organization.

Following a private conference between Central Intelligence Agency Director Allen Dulles and Meany, the AFL president announced that U.S. labor supported a plan to come to a showdown with communists in Guatemala. In June 1954 an invasion force that included members of the free trade union confederation created by the AFL and ORIT crossed the border from Honduras and toppled the Arbenz government. As subsequent scholars would reveal, the coup was financed and carried out under the direction of the Central Intelligence Agency. The AFL immediately hailed the coup as a victory for democracy. By contrast, some CIO leaders initially opposed the coup, suggesting that communist penetration in Latin America had been greatly exaggerated and that State Department policy was really driven by its desire to give aid to the United Fruit Company. After Carlos Castillo Armas took power in Guatemala, AFL, CIO, and ORIT members traveled to Guatemala to reorganize the labor movement along anticommunist lines. Yet his government proved quite hostile to labor and thousands of unions were dissolved by the military regime. Union membership plummeted and Guatemalan workers remained impoverished. The Armas government, however, satisfied the U.S. government and corporate interests by returning expropriated United Fruit land. Activities like these helped to discredit ORIT. As the U.S. Senate conceded, “To many Latin Americans . . . ORIT is an instrument of the U.S. State Department.”

The AFL and CIO merged in 1955, and during the 1960s, to overcome its increasingly bankrupt image in Latin America and other underdeveloped regions, the AFL-CIO created three new labor centers: the American Institute for Free Labor Development (Latin America), the African-American Labor Center, and the Asian-American Free Labor Institute. The organizations’ goals were to provide education and training for trade unionists from underdeveloped countries. Yet some charged that paternalistic assumptions permeated the centers’ educational programs. As Nathan Godfried writes, American labor leaders active in the centers tended to assume a stage theory of trade union development comparable to the stages of economic development posited by Western economic theorists for developing countries. Trade union movements in the Third World were allegedly in a “primitive” stage of development and thus were preoccupied with unrealistic political and radical agendas. By contrast, mature unions from the developed world focused on plausible economic goals that could be obtained through peaceful collective bargaining. Thus, Everett Kassalow, director of the AFL-CIO’s Industrial Union Department, argued that American labor-education efforts would enable unions in the Third World to skip “long years of struggle which molded Western union leadership and membership.” But critics from Africa, Asia, and
Latin America countered that U.S. models were often unsuitable for conditions existing in other areas of the world.

More troubling than criticisms of the content of the centers’ educational programs were charges that the institutes worked with the Central Intelligence Agency and other U.S. government operatives to undermine democratically elected but left-leaning governments in Third World areas. The American Institute for Free Labor Development, in particular, was implicated in U.S. efforts to undermine the governments of Joao Goulart in Brazil in 1964 and of Salvador Allende in Chile in 1973. In both cases, the institute channelled money to conservative union groups that staged disruptive protests and strikes designed to paralyze their governments. Both Goulart and Allende were eventually overthrown in military coups supported by the United States. Former CIA agents such as Philip Agee subsequently disclosed that the institute was riddled with CIA operatives during these years and was a conduit for the agency. In contrast to the early Cold War period, the institute’s activities provoked disension within the U.S. labor movement as critics like Victor Reuther of the United Auto Workers concluded that it represented “an exercise in trade union colonialism.” By the 1980s many grassroots labor councils had also emerged to oppose U.S. policy in Central America and to criticize the AFL-CIO’s collaboration in these policies. The African-American Labor Center and Asian-American Labor Center operated in greater obscurity, but they too faced increasing criticism for allegedly collaborating with the CIA and other government agencies to promote U.S. Cold War objectives.

The Vietnam War also provoked opposition to the AFL-CIO’s international agenda during the 1960s and 1970s. George Meany, president of the organization during these years of turmoil, unstintingly supported the policies of the Lyndon Johnson administration, as did the regular yearly conventions of the AFL-CIO. The executive council, in defending the AFL-CIO’s hawkish position on the war, argued that to undermine support for U.S. military forces in Vietnam would be aiding the “communist enemy.” Newscasts left an indelible imprint on the American memory by featuring demonstrations of “hard hat unionists” supporting the war and sometimes attacking antiwar demonstrators. Yet opposition to the war within the labor movement began to build from at least 1967, when a National Labor Leadership Assembly for Peace met in Chicago. Chapters of the assembly spread to at least fifteen cities. Following the bombing of Cambodia, United Auto Workers President Walter Reuther condemned the widening of the war, as did a host of other labor unions and local and regional labor bodies. The dissenters ultimately failed to alter the prowar policies of the AFL-CIO, but they set the stage for revival of debate within the labor movement over the proper direction of the AFL’s international policies in an increasingly global economy.

**LABOR AND THE GLOBAL ECONOMY IN THE LATE TWENTIETH CENTURY**

Confronted with economic stagnation in the 1970s and 1980s, many labor activists began to question not only the morality of the AFL-CIO’s Cold War policies but also whether they protected the economic interests of American workers. Undergirding the AFL-CIO’s international agenda during the early Cold War lay the assumptions that a freer international marketplace would enable American capitalism to flourish and that some of the profits would trickle down to U.S. workers. Yet as industrial products from other countries—such as Japanese cars—flooded U.S. markets, many American workers faced layoffs and concessions and began to question whether a freer marketplace was really in their best interest. Thus, activists from the United Auto Workers launched a “Buy American” campaign and staged demonstrations at which they bashed Japanese cars with sledgehammers to demonstrate their point. UAW leaders sought to discourage the racism that surfaced in these campaigns but nonetheless jumped on the bandwagon of economic nationalism by promoting domestic content legislation. Such legislation took into account the global assembly line, recognizing that even cars bearing an American logo were often partly or wholly produced abroad, while some foreign companies had plants in the United States. The solution, believed UAW leaders, was to legislatively mandate that most cars sold in the United States have a 25 percent U.S. domestic content. Faced with widespread discontent among constituent unions, even the national leadership of the AFL-CIO began—in seeming contradiction to its earlier Cold War advocacy of a freer marketplace—to promote protectionist legislation.

Other labor activists, however, eschewed economic nationalism and believed that globalization instead called for a new kind of labor interna-
tionalism. The reform initiatives of these activists were given momentum by the fall of communism in the former Soviet Union and Eastern Europe.

With no Cold War to give legitimacy to their policies, Lane Kirkland and his advisers within the AFL-CIO increasingly found it difficult to defend the organization’s international strategies. The AFL-CIO hierarchy temporarily joined hands with reformers in 1992 and opposed the North American Free Trade Agreement. But as union membership continued to plummet and U.S. workers continued to feel themselves at the mercy of globalization, reformers gained ascendency within the AFL-CIO and in 1995 elected as president John Sweeney of the Service Employees International Union.

Sweeney revamped the AFL-CIO’s foreign policy apparatus, shutting down many of its existing overseas operations—including the CIA-linked American Institute for Free Labor Development. In its place the new American Center for International Labor Solidarity was created. The AFL-CIO’s International Affairs Department was placed under the direction of the reformer Barbara Shailor of the International Association of Machinists, an experienced transnational strategist in labor solidarity. Many credited the AFL-CIO’s new foreign policy team with helping to defeat the Clinton administration’s efforts to gain congressional ratification for special presidential authority to “fast-track” North American trade agreements in 1997.

Also propelling the U.S. labor movement along a new international track in the 1980s and 1990s were individual AFL-CIO unions that initiated negotiations and forged ties with Canadian and Latin American unions representing workers in comparable industries. The case of the United Mine Workers of America is one of the most striking. When the Exxon Corporation closed a coal mine in West Virginia in 1983 and instead invested in one in El Cerrejon, Colombia, the United Mine Workers eschewed economic nationalism and chose to help the Colombian miners union, SINTERCOR, in its fight for better wages for Colombia miners. Perhaps most notably, the United Mine Workers filed a protest in the early 1990s under the Generalized System of Preferences, a U.S. tariff system, which charged Exxon with violating internationally recognized workers’ rights. It also joined the International Metalworkers Federation in publicizing the plight of Colombian miners throughout the world. Significantly, SINTERCOR won substantial wage increases for Colombian miners in 1992 and 1993 without resorting to a strike. The United Mine Workers president, Richard Trumka, defended his union’s activities on behalf of Colombian miners by arguing that if the American labor movement did not help strengthen unions and improve working conditions in low-wage countries, then “the multinational corporations will attempt to lower our standards to the lowest international common denominator.”

Trumka’s arguments suggested that the American labor movement had come full circle in its approach to international affairs. During its earliest years, the AFL-CIO had tried to foster international labor cooperation in an effort to gain some influence for workers over global economic and political developments. Yet for most of the twentieth century, the AFL, and later the AFL-CIO, seemed to place greater priority on promoting national economic expansion and U.S. foreign policy goals than on fostering international labor solidarity through international labor organizations. The dangers of the AFL-CIOs nationalist approach became particularly apparent during the Cold War, when AFL leaders engineered the destruction of the World Federation of Trade Unions and often joined government officials, U.S. businesspersons, and CIA operatives in undermining left-leaning and communist labor movements and governments abroad. Such activities often had the long-term effect of weakening foreign labor movements and helping create low-wage economies that invited capital flight and encouraged a loss of U.S. jobs. As the twenty-first century dawned, however, many labor activists seemed reawakened to the need to continue the task of building a strong international labor movement that European workers had begun early in the nineteenth century.

For years the issue of international competition and cooperation in space has dominated much space exploration policy. Indeed, it is impossible to write the history of spaceflight without discussing these themes in detail. The early U.S. space exploration program was dominated by international rivalry and world prestige, and international relations have remained a powerful shaper of the program since. From the time of the creation of the National Aeronautics and Space Administration (NASA), all of its human spaceflight projects—the Apollo program, the space shuttle, and the space station—have been guided in significant part by foreign relations considerations.

In the 1950s and 1960s the United States and the Soviet Union were locked in the “Moon race,” an intensely competitive Cold War struggle in which each sought to outdo the other. No cost seemed too high; no opportunity to best the rival seemed too slight. U.S. astronauts planted the American flag on the surface of the Moon when the great moment came in 1969. The irony of planting that flag, coupled with the statement that “we came in peace for all mankind,” was not lost on the leaders of the Soviet Union, who realized that they were not considered a part of “all mankind” in this context.

THE FREEDOM OF SPACE DOCTRINE

From before the beginning of the space age, U.S. leaders sought to ensure the rights of free passage of spacecraft anywhere in the world. In a critical document, “Meeting the Threat of Surprise Attack,” issued on 14 February 1955, a group of academics, industrialists, and the military, working at the request of President Dwight D. Eisenhower, raised the question of the international law of territorial waters and airspace, in which individual nations controlled those territories as if they were their own soil. That international custom allowed nations to board and confiscate vessels within territorial waters near their coastlines and to force down aircraft flying in their territorial airspace. But outer space was a territory not yet defined, and the United States called for it to be recognized as free territory not subject to the normal confines of territorial limits.

“Freedom of space” was extremely significant to those concerned with orbiting satellites, because the imposition of territorial prerogatives outside the atmosphere could legally restrict any nation from orbiting satellites without the permission of those nations that might be overflown. U.S. leaders thought that the Soviet Union might clamor for a closed-access position if the United States was the first to orbit a satellite. President Dwight D. Eisenhower, committed as he was to development of an orbital reconnaissance capability to spy on the Soviet Union as a national defense initiative, worked to ensure that no international bans on satellite overflights occurred.

Eisenhower tried to obtain a “freedom of space” decision on 21 July 1955 when he attended a summit conference in Geneva, Switzerland. The absence of trust among states and the presence of “terrible weapons,” he argued, provoked throughout the world “fears and dangers of surprise attack.” He proposed a joint agreement “for aerial photography of the other country,” adding that the United States and the Soviet Union had the capacity to lead the world with mutually supervised reconnaissance overflights. The Soviets promptly rejected the proposal, saying that it was an obvious American attempt to “accumulate target information.”

Eisenhower bided his time and approved the development of reconnaissance satellites under the strictest security considerations. Virtually no one, even those in high national defense positions, knew of this effort. The WS-117L program was the prototype reconnaissance satellite effort of the United States. Built by Lockheed’s Missile Systems
Division in Sunnyvale, California, the project featured the development of a two-stage booster known as the Agena and a highly maneuverable satellite that took photographs with a wide array of natural, infrared, and other invisible light cameras. This early military space effort, while a closely guarded secret for years, proved critical to the later development of the overall U.S. space program.

The Soviets proved singularly inhospitable to Eisenhower’s entreaties for “freedom of space,” but that changed in a rather ironic way on 4 October 1957 when Sputnik 1 was launched and ushered in the space age. Since the Soviet Union was the first nation to orbit a satellite, flying as it did over a multitude of nations, including the United States, it established the precedent of “freedom of space.” It overflowed international boundaries numerous times without provoking a single diplomatic protest. On 8 October 1957, knowing the president’s concern over the legality of reconnaissance satellites flying over the Soviet Union, Deputy Secretary of Defense Donald Quarles told the president: “The Russians have done us a good turn, unintentionally, in establishing the concept of freedom of international space.” Eisenhower immediately grasped this as a means of pressing ahead with the launching of a reconnaissance satellite. The precedent held for Explorer 1 and Vanguard 1, and the end of 1958 saw established the tenuous principle of “freedom of space.”

**LAUNCHING NASA**

Sputnik kicked off an intensely competitive space race in which the two superpowers sought to outdo each other for the world’s accolades. At a fundamental level a primary reason for NASA’s emergence was because of U.S. rivalry during the Cold War with the Soviet Union—a broad contest over the ideologies and allegiances of the non-aligned nations of the world in which space exploration emerged as a major area of contest. From the latter 1940s the Department of Defense had pursued research in rocketry and upper atmospheric sciences as a means of assuring American hegemony. A part of the strategy required not only developing the technology for war, but also pursuing peaceful scientific activities as a means of demonstrating U.S. leadership worldwide. A major step forward came in 1955 when Eisenhower approved a plan to orbit a scientific satellite as part of the International Geophysical Year (IGY) for the period 1 July 1957 to 31 December 1958, a cooperative effort to gather scientific data about the Earth. The Soviet Union quickly followed suit, announcing plans to orbit its own satellite.

The Naval Research Laboratory’s Project Vanguard was chosen on 9 September 1955 to support the IGY effort. The Eisenhower administration did so largely because the Vanguard program did not interfere with high-priority ballistic missile development programs—it used the non-military Viking rocket as its basis—while a U.S. Army proposal to use the Redstone ballistic missile as the launch vehicle waited in the wings. The Redstone was being developed by Wernher von Braun and a team of engineers as a response to ballistic missile advances by the Soviet Union and was designed to carry a warhead a distance of two hundred miles on a preplanned trajectory. Project Vanguard enjoyed exceptional publicity throughout the second half of 1955 and all of 1956, but the technological demands upon the program were too great and the funding levels too small to ensure success.

A full-scale crisis resulted when the Soviets launched Sputnik 1, the world’s first artificial satellite, as its IGY entry. This had a “Pearl Harbor” effect on American public opinion, creating an illusion of a technological gap and providing the impetus for increased spending for aerospace endeavors, technical and scientific educational programs, and the chartering of new federal agencies to manage air and space research and development.

Sputnik led directly to several critical efforts aimed at “catching up” to the Soviet Union’s space achievements, among them: (1) a wide-ranging review of the civil and military space programs of the United States (scientific satellite efforts and ballistic missile development); (2) establishment of a presidential science adviser in the White House who had responsibility for overseeing the activities of the federal government in science and technology; (3) creation of the Advanced Research Projects Agency in the Department of Defense and consolidation of several space activities under centralized management; (4) creation of the National Aeronautics and Space Administration to manage civil space operations for the benefit “of all mankind” by means of the National Aeronautics and Space Act of 1958; and (5) passage of the National Defense Education Act of 1958 to provide federal funding for education in scientific and technical disciplines.

More immediately, the United States launched its first Earth satellite on 31 January 1958, when Explorer 1 documented the existence
of radiation zones encircling the Earth. Shaped by the Earth's magnetic field, what came to be called the Van Allen radiation belt partially dictates the electrical charges in the atmosphere and the solar radiation that reaches Earth. The *Explorer 1* launch also began a series of scientific missions to the Moon and planets in the latter 1950s and early 1960s.

As a direct result of this crisis, NASA began operations on 1 October 1958, absorbing the resources of the National Advisory Committee for Aeronautics intact, including its 8,000 employees, an annual budget of $100 million, three major research laboratories—Langley Aeronautical Laboratory, Ames Aeronautical Laboratory, and Lewis Flight Propulsion Laboratory—and two smaller test facilities. NASA quickly incorporated other organizations into the new agency. These included the space science group of the Naval Research Laboratory in Maryland, the Jet Propulsion Laboratory managed by the California Institute of Technology for the U.S. Army, and the Army Ballistic Missile Agency in Huntsville, Alabama. Eventually NASA created several other centers and by the early 1960s had ten located around the country.

NASA began to conduct space missions within months of its creation, and during its first twenty years NASA carried out several major programs:

1. Human space-flight initiatives: Mercury's single astronaut program (flights during 1961 to 1963) to ascertain if a human could survive in space; Project Gemini (flights 1965–1966) with two astronauts to practice space operations, especially rendezvous and docking of spacecraft and extravehicular activity (EVA); and Project Apollo (flights 1968–1972) to explore the Moon.
2. Robotic missions to the Moon (Ranger, Surveyor, and Lunar Orbiter), Venus (*Pioneer Venus*), Mars (*Mariner 4, Viking 1 and 2*), and the outer planets (*Pioneer 10 and 11, Voyager 1 and 2*).
3. Aeronautics research to enhance airplane safety, reliability, efficiency, and speed (X-15 hypersonic flight, lifting body flight research, avionics and electronics studies, propulsion technologies, structures research, aerodynamics investigations).
4. Remote-sensing Earth satellites for information gathering (*Landsat* satellites for environmental monitoring).
5. Applications satellites for communications (*Echo 1, TIROS, and Telstar*) and weather monitoring.

In no case were these cooperative ventures with other nations, because the Cold War patina that overlay everything done by NASA during its first thirty years necessitated that the United States demonstrate its unique technological capability vis-à-vis the Soviet Union.

**THE LUNAR LANDING PROGRAM**

When U.S. astronauts planted the flag on the surface of the Moon in 1969 it signaled the final triumph of the United States over the Soviet Union in the space race, nothing more nor less. Indeed, this singular achievement of Project Apollo during NASA's early years—one that was particularly focused on demonstrating American preeminence as a spacefaring nation to the people of the world—made possible the cooperative ventures that followed.

The effort to land Americans on the Moon came about because of a unique confluence of political necessity, personal commitment and activism, scientific and technological ability, economic prosperity, and public mood. When President John F. Kennedy announced on 25 May 1961 his intention to carry out a lunar landing program before the end of the decade, he did so as a means of demonstrating U.S. technological virtuosity. In so doing Kennedy responded to perceived challenges to U.S. world leadership not only in science and technology but also in political, economic, and especially military capability.

For the next eleven years Project Apollo consumed NASA's every effort. It required significant expenditures, costing $25.4 billion in 1960s dollars over the life of the program to make it a reality. Only the building of the Panama Canal rivaled the Apollo program's size as the largest nonmilitary technological endeavor ever undertaken by the United States; only the Manhattan Project was comparable in a wartime setting.

The first mission to capture public attention was the flight of *Apollo 8*. On 21 December 1968 it took off atop a Saturn V booster from the Kennedy Space Center in Florida. Three astronauts were aboard—Frank Borman, James A. Lovell, Jr., and William A. Anders—for a historic mission to orbit the Moon. After *Apollo 8* made
one and a half Earth orbits, its third stage began a burn to put the spacecraft on a lunar trajectory. It orbited the Moon on Christmas Eve and then fired the boosters for a return flight. It splashed down safely in the Pacific Ocean on 27 December. Two more Apollo missions occurred before the climax of the program, but they did little more than confirm that the time had come for a lunar landing.

That landing came during the flight of Apollo 11, which lifted off on 16 July 1969 and, after confirmation that the hardware was working well, began the three-day trip to the Moon. Then, on 20 July 1969 the lunar module—with astronauts Neil A. Armstrong and Edwin E. “Buzz” Aldrin aboard—landed on the lunar surface while Michael Collins orbited overhead in the command module. After checkout, Armstrong set foot on the surface, telling millions who saw and heard him on Earth that it was “one small step for [a] man—one giant leap for mankind.” Aldrin soon followed him out and the two explored their surroundings and planted an American flag but omitted claiming the land for the United States, as had been routinely done during European exploration of the Americas. They collected soil and rock samples and set up scientific experiments. The next day they rendezvoused with the Apollo capsule orbiting overhead and began the return trip to Earth, splashing down in the Pacific Ocean on 24 July.

Five more landing missions followed at approximately six-month intervals through December 1972, each of them increasing the time spent on the Moon. The scientific experiments placed on the Moon and the lunar soil samples returned have provided grist for scientists’ investigations ever since. The scientific return was significant, but the program did not answer conclusively the age-old questions of lunar origins and evolution. Three of the latter Apollo missions also used a lunar rover vehicle to travel in the vicinity of the landing site, but despite their significant scientific return none equaled the public excitement of Apollo 11.

Even as Project Apollo proceeded, the United States and the Soviet Union—as well as other nations—crafted in 1967 the Treaty on Principles Governing the Activities of States in the Exploration and Use of Outer Space, commonly known as the Outer Space Treaty. Its concepts and some of its provisions were modeled on its predecessor, the Antarctic Treaty. Like that document it sought to prevent “a new form of colonial competition” and the possible damage that self-seeking exploitation might cause.

After years of discussion this treaty became a possibility on 16 June 1966 when both the United States and the Soviet Union submitted proposals to the United Nations. While there were some differences in the two texts, these were satisfactorily resolved by December 1966 in private consultations during the General Assembly. This allowed the signature of the treaty at Washington, London, and Moscow on 27 January 1967. On 25 April the U.S. Senate gave unanimous consent to its ratification, and the treaty entered into force on 10 October 1967. This treaty has remained in force and both provides for the nonmilitarization of space and directs use of the Moon and other celestial bodies exclusively for peaceful purposes. It expressly prohibits their use for establishing military bases, installations, or fortifications; for testing weapons of any kind; or for conducting military maneuvers. After the treaty entered into force, the United States and the Soviet Union began to collaborate in several joint space enterprises.

**TOWARD A TRAJECTORY FOR COOPERATIVE EFFORTS IN THE 1970S**

With the successful completion of the Apollo program, everyone realized that the United States was the unquestioned world leader in scientific and technological virtuosity, and continued international competition seemed pointless. President Richard M. Nixon, who took office in January 1969, made it clear that there would be during his leadership no more Apollo-like space efforts. Coupled with this was the desire of those working for a continuation of an aggressive space exploration effort, and the result, predictably, was the search for a new model. While successfully continuing to tie space exploration to foreign relations objectives, now the linkage would be based more on cooperation with allies rather than competition with the nation's Cold War rival. From the 1970s NASA leaders increasingly emphasized visible and exacting international programs. All of the major human space flight efforts, and increasingly as time progressed minor projects, have been identified with international partnerships, particularly with America's European allies.

The European Space Agency was created in 1975 after the space race of the Cold War gave way to worldwide cooperation. Its aims are to provide cooperation in space research and technology. Its ten founding members were France,
Germany, Italy, Spain, the United Kingdom, Belgium, Denmark, the Netherlands, Sweden, and Switzerland. Ireland, Austria, Norway, Finland, and Portugal joined later, and Canada is considered a cooperating state. The agency acts for Europe in a global way by promoting creative interaction and collaboration with other global space agencies, aerospace industries, and civilian space activities. In addition, there is a cooperation of international space law and a practical sharing of resources, research, and personnel.

The Cold War context in which the U.S. civil space program arose in 1958 ensured that foreign policy objectives dominated the nature of the activity. This led to the need for cooperative ventures with U.S. allies. The U.S. Congress said as much in the National Aeronautics and Space Act of 1958, the legislation creating NASA. In this chartering legislation Congress inserted a clause mandating the new space agency to engage in international cooperation with other nations for the betterment of all humankind. This legislation provided authority for international agreements in the broad range of projects essential for the development of space science and technology in a naturally international field. NASA's charter provided the widest possible latitude to the agency in undertaking international activities as the means by which the agreed goal could be reached. The scope of NASA's international program has been fortified since that time by repeated involvement with the United Nations, bilateral and multilateral treaties, and a host of less formal international agreements.

The central question for the United States has always been how best to use space exploration as a meaningful foreign policy instrument. At times an odd assemblage of political, economic, and scientific-technological objectives emerged to guide the development of international programs. The most fundamental of these objectives were the overarching geopolitical considerations, without which there would have been no space exploration program at all, much less a cooperative effort. Cooperative projects in space were thought to create a positive image of the United States in the international setting, an image that in the early years of the space age was related to the greater battle to win the “hearts and minds” of the world to the democratic-capitalistic agenda, and after the Cold War to ensure continued goodwill between the United States and the European community. Such cooperation also was thought to encourage both European unity and American relations to collective European entities.

Equally important, the United States pursued two overarching economic objectives with its cooperative space efforts. First, cooperative projects expanded the investment for any space project beyond that committed by the United States. (Kenneth S. Pedersen, NASA director of international programs in the early 1980s, opined that “by sharing leadership for exploring the heavens with other qualified spacefaring nations, NASA stretched its own resources and was free to pursue projects which, in the absence of such sharing and cooperation, might not be initiated.”) Second, cooperative projects might also help to improve the balance of trade by creating new markets for U.S. aerospace products. Finally, a set of important scientific and technological objectives have motivated U.S. international cooperative efforts in space, including the idea that such efforts enhance the intellectual horsepower applied to any scientific question, thereby increasing the likelihood of reaching fuller understanding in less time. These initiatives also have helped to shape European space projects along lines compatible with American goals, encourage the development of complementary but different experiments from European scientists, and ensure that multiple investigators throughout the international partnership make observations that contribute to a single objective.

In light of these macro-national priorities, NASA has always wrestled with how best to implement the broad international prospects mandated in legislation and policy in line with its own specific history and goals. NASA leadership developed very early, and it remained in place until an international partnership was required to build the International Space Station (ISS) in the early 1990s. As a result of that history, a set of essential features have guided the agency's international arrangements with European partners, among them, that cooperation is undertaken on a project-by-project basis, not on an ongoing basis for a specific discipline or general effort; that each cooperative project must be both mutually beneficial and scientifically valid; that scientific-technical agreement must precede any political commitment; that funds transfers will not take place between partners, but each will be responsible for its own contribution to the project; that all partners will carry out their part of the project without technical or managerial expertise provided by the other; and that scientific data will be
made available to researchers of all nations involved in the project for early analysis.

From the NASA leadership’s point of view, moreover, cooperative projects offered two very significant advantages in the national political arena. First, at least by the time of the lunar landings, the leadership recognized that every international partnership brought greater legitimacy to the overall project. This important fact was not lost on NASA Administrator Thomas O. Paine in 1970, for instance, when he was seeking outside sponsorship of the space shuttle program and negotiating international agreements for parts of the effort. Second, although far from being a coldly calculating move, agreements with foreign nations could also help to insulate space projects from drastic budgetary and political changes. American politics, which are notoriously ram-bunctious and shortsighted, are also enormously pragmatic. Dealing with what might be a serious international incident resulting from some technological program change is something neither U.S. diplomats nor politicians relish, and that fact could be the difference between letting the project continue as previously agreed or to dicker over it in Congress and thereby change funding, schedule, or other factors in response to short-term political or budgetary needs. The international partners, then, could be a stabilizing factor for any space project, in essence a bulwark to weather difficult domestic storms.

Perhaps the physicist Fritjof Capra’s representative definition of a social paradigm is appropriate when considering the requirements for space projects in the United States in the aftermath of the Apollo Moon landings. While Apollo was seen as an enormous success from a geopolitical and technological standpoint, NASA had to contend with a new set of domestic political realities for its projects thereafter, and a radical alteration had taken place in what Capra described as the “constellation of concepts, values, perceptions and practices shared by a community, which forms a particular vision of reality that is the basis of the way the community organizes itself.” International cooperative projects helped NASA cope with that changing social paradigm.

IMPEDIMENTS TO INTERNATIONAL COOPERATION IN SPACE

At the same time that critical objectives at both the national and agency levels might be achieved through cooperative space projects both individually and collectively, there were genuine and not inconsiderable impediments to undertaking international programs. The most important was that NASA would lose some of its authority to execute the cooperative program as it saw fit. Throughout its history the space agency had never been very willing to deal with partners, either domestic or international, as equals. It tended to see them more as hindrance than help, especially when they might get in the way of the “critical path” toward any technological goal. R. Buckminster Fuller in his 1982 book Critical Path discussed the evolution of technology involving project scheduling and resource allocation. Assigning an essentially equal-partnership responsibility for the development of some critical system or instrument meant giving up the power to make changes, dictate solutions, and control schedules and other factors. Partnership, furthermore, was not a synonym for contractor management—something agency leaders understood very well—and NASA was not very accepting of full partners unless they were essentially silent or at least deferential. Such an attitude mitigated against significant international cooperation in space efforts, and difficulties arose whenever any project was undertaken.

In addition to this concern, some technologists at NASA, but even more so at the U.S. Department of State, expressed fears that bringing foreign nations into any significant space project really meant giving those nations technical knowledge that only the United States held. Only a few nations were spacefaring at all, and only a subset of those had launch capabilities. Many American leaders voiced reservations about the advisability of ending technological monopolies. The prevention of technology transfer in the international arena was an especially important issue to be considered.

NASA officials understood that European space leaders were aware of these issues and that the latter understandably took a guarded approach toward dealing with American overtures in space. They also believed that this watch-and-wait attitude was not solely due to the United States, although it may have been the deciding factor, but also related to the unique difficulties of European space activities. Senior NASA officials were also convinced that the history of European involvement in space had been marked by difficulties in obtaining long-term commitments to specific programs in which participating nations
had a reasonable part. And long-term, highly focused projects required centralized management capable of enforcing order on a diverse set of interests. Americans recognized that NASA had its own difficulties on this score, but with national and language barriers added in, the demands were daunting. Finally, the costs of involvement in such endeavors with the United States were not inconsiderable. The financial, organizational, and political issues of European space activity had long been understood by leaders in the field, but they had not been fully resolved. Unfortunately, NASA’s efforts have long been insufficient to fully resolve them.

THE RECORD OF INTERNATIONAL COOPERATION IN SPACE

From its inception in 1958 to 2000, NASA concluded nearly 2,000 cooperative agreements with other nations for the conduct of international space projects. While most of these were bilateral in focus—such as the very first, which led to the Alouette mission with Canada in 1962—some, and increasingly so, have been multinational efforts. These agreements resulted in 139 cooperative science projects with European nations between 1962 and 1997: 29 in the earth sciences, 23 in microgravity and life sciences, and 87 in space sciences.

When this development is explored over time there are some interesting trends. First, there were small numbers of projects in the 1960s—something to be expected—but they began to rise precipitously during the late 1960s and peak in the first third of the 1970s. This coincided with the downturn in the NASA budget from a high in 1965 to a low in 1973. In the 1980s and 1990s this trend also accelerated in relation to the political realities of the era.

Is there a correlation between the demise of the NASA budget and increased international cooperative ventures with other nations? Probably, but it is also related to the emphasis on détente and international relations of the Nixon administration in the late 1960s through mid-1970s. This seemed to collapse in the early 1980s, perhaps in relation to the rise of the NASA budget during the Reagan buildup and the renewal of Cold War hostilities. If this is a correct analysis, one would expect the number of cooperative efforts to rise in response to the drastic cuts in the NASA budget undertaken by the Clinton adminis-

tration in the 1990s. Such was indeed the case, but more in relation to the former Soviet Union than with international partners.

THE INTERNATIONAL SPACE STATION

In 1984, as part of its interest in reinvigorating the space program, the Reagan administration called for the development of a space station. In a “Kennedysque” moment, Reagan declared in his 1984 State of the Union address that “America has always been greatest when we dared to be great. We can reach for greatness again. We can follow our dreams to distant stars, living and working in space for peaceful, economic, and scientific gain. Tonight I am directing NASA to develop a permanently manned space station and to do it within a decade.”

The dream of a space station had been omnipresent within NASA since the 1950s, when a station had been envisioned as a necessary outpost in the new frontier of space. The station, however, had been forced to the bottom of the priorities heap in the 1960s and 1970s as NASA raced to the Moon and then went on to build the space shuttle. When the shuttle first flew in April 1981, the space station reemerged as the priority in human space flight. Within three years space policymakers had persuaded Reagan of its importance, and NASA began work on it in earnest.

From the outset both the Reagan administration and NASA intended space station Freedom to be an international program. Although a range of international cooperative activities had been carried out in the past, the station offered an opportunity for a truly integrated effort. The inclusion of international partners, many with rapidly developing spaceflight capabilities, could enhance the effort. In addition, every partnership brought greater legitimacy to the overall program and might help insulate it from drastic budgetary and political changes. Inciting an international incident because of a change to the station was something neither U.S. diplomats nor politicians relished, and that fact, it was thought, could help stabilize funding, schedule, or other factors that might otherwise be changed in response to short-term political needs.

NASA officials pressed forward with international agreements among thirteen nations to take part in the space station Freedom program. Japan, Canada, and the nations pooling their resources in the European Space Agency agreed in
the spring of 1985 to participate. Canada, for instance, decided to build a remote servicing system. The European Space Agency agreed to build an attached pressurized science module and an astronaut-tended free-flyer, a vehicle to transport an astronaut and equipment away from a spacecraft. Japan's contribution was the development and commercial use of an experiment module for materials processing, life sciences, and technology development. These separate components, with their “plug-in” capacity, eased somewhat the overall management (and congressional) concerns about unwanted technology transfer.

Almost from the outset, the space station program was controversial. Most of the debate centered on its costs versus its benefits. One NASA official remembered that “I reached the scream level at about $9 billion,” referring to how much U.S. politicians appeared willing to spend on the station. To stay within budget, NASA pared away at station capabilities, in the process eliminating functions that some of its constituencies wanted. This led to a rebellion among some former supporters. For instance, the space science community began complaining that the space station configuration under development did not provide sufficient experimental opportunity. Thomas M. Donahue, an atmospheric scientist from the University of Michigan and chair of the National Academy of Science's Space Science Board, commented in the mid-1980s that he thought the government should be honest about the goals of the station, and “if the decision to build a space station is political and social, we have no problem with that . . . but don't call it a scientific program.”

Because of the cost challenges, redesigns of space station Freedom followed in 1990, 1991, 1992, and 1993. Each time, the project got smaller, less capable of accomplishing the broad projects envisioned for it, less costly, and more controversial. As costs were reduced, capabilities also had to diminish, and increasingly political leaders who once supported the program questioned its viability. It was a seemingly endless circle, and some leaders suggested that the United States, the international partners, and the overall space exploration effort would be better off if the space station program were terminated.

In the latter 1980s and early 1990s a parade of space station managers and NASA administrators, each of them honest in their attempts to rescue the program, wrestled with Freedom and lost. They faced on one side politicians who demanded that the jobs aspect of the project—itself a major cause of the overall cost growth—be maintained, with station users on the other demanding that Freedom's capabilities be maintained, and with people on all sides demanding that costs be reduced. The incompatibility of these various demands ensured that station program management was a task not without difficulties.

Just as the Cold War was the driving force behind big NASA budgets in the 1960s, its end was a critical component in the search for a new space policy in the 1990s. Cold War rivalries no longer held real attraction as a selling point for an aggressive space exploration program at least by the mid-1980s. Accordingly, when he became NASA administrator in 1992, Daniel S. Goldin worked to salvage the space station effort with a total redesign that brought the significant space capabilities of the former Soviet Union into the effort. The demise of the Cold War, and the collapse of the Soviet Union, created a dramatically changed international situation that allowed NASA to negotiate a landmark decision to include Russia in the building of an international space station. On 7 November 1993 the United States and Russia agreed to work together with the other international partners to build an International Space Station for the benefit of all.

This strikingly new spin on international relations regalvanized support for the program, and for the next eight years building the ISS dominated the efforts of all the spacefaring nations. In the post–Cold War era this decision provided an important linkage for the continuation of the space station at a time when many were convinced that for other reasons—cost, technological challenge, return on investment—it was an uninviting endeavor.

As a lead-in to the ISS, twenty years after the world's two greatest spacefaring nations and Cold War rivals staged a dramatic docking in the Apollo-Soyuz Test Project during the summer of 1975, the space programs of the United States and Russia again met in Earth orbit when the space shuttle Atlantis docked to the aging Russian Mir space station in June-July 1995. “This flight heralds a new era of friendship and cooperation between our two countries,” said NASA's Goldin. “It will lay the foundation for construction of an International Space Station later this decade.”

The docking missions conducted through 1998 represented a major alteration in the history of space exploration. They also portended considerable controversy. For example, several accidents
took place aboard the aging Russian space station that called into question the validity of American involvement in a Russian program that might compromise the safety of American astronauts aboard. Mishaps on Mir in 1996–1998 included a fire inside the station, failure of an oxygen generator, leaks in the cooling system, a docking accident that damaged both the station and the spacecraft to be docked to it, and the temporary malfunction of an attitude control system.

These accidents triggered criticism of U.S.–Russian cooperation in the shuttle-Mir program. That criticism emphasized the safety of the astronauts and the aging character of Mir, noting it was in such bad shape that no meaningful scientific results could be achieved aboard the station. Most asked that Russia deorbit Mir and thereby bring it to “an honorable end,” something that finally took place in the spring of 2001. Only with the launch of the first elements of the International Space Station in the autumn of 1998 did public criticism subside on the role of the shuttle-Mir missions in the American space program.

Other questions about the International Space Station program, however, did not subside even with first-element launches in 1998. In addition to schedule and budget concerns, many complained about the integral part played by Russia in building the International Space Station. Most observers agreed that the fundamental problems associated with Russian participation in the space station program could be reduced to a few fine points, as stated by Representative F. James Sensenbrenner, Jr., chair of the House Committee on Science, in 1998: “One, the Russians failed to follow through on their funding commitments, and two, the Clinton administration brought the Russians into the project for the wrong reasons, placed the Russians in the critical path, and routinely let them off the hook for their failures.”

Some warned of complications with Russian involvement as early as September 1993, when President Clinton formally invited the Russian government to join the project, ostensibly as a gesture of goodwill to the former Cold War enemy. In reality, the invitation to the Russians involved gaining Russian compliance with the Missile Technology Control Regime, a voluntary arrangement among twenty-seven countries to control the export of weapons of mass destruction. The Clinton administration admitted as much to Congress on 20 April 1994, when the U.S. ambassador to Russia James Collins was asked by Representative Ralph M. Hall, “Give me a 1 to 10 on whether or not we are building the space station with Russia to achieve a particular foreign policy objective such as Russian compliance with the Missile Technology Control Regime.” Ambassador Collins replied, “Getting Russia into the Missile Technology Control Regime and bringing it into willingness to comply with those guidelines is a very important objective.” This proved unsuccessful, however, as the Russian Space Agency continued selling missile technology to so-called rogue nations. According to Sensenbrenner, American “nonproliferation goals for cooperating with the Russians in the civil space area have not been realized.”

Even more than this, the Russians were integrated deeply into the critical path of International Space Station assembly. If they failed to deliver their modules on schedule, ISS assembly had to wait, and every slippage on the part of the Russian Space Agency stretched out the overall station schedule. NASA had assumed a position of complete reliance on Russia for the service module—sole provider of oxygen, avionics, reboost, and sanitary facilities—until much later in the assembly process. This meant, in simple terms, that the entire program was held hostage pending resolution of Russia’s internal economic and political problems and external goodwill.

With the belated launch of the Russian service module in July 2000, however, it became clear that international competition had been firmly replaced with cooperation as the primary reason behind huge expenditures for space operations. As the dean of space policy analysts John M. Logsdon concluded, “there is little doubt, then, that there will be an international space station, barring major catastrophes like another shuttle accident or the rise to power of a Russian government opposed to cooperation with the West.”

While the challenges of completing the ISS remained quite real, as the twenty-first century dawned the dream of a permanent presence in space seemed on the verge of reality. Before the end of 2000 the first ISS crew inhabited the station. Furthermore, the spacefaring nations of the world had accepted ISS as the raison d’être of their space efforts. Only through its successful achievement, space advocates insisted, would a vision of space exploration that includes all nations venturing into the unknown be ultimately realized. This scenario makes eminent sense if one is interested in developing an expansive space exploration effort, one that leads to the perma-
nent colonization of humans on other planets. At the end of the century, that debate continued. What no one was sure of was how this would unfold in the next century.

TWENTY-FIRST-CENTURY ISSUES IN SPACE COOPERATION

In the last decade of the twentieth century U.S. space policy entered an extended period of transition. This was true for several reasons. For one thing, U.S. preeminence in space technology was coming to an end as the European Space Agency developed and made operational its superb Ariane launcher, and the agency’s ancillary space capabilities made it increasingly possible for Europe to “go it alone.” At the same time, U.S. commitment to sustained leadership in space activities overall waned, and significantly less public monies went into NASA missions. U.S. political commitment to cooperative projects seemingly lessened as well: for example, the United States refrained from developing a probe for the international armada of spacecraft that was launched toward Comet Halley in 1984–1985 and withdrew part of its support from the controversial International Solar Polar Mission to view the Sun from a high altitude, renamed Ulysses and launched in 1990. Of those cooperative projects that remained, NASA increasingly acceded to the demands of international collaborators to develop critical systems and technologies. This overturned the policy of not allowing partners into the critical path—something that had not been accepted in earlier development projects—and was in large measure a pragmatic decision on the part of American officials. Because of the increasing size and complexity of projects, according to Kenneth Pedersen, more recent projects had produced “numerous critical paths whose upkeep costs alone will defeat U.S. efforts to control and supply them.” He added, “It seems unrealistic today to believe that other nations possessing advanced technical capabilities and harboring their own economic competitiveness objectives will be amenable to funding and developing only ancillary systems.”

In addition to these important developments, in the 1990s the rise of competitive economic activities in space mitigated the prospects for future activities. The brutal competition for launch business, the cutthroat nature of space applications, and the rich possibilities for future space-based economic activities such as asteroid mining were rapidly creating a climate in which international ventures might once again become the exception rather than the rule. John Krieger astutely commented in 1997 that “collaboration has worked most smoothly when the science or technology concerned is not of direct strategic (used here to mean commercial or military) importance. As soon as a government feels that its national interests are directly involved in a field of R&D, it would prefer to go it alone.” He also noted that the success of cooperative projects may take as their central characteristic that they have “no practical application in at least the short to medium term.”

The sole exception to this perspective might be when nations decide that for prestige or diplomatic purposes it is appropriate to cooperate in space. A concern existed that in the United States, where economic competitiveness in space was such a powerful motivation for “going it alone,” and where prestige and diplomacy seemed to have taken a backseat to nationalistic hyperbole, that with every passing year there would be less tolerance for large-scale cooperative, and by extension difficult, projects in space. Indeed, there was a constant reduction under way in government spending for space exploration and open discussions of strategies on how to shift the thrust of space flight to the private sector. That would, of necessity, curtail international space exploration activities, with less funding available for scientific space missions, the very missions that are natural candidates for cooperative work. Corporations, that may well provide the greatest share of investment for space flight in the United States in the twenty-first century would be loath to engage in partnerships in which their technological advantages might be compromised. The proliferation of space technology throughout the world, especially to those nations perceived as rogue states, may well prompt U.S. leaders to clamp down on anything that smacks of technology transfer. (This has already been seen in relation to the supposed satellite technology transferred inadvertently to the People’s Republic of China through Hughes Aerospace Corp.) Finally, the disagreeable experiences of such cooperative projects as the International Space Station might sour both national and NASA officials on future endeavors. It is certain, for example, that it will be a long time before anyone in authority in the United States will sign on to an international project of similar complexity.
CONCLUSIONS

One of the key conclusions that we might reach about both the course of international cooperation between the United States and other international partners is that it has been an enormously difficult process. Apropos is a quote from Wernher von Braun, that “we can lick gravity, but sometimes the paperwork is overwhelming.” Perhaps the hardest part of spaceflight is not the scientific and technological challenges of operating in an exceptionally foreign and hostile environment but in the down-to-earth environment of rough-and-tumble international and domestic politics. But even so, cooperative space endeavors have been richly rewarding and overwhelmingly useful, from all manner of scientific, technical, social, and political perspectives.

Kenneth Pedersen observed in a public forum in 1983 that “international space cooperation is not a charitable enterprise; countries cooperate because they judge it in their interest to do so.” For continued cooperative efforts in space to proceed into the twenty-first century it is imperative that those desiring them define appropriate projects and ensure that enough national leaders judge those projects as being of interest and worthy of making them cooperative. Since the 1960s space-exploration proponents have gained a wealth of experience in how to define, gain approval for, and execute the simplest of cooperative projects. Even those have been conducted only with much trial and considerable force of will. For those involved in space exploration it is imperative that a coordinated approach to project definition, planning, funding, and conduct of future missions be undertaken. Only then will people be able to review the history of international programs and speak with pride about all of their many accomplishments while omitting the huge “but” that must follow in considering all of the difficulties encountered.

The meaning of “pacifism” was altered in Anglo-American usage during World War I. Before 1914 the word was associated with the general advocacy of peace, a cause that had enlisted leaders among the Western economic and intellectual elite and socialist leadership. In wartime, “pacifism” was used to denote the principled refusal to sanction or participate in war at all. This doctrine was associated with the nonresistance of the early Christian church or the traditional “peace” churches, such as the Mennonites, Quakers, and Brethren. During and after World War I, absolute opposition to war was joined with support for peace and reform programs to produce modern, liberal pacifism. The earlier broad usage is still current in Europe and, to some extent, in the United States; and so the significance of changes in the concept is somewhat lost.

The shift in conceptualization of pacifism early in the twentieth century is the key to its significance for American foreign policy, however. Once this is understood, it is possible to interpret pacifism as simultaneously the core of several modern peace movements and, ironically, a source of factionalism among peace workers; it is also possible to appreciate the contributions of pacifism to the foreign policymaking process.

THE ORIGINS OF MODERN PACIFISM

Pacifism, although absolutely opposed to war, never has been confined to antiwar movements. It has been a way of life for individuals and religious sects, and it has characterized peace organizations founded in the wake of wars. Thus, pacifism contributed to the formation of the first peace groups after the Napoleonic wars, notably the American Peace Society (1828). It was the basis of the Garrisonian New England Non-Resistance Society, founded in 1838 by abolitionists and others dissatisfied with the moderate position of the American Peace Society, and of the Universal Peace Union, founded in 1866 by Alfred A. Love following the collapse of peace societies during the Civil War.

The modern conceptualization of pacifism draws upon the doctrinal sacredness of life and abrogation of violence in the Christian religion, strains of philosophical anarchism and socialism, nineteenth-century internationalism, and a religious principle of social responsibility. These were the basic elements that were brought together in the context of World War I.

The oldest element of modern pacifism is the tradition of religious nonresistance that was formed in the first three centuries of the Christian church, under Roman rule. Abandoned for the concept of just war, in fact by the time of Constantine I and in theory Saint Augustine, nonresistance pacifism appeared again with Christian sects in the medieval era. It emerged in the Protestant Reformation, notably under Peter Chelčický and the Unity of the Brethren (Bohemian Brethren) in the fifteenth century and among the Anabaptists. From the sixteenth through the eighteenth centuries, it was institutionalized in the writings and practice of so-called peace churches: the Mennonites, the Quakers, and the Brethren.

Nonresistance characterized the thought of leaders in the early-nineteenth-century peace societies of the United States. It was officially recognized as ground for exemption under the conscription systems of the Civil War and World War I. Many of the Mennonites and Brethren who immigrated to the United States late in the nineteenth century at least partly sought to escape conscription abroad. Traditional nonresistance implied not only the repudiation of violence and warfare but, frequently, dissociation from government, based as it seemed to be on physical force.

In the second half of the nineteenth century, traditional nonresistance was supplemented by anarchism deriving from the religious inspiration of Leo Tolstoy and from those philosophical anar-
chists who repudiated violence. In addition, some leading European socialists took the position that national wars were instruments of class action that should be boycotted by workers. In the United States during World War I these elements of pacifism brought objectors into conflict with American law, which provided for conscientious objection based only on religious opposition to fighting and not that which derived from secular or political principles or was directed against conscription itself. Furthermore, the majority position of the Socialist Party then condemned American involvement, thus bringing socialists to the antiwar cause.

Also during the second half of the nineteenth century, nonresistance as a force motivating peace advocacy was supplemented by organized internationalism. In some measure this derived from the humanistic traditions of Hugo Grotius and Immanuel Kant, and it evolved into programs for international law, international arbitration, and even international organization. In some measure, too, internationalism derived from classical economists who, like Jeremy Bentham, repudiated mercantilism and advocated free trade. In the United States, internationalism was buttressed by Americans' tendency to assume that their institutions would produce harmonious progress if written on a world scale, and it garnered enthusiastic support from men of means and prestige in the years before World War I. It is important in the development of modern pacifism because its institutional and world views, and even some of its programs, were incorporated into the encompassing policy platforms of pacifists.

A fourth element of modern pacifism was the sense of social responsibility that derived from antebellum evangelical religion and especially from religious analyses of industrialism and urbanism about the turn of the century. The reform spirit, the transnational outlook, and the political philosophy of liberal pacifism were rooted in two decades of Social Gospel and Progressive activity that preceded World War I. Upon the outbreak of that conflict, most traditional internationalists supported the Allied cause and became reconciled to American intervention. When the United States entered the war, they viewed the crusade as the vehicle of international organization and tried to write their views into the Allied war aims, notably in the case of the League of Nations.

Meanwhile, between 1914 and 1917 several organizations were formed to oppose Woodrow Wilson's preparedness program and intervention, and to support conscientious objectors: the American Union Against Militarism (1915–1921), which was succeeded by the National Council for Prevention of War; the Women's Peace Party (1915), which was succeeded by the United States Section of the Women's International League for Peace and Freedom; the Fellowship of Reconciliation (1915), which was supplemented in 1923 by the War Resisters' League; and the American Friends Service Committee (1917). In wartime these groups were sifted of nearly all but pacifists, and they became the institutional base of modern pacifism in the United States.

The leaders of these and other wartime pacifist organizations were predominantly Progressives, often women, and with few exceptions were religious. They included Jane Addams and Emily Balch, directors of Hull House and Denison House settlements; Crystal Eastman and Emily Balch, directors of Hull House and Denison House settlements; Crystal Eastman, an ardent suffragist and expert on the legal aspects of industrial accidents; her brother Max Eastman, who edited two radical literary journals, Masses and Liberator; Norman Thomas, later the leader of the Socialist Party; Roger Baldwin, longtime director of the American Civil Liberties Union; Rufus Jones, a Quaker historian; Paul Jones, an Episcopal bishop; Jessie Wallace Hughan, founder of the War Resisters' League; John Nevin Sayre, interwar stalwart of the Fellowship of Reconciliation; and John Haynes Holmes, a Unitarian pastor. They identified with transnational ideologies, whether religious, humanitarian, or socialist; but politically they were pragmatists in the Progressive tradition. They believed in the ultimate worth of the individual, but they appreciated the influence of social institutions upon personal development.

They associated with antiwar radicals, with whom they were often persecuted. Indeed, pacifists formed the American Civil Liberties Bureau in 1917 for the defense of conscientious objectors and radicals during the war. Leading pacifists identified force as an instrument of social control and associated violence with authoritarianism. They therefore associated their own quest for peace with a commitment to social justice, so that they combined complete opposition to war with the spirit of reform and internationalism. Their organized expression of this belief during World War I marks the beginning of modern liberal pacifism and the development of an activist core of the peace movements in recent American history.

Traditional religious pacifism as documented by Peter Brock and colleagues has been a vital, often poignant part of the twentieth-century
experience in Europe and North America. It was the liberal and activist strand of pacifism, however, that became most relevant to American foreign relations.

THE PACIFIST ROLES IN POLICYMAKING

Peace and antiwar movements can be viewed, institutionally, as a single element of the foreign policymaking process. To draw a distinction between them is legitimate with regard to specific foreign policy issues—that is, specific wars—but not with regard to the process of policy formation. Taken together, peace and antiwar movements in all periods of U.S. history have been coalitions of separate groups aligned variously with regard to different policy issues. These constituencies have combined to influence public policy either directly through the professional expertise of peace advocates (as in the case of numerous projects of the Carnegie Endowment) or through political lobbying, or indirectly through public opinion. In any case, pacifists have been relevant to the policymaking process in terms of the broader peace movements, and they cannot be evaluated apart from them.

CONSCRIPTION AND CONSCIENTIOUS OBJECTION

There is one possible exception to this observation: the contribution made by pacifist pressure groups to the administration of conscription and the treatment of conscientious objectors. In this case pacifist pressure groups acted directly upon government agencies and substantially affected policy formation.

Efforts on behalf of conscientious objectors have taken essentially three forms. First, pacifists representing the peace churches—the ecumenical Fellowship of Reconciliation and, prior to World War II, the secular War Resisters' League—lobbied to broaden the basis of exemption. At the outset of World War I objectors were exempted only if they belonged to churches with doctrinal positions against military service, and even then they were legally exempted only from fighting. Provisions were broadened administratively during the war to include all religious objectors. Subsequently, exemption was expanded by court decision to include philosophical authority embodying a universal principle, and leading churchmen and church bodies later endorsed the principle of selective objection to war on political grounds.

Second, pacifists have lobbied in support of administrative agencies that would remove objectors from military jurisdiction, in recognition of those who object to conscription per se. The Civilian Public Service of World War II was the result of such pressure, although it proved to be an unsatisfactory solution. Various forms of exemption for civilian jobs since that time represent attempts to accommodate pressure from pacifists, buttressed as it often is by church bodies and liberals who recognize conscientious objection as an authentic ethical choice even when they do not endorse it as a preferred one.

Third, pacifists lobbied for amnesty for conscientious objectors following each war of the twentieth century. The basic rationale for amnesty has been that objectors are really political prisoners, although the laws of the United States do not recognize political crimes and treat objectors as criminals. During the Vietnam War the number of men who publicly deserted from the military or fled the country to escape the draft created a situation in which pacifists found themselves joined in their demand for amnesty by nonpacifists interested in political and social reconciliation. Insofar as conscientious objection has become recognized as a legitimate ethical option and a form of protest, it has ceased to become the exclusive concern of pacifists.

Even with regard to conscientious objection, therefore, the influence of pacifists must now be evaluated in relation to that of the general peace movements. Indeed, as John Chambers and Charles Moskos have shown, the recognition of conscientious objection is integral to the modern character of military service.

COALITION POLITICS

Pacifists affected peace coalitions in which they participated by their cultivation of a political base in specific publics and by the political techniques they employed. In the Cold War period they introduced new techniques of nonviolent protest. They also gave distinctive emphases to movements in which they were associated.

Pacifists were drawn together both by their opposition to World War I and by their isolation from the American public during the conflict. Increasingly, they became committed to a campaign against all future wars (and to campaigns for
social and labor justice). They cooperated with those who had supported the war effort as a vehicle of internationalism and who, in the 1920s, supported membership in the League of Nations and the World Court, or ratification of a treaty outlawing war. In an era when leading peace advocates maneuvered to secure their own pet approaches at the expense of others, the more pacifist among them tended to be the most inclusive. Pacifists also systematically cultivated constituencies that had been largely neglected by other peace workers: religious bodies, college youth, Christian youth organizations, and labor. Although their primary appeal was to repudiate warfare altogether, pacifists also educated the public on international relations and recruited support for specific legislation, notably arms limitation. They lobbied through their own associations and also created a major coalition organization, the National Council for Prevention of War (1921).

By the mid-1930s a core of pacifist leaders had developed a network of support groups, a political base from which they tried to build a public consensus for strict neutrality. To this end they managed to align nonpacifist internationalists affiliated with the League of Nations Association in their $500,000 Emergency Peace Campaign. Occasionally they were able to translate public opinion into congressional positions, and they considerably reinforced popular resistance to overseas involvement. In the course of the neutrality controversy, however, the League of Nations Association gradually broke from its coalition with pacifists and organized a counter-campaign for collective security arrangements. In this respect, the activity of pacifists heighten the political organization of the interwar peace movement, which, however, it also helped to polarize.

During World War II pacifists were largely isolated from political influence except insofar as they cooperated with prowar internationalists to popularize the proposed United Nations. They remained isolated after the war, as the world became polarized between the United States and the Soviet Union, and collective security was reinterpreted in terms of Cold War containment, still ostensibly in the service of internationalism.

Then, in 1957 pacifists became instrumental in forming a new national coalition to challenge nuclear weapons testing. Disclosures about the threat of nuclear fallout engendered worldwide protest that was led in the United States by the National Committee for a Sane Nuclear Policy (SANE) and the Committee for Nonviolent Direct Action (CNDA). The former was a coalition with nonpacifist liberals like Norman Cousins, and it used traditional techniques of education, lobbying, and electoral action. CNDA represented an activist pacifist core, and it employed the tactics of nonviolent direct action, including civil disobedience like climbing or sailing into nuclear test zones and blockading nuclear submarines.

The bulk of the test-ban campaign was carried by SANE and the pacifist groups that had sponsored it—the American Friends Service Committee, the Fellowship of Reconciliation, and the Women's International League for Peace and Freedom. The cause also spawned new organizations, notably Women Strike for Peace and the Student Peace Union, and the whole U.S. effort was in limited measure coordinated with the international campaign. It contributed to a moratorium on atmospheric testing during the Eisenhower administration and had a direct role in the adoption of the 1963 partial nuclear test-ban treaty under President John F. Kennedy.

The test-ban coalition formed the initial base for the antiwar coalition that challenged the U.S. war in Vietnam, even before that conflict became formalized in the bombing campaign early in 1965. Again SANE negotiated the linkage between pacifists and nonpacifist liberals, although increasingly an independent left wing competed for recognition. In the first three years of the Vietnam War, antiwar constituencies multiplied: business and professional groups, cultural and entertainment notables, Peace Corps and social service groups, Old Left socialists and New Left students (notably Students for a Democratic Society), and religious leaders (notably Clergy and Laity Concerned). The latter was predominantly though not exclusively pacifist, while a core of radical pacifist Catholics led by the priests Daniel and Philip Berrigan developed a sharp civil disobedience witness in the Catholic Worker tradition.

In 1968 the antiwar coalition fully informed Democratic Party politics and conditioned even the Republican platform on the war. The following year the coalition severely constrained President Nixon's war policies. By then the large liberal wing of the antiwar movement was becoming thoroughly politicized, especially in Democratic Party politics, while its smaller radical wing spun apparently out of control (where it could not be disciplined by pacifists). Given its media-driven stereotype as radical and countercultural, the movement seemed to have died, whereas actually the coalition had become mainstreamed.
Throughout this period, activist pacifists in the Fellowship of Reconciliation, American Friends Service Committee, Clergy and Laity Concerned, and Catholic and other groups were intensely involved in coalition politics of the political left and center. By the same token, pacifist communities were sharply tested by the tension between the radical and liberal approaches their members espoused.

Two other large-scale peace coalitions made serious impacts on twentieth-century U.S. foreign relations: the nuclear freeze campaign against nuclear weapons of the 1980s and the concurrent campaign for solidarity with Latin American liberation movements. In the case of the 1991 Gulf War, by contrast, no serious coalition arose. At the outset it was widely conceded that the evenly divided country was ripe for protest, and pacifist groups were prepared even to wield nonviolent disobedience. However, the limited duration and tight control of military operations obviated the development of a broad public coalition in opposition to the Gulf War.

The nuclear freeze campaign in the first half of the 1980s was systematically organized against the background of massive European protest, dramatic revelations of the destructive scope of nuclear weapons, and fear of nuclear war that was intensified by the Ronald Reagan administration. Pacifists were among the organizing and motivating core of a broad, diverse public coalition that was fed by media coverage. Although it failed to secure an outright freeze on nuclear weapons building or deployment, the nuclear freeze campaign was substantially responsible for reinstating the policy and institutions of arms control that the administration had begun to scrap.

Out-publicized by the more visible and larger nuclear freeze campaign, another coalition successfully challenged the Reagan administration on Latin America. It consisted of innumerable grassroots groups with direct contacts in Central America, which were linked by a few national organizations. These groups disseminated information from sources abroad, mounted public pressure, and lobbied in Congress. Their main focus was on human rights abuses in El Salvador and Honduras and U.S. intervention in the civil war in Nicaragua through the contras. In the former two countries, transnational associations channeled economic help to revolutionary forces and peasant war victims, exposed human rights abuses, and challenged U.S. ties to military regimes. On Nicaragua, peace groups lobbied and disseminated information. In all three cases they worked with the international community. Pacifists also brought organized nonviolent action to bear in the solidarity campaign.

**NONVIOLENT DIRECT ACTION**

From World War I on, a core of pacifists supported domestic reform programs as a concomitant of cultivating labor and reform constituencies for peace. Increasingly, they developed techniques of nonviolent direct action (often modeled on the example of Mohandas Gandhi) that they employed on behalf of labor and especially in the civil rights struggle. Thus, the Congress of Racial Equality (CORE, 1942) was nourished by the Fellowship of Reconciliation. By the time of the Reverend Martin Luther King’s campaign to desegregate buses in Montgomery, Alabama (1955–1956), a few pacifists had considerable experience with these forms of protest. The Fellowship of Reconciliation, American Friends Service Committee, and War Resisters’ League played an active role in the early civil rights movement about the same time that the core of radical pacifists in the Committee for Nonviolent Direct Action employed civil disobedience in the test-ban campaign. Accordingly, nonviolent direct action was a ready tool in the pacifist repertoire during the Vietnam War.

The technique took many forms: it involved returning or burning draft cards, trespassing, blocking arms shipments and troop trains, or otherwise challenging authority. On occasion it meant defiling or destroying draft records or providing sanctuary for draft resisters. It was street theater, designed to dramatize the tragedy and moral turpitude that pacifists attached to the war. Occasionally, direct action was applied violently by nonpacifists, and then it was counterproductive.

It was again applied in the 1980s campaign against nuclear weapons, notably in the actions of the Berrigans’ Plowshares group, which aimed to defile or destroy missile components, or of Women’s Pentagon Action. By that time the technique had become widely, even legally, accepted as a viable form of public protest. It found expression in the last decade of the twentieth century as a form of protest against economic globalism, where it appears to have inclined governments to be more discreet if not more responsive to protest.
TRANSNATIONAL LINKS

It has become conventional to regard transnational nongovernmental organizations (NGOs) as players in the foreign relations field. The peace movement, viewed as a transnational social movement, spans two centuries, and its pacifist core comprises a century of transnational experience.

The International Fellowship of Reconciliation (IFOR, 1919), the Women's International League for Peace and Freedom (WILPF, 1919), and the War Resisters' International (WRI, 1921) all were transnational associations with strong U.S. components. Except for the WRI, they were formed during World War I. (Indeed, the WILPF derived from a 1915 meeting in The Hague, where mainly pacifist women from the then belligerent countries delegated emissaries to heads of government in search of a mediated peace.) In wartime these groups linked isolated pacifists and conscripted war resisters. Thereafter they cooperated in relief and reconstruction projects, except that the WRI focused on providing a socialist matrix for war resistance.

In the interwar years the WILPF established an office in Geneva from which it sought to mobilize a transnational, citizen constituency for disarmament and other League of Nations initiatives. Pacifists in fascist countries were part of an international network. As the prospect of war grew again, U.S. pacifists strengthened their international ties, sponsoring colleagues from abroad to the United States on behalf of neutrality legislation.

The largely pacifist-initiated U.S. test-ban coalition of the 1950s was part of a world movement, as was its successor campaign against nuclear weapons in the 1980s. In both cases transnational coordination was secondary to national concerns, although the 1980s campaign was explicitly interfaced with the UN agenda. Similarly, pacifists extended their international links during the Vietnam War. The Fellowship of Reconciliation mounted an ambitious attempt to coordinate Vietnamese Buddhist and American antiwar efforts, publicized the existence and persecution of antiwar South Vietnamese, sent reconciliation and information teams to North Vietnam, and tried to relate public protest in Europe to that in the United States.

In Latin America the International Fellowship of Reconciliation and its U.S. national chapter worked from the 1960s to the 1980s to spread the concept and techniques of nonviolent resistance as a viable alternative to both violent revo-

ution and apathy. U.S. civil rights and Fellowship of Reconciliation leaders reached both Protestants and Catholics in Latin America, while IFOR emissaries Jean Goss and Hildegard Goss-Mayr were particularly effective in Catholic circles. A period of social evangelism and preliminary organization led to the formation of SERPAJ (Servicio Paz y Justicia en América Latina, or Service for Peace and Justice) in 1974. Itself a regional organization, SERPAJ provided Latin American national and church leaders with nonviolent resistance techniques and with contacts in the international community, greatly empowering, for example, Nobel Peace Prize winner Adolfo Pérez Esquivel of Argentina.

Nonviolent direct action was brought to bear upon the region's human rights crises and civil wars. Beginning in 1983, for example, Witness for Peace stationed trained North Americans in teams along the Nicaraguan border. They helped with economic development, but their high visibility was designed also to deter contra attacks. After U.S. support for the contras was withdrawn in 1988, the Witness for Peace program of intercession was expanded to other areas. Pacifist nonviolent action thus became one of several instruments through which a coalition with transnational linkages effectively challenged U.S. Latin American policy in the 1980s. Meanwhile, within the United States there was a surge of refugees from political life-threats in Central America. The U.S. government's reluctance to grant them asylum led to a sanctuary movement to provide safety, most often in churches. By the time the refugee flow subsided late in the decade, hundreds of sites were networked to smuggle people across borders and provide safe havens and legal and humanitarian services. Sometimes this modern Underground Railroad moved refugees on into Canada. The operation was a case of large-scale civil disobedience so widely condemned that the U.S. Immigration and Naturalization Service was slow to challenge it.

FRAMING POLICY ISSUES WITH PACIFIST PERSPECTIVES

Pacifists have not evolved a vision of foreign policy as coherent as collective security or its counterpart, containment. Nonetheless, they have shared distinctive qualities with which they helped to frame foreign policy issues. These qualities include their transnational orientation,
moral thrust, and skepticism about the efficacy of military force.

**Transnational Orientation** The orientation of nineteenth-century pacifists was largely religious and resulted from the dualism of Christian perfectionism, which assigned different roles to religious bodies and secular societies. To this was added the antistate individualism of philosophical anarchists and the class analysis of socialists. But none of these elements yielded specific implications for foreign policy.

In the twentieth century the perspective of pacifists was secularized, but it remained essentially ethical and humanistic rather than political. It was oriented to the quality of life and the equitable distribution of power rather than to the political relations of states. In this sense, leading pacifists found World War I, for all its magnitude, to be irrelevant to the solution of fundamental world problems. What they found truly basic was human need, creativity, and community. Progressive pacifists, and especially the articulate women among them, thus brought a strong sense of community to peace work (by contrast to the social, legal, and political structures emphasized by other peace advocates). They eventually supported the League of Nations, but they harbored the reservation that such international organizations were inadequate vehicles for change and human welfare.

But some pacifists were systems oriented. The outstanding pacifist analyst of international affairs in the 1930s was Kirby Page, who argued that traditional European rivalries had vitiated the League of Nations and would lead to another world war unless a new foundation could be built for international relations. Ironically, although pacifists viewed historical revisionism as the basis for a realistic assessment of traditional diplomacy and a justification for radically internationalizing world power, many Americans used it as their justification for a new isolationism.

Following World War II some pacifists followed pacifist leader Abraham J. Muste in seeking a new basis for a transnational foreign policy. By the 1950s, Muste viewed the Third World as the fulcrum for a global policy beyond the bipolar terms of the Cold War. This notion was taken up in the following decade by some New Left radicals; but as a basis for foreign policy analysis, it was eclipsed by the rhetoric against nuclear arms and then war in Vietnam. Nonetheless, the American Fellowship of Reconciliation and other pacifists actively promoted the “Third Force” concept of Vietnamese Buddhists as a standard against which to frame U.S. policy goals.

**Moral Emphasis** The moral emphasis of nineteenth-century pacifism was individualistic. Pacifists tended to assume that good people would make a good world. Twentieth-century pacifists, however, initially reflected the Progressive emphasis on social environmentalism. They included war among the social institutions in which good men and women become enmeshed with devastating consequences. Accordingly, they made pacifism an expression of social ethics; and their journal, The World Tomorrow (published 1918–1934), became the most forthright exponent of the social gospel. “If war is sin,” wrote Kirby Page, then it must be abjured and overcome by every available stratagem. Their essentially moral outlook enabled several pacifist leaders to transcend the narrow allegiances to specific programs that set so many internationalists at odds with one another.

In the 1920s, for example, Page and his colleagues made futile attempts to devise a plan of unity between the advocates of a World Court and of a general treaty to outlaw war. Similarly, in the 1930s pacifists were able to write an umbrella platform that attracted nonpacifist internationalists to their Emergency Peace Campaign, with its neutralist bias. In 1957 a pacifist nucleus stimulated the formation of both the National Committee for a Sane Nuclear Policy and the Committee for Nonviolent Direct Action in order to enlist both liberal and pacifist constituencies in action against nuclear arms. And in the 1960s, a generalized sense of moral outrage accounted for whatever cohesion there was in the organized antiwar movement. It was the basis on which pacifists could associate with groups having nonpacifist political biases.

The very sense of moral commitment that led to comprehensiveness in some circumstances engendered division in others. Ideologies often have served as standards of factional loyalty within out-of-power groups, and the principled total repudiation of violence and warfare sometimes functioned in this way among pacifists in the coalitions they joined. A few examples illustrate this problem. Prior to the Civil War, the American Peace Society was impelled by a sense of moral obligation, but it was wracked by factional disputes over the question of whether to prohibit all wars or only aggressive ones. Again,
in World War I absolute pacifism was both the cohesive element of pacifist organization and the reason that prowar liberals refused to work with pacifists even for liberal goals. Although the Women's International League for Peace and Freedom, formed just after the war, included pacifists Jane Addams and Emily Balch, the coalition was too broad for Fanny Garrison Villard and other absolutists, who created the separate Women's Peace Society. Early in the 1930s both the Fellowship of Reconciliation and the Socialist Party were sharply divided over how completely they should renounce violence in a potential class struggle. Socialists never recovered from the political effects of that controversy, and they also were faced with the theoretical issue of whether to support an antifascist war.

By 1938 pacifist groups were united against intervention, but they tended to withdraw from political action in order to prepare communities of believers for the coming crisis. During World War II the pacifist community was divided over the implications of its moral commitment to conscientious objection, and its support groups disagreed about the limits of cooperation with Civilian Public Service, the administrative agency for objectors.

The antiwar movement of the 1960s was no more immune to factionalism than its predecessors, and the division was often over conflicting principles. Divisive issues included whether to exclude communists from coalitions, whether to criticize North Vietnamese and communist policy in the context of analyses of American involvement, tactics for demonstrations, and organizational principles within the movement. Protest during the Vietnam conflict was united under an intense sense of moral outrage, but it also was divided by the question of allegiance to specific principles, of which the total repudiation of violence and authoritarianism was one.

In any case, pacifists have reinforced an essentially ethical interpretation of national interest: that world interest should be a criterion of national policy and that the concomitants of peace are change as well as order, justice as well as stability. This moral thrust is not unique to pacifists, but it has been sharpened by their participation in American peace movements.

Skepticism of War No less than belief, skepticism has characterized pacifist propaganda and attitudes. Indeed, modern pacifism was formed in opposition to a popular war, the so-called Great War, and to the power assumed by government in it. That skepticism became a valuable credential when disillusionment followed the war. Pacifists themselves assiduously propagated skepticism about the justness of specific wars, the credibility of war aims, and the constructive potential of victory. For most of the twentieth century they challenged the general claim that preparedness deters warfare and the specific claims of military security needs. From Woodrow Wilson's 1916 preparedness campaign to legislation for arms spending in the 1920s and nuclear arms in the 1950s, from the inauguration of conscription in 1917 to its reinstatement in 1940 and the peacetime draft of 1948, the small body of pacifists constituted a core of political opposition. They challenged not only programs but also the rationale for them. Some pacifists also marshaled economic and anti-imperialist interpretations of war to expose the economic linkages of warfare and to challenge official explanations of foreign policy. And they propagated skepticism about the efficacy of American intervention abroad, whether public or covert, whether in World War I or the Cold War, in Southeast Asia or Latin America.

Skepticism about the use of military power and the rationale for violence has been extended to systematic inquiries about the nature of power by building first on the experience of Mohandas Gandhi and then on American reform experience. Late-twentieth-century scholarship put nonviolent application of social force on a systematic and empirical basis and explored its implications for national security. In this sense the study of nonviolence is no longer confined to ethical pacifism.

Skepticism about foreign policy and governmental accountability is the legacy of the nonresistants and the experience of the peace sects. It was reinforced when pacifists were persecuted or were treated as irrelevant. It is the concomitant of the pacifist values of individual worth, harmony, and brotherhood, contrasted as they are with articles of foreign policy such as national interest, conflict, and sovereignty. Skepticism follows from the pacifist emphasis on a transnational orientation and moral commitment, as against foreign policy based on national interest and pragmatic choices. It is at the heart of the demand that foreign policy be tested publicly by the very values it purports to secure. Skepticism is not unique to pacifism, but it has been significantly sharpened in the American peace movement as a result of pacifist activity.
CONCLUSION

Foreign policymaking can be interpreted as the process of relating national interest to international situations. A crucial stage of the process is the definition of national interest, and it is at this point that ideals are related to concrete self-interests. A given principle of American institutions is that policy choices should be subject to public scrutiny and popular pressure. Accordingly, coalitions of peace advocates are essential in a democratic republic because they serve the twin functions of providing independent education about international affairs and of organizing public opinion and translating it into political pressure.

Pacifism has been significant for foreign policymaking insofar as pacifists have influenced peace coalitions. Pacifists have broadened the popular base of pressure, stimulated political organization, and developed techniques with which minorities may challenge majority consensus. They also have imbued the peace movements with such distinctive qualities as their transnational orientation, moral thrust, and skepticism about the efficacy of military force to bring about orderly change or an equitable distribution of world power.

Furthermore, organized pacifists have occasionally played historical roles in consensus formation, notably in the resistance to preparedness and intervention in World War I, in the neutrality controversy of 1935–1937, in constraining nuclear weapons, in the protest against the Vietnam War, and in solidarity with Latin Americans resisting repression. They have attempted to abolish conscription and have liberalized the treatment of conscientious objectors. At the opening of the twenty-first century, pacifists mobilized Nobel Peace Prize winners to challenge U.S. sanctions on Iraq and were working directly with the United Nations to promote a culture of peace.

Influenced by social-movement approaches, modern analysts have treated peace movements as transnational social change movements, often with liberal pacifists at their core. Pacifists in this sense can be understood as integral to foreign policymaking as they collectively interact with the general public, national government, other national and international nongovernmental organizations, and international agencies.

Most people who repudiate violence and war on the basis of pacifist beliefs are not politically active. But even their faith is significant for American foreign policy in two respects. First, in its conduct of foreign relations, including warfare, the nation has been obligated to protect principled dissent from persecution or repression. The fact that this rule has been abrogated does not minimize its constraint on the foreign policy process. Second, the definition of national interest and power is subject to openly advocated alternative conceptions. Whatever the merits of pacifist judgments on specific policies, the free existence of pacifism and its political expression constitute a significant index of the consistency of foreign policymaking with democratic institutions.

BIBLIOGRAPHY

Allen, Devere. The Fight for Peace. New York, 1930. Written by a journalist and editor who advocated war resistance and political activism, this substantial volume remains an important primary source of pacifist thought and history.

———. *The Struggle Against the Bomb*. Stanford, Calif., 1993. A trilogy (of which two volumes have been published) narrating the history of transnational movement against nuclear weapons; the only comprehensive account of a transnational peace movement.

According to Joseph B. Lockey, the closest student of Pan-Americanism’s early days, the adjective “Pan-American” was first employed by the *New York Evening Post* in 1882, and the noun “Pan-Americanism” was coined by that same journal in 1888. The convening of the first inter-American conference in Washington the next year led to wider usage of the first term about 1890 and popularization of Pan-Americanism in the early years of the twentieth century. While the terms have since become familiar expressions to most of the reading public in the Western Hemisphere, their connotations remain vague. Broadly defined, Pan-Americanism is cooperation between the Western Hemisphere nations in a variety of activities including economic, social, and cultural programs; declarations; alliances; and treaties—though some authorities narrow the definition to include political action only. However, the specific definition must always be partly in error, and the broad one borders on the meaningless.

**THE ROOTS OF PAN-AMERICANISM**

Pan-Americanism is more easily traced than defined. In the middle of the nineteenth century, various “Pan” movements achieved popularity as adjuncts or exaggerations of the powerful nationalism of the times, throwbacks to ancient Pan-Hellenism. Pan-Slavism was perhaps the first to acquire some measure of fame; Pan-Hellenism revived about 1860 and was followed by Pan-Germanism, Pan-Islamism, Pan-Celtism, Pan-Hispanism, and others. Probably all these “Pan” movements share certain predicates: their believers feel some unity, some uniqueness—perhaps superiority—and they share mutual interests, fears, history, and culture. In short, their similarities make them different from the rest of the world, and they combine for strength. Pan-Americanism, however, fails to meet most of those criteria and must fall back upon the weaker elements of a common geographical separation from the rest of the world and something of a common history.

From early colonial times, Western Hemisphere peoples believed that they were unique. Statesmen of the Americas, both North and South, were united in affirming that some force—nature, or perhaps God—had separated the Old World and the New World for a purpose; and this isolation in an unknown land had brought a common colonial experience that deserved the name of “system.” Among leaders who saw and described this division was Thomas Jefferson; Henry Clay often argued before Congress for its preservation; Simón Bolívar acted upon it; and President James Monroe’s doctrine most fundamentally assumes it.

What were the elements of this American system? First was independence, defined by Clay as freedom from despotism, either domestic or European. Peoples of the Americas believed in a common destiny, a body of political ideals, the rule of law; and cooperation among themselves (at least when threatened from the outside). In later years Secretary of State James G. Blaine saw these factors strengthened by commerce; the Brazilian statesmen Joaquim Nabuco and José Maria da Silva Paranhos, Baron Rio Branco, talked of a common past; Woodrow Wilson thought he saw a unique American spirit of justice.

Americans could not ignore geography. They had moved to, or been born in, an underpopulated continent, where the strife of Europe was put aside and mobility, vertical or horizontal, was easily achieved. Nature isolated the American, and that isolation would produce a different people. But the most apparent difference between Americans and their European cousins was in the form of government. The vastness of America enhanced the individual’s worth, and the right of each person to have a share in government found
fertile soil there. Thus, when the Spanish and Portuguese colonies struggled to gain their freedom in the half-century after 1789, most deliberately chose the unfamiliar republican form of government that would safeguard the rights of citizens to choose those who would govern them. Inevitably some constitutions were copied, but that was the plagiarizing of words; the ideas were pandemic. (That a few nonrepublican administrations arose was a matter singularly ignored and always easily explained away to anyone who pursued the puzzle.) From Philadelphia to Tucumán in the Argentine, new constitutions proclaimed that Americans had a new way of life and a new form of government to ensure its continuance.

Nowhere were these American ideas better expressed than in paragraphs of the presidential address that became known as the Monroe Doctrine. Monroe asserted a belief in the existence of two worlds, one monarchical and one republican; the New World was closed to further colonization by the Old, and neither should interfere with the other. Third parties were not to tamper even with regions in the Americas that were still colonies. Whether the U.S. will to protect this separation was based upon geography or, ironically, the British fleet, the doctrine expressed what Americans believed and would fight to preserve.

At times Americans have been carried away with the enthusiasm of their rhetoric and have found unifying interests where they did not exist. Proponents of Pan-Americanism have often spoken of the existence of a common heritage, a statement with limited application, for in the hemisphere there is no common language, culture, or religion. Contrary to most “Pan” movements, Pan-Americanism has little basis in race or ethnicity, and it scarcely seems necessary to belabor the cultural diversity of the persons who bear the name American. If heritage were the chief basis of community, Spanish Americans would have their strongest ties with Spain, Brazilians with Portugal, Anglo-Americans with Great Britain, and so on. Nor can Pan-Americanism ignore those millions of African heritage or those who are indigenous to the Americas. Language and religion are even more varied than race in the Americas and can offer no more means of unification.

Finally, consideration must be given to the geographical basis for Pan-Americanism. It is a fact that the Americas occupy their own hemisphere and that they had been comfortably separated from the disturbances of Europe by great seas until the mid-twentieth century. Clearly this isolation resulted in some community of interest. The danger lies in exaggeration, for the modern traveler soon learns that in terms of dollars, hours, or miles, much of the United States is far closer to Europe than it is to most of Latin America, and Buenos Aires is far closer to Africa than it is to New York or Washington, D.C. In short, it is a fallacy to contend that the Americas are united by their proximity. The Americas, North and South, occupy the same hemisphere, and that does present an important mythology and symbolism to the world. More than that cannot be demonstrated.

Who are the Pan-Americans? No one has ever established requirements for membership nor set forth the procedures by which a people can become part of the elect. Form of government played a more or less clear part; the American nations all seemed to understand that colonies could not participate in Pan-American movements, but that local empires (the only one bearing that title for any duration was Brazil) were welcome. Nations sent delegates to the various conferences called during the nineteenth century primarily because they were invited by the host, not because of any established rules. Thus, some meetings that are classified as Pan-American might have had delegates from only four or five states. After 1889 nearly all of the republics of the hemisphere took part. The proliferation of new states in the years following World War II is reflected in Pan-Americanism, and former British colonies, no matter how small (and perhaps unviable), seem to have been welcomed into the American family, as has Canada, though generally the Canadians have often pursued their own policies. A nation can also be excommunicated, as Cuba was in 1961. And despite sanctions imposed upon Cuba by the Organization of American States (OAS), it continued to have diplomatic and economic relations with several American states, particularly following the collapse of the Soviet Union in 1991.

**PAN-AMERICANISM TO 1850**

Pan-Americanism most often expresses itself through international conferences, very loosely joined in the early years, highly structured in more recent decades. In the nineteenth century, conferences were often called to seek combined action against some specific problem. In the twen-
The fear that Spain might attempt to reclaim its empire with the assistance of Europe's Holy Alliance provided Bolivar with the opportunity for his grand alliance. In December 1824 he called for an "assembly of plenipotentiaries" to meet at Panama to address the security issue. Bolivar's notice was addressed to "the American republics, formerly Spanish colonies," and therefore omitted several American states. The invitation included Great Britain, signaling Bolivar's understanding that British support was essential for the success of his confederation. He also permitted the Netherlands to send an observer, apparently without an invitation. Bolivar had ignored both the United States and Brazil, which of course, were not "formerly Spanish colonies"; but when their attendance was sought by other Latin Americans, he posed no objection.

Bolivar's classical training caused him to see Panama as the modern counterpart of the Isthmus of Corinth, and parallel to the Greek experience, he selected Panama as the site of the conference. That unsavory location had many defects as a host of an international conference. In fact, every delegate took ill during the sessions, but it did have the advantage of a central location. In June 1826 the representatives of Peru, Gran Colombia, Mexico, and the Central American Federation met and planned the first steps toward Pan-Americanism.

Technically speaking, attendance was much greater, for in time Gran Colombia was to be divested of Venezuela, Ecuador, and Panama, and in 1838 the Central American Federation was split into its original five parts, which became the republics of Guatemala, El Salvador, Honduras, Nicaragua, and Costa Rica. In that sense, the four nations accounted for eleven future Latin American republics. But what of the others? The United Provinces of La Plata already evidenced the isolationism and antipathy to alliances that were to mark the policy of its successor state, Argentina. Even more self-contained was Paraguay, which simply declined to be represented. Brazil, Chile, and Bolivia exhibited some interest but for various reasons failed to send delegates to Panama.

Bolivar not only mistrusted U.S. intentions in the hemisphere but thought its presence would preclude an honest discussion about the African slave trade. For its part, when the invitation did come, the United States, officially neutral in Latin America's wars for independence, could quite properly have declined the invitation. However, members of President John Quincy Adams's administration, led by Secretary of State Henry
Clay, were eager to join in any movement toward inter-American cooperation, if for no other reason than economic opportunity. Strong congressional opposition arose. Some of it could be attributed to the Democrats seeking to embarrass the Adams administration, but there were more serious concerns. The isolationists objected to participating in any conclave that might produce a permanent and entangling alliance. Many southerners feared a discussion of the slavery issue. In contrast, representatives from the Northeast saw the need to protect commercial interests against British competition. After four months of debate, Congress approved sending two delegates, but to no avail. One died en route to Panama; the other made no effort to reach Panama, but journeyed instead to Tacubaya, Mexico, where the Spanish-American statesmen planned further meetings.

Rivalries, both petty and large, soon appeared at Panama. Some states professed to fear Bolívar's ambitions; others wanted only a temporary league to complete the independence of Latin America from Europe. Even the role of the British at the sessions was debated. Owing to the local climate and unsanitary conditions, the Panama Congress lasted less than one month, but not before concluding a treaty of perpetual union, league, and confederation; a convention providing for future meetings; and a second convention outlining each participating state's financial support for maintenance of an armed force and the confederation's bureaucracy. The treaty contained thirty-one detailed articles designed to implement the treaty's objective: "to support in common defense . . . the sovereignty and independence" of each state against foreign domination.

After signing the agreements, some of the representatives departed for home; others traveled to Tacubaya, a small village near Mexico City, where they planned to reconvene if their governments deemed the effort worthwhile. Some informal talks were held at Tacubaya, but no formal sessions ever took place, and the Panama Congress had to stand upon its completed work. A dismal fate awaited the Panama Congress treaties across Latin America. Only Gran Colombia ratified them all, despite the surprising opposition of Bolívar.

In only one regard can the Panama Congress be looked upon as a success: the fact of its existence perhaps made the holding of future such conferences a bit easier. Little else was accomplished. Why did it fail so badly? The end of the threat from Spain and the beginnings of civil strife all over Latin America had coincided to make the congress a forum for expressing the new republics' distrust of each other. For the time being, the newly independent nations of Latin America set about the task of nation building. Panama was a noble experiment. Though its aims were obviously far ahead of its time, they were appropriate to any time.

The failure of the Panama Congress also demonstrated that its prime mover, Bolívar, had changed his mind about the vast confederation of states, and would concentrate instead upon establishing a tight federation of the Andes with himself as permanent dictator. This change left a leadership vacuum in Pan-Americanism that was briefly filled by Mexico. Despite rapid shifts from conservative to liberal administrations, the Mexican government for a decade followed a policy of urging the Latin American states to consummate some of the plans drafted at Panama and help protect the region against the possibility of European intervention. Armed with a proposal for a treaty of union, and calling for renewal of the Panama discussions, Mexican ministers were dispatched to several capitals. Mexico was willing that the meetings be convened in almost any convenient spot, but the suggestion received little support. This first bid of 1832 was repeated in 1838, 1839, and 1840, by which time Mexico faced an increasing North American presence in Texas. However, the other nations lacked Mexico's concern, and the proposals did not result in even one conference. Only when the South Americans feared for their own security did they decide to band together again.

The United States also distanced itself from Latin America. President James Monroe's 1823 announcement that the Western Hemisphere was off-limits to European encroachments because the hemispheric nations shared common democratic and republican ideals lost its luster as U.S. diplomats reported back from the region that the Latin American nations were anything but democratic or republican. Nor did the visions of commercial success ever materialize. These same diplomats found the British, who helped to finance Latin America's independence, well entrenched.

The second Latin American conference took place in Lima, Peru, from December 1847 to March 1848. The conference was in response to two threats: the fear of Spanish designs upon South America's west coast and the U.S. incursion into Mexico. General Juan José Flores, a Venezuelan-born conservative, became Ecuador's first
PAN-AMERICANISM

PAN-AMERICANISM, 1850–1900
What appeared to be the insatiable U.S. appetite for territory prompted two Latin American meetings in 1856. Santiago, Chile, was the site of the third Pan-American conference under Spanish-American auspices. The conference was called because Ecuador proposed granting the United States the right to mine guano on the Galápagos Islands, an action that disturbed Ecuador's Pacific Coast neighbors. The republics of Peru, Ecuador, and Chile sent delegations to Santiago, where they drafted plans for another confederation and agreed upon joint measures for handling “piratical” expeditions. In September 1856 the delegates signed the Continental Treaty, dealing with many aspects of international law, filibustering, and acts of exiles, as well as the usual nod in the direction of a confederation. Significantly, while all of the nations of Latin America were urged to join, including Portuguese-speaking Brazil, the United States was not invited to attend the conference or to join the confederation. But once more failure ensued. The Continental Treaty was not ratified.

Meanwhile the United States, not a European nation, appeared as the chief threat to Latin America's territorial integrity. Its acquisition of more than one-third of Mexico was followed by the presence of filibusters in the circum-Caribbean region. William Walker's filibustering expedition into Nicaragua caused the ministers of Costa Rica, Guatemala, Mexico, New Granada, Peru, El Salvador, and Venezuela assigned to Washington, D.C., to sign a treaty of alliance and confederation on 9 November 1856. The signatories pledged themselves to prevent the organizing of expeditions by political exiles against an allied government and, if an attack occurred, to provide military assistance to the aggrieved nation. Hoping to convert this arrangement into a Hispanic-American Confederation, the delegates called for a conference to convene in Lima in December 1857. As in the past, nothing materialized. The Washington agreement was not ratified, and the conference was not convened.

The fourth and last of the “old” Spanish-American conferences took place at Lima, Peru, in 1864. The weakness of many of the Latin American states and the U.S. preoccupation with its Civil War had allowed a series of European flirtations in the American hemisphere. Spain claimed the reannexation of the Dominican Republic in 1861; Spain, Great Britain, and especially France threatened, and then invaded, Mexico; and Spain occupied Peru's Chincha Islands to collect debts, under the pretext that Peru was still a Spanish colony. In response, in 1864, the Colombian government encouraged the Peruvians to invite all former Spanish colonies to a conference at Lima to take up the matter of intervention by foreign powers. In addition to Peru, states attending included Argentina, Chile, Colombia, El Salvador, Guatemala, and Venezuela. The United States and Brazil were not invited, ostensibly because they were not former Spanish colonies. The Lima Congress failed to negotiate with Spain for the withdrawal of its troops from the Chincha Islands, and when the delegates turned their full attention to the usual grand treaty of confederation, the failure was just as complete. Once again no nation ratified any of the agreements. The end of the American Civil
War and the renewed preoccupation of Spain and France with domestic and foreign problems elsewhere account for the departure of those two nations from their Latin American adventures.

The War of the Triple Alliance (1865–1870), which pitted Paraguay against a loose league of Argentina, Brazil, and Uruguay, and the War of the Pacific (1879–1884), in which Chile easily mastered Bolivia and Peru, left bitter residues that in the short run meant the end of any program of Pan-Americanism led by Spanish-American republics. Although a few technical and nonpolitical conferences were held in the next few years, Pan-Americanism was discarded until the United States assumed the responsibility.

U.S. leadership marks the beginning of the “new” Pan-Americanism, dating from the 1880s until its demise in the 1930s. The “new” Pan-Americanism differed significantly from the “old.” The four early conferences were dominated by the Spanish-American states and concerned themselves with problems that, while not exclusively Spanish American, seemed to threaten those states particularly. The meetings were usually provoked by the threat of outside aggression, and the solutions sought were political and military in nature. The “new” Pan-Americanism was more inclusive yet less ambitious in scope. It focused on low-profile issues, which contributed to increased conference participation and the building of Pan-Americanism into an institution of imposing size and machinery. Concomitantly, Latin Americans became increasingly vocal regarding U.S. dominance of hemispheric relations, culminating at the 1928 Havana conference.

Credit for inaugurating the series of “new” Pan-American conferences rests with James G. Blaine, who served as secretary of state in the brief (March to September 1881) administration of James A. Garfield. Blaine owed much of his genuine interest in Latin America to his admiration for Henry Clay. Both men envisioned a free-trade relationship among the countries of the Western Hemisphere. While U.S.–Latin American trade was nearly immeasurable during Monroe’s presidency in the 1820s, by the 1880s the United States faced a healthy unfavorable trade balance caused by its large purchases of Latin America’s raw materials and the small sales of manufactured goods to the area in return.

In addition to trade issues, Blaine confronted several ongoing disputes. The worst of these was the War of the Pacific, in which Bolivia had been decisively defeated by Chile, whose troops were occupying Lima, Peru. The Chileans gave every indication of making vast territorial acquisitions at Bolivia’s and Peru’s expense. In addition, several boundary disputes threatened the stability of Latin America and provoked Blaine into assuming the unpopular role of peacemaker. Blaine’s intentions were better than either his methods or his agents, and he incurred significant displeasure from Latin Americans during his brief first term in office. Following Garfield’s death, Blaine resigned the secretariat. Before leaving the State Department, however, he promoted a call for the first International Conference of American States, to be held in Washington, D.C. Blaine’s successors, Frederick T. Freylinghuysen and Thomas F. Bayard, had little interest in Latin American affairs. Freylinghuysen withdrew Blaine’s invitation for an Inter-American conference in Washington.

The movement was renewed a few years later by the U.S. Congress, when it sponsored a survey of Latin America’s economic conditions. With a more friendly atmosphere, the First International Conference convened in 1889, when the secretary of state was again James G. Blaine. All of the American states except the Dominican Republic (its absence was due to U.S. failure to ratify a trade treaty with its Caribbean neighbor) sent delegations of high caliber. With some opposition Blaine was chosen chairman of the sessions, a post in which he demonstrated considerable tact and skill.

In the midst of its industrial revolution, the United States anticipated that the conference would bring economic benefits through a customs union. Toward that end, the Latin American delegates were entertained lavishly and given an impressive and fatiguing six thousand mile railroad tour through the industrial heart of the nation. Understanding the U.S. intention, the Latin American delegates, led by the Argentines, failed to accept Blaine’s proposed customs union. As producers of raw materials, the Latin Americans preferred open markets. Opposition also came from some U.S. congressmen, particularly those from the nation’s agricultural sectors. Instead, a program of separate reciprocal trade treaties was recommended; a few were instituted, decades ahead of the Good Neighbor program of the 1930s. On the political front, an ambitious arbitration treaty was watered down in conference, nullified by a minority of delegations, and ratified by no one.

The most notable achievement of the Washington conference was the establishment of the International Union of American Republics for the
collection and distribution of commercial information. The agency to execute this command was the Commercial Bureau of the American Republics, supervised by the U.S. secretary of state in Washington, D.C. This bureau met regularly and, expanding in both size and functions, became a useful agency to the American states, though a far cry from the Pan-Americanism of Bolívar's day. The date of the union's establishment, 14 April 1890, became known as Pan-American Day.

Although the delegates to the First International Conference had not scheduled any future meetings, they left Washington with the clear intention of so doing. Nothing happened until 1899, when President William McKinley suggested another conclave. Only then did the Commercial Bureau act. It selected Mexico City as the site for the second conference and handled the drafting of agenda and invitations.

**PAN-AMERICANISM, 1900–1945**

In this fashion the institutionalization of the International Conferences of American States developed. To reduce the appearance of U.S. domination, the conferences were held in the various Latin American capital cities, with the presumed hope of meeting in all of them. The record of attendance was very high, frequently unanimous, and only once were as many as three states absent (from Santiago, Chile, in 1923). The frequency of the sessions varied because of world wars, but four- or five-year intervals were the norm.

The second through sixth conferences (Mexico City, 1901–1902; Rio de Janeiro, 1906; Buenos Aires, 1910; Santiago, Chile, 1923; Havana, Cuba, 1928) experienced minimal success. The issues recurring most prominently at these meetings were arbitration, hemispheric peace, trade, the forcible collection of debts, U.S. dominance of the organization, and intervention by one state in the affairs of another (and, in the 1920s, arms control). Specific accomplishments of these many conferences were more modest. Resolutions, conventions, and treaties were often debated, but compromise was endless, and major solutions were rarely reached or ratified. One exception was the 1923 Gondra Treaty, designed to create machinery for the peaceful settlement of American disputes. This treaty served as the basis for similar machinery in the later Organization of American States. Major alterations included the substitution in 1910 of the name Pan-American Union for the Commercial Bureau, and in popular usage Pan-American Conference replaced International Conference of American States. From time to time some delegates expressed their dismay that Pan-Americanism was taking no steps toward the confederation so often praised, but the majority clearly preferred the use of the Pan-American Union as a sounding board for international public opinion and an agency that moved slowly in the settlement of specific problems.

The growing U.S. presence in the circum-Caribbean region after 1898 gave the Latin Americans cause for concern, and they used the Pan-American forums as the vehicle to chastise Washington's imperialistic policies. Before World War I, at Mexico City, Rio de Janeiro, and Buenos Aires, the Latin Americans insisted on recognition of national sovereignty as a means to thwart U.S. intervention. For the same reasons, they joined the League of Nations following the end of World War I, hoping to use that international forum to curtail U.S. ambitions south of the Rio Grande River. When the United States failed to join the league, the Latin Americans lost interest in the organization, and by the mid-1920s their attendance at annual meetings had dwindled greatly. At Santiago in 1923 and again at Havana in 1928, the Latin Americans vociferously protested the U.S. domination of the hemispheric agenda and its continued presence in several circum-Caribbean countries. Only the efforts of former Secretary of State Charles Evans Hughes prevented the passage of a resolution declaring that "no state has the right to intervene in the internal affairs of another." This was the last major U.S. stand on behalf of its interventionist policies.

In addition to the growing Latin American pressure, other factors influenced the United States to abandon its interventionist policy, and with it bring to an end the era of the “new” Pan-Americanism. The roots of the U.S. policy change can be traced to the end of World War I, which left Europe incapable of threatening the Western Hemisphere. Also, within the State Department since the early 1920s there was a growing frustration about the failure of the numerous interventions. The 1924 Democratic Party platform criticized the interventionist policy, a position repeated by Franklin D. Roosevelt, writing in *Foreign Affairs* in 1928. What did the United States have to show for its interventions in the circum-Caribbean region? the critics asked. As secretary of commerce, Herbert Hoover argued that the larger and more prosperous Latin American states refused to purchase U.S. goods as a protest against its Caribbean presence. And as president-elect in 1928, Hoover embarked on a goodwill tour of Central and South America, a harbinger of forthcoming change. Subsequently, State Department official Joshua Reuben Clark’s *Memorandum on the Monroe Doctrine* renounced U.S. interventions in Latin America’s domestic affairs under the terms of the Monroe Doctrine.

The policy shift climaxed on 4 March 1933, when President Franklin Roosevelt, in his inaugural address, promised to be a “good neighbor.” Originally intended for all the world, in application it came to apply to Latin America. A further indicator of Roosevelt’s intention not to interfere in Latin America’s internal affairs was the selection of Sumner Welles as assistant secretary of state, a man who believed that hemispheric relations should be conducted on the basis of absolute equality. The policy shift was completed at the 1933 Montevideo conference, where the U.S. delegation approved the Convention on Rights and Duties of the States. It affirmed that “No state has the right to intervene in the internal or external affairs of another.” The Latin American delegates at Montevideo were equally pleased when Secretary of State Cordell Hull announced that their countries need not fear intervention during the Roosevelt administration. Still, the Latin Americans needed to be reassured. Not sharing Washington’s concerns about the rising European war clouds, they were not interested in discussing hemispheric defense at the 1936 Inter-American Conference for the Maintenance of Peace held in Buenos Aires, and in 1938 at the Lima Conference. Instead, they pressed for, and received, additional U.S. pledges of nonintervention. With these pledges, the “new Pan-Americanism” passed into history.

Roosevelt’s words were followed by pragmatic actions. American troops were withdrawn from Haiti, the Dominican Republic, and Nicaragua. The United States did not interfere in either the Cuban or the Panamanian political turmoil of the 1930s. In fact, a new treaty with Panama provided additional advantages to the isthmian republic. Nor did the United States act when Central American dictators Tiburcio Carías, Maximiliano Hernández-Martínez, Anastasio Somoza, and Jorge Ubico illegally extended their presidential terms. A potentially explosive question raised by Mexico’s expropriation of vast foreign oil holdings was treated by the Roosevelt administration as a matter of concern between the Mexican government and the oil companies.

Contrasted with the “old,” the “new” Pan-Americanism was marked by more concern for nonpolitical objectives, both technical and social. The “old” had been geographically more restrictive and often purely Spanish; the “new” was deliberately hemispheric in scope, and the leadership clearly rested with the United States. Just as the “new” Pan-Americanism was passing into history, the trajectory of inter-American relations took yet another turn, and again the United States took the leadership role. Confronted with international crises—the Great Depression, World War II, and the cold war—the United States attempted to incorporate the Pan-American movement into its international policies.

The world was staggering under economic collapse when Franklin D. Roosevelt took the presidential oath in March 1933. World trade had declined by 25 percent in volume and by 66 percent in value since 1929. At the same time, U.S. trade with Latin America had declined more drastically: exports, by 78 percent in value and imports, by 68 percent. Convinced that economic nationalism exacerbated the depression, Secretary of State Hull sought the liberalization of trade policies. Congress consented in 1934 with the passage of the Reciprocal Trade Agreements Act, which enabled the U.S. government to strike beneficial tariff agreements with trading partners. Latin America fit neatly into the plan because it did not have a competitive industrial sector, nor did its major exports compete with U.S. commodities. In comparison, the United States was in a stronger position because it could serve as Latin America’s chief supplier of manufactured goods, and given the fact that reciprocal trade agree-
ments favored the principal supplier, tariff negotiations would focus only on products that constituted the chief source of supply. In sum, the act gave the U.S. a favorable negotiating position.

The Latin Americans understood the U.S. position, and that understanding contributed to the refusal of Argentina, Bolivia, Chile, Peru, Paraguay, and Uruguay to reach trade agreements with the United States. The United States managed to conclude agreements only with countries that were heavily dependent upon its markets for agriculture (usually monoculture) exports: Brazil, Colombia, Costa Rica, Cuba, El Salvador, Guatemala, Honduras, and Nicaragua. In the end, the reciprocal trade agreements with these countries had little economic impact, but for the Central American dictators the agreements provided an air of legitimacy for their illegal regimes.

Negotiations with Brazil illustrated the need to address another international issue: the threat of Nazi Germany to the Western Hemisphere. In addition to Brazil, influential German communities were located in Argentina, Chile, Colombia, Guatemala, Costa Rica, Mexico, Panama, and Paraguay. Over the course of the 1930s the United States viewed these communities as threats to hemispheric stability by spreading German propaganda, sending funds back to Berlin to be used for Nazi purposes, and engaging in espionage and, possibly, sabotage. The increased U.S. concern with Axis influence prompted Washington policymakers to commence western hemispheric defense plans in 1936. For the most part, Latin America’s political leadership did not share Washington’s concerns, and believed that Roosevelt was using the European troubles to circumvent the nonintervention pledge made in 1933 at Montevideo. Only after the German invasion of Poland in 1939 and the fall of France in June 1940 did the Latin American nations feel a sense of urgency about hemispheric defense. Until then, the United States obtained only an innocuous agreement at the 1936 Buenos Aires conference, reaffirmed at Lima in 1938, which called for consultation when an emergency threatened the hemisphere. The Lima conference was the last regular meeting of the American states until after World War II, but on three occasions the foreign ministers convened to confront wartime issues. Their work proved essential to the continuity of Pan-Americanism at a time when world-scale military agreements took precedence.

The first meeting of the foreign ministers took place in Panama City after the German invasion of Poland in September 1939. To protect hemispheric neutrality, the ministers agreed upon a safety zone south of Canada, extending an average of three hundred miles out to sea around the remainder of the hemisphere. Belligerent nations were warned not to commit hostile acts within this zone. Within a matter of weeks the zone was violated by both the British and the Germans, and frequent ship scuttlings in American waters in 1940 made the zone something of a nullity. More important, however, was the unanimity of the Americans in their resolve to keep the war away.

The second meeting of the Consultation of the Ministers of Foreign Affairs (the full title of these sessions) followed the fall of France to the Germans in June 1940. Again at the urging of the United States, the ministers met at Havana, Cuba, in July to discuss the question of European colonies in the Western Hemisphere and the danger of their falling into German hands. They agreed upon the Act of Havana, which provided that if a non-American state (Germany) should attempt to obtain from another non-American state (France, for example) any islands or other regions in the Americas, one or more American states would step in to administer such territory until it was able to govern itself freely or had been restored to its previous status. Fear that the Axis powers might attempt to occupy some of the many possessions in America was real enough; however, no such attempt was made. The ministers also affirmed the Declaration of Reciprocal Assistance and Cooperation for the Defense of the Nations of the Americas, the gist of which was that an attack upon the sovereignty of any American state was to be treated as an attack upon them all, a further broadening or multilateralizing of the Monroe Doctrine in process since 1933.

The third and last wartime meeting of the foreign ministers convened at the request of Chile and the United States as a consequence of the Japanese attack upon Pearl Harbor in December 1941. The statesmen met at Rio de Janeiro in January 1942, by which time ten American nations, including the United States, had declared war upon the Axis powers. The U.S. military services were not anxious for the participation of underequipped and poorly trained Latin American forces in a global struggle. U.S. military officials agreed with many of the ministers that the proper gesture would be the severing of diplomatic relations, which would eliminate the Axis influence in the Americas, and thereby help to reduce the flow of classified information to those governments. However, a strong
declaration requiring the American states to break relations (favored by Secretary Hull) was so rigidly opposed by Argentina and Chile that the U.S. delegation, led by Sumner Welles, settled for a milder version that merely recommended such an action. The issue was deeper than one of semantics, for the Argentines were doing more than expressing their usual reluctance to appear to be following U.S. policy. The Argentine military was actually pro-German and gave considerable assistance to the Axis in the war.

The most important agreements at Rio dealt with the elimination of Axis influence in the Americas. With the exception of Argentina and Chile, the Latin American governments agreed to cooperate with the United States in deporting selected German nationals and their descendants back to Germany or to internment camps in the United States. Those who remained behind would be subject to tight supervision of their properties and greatly restricted freedoms. With a few exceptions, such as Brazil, Chile and Mexico, the war impacted adversely upon the Latin American economies, setting the stage for postwar political and social upheaval.

The United States also spread its ideals, values, and culture throughout Latin America via the wartime Office of Inter-American Affairs (OIAA), headed by Nelson A. Rockefeller. OIAA proselytized the war's democratic objectives through educational programs and dissemination of propaganda literature and Spanish-language Walt Disney films. It sponsored visits by U.S. artists, writers, and athletes to Latin America, and brought many Latin American students and professionals to U.S. institutions for advanced training. Of course, this was Pan-Americanism as seen by the United States, and it did not always achieve universal acceptance. Sometimes too glossy, and frequently expensive, it was reasonably sincere even when some cultural programs insulted the intelligence of the Latin Americans. But under the veneer was a solid construction of goodwill, and the U.S. policymakers—Sumner Welles, Cordell Hull, Nelson Rockefeller, and Franklin D. Roosevelt—understood the Latin American need for equality and dignity.

**PAN-AMERICANISM SINCE 1945**

Toward the close of the war, the American states met in the Inter-American Conference on the Problems of War and Peace at Mexico City in February 1945. Uninvited Argentina was conspicuously absent. The diplomats focused their attention upon the place that Pan-American regionalism would have in the plans for the proposed United Nations. Prodded by the United States, the Latin Americans insisted upon their right to protect themselves without having to seek the approval of the UN Security Council. Ultimately this demand was approved in the UN Charter. The conference also recommended that Argentina, after declaring war on the Axis, be permitted to participate in the San Francisco sessions that formalized the United Nations. The delegates drafted the Act of Chapultepec, which required the states to conclude a treaty of reciprocal assistance, a treaty on the settlement of disputes, and a new regional arrangement that would substitute a permanent treaty for the various informal agreements underlying the inter-American association in the past. These objectives were concluded in 1947 at a special conference in Rio de Janeiro and in 1948 at Bogota, Colombia, when the next regular International Conference of American States (the ninth) convened. Significantly, these meetings came at a time when the Truman administration was fashioning a Latin American policy that reflected its larger global strategy of containing Soviet aggression.

The Inter-American Treaty of Reciprocal Assistance, signed at Rio de Janeiro on 2 September 1947, committed the signatories to the solidarity sought against external aggression since Bolivar’s days. An armed attack by a state against any American state was henceforth considered an attack against all, and each contracting party agreed to assist in meeting the attack. The assistance would be rendered collectively, following a consultation of the inter-American system and in accordance with the constitutional process of each nation, a recognition that not all countries were practicing democracies. The same obligations also applied should an armed attack occur within the region. In 1947, however, influenced by the World War II experience, policymakers focused upon potential external aggression.

The 1948 Bogota conference was nearly destroyed when the assassination of a popular Liberal Party leader was followed by citywide rioting. Nevertheless, the sessions were completed. The treaty for the pacific settlement of disputes was signed, but with so many additions and amendments that several states failed to ratify it. The major achievement was the reorganization of the entire inter-American system by the Charter
of the Organization of American States (OAS), the first permanent treaty basis for the old structure. The charter declares the principles upon which the organization is based and the necessity for such machinery to be welded into the UN framework. Briefly, the OAS accomplishes its purposes by means of the following:

1. The Inter-American Conference, the supreme organ of the OAS, meeting every five years to decide general policy and action.
2. The Meeting of Consultation of Ministers of Foreign Affairs, called to discuss urgent matters and to serve as the organ of consultation.
3. The Council of the Organization of American States, meeting in permanent session and composed of one delegate from each member state. The council takes cognizance of matters referred to it by the agencies listed above and supervises the Pan-American Union.
4. The Pan-American Union is the general secretariat of the OAS, with a wide variety of functions. In addition there are several organs of the Council, specialized organizations, and special agencies and commissions.

In the 1960s several amendments were made to the OAS charter, the most fundamental being the replacement of the Inter-American Conference with an annual general assembly.

The final measure that incorporated Pan-Americanism into the U.S. global strategies came with U.S. congressional approval of the Military Assistance Program (MAP) in 1951. Since the end of World War II in 1943, the Truman administration had pushed Congress to approve MAP, designed to harmonize military equipment, training, and strategy throughout the hemisphere. Congress consistently resisted, on the grounds that the United States would be blamed for securing the positions of Latin American dictators. But with a global cold war, Congress relented. From 1951 through 1960, the U.S. materiel supplied to Latin America focused upon the need to resist external aggression in general, and to protect the Panama Canal and Venezuelan and Mexican oil supplies, in particular. In addition, Latin American military officers received training at U.S. military bases and institutions, most notably the School of the Americas in the Panama Canal Zone.

During the period 1945–1951, administration spokesmen continued to espouse traditional Pan-American ideals, such as the need for political stability, faith in democracy, and promises of nonintervention. While preaching these ideals, the United States ignored Latin American demands for an end to dictatorships and an improvement in the quality of life for the less fortunate. Until the mid-1950s, communism in Europe and Asia appeared more important.

In Latin America the tendency to indict social and political reformers as communists intensified as the cold war took root. Fearing the personal consequences of changes to the established order, Latin America's political leadership and socioeconomic elites came to accept the U.S. view that these reformers were Moscow-directed communists and that they were part of the Soviet scheme for world domination. The test case became Guatemala, where reformers Juan José Arévalo and Jacobo Arbenz introduced social programs that challenged the local elite's privileges. Arbenz's nationalization of United Fruit Company lands convinced Secretary of State John Foster Dulles of the need for action. In 1954 he took his case to the tenth inter-American conference at Caracas, where he sought a multinational blessing for a unilateral action. Dulles denied the existence of indigenous communist movements and asserted that every nation in the hemisphere had been penetrated by international communists under Moscow's direction. He called for decisive action, presumably under the terms of the Rio Treaty, to eliminate subversive activities in the hemisphere. In effect, Dulles sought to Pan-Americanize the Monroe Doctrine in order to prevent what he alleged was Soviet penetration of the Western Hemisphere. Dulles did not single out Guatemala, but all present understood it was the target. Following the vote, Dulles left Caracas just as the conference began its discussion of Latin America's social and economic distress.

At Caracas, the U.S.-sponsored resolution was approved by a 17–1 vote, with Guatemala dissenting and Argentina and Mexico abstaining. A month later the Central Intelligence Agency sponsored an “invasion” of Guatemala by loyalist forces that ousted Arbenz and restored the traditional order. The United States manipulated events at the United Nations to prevent international scrutiny of its actions. Under Article 51 of the UN Charter, regional organizations were permitted to deal with regional problems before the United Nations intervened. In this case, the United States convinced the Security Council that the OAS had the Guatemalan situation under control.
The U.S. actions fueled anti-American sentiment across Latin America. Coupled with its failure to address the region’s socioeconomic problems, the intervention in Guatemala reaffirmed Latin America’s view that the United States did not intend to treat its southern neighbors as equals. Security from foreign intervention remained at the heart of Pan-Americanism, but since the late 1930s only the United States had determined the parameters of the threat.

The rise of communism as a threat in Latin America unquestionably provoked the feeling among many Americans, both North and South, that the Pan-American movement needed a long-range program to improve the economy and quality of life across South America. The first organized economic assistance to Latin America had been a part of the Good Neighbor program of the 1930s. Other precedents rested with the Point Four and mutual security programs during the Truman administration. Still, these programs did not address the disparities that characterized Latin America’s socioeconomic landscape. In 1958, when Brazilian President Juscelino Kubitschek suggested some kind of “Economic Pan America,” he unknowingly forewarned of Latin America’s impending social revolutions. In response to Kubitschek’s appeal, the OAS and the United Nations developed financial assistance programs for the hemisphere, and the Eisenhower administration initiated the Social Progress Trust Fund, but little was accomplished until the success of Fidel Castro’s revolution in Cuba, which by 1961 destroyed Cuba’s traditional political, social, and economic orders.

To meet the challenge, in 1961 President John F. Kennedy implemented the Alliance for Progress, which pledged a U.S. contribution of $1 billion per year over a ten-year period to modernize Latin America’s economic and political systems. In effect the alliance was an admission that previous private and public investment and technical assistance programs alone were insufficient for the steady development of the region. The Latin Americans were to raise a total of $80 billion in investment capital over that ten-year period. Machinery for the alliance was established in 1961 at Punta del Este, Uruguay. The aim was to increase the per capita wealth of participating Latin American states by 2.5 percent each year for ten years. The revolutionary elements of the alliance, the vast amount of cooperative spending, and the strict requirements—such as tax reform, a commitment to land distribution, and broadening the democratic process—in order to qualify for alliance assistance raised the expectations of many Latin Americans.

For the most part, expectations were not realized. Despite advances in gross national products and progress in land tenure patterns, education, and health care, the same people who were in power in 1960 remained the most privileged in the 1970s, and the socioeconomic gap between them and the poor had not narrowed. There was sufficient blame to go around. Latin American elites refused to accept economic and political reforms. Latin Americans wanted a larger share in the decision making; the U.S. government wanted to give them less. As the fear of Castroism diminished by the late 1960s, owing to the bankruptcy of the Cuban economy and the emergence of military governments throughout Latin America, so did regional interest in socioeconomic reform. U.S. administrators and members of Congress became frustrated with Latin America’s graft and corruption. Latin America’s blip on the U.S. radar screen disappeared with the continuing crises in the Middle East and in Vietnam. Subsequently, the Watergate scandal preoccupied the Nixon administration until its downfall in 1973 and marred the brief presidency of Gerald Ford. Although aid to Latin America continued in reduced form after 1970, the U.S. Congress continually asked questions about the validity of any foreign aid program. In the vacuum created by the U.S. absence, the Latin American governments either turned inward or looked beyond the Western Hemisphere for economic assistance.

If the spirit of mutual respect projected in the early days of the alliance was jeopardized by the program’s inadequacies, it was destroyed by unilateral U.S. political decisions: the Bay of Pigs invasion in 1961; the Cuban missile crisis in 1962; the landing of U.S. marines in the Dominican Republic in 1965; and the sale of U.S. arms to Latin America’s military governments in the late 1960s and early 1970s. For all intents and purposes, a Pan-American consciousness did not exist by the mid-1970s.

President Jimmy Carter came to Washington in January 1977 determined to repair the damage done to Pan-Americanism during the previous fifteen years. He set the tone by negotiating treaties with Panama that returned the canal to that country in 2000. He made friendly gestures toward Cuba, which had been ousted from the inter-American system and had been experiencing a U.S. trade embargo since 1961. His human rights
policy gave credence to the ideals of Pan-Americanism, but prompted the military governments in Argentina, Brazil, and Chile to produce their own armaments, and forced the besieged Central Americans to purchase their equipment on the world market.

If Carter had nudged toward closer cooperation with Latin America, President Ronald Reagan took several steps backward. His insistence that the Central American civil wars of the 1980s were yet another Soviet effort to extend communism in the Western Hemisphere fell on deaf ears in Latin America. Not only did Reagan fail to gain the support of the OAS, but his position was openly challenged by the Contadora Group—Colombia, Mexico, Panama, and Venezuela—which received encouragement from the “support group” of Argentina, Brazil, Peru, and Uruguay. The Latin Americans perceived the Central American crisis as a local one, caused by the socioeconomic and political disparities that characterized the region, not Soviet interventionism. These nations were determined to bring peace to the embattled region at the expense of the United States. Their efforts led eventually to the successful peace initiative by Costa Rican President Oscar Arias Sánchez, who received the 1987 Nobel Peace Prize for his efforts. Other U.S. unilateral actions that damaged inter-American relations included its invasions of Grenada (1983) and Panama (1989) and the threatened invasion of Haiti (1993). In tightening its embargo against Cuba in the early 1990s, the United States placed itself outside the hemispheric trend, which included the opening of trade relations between Cuba and several Latin American countries and Canada.

While U.S. Cold War policies gave credence to the charges of U.S. hegemonic influence over hemispheric affairs, they also severely damaged the spirit of Pan-Americanism. And the political purpose of Pan-Americanism, hemispheric security from a European threat that dated to the days of Simón Bolívar, disappeared with the collapse of the Soviet Union in 1991.

As the twentieth century came to a close, three issues dominated the hemispheric agenda: illegal drugs, migration, and commerce. Because these problems are multinational, each provides the opportunity for reviving the intention of Pan-Americanism: cooperation among the nations of the Western Hemisphere. While drugs have corrupted governments and terrified society in such places as Colombia, Mexico, Bolivia, and Peru, all hemispheric nations pay a heavy social and economic price for drug use. Rather than find a common ground for cooperation, the United States and Latin America place responsibility at one another’s doorstep. Washington policymakers appear determined to eradicate drugs at the source—the remote areas of Colombia and the Andean countries—and to punish those nations that serve as transit points for the entry of drugs into the United States. In contrast, the Latin Americans charge that if U.S. residents cut their demand, there would be a concomitant decrease in the production of illegal drugs.

Migration, particularly of Latin Americans to the United States, is a most vexing problem. Given the fact that since the mid-1980s democratic governments have taken root across the region, save Cuba, immigrants can no longer claim to be escaping political persecution, the most valid reason for seeking asylum in the United States. Instead the new migrants are seen as economic refugees, and therefore are not admissible under current U.S. law. The United States also focuses its attention on the poor and unskilled immigrants, not the skilled or professional workers who are absorbed quickly into the North American economy and society. The unskilled workers are viewed as a threat to U.S. workers and a drain upon state and federal social programs that sustain them. On the other hand, Latin American nations fret at the loss of skilled and professional workers, but not the loss of the unskilled (because of limited economic opportunities for them at home). Furthermore, these workers remit badly needed U.S. currency to their relatives at home, and these monies become an important part of smaller nations’ gross domestic product.

One way to address the drug and migration problems in Latin America is economic development, and since the 1980s these nations have become increasingly involved in the global economy. At first, regional cooperation appeared to be the best route. Toward that end several regional economic organizations were formed. The Central American Common Market (CACM) dates to 1959. Others include the Andean Pact (1969) and the Caribbean Community and Common Market (CARICOM) of 1972. Each took on new significance with the globalization process that began in the 1980s. The most promising organization appears to be the Southern Cone Common Market (MERCOSUR). Established in 1991, it brought together Argentina, Brazil, Paraguay, and Uruguay for the purpose of establishing a customs union similar to the European Union. By
2000 Chile and Bolivia had become associate members in anticipation of full membership at some point in the future. The United States joined the parade in 1993 when Congress finally approved the North American Free Trade Agreement (NAFTA), linking it with Mexico and Canada in what is to be a free market by 2005. But the United States would go no farther. Congress denied President Bill Clinton “fast track” negotiating privileges to reach an accord with Chile that would bring the latter into the NAFTA accord. The latter congressional action may be symptomatic of the basic problem that has plagued the Pan-American movement since its inception in the early nineteenth century: national interest.

In June 1990, President George H. W. Bush launched the Enterprise for the Americas Initiative, its ultimate goal being a free trade zone “stretching from the port of Anchorage to the Tierra del Fuego.” Shortly thereafter the NAFTA agreement was concluded, prompting many analysts to predict that it would become the vehicle to expand free trade throughout the Western Hemisphere. President Bill Clinton kept the initiative alive when he convened a meeting of thirty-four heads of state (only Cuba’s Fidel Castro was not invited) in Miami in December 1994. This was the first such gathering since 1967. In the end, the signatories designated 2005 as a deadline for the conclusion of negotiating a Free Trade Association of the Americas (FTAA), with implementation to follow in subsequent years. Advocates hailed the agreement for its high-minded principles and ambitious goals. Critics lamented its vagueness and its drawn-out timetable. The pledge of free trade was repeated when the heads of state gathered again in Santiago, Chile, in 1998 and Quebec City, Canada, in April 2001. In between, technical committees have been working on the details of a free trade pact. Still, national interests stand in the way. Given the history of inter-American relations, Latin Americans question the sincerity of the U.S. commitment to hemispheric free trade. Brazil has made clear its intention to unite all of South America into one trading bloc before dealing with the FTAA. Mexico has signed a trade agreement with the European Union, and the MERCOSUR partnership is seeking agreements with Europe and South Africa. Chile, the unabashed example of free market reforms, pursues its own global strategies.

The world has changed drastically since the Latin Americans sought security from European intervention in the nineteenth century. It also has changed from the early twentieth century through the end of the cold war, when the United States single-handedly worked to keep the Europeans out of the Western Hemisphere. With the end of the Cold War, the need for hemispheric political security disappeared, at least momentarily, and with it, the original reason for the Pan-American movement. But the realities of the new world—drugs, migration, and commerce—provide the opportunity to revive the Pan-American spirit. The challenge before the nations of the Western Hemisphere is great: Can they overcome the national interests that have plagued the relationship in the past?

“A splendid little war,” John Hay called the 1898 conflict between Spain and the United States. It was splendid, he told his fellow Republicans Theodore Roosevelt and Henry Cabot Lodge, because it had moved things “our way.” In other words, military victory and overseas expansion were helping President William McKinley and his Republican administration against William Jennings Bryan’s Democrats. “I do not see a ghost of a chance of Bryanism in the new few years,” remarked Hay. At the time, the summer of 1898, John Hay was the U.S. ambassador to Great Britain. Before long he would be appointed secretary of state. Thus, his was no ivory tower statement pronounced far from the halls of power. Rather, his comments on the connection between party politics and foreign policy came from the highest level of American officialdom.

The ambassador was not claiming that McKinley had chosen war to help the Republican Party, although it was widely believed that the president would have suffered politically if he had not requested a declaration of hostilities against Spain. What Hay was saying was that the course of American foreign policy was inextricably tied to domestic politics in the United States, and that the party in power has partisan politics partly in mind when it acts on international developments. Hay saw nothing wrong with this. The developments in 1898 meshed with his own worldview; he had no objection to the use of force “when necessary,” and he saw an imperial push into the Caribbean and Pacific as potentially helpful to his business friends. If the Republicans benefited as well, so much the better. Hay believed in the GOP, considering it the “party fit to govern,” a bulwark against inflation, radicalism, and civil disorder. Bryan’s Democratic-Populist rural alliance almost won the 1896 presidential election on free silver, a domestic issue. Hay now judged that the Republicans would pick up strength on foreign policy and could establish themselves in power for a decade or more.

This is by no means an unusual example in American history. If anything, John Hay represents less than the usual identification of domestic politics with U.S. foreign relations. He never ran for elective office, although other secretaries of state have, from Thomas Jefferson and John Quincy Adams to William H. Seward and James G. Blaine on down to William Jennings Bryan, Charles Evans Hughes, James F. Byrnes, and John Foster Dulles. Nor did Hay depend on politics for his living after his early thirties. Hence, he was not forced to think of the next election in terms of personal financial survival.

In contrast, most of those who have shaped American foreign policy have been professional politicians, accustomed to thinking of individual recognition, career progress, and personal income in connection with party favor and victory at the polls. So it has been with presidents of the United States, the most important makers of foreign policy. So also with secretaries of state and defense, at least until the last few decades, when these offices have usually been held by nonpoliticians (who, of course, are bound to the president’s political positions). So with a number of those who have headed American diplomatic missions abroad; now, as always, many of these assignments are handled under political patronage. So also with congressmen who specialize in international matters and with other leaders in both major parties, in and out of office.

Could these individuals, being practical party politicians, be expected to forget domestic politics when they weigh foreign policy alternatives? Hardly. And, as a general rule, they do not. No doubt some have obsessed about it more than others, but all, or virtually all, have operated from the assumption that if they do stop thinking of the next election or ignore the reaction of the other professional politicians in Congress and in the field, they are not likely to be able to put across their programs. In the words of the histo-
rian Fred Harvey Harrington, “Success in American foreign policy, like success on domestic issues, requires continuing success in domestic politics.”

Which is not to say it is only about winning elections. As the Hay example illustrates, politicians often have had particular and deeply felt ideas about international matters, ideas that their party (or a large segment of their party) have shared or endorsed. Often the candidates of the opposing party have had different ideas. Foreign policy, therefore, is about choosing among real policy choices as well as getting partisan advantage from those choices.

That said, the argument here is that elections are particularly important in determining why the United States has followed the international course it has. In America the jockeying for political advantage never stops. Viewed from a president’s perspective the next election (whether midterm or presidential) will arrive all too soon, and presidents are well aware that voters are capable of giving incumbent parties the boot (as they have done with regularity since 1945: in 1952, 1960, 1968, 1976, 1980, 1992, and 2000). Moreover, the overall state of a president’s relations with Congress and his standing in public opinion deeply impact his ability to get things done and, in general, to lead effectively. As Ralph Levering reminds us, political campaigns are significant because they indicate which foreign policy issues each candidate believes his opponent is vulnerable on, and which issues each candidate believes are likely to strike a response chord in the voting public. “The interplay between candidates and voters, culminating in the voting first in the primaries and then in the general election in November, thus establishes (a) the winners who will have primary responsibility for shaping U.S. foreign policy, and (b) the broad parameters of acceptable political discourse on foreign policy for the foreseeable future.”

It seems obvious, then, that those who analyze U.S. foreign policy decisions should carefully consider the role of domestic politics in those decisions and in what happened afterward. Analysis must, of course, also take into account geostrategic, economic, cultural, moral, and other influences. Sometimes these influences, rather than practical politics, have been decisive. More often than not, however, the nonpolitical factors have been interwoven with political considerations, which need to be identified and explained. Although students of the interplay between domestic politics and foreign policy often include within their purview—and properly so—a wide range of potential influences, including public opinion, the media, and ethnic groups and other special interest groups, the focus here is on party politics, in particular on the impact of partisan imperatives and election-year concerns on presidential decision making in foreign affairs.

A CURIOUS NEGLECT

Over the years scholars have produced some excellent special studies of the interrelationship between politics and diplomacy. What is striking, though, is how often studies altogether omit mention of domestic politics. Some do so because they tell the story in the old-fashioned way, recording exchanges of diplomatic notes and making no attempt to get behind the formal documents. Others dig much deeper yet still treat the professional politicians involved in the making of foreign policy as though they were not politicians at all.

Historio graphical trends among diplomatic historians, it is clear, have conspired against a prominent place for domestic politics. Most of the early giants in the field, among them Samuel Flagg Bemis, Dexter Perkins, and Arthur Whitaker (Thomas A. Bailey was a notable exception), focused on state-to-state interaction, on high U.S. officials and their counterparts in the countries with which Washington dealt. The research of these “orthodox” historians was often intelligent and exceptionally valuable, but they tended to frame their questions in a manner that allowed them to avoid inquiring into the domestic political calculations that helped shape policy, or the partisan disputes that often accompanied the implementation of that policy. Perkins’s three-volume study of the Monroe Doctrine of 1823, for example, takes more or less as a given that national security concerns brought about the doctrine, while Bemis’s book on Jay’s Treaty concludes before the bitter debate in Congress in 1795–1796 on the treaty’s implementation. Herbert Feis, an orthodox historian of the early Cold War, likewise focused exclusively on the White House, the State Department, and state-to-state relations in his effort to assign responsibility for the origins of the Soviet-American confrontation.

This emphasis among orthodox historians on high politics met with a spirited response from a group of “revisionist” scholars who came of age in the late 1950s and 1960s. But although revi-
sionists distinguished themselves by emphasizing the importance of domestic forces in the conduct of U.S. foreign policy, they paid curiously little attention to party politics. No less than the traditionalists, they treated the U.S. government as a monolithic actor, albeit one shaped largely by the economic and ideological interests associated with the U.S. government's capitalist structure. The emphasis was on internal sources of foreign policy, but not on partisan wrangling, election-year maneuvering, or other political concerns. Thus, Walter LaFeber's *The New Empire* (1963), which dealt with Gilded Age foreign relations, gave little room to the congressional coalition that time and again thwarted the expansionist initiatives of the high officials that are a chief concern of the book. In William Appleman Williams's classic work *The Tragedy of American Diplomacy* (1959) one looks in vain for any sense that partisan concerns have on occasion played a key role in shaping American foreign policy. In this and other Williams works, congressional speeches and campaign pronouncements were generally cited only to show the supposed consensus behind American economic expansion. As the historian Robert David Johnson has rightly noted, revisionist interpretations of the Cold War by the likes of Gabriel Kolko and Noam Chomsky share little or nothing in common with Herbert Feis apart from a tendency to treat the U.S. government as a unitary actor unencumbered by internal dissension.

The emergence in the last two decades of the twentieth century of "postrevisionists"—a loose collection of scholars of the Cold War who did not fit easily into either the orthodox or revisionist camps—did not change the pattern. John Lewis Gaddis, a founder of postrevisionism, gave close scrutiny to domestic politics in his first book, *The United States and the Origins of the Cold War*, but gave steadily less attention to it in his subsequent works—to the point that in *We Now Know* (1997), Gaddis's major reinterpretation of the early Cold War, party politics figured hardly at all. Melvyn P. Leffler's *A Preponderance of Power* (1992), a highly important volume on the Truman administration's national security policy, likewise gave little space to the interplay between foreign policy and party politics, a characteristic shared as well by Marc Trachtenberg in his prize-winning book *A Constructed Peace* (1999). Trachtenberg's study, subtitled "The Making of the European Settlement, 1945–1963," says nary a word about domestic politics, and his American policymakers appear to operate in a rarefied geopolitical stratosphere that keeps them largely immune to domestic pressure.

What is striking about these and other postrevisionist studies is not that they have tended to place geopolitics at the top in their hierarchy of causality; given the neorealist or national security perspectives to which many postrevisionists adhere, that is to be expected. Rather, what is striking is that domestic politics appears so far down in that hierarchy, if it even makes it on the list at all.

To a remarkable degree, then, scholars of American diplomacy, whatever their other disagreements, have tended over the years to agree on one important point: partisan wrangling and electoral strategizing have generally not been significant determinants of the nation's foreign policy. It is a perspective that accords with the popular belief that political differences among Americans should, and in fact usually do, stop at the water's edge, that it would be improper and indecent to mix politics and foreign policy, and that American leaders generally have avoided doing so.

In 1974, when the Watergate scandal was catching up with President Richard M. Nixon, Secretary of State Henry A. Kissinger was asked if the resignation of the chief executive and the resulting damage to the Republican Party would change the course of American diplomacy. Certainly not, retorted Kissinger, everything would be the same. "The foreign policy of the United States," he maintained, "has always been, and continues to be conducted on a bipartisan basis in the national interest and in the interest of world peace." Others have voiced like sentiments, though usually without introducing quite so much historical error. Operating here is the traditional belief that national patriotism holds Americans together against the outside world. However much citizens may disagree on domestic questions, runs the argument, they must—and will—present a united front on foreign relations, in the national interest and to uphold the nation's honor. Discussions of this subject can become heated and bring forth Stephen Decatur's celebrated toast given at Norfolk in 1816: "Our Country! In her intercourse with foreign nations may she always be in the right; but our country, right or wrong."

It is a comforting notion, since it protects America's leaders from charges of "sordid political calculation" or "playing politics with the national honor." But it also separates diplomatic history from reality. It fails to consider the plain fact that...
there inevitably are differences of opinion on foreign policy, and that in a democracy these differences are put before the people, if at all, through the political process (that is, through politics)—facts that professional politicians are not likely to forget.

**THE FIRST DECADES**

These differences were much in evidence from the very beginning of the two-party system, in the 1790s. Few were the foreign policy decisions in that decade that were not affected by partisan concerns. Even George Washington's Farewell Address, to this day the major statement of the need for American freedom of action in foreign affairs (it warned against "permanent alliances"), must be seen in light of the 1796 election. The French minister to Philadelphia, Pierre Adet, upset over the pro-British Jay's Treaty and America's failure to honor the 1778 alliance with France, worked hard to have Thomas Jefferson win the 1796 presidential race over the Federalist candidate, John Adams. That interference influenced Washington (and his coauthor Alexander Hamilton, a bitter foe of Jefferson) to issue the Farewell Address that warned Americans against tying themselves to the fortunes of any "foreign influence." The historian Alexander DeConde put it succinctly: "Although cloaked in phrases of universal or timeless application, the objectives of the address were practical, immediate, and partisan."

Party politics and electoral strategizing also permeated the atmosphere in the lead-up to the War of 1812 and indeed helped bring on the hostilities. As many historians have demonstrated, the increasingly bitter partisan struggle over domestic and foreign policy in the early years of the century, exacerbated by the effects of the war between Britain and France, grew into corrosive mutual distrust. Federalists and Republicans were deeply split on the best policy vis-à-vis Great Britain, and the vote for war followed partisan lines—81 percent of Republicans in both houses voted for war (98 to 23), and all Federalists voted nay (39 to 0).

But President Madison's concerns went deeper than defending against Federalist attacks on his commercial warfare policy. He also had to worry about dissension among fellow Republicans and the possibility that these "malcontents"—who wanted a tougher line against the British—might move to create an anti-Madison ticket in 1812. By the spring of 1811, sympathetic legislators were warning Madison that he had to do something to unify the party, and by July of that year the pressures of domestic politics were making it very hard for the administration to agree to anything short of Britain's total capitulation to American demands. According to the historian J. C. A. Stagg, for Madison "there seemed to be only one course of action that would be both honorable and effective. He could regain the initiative at home and abroad by moving toward the positions advocated for so long by his Republican opponents. If he did not do so, there was the possibility that they would coalesce into a formidable anti-administration party, make the issue of war and preparedness wholly their own, and turn them against him in the months to come." In Stagg's words, "the nation's honor, the president's political salvation, and the unity of the Republican Party required that American policy now be directed toward war." What's more, the strategy worked: by May 1812 the malcontents had faded and a sufficiently large Republican majority had emerged in both houses to renominate Madison. The declaration of war followed in June.

This is not to suggest that Madison's fears for his domestic political standing alone drove the decision making that led to war with Great Britain. Monocausal history is seldom satisfactory history. The violations of American maritime rights, the impressment of American seamen, British incitement of hostile Native Americans, American designs on Canada and Florida, the depressing effects of British policy on American farm prices—each of these mattered as well, as did the long-standing partisan squabbling between Federalists and Republicans. It is also clear, though, that the president's perceived political needs, specifically his concern about possibly losing his party's nomination in 1812, shaped American policy in crucial ways. In particular, understanding why the war happened when it did—in a presidential election year, and with the incumbent in a precarious position at home—requires understanding the high-stakes struggle within the Republican Party.

Consider again the Monroe Doctrine of 1823. In a provocative work bearing the prosaic title *The Making of the Monroe Doctrine* (1975), the historian Ernest R. May rejected the claim of Perkins and others that conceptions of national interest and foreign policy were supreme in the origins of the doctrine. Instead, May argued, party politics were decisive. ("The positions of the poli-
cymakers were determined less by conviction than by ambition.” In May's view the outcome of the foreign policy debates can only be understood in relation to the struggle for the presidency, because the Monroe Doctrine was “actually a by-product of an election campaign.” The threat of intervention by the European powers into the Western Hemisphere was nonexistent, and American officials knew it. As a result, they could play politics with the British proposal for a joint policy statement; John Quincy Adams opposed joint action while his bitter presidential rival John C. Calhoun fervently supported it. Adams's candidacy would have been hurt by consummation of an alliance with Britain because the British were thoroughly unpopular among the U.S. electorate. As secretary of state, Adams would have been attacked for joining with the British even if he opposed the alliance in private cabinet discussions. Calhoun pushed for acceptance of the London government's offer, knowing Adams would be blamed for it, while President Monroe, anxious to leave the presidency with his reputation intact, gave in to Adams to avoid a fight that might tarnish his record. It is a compelling argument, made in part, as May noted, on the basis of “inference from circumstantial evidence.” One does not have to embrace May's thesis in its entirety—Were officials really so certain that no foreign danger existed?—to see that party politics were instrumental in the making of the doctrine.

And party politics were instrumental in foreign policymaking at various other times as well in the decades before John Hay took such delight at the outcome of the war against Spain. Here one thinks, for example, of the debate over whether to recognize Greek independence in 1823 (which, like the Monroe Doctrine, was intimately bound up with the 1824 presidential race); of President Franklin Pierce's attempt to acquire Cuba in 1854 in order to placate proslavery leaders in the American South; and of Grover Cleveland's decision—made partly for partisan reasons—not to submit the 1884 Berlin agreement on Africa's partition (of which he basically approved) to the Senate for approval.

Nor did things change after the century turned. The Wilson administration's original decision to postpone recognition of Bolshevik Russia in 1918 was not primarily the product of political pressure within the United States, but the fact that this nonrecognition continued for fifteen years and was intimately connected with domestic politics. A few politicians seem to have felt that nonrecognition would damage the Soviet Union or protect the United States against real dangers. Many more were convinced that taking a stand against the Soviet Union and domestic radicals was “good politics” or that those who openly favored diplomatic recognition of the Soviet Union would suffer political punishment. Consequently, practical politics in the United States served to prevent these two major powers from discussing their differences until the need for foreign trade enabled Franklin D. Roosevelt to reestablish diplomatic relations in 1933.

In 1936 and again in 1940, Roosevelt allowed reelection concerns to affect his approach to the Nazi menace. In the late summer of 1936, Roosevelt told journalists of his desire to convene a conference of world leaders to discuss ways to assure the peace of the world; at the same time, he ruled out taking any steps prior to the election that could open him to Republican charges that he was embroiling the United States in overseas commitments. Four years later, Roosevelt’s hesitation in finalizing the destroyers-for-bases deal with Great Britain—he delayed for nearly four months after receiving Winston Churchill's desperate pleas for destroyers—owed much to his fear that Republican challenger Wendell Willkie might use the issue to rouse isolationist sentiment and thereby cost Roosevelt the election that fall. Only after Willkie agreed not to make the transaction a campaign issue was the deal struck. Overall during that critical year, Roosevelt moved cautiously on foreign policy, concerned that open diplomatic moves would evoke isolationist predictions of U.S. involvement in the fighting and undermine his chances for a third term.

**THE EARLY COLD WAR**

To be sure, Americans have on occasion set partisan and personal political concerns aside in foreign policy, in line with the sentiment of Stephen Decatur’s toast. This has been the pattern in the early stages of the nation’s wars. But such consensus on international matters has often been short-lived, more so than is generally acknowledged. It is often assumed, for example, that the period surrounding the onset of the Cold War—from the end of World War II to the start of 1950—was a bipartisan period in U.S. foreign policy. A close examination of these years suggests otherwise. There was a period of strong bipartisanism on foreign policy decisions in Washington from the
passage of the aid to Greece and Turkey in 1947 through the middle of 1949, but it was not there before that time or after.

In late 1945, with the popular Franklin D. Roosevelt dead and World War II over, Republicans in Congress saw a chance to gain control on Capitol Hill in the 1946 elections and to take the presidency two years later. On domestic issues they could run against the federal government and against trade unions, especially the open influence of the American Communist Party in those unions. On foreign policy issues the GOP could denounce Truman’s “weakness” in dealing with the Soviet Union—that is, unless the administration preempted this line of attack by standing up forcefully to Moscow.

Domestically, Truman could do relatively little to deflect the Republican challenge on policy issues. He could, however, be firmer with the Soviets—a shift urged on him in the fall of 1945 by his White House chief of staff, Admiral William Leahy, and by the two leading senators on the Foreign Relations Committee, Democrat Tom Connally of Texas and Republican Arthur Vandenberg of Michigan. Vandenberg, who represented a state with a large number of Polish Americans unhappy with developments in their native land, was especially adamant about standing up to the Kremlin on all fronts.

It is unclear just how much of an effect partisan politics had on Truman’s decision to “stop babying” the Soviets in early 1946. But he was very much aware of the growing congressional criticism of Secretary of State James Byrnes’s continuing efforts to make deals with Moscow, and also Congress’s aim, now that World War II was over, to reassert legislative authority of some foreign policy issues. The evidence is not conclusive, but it appears Truman was significantly affected by strong pressures from Congress to take a harder line toward the Soviet Union in the early weeks of 1946. In the election campaign that autumn, political paranoia and exploitation was much in evidence. Republican campaigners delighted in asking voters: “Got enough inflation? . . . Got enough debt? . . . Got enough strikes? . . . Got enough communism?” Senator Robert Taft, one of the most distinguished figures on Capitol Hill, accused Truman of seeking a Congress “dominated by a policy of appeasing the Russians abroad and fostering communism at home,” while in California, a young House candidate named Richard Nixon denounced his opponent as a “lip service American” who consistently voted the Moscow line in Congress and who fronted for “un-American elements.” And indeed, the GOP scored a resounding victory in the election, gaining control of both houses of Congress for the first time since 1928. The day after the election several of Truman’s advisers met and concluded that the White House would have to take definite steps to put the Democratic coalition back together if Truman was to have any chance of winning the 1948 election. One such step: make clear to the American people that Harry Truman opposed Soviet domination of eastern Europe.

As the 1948 election approached, Truman missed few opportunities to talk up the Cold War, a strategy urged on him by numerous advisers. Such a stance, they pointed out, would insulate the president against Republican charges that he was too soft on Moscow and at the same time undercut Henry Wallace’s bid for the presidency on the Progressive ticket. In November 1947, White House aide Clark Clifford and former FDR assistant James Rowe predicted that relations with Moscow would be the key foreign policy issue in the campaign, that those relations would get worse during the course of 1948, and that this would strengthen Truman’s domestic political position. “There is considerable political advantage in the administration in its battle with the Kremlin,” the two men told the president. “The worse matters get . . . the more is there a sense of crisis. In times of crisis, the American citizen tends to back up his president.” In the months that followed, White House speechwriters talked tough on Soviet-American relations and mocked Wallace’s call for improved relations with the Kremlin, portraying him as an unwitting dupe of communists at home and abroad.

It was a conscious blurring of domestic and foreign communism, and it would have important implications for politics in Cold War America. In the spring of 1947, Truman had created the Federal Employee Loyalty Program, which gave government security officials authorization to screen two million employees of the federal government for any hint of political deviance. It marked the inauguration of an anticommunist crusade within America’s own borders that paralleled the Cold War abroad, a crusade that contained a large element of practical politics. Opposing radicals and the Soviet Union was a way of attracting votes and building a political reputation, or of avoiding being denounced as a fellow traveler. Meanwhile, any possibility for honest debate and criticism about policy toward the communist world disap-
peared, as those on the left who might have articulated an alternative vision lost cultural and political approval. For at least a quarter of a century thereafter, campaign attacks from the left on either Democratic or Republican foreign policies proved singularly unsuccessful.

Truman went on to win the 1948 election against the expectations of many. Stunned Republicans immediately began working overtime to exploit the communist victory in China, allegations of communists within the U.S. government, and Secretary of State Dean Acheson’s support of the accused spy Alger Hiss as they maneuvered for revenge in the midterm election two years later. When the Korean War broke out in June 1950, Truman initially received strong bipartisan support for his decision to intervene. But he knew the Republican support could evaporate quickly. When Truman that summer considered a plan to expand the war into North Korea, he feared that what the historian Melvin Small called “the prudent but not anticomunist-enough decision” to halt at the Thirty-Eighth Parallel could hurt the Democrats at the polling booth in November. Truman authorized General Douglas MacArthur to try to liberate North Korea and announced his decision at a cabinet meeting where the major item on the agenda was the election.

MacArthur’s gambit caused Chinese forces to intervene from the North in November 1950, and a military stalemate quickly developed. When the Truman administration commenced armistice talks in 1951, GOP leaders, still determined to make foreign policy a central part of their criticism of the Democrats, immediately went on the attack. Any truce at or near the Thirty-Eighth Parallel would be an “appeasement peace,” they charged. When the presidential election campaign geared up the following year, Republican leaders, including nominee Dwight D. Eisenhower, asserted that Truman had been foolish to agree to negotiations and that he was compounding the error by continuing them in the face of clear evidence that the communists were using the time to build up their forces in Korea. Even the apparent economic health of the nation was turned against the White House: the prosperity, GOP spokesmen charged, “had at its foundation the coffins of the Korean war dead,” slaughter that as yet appeared to have no end. The historian Rosemary Foot, in her study of the Korean armistice talks, showed that this partisan pressure contributed to the hardening of the administration’s bargaining posture in 1952. “Sensitivity to public charges, to congressional attacks, and to electoral charges that the Democratic administration had been led into a negotiating trap by its ‘cunning’ enemies, all reinforced the administration’s preference for standing firm rather than compromising,” Foot concluded. Pleas from the State Department for a flexible posture, especially on the nettlesome issue of repatriating prisoners of war, fell on deaf ears.

Attacking an incumbent’s policies is a simpler matter than governing, as the Republicans would soon learn. Upon taking office in January 1953, Eisenhower faced not merely the task of bringing the Korean War to an end (a deal was reached in July 1953) but a myriad of other thorny issues as well. Party politics, it is clear, influenced his approach to many of them. And it was not just the Democrats Eisenhower had to think about; he also confronted differing impulses on foreign policy within his own party. Some so-called old guard Republicans such as Robert Taft were dubious about the Europe-centered internationalism to which Eisenhower and his soon-to-be secretary of state, John Foster Dulles, adhered in the 1952 campaign; many of them wanted a limited American role in world affairs, rooted in an airpower-oriented Fortress America strategy and weighted more toward Asia. Eisenhower immediately set upon placating this old guard on military, Asian, and domestic security matters to gain its acquiescence in a Europe-first internationalism. He undoubtedly had the old guard partly in mind when he wrote to his NATO commander, Alfred Gruenther, in the midst of the Quemoy-Matsu crisis of 1954–1955, that “at home, we have the truculent and the timid, the jingoists and the pacifists.” On Taiwan, the president continued, he was considering “what solutions we can get that will best conform to the long term interests of the country and at the same time can command a sufficient approval in this country so as to secure the necessary Congressional action” (original emphasis).

VIETNAM

On Indochina, as well, domestic political imperatives affected Eisenhower’s policymaking. During the intense administration discussions about whether to intervene militarily to help the beleaguered French forces at Dien Bien Phu in 1954, Eisenhower told his cabinet that he could not afford to let the Democrats ask who lost Vietnam. But he was not prepared to get involved without
broad domestic and international backing. At a news conference Eisenhower invoked the domino theory to try to create support for intervention (probably less because he believed in the theory than because its dramatic imagery could rally support to the cause), and he consulted with Congress and key allied governments. The misgivings of the Senate leadership and the British government convinced the president to reject air strikes to save the French position, but there is no doubt that fear of the “who lost Vietnam” charge continued to weigh on his mind. One reason the administration worked hard to distance itself from the Geneva Accords on Indochina later that year was that it feared it might get a hostile reaction from vocal anticommunists on Capitol Hill.

It was not the first Vietnam decision by an American president in which domestic politics played a role, nor would it be the last. Indeed, a good argument could be made that for all six presidents who dealt with Vietnam from 1950 to 1975—from Truman to Ford—the Indochina conflict mattered in significant measure because of the potential damage it could do to their domestic political positions.

This was especially true of the three men who occupied the White House during the high tide of American involvement—John F. Kennedy, Lyndon B. Johnson, and Richard Nixon. From the start in 1961, and especially after Kennedy agreed to seek a negotiated settlement in Laos giving the communist Pathet Lao a share of the power, senior U.S. officials feared what would happen to the administration at home if South Vietnam were allowed to fall. Kennedy told his ambassador to India, John Kenneth Galbraith: “There are just so many concessions that one can make to communists in one year and survive politically. . . . We just can’t have another defeat this year in Vietnam.” In November 1961, Secretary of State Dean Rusk and Secretary of Defense Robert McNamara advised JFK that the loss of South Vietnam would not merely undermine American credibility elsewhere but would “stimulate bitter domestic controversies in the United States and would be seized upon to divide the country and harass the administration.” U.S. assistance to South Vietnam increased steadily in 1962 and 1963, ultimately reaching the amount of $1.5 million per day. Still, success remained elusive. By mid-1963 the president had grown disillusioned about the prospects in the struggle, and he reportedly told several associates of his desire to get out of the conflict. But it could not happen, he added, until after the 1964 election.

Johnson’s misgivings did not go quite so deep, but he too, after he succeeded JFK in office in November 1963, ruled out a major policy change before voting day. As McGeorge Bundy would later say, “Neither [Kennedy nor Johnson] wanted to go into the election as the one who either made war or lost Vietnam. If you could put it off you did.” Bundy’s comment carries great historical importance, and not merely because he was right in his assessment—Johnson, we now know, sought above all else that year to keep Vietnam from complicating his election-year strategy, judging all Vietnam options in terms of what they meant for November. No less important, the comment matters because 1964 proved so crucial in the making of America’s war in Vietnam. It was a year of virtually unrelieved decline in the fortunes of the South Vietnamese government, a year in which the Vietcong made huge gains and the Saigon government lost steadily more support. It was a year when America became increasingly isolated on Vietnam among its Western allies, and when influential voices in Congress and the press—and indeed within the administration itself—began voicing deep misgivings about the prospect of a major war. And it was a year when the administration made the basic decisions that led to Americanization early in 1965. Already in the spring of 1964 the administration commenced secret contingency planning for an expansion of the war to North Vietnam, but with the tacit understanding that nothing substantive would happen until after Election Day. In November and December, with LBJ safely elected, the administration moved to adopt a two-phase escalation of the war involving sustained bombing of North Vietnam and the dispatch of U.S. ground troops (subsequently implemented in February–March 1965). The White House strategy of delay through the first ten months of 1964 had not eliminated Johnson’s freedom of maneuver, but it had reduced it considerably.

Nixon, it is clear, had his eyes very much on the home front in making Vietnam policy, not merely in the lead-up to the 1972 election but from the start of his administration in 1969. In vowing to get a “peace with honor,” he and his national security adviser Henry Kissinger thought as much about voters in Peoria as about leaders in Moscow and Beijing and Hanoi. Top-level conversations captured on the taping system Nixon had installed in the Oval Office early in 1971, for example, make clear just how deeply concerns about Nixon’s domestic standing permeated Viet-
In a phone conversation that took place late in the evening of 7 April 1971, shortly after a televised Nixon speech announcing further Vietnam troop withdrawals, Nixon and Kissinger concurred on the matter of the “breathing space” they would get domestically by ending the draft:

KISSINGER: I think, Mr. President, I'm gonna put the military to the torch [on the matter of the draft].

NIXON: Yeah. They're screwing around on this.

KISSINGER: They're screwing around. They're worried that it will make the volunteer army not work. But the hell with that if we can get ourselves breathing space for Vietnam.

NIXON: Listen. Ending the draft gives us breathing space on Vietnam. We'll restore the draft later, but goddamn it, the military, they're a bunch of greedy bastards that want more officers clubs and more men to shine their shoes. The sons of bitches are not interested in this country.

KISSINGER: I mean, ending, going to all-volunteer in Vietnam is what I mean, is what we ought to do.

NIXON: Mmm-hmm.

In the summer of 1972, as a negotiated settlement with Hanoi looked to be within reach, Nixon expressed ambivalence about whether the deal should come before or after the election that November. On 14 August Nixon told aides that Kissinger should be discouraged from expressing too much hopefulness regarding the negotiations, as that could raise expectations and be “harmful politically.” On 30 August, Nixon chief of staff H. R. Haldeman recorded in his diary that Nixon did not want the settlement to come too soon. The president, according to Haldeman, “wants to be sure [Army Vice-Chief of Staff Alexander] Haig doesn't let Henry's desire for a settlement prevail; that's the one way we can lose the election. We have to stand firm on Vietnam and not get soft.”

Even before he assumed the presidency, Nixon had sought to manipulate foreign policy for personal political advantage. In the final weeks of the 1968 campaign, rumors that Johnson was on the verge of announcing a bombing halt (to hasten a peace settlement and thereby help Democratic presidential candidate Hubert H. Humphrey), sent the Nixon campaign into a panic. Nixon secretly encouraged the South Vietnamese president Nguyen Van Thieu to refuse to participate in any talks with Hanoi before the election, with assurances that if elected he would provide Thieu with more solid support than Humphrey would. It is possible that Thieu's subsequent refusal to take part in the negotiations in Paris, announced just days before Election Day, might have damaged Humphrey's campaign sufficiently to deliver what was a razor-thin victory to Nixon.

THE LATE COLD WAR AND BEYOND

The Vietnam War may be somewhat unusual in the degree to which it linked domestic political considerations and foreign policy, but it is by no means exceptional in the nation's recent history. Jimmy Carter's decision to launch a risky and ultimately disastrous mission to free American hostages in Iran in the spring of 1980, for example, owed something to his domestic political difficulties in an election year, including a tough challenge for the Democratic nomination from Senator Edward Kennedy. Carter's chief of staff, Hamilton Jordan, urged the action “to prove to the columnists and our political opponents that Carter was not an ineffective Chief Executive who was afraid to act.” Carter himself explained that he had “to give expression to the anger of the American people. If they perceive me as firm and tough in voicing their rage, maybe we'll be able to control this thing.”

A decade later another president confronted the perception that he was too timid. During the 1988 campaign George Bush had to endure a Newsweek story on him in which the words “Fighting the Wimp Factor” were emblazoned on the cover, and there were charges from conservative quarters in the months after the inauguration that he was not resolute enough in foreign policy. The “wimp” charges could be heard again in October 1989, when Bush failed to back a nearly successful coup d'état against the drug-running Panamanian strongman Manuel Noriega. “We'll be hit from the left for being involved at all,” the president noted privately, “and we'll be hit harder from the right for being timid and weak.” This right-wing reaction to his inaction—Republican Senator Jesse Helms referred to a “bunch of Keystone Kops” in the administration—almost certainly contributed to Bush's decision in December to order the invasion of Panama to arrest Noriega. In August 1990 various motives moved Bush to adopt an uncompromising position toward Saddam Hussein’s invasion of Kuwait, but one of them was surely the domestic political benefits.
that he and his advisers believed could accrue from it. Locked in a budget battle with Congress, faced with a messy savings and loan scandal, and with approval ratings sagging, Bush saw a chance to demonstrate forceful presidential leadership and galvanize popular support. Tellingly, perhaps, he received encouragement to “draw a line in the sand” from British prime minister Margaret Thatcher—who herself had received a powerful boost to her domestic position from Britain’s “splendid little war” in the Falkland Islands eight years earlier.

The war against Iraq was the first military conflict of the post–Cold War era. In the years thereafter various commentators complained that America’s newfound status as the world’s sole superpower, one without a compelling external threat to unify the populace, had allowed party politics to infuse foreign policymaking to an unprecedented degree. Many drew a contrast with the supposedly bipartisan and sellout days of the Cold War. It was a dubious claim; party politics and foreign policy have always enjoyed a close relationship in the United States. This was so in the most tense periods of the superpower confrontation—during the Cuban missile crisis, John Kennedy considered the domestic political implications of the various options before him—and it was true in less traumatic times.

Still, few would deny that the partisanship became more pronounced in the Clinton years than it had been in decades, the atmosphere in Washington more poisonous. The power of the presidency in foreign policy seemed diminished and that of Congress as well as ethnic and other special-interest lobbies enhanced. Republicans saw personal political advantage as motivating virtually every one of Bill Clinton’s foreign policy decisions and, after capturing control of Congress in the 1994 midterm elections, worked diligently to thwart many of his initiatives. In April 1999, for example, during the war in Kosovo, the House of Representatives refused to vote to support the bombing; that October, the Senate voted down the Comprehensive Test Ban Treaty—an action the New York Times compared with the Senate defeat of the League of Nations after World War I—even though the president and sixty-two senators asked that it be withdrawn. Clinton and his advisers, meanwhile, insisted that their only concern in making policy was promoting the national interest. The early evidence about the policymaking process in the Clinton White House suggests strongly that he and his aides paid close attention to how various policy options would be perceived at home and that their determinations in this regard helped inform their decisions. In other words, Clinton was much like his predecessors.

During the debate over the North Atlantic Treaty Organization’s eastward enlargement in 1996–1997, Clinton administration officials insisted that bringing as much of Europe as possible under the NATO banner would serve the nation’s strategic interests. They also said it was important to reassure the eastern and central European populations after Moscow became more nationalistic and assertive in 1994. No doubt they were being truthful in these claims, but Democratic Party leaders surely also saw enlargement as a surefire vote-getter among eastern European ethnic communities in battleground states in the Midwest, states Clinton had to win in the 1996 election. Foreign observers often perceived this domestic political element to be the root motivation behind the expansion. Said Canadian prime minister Jean Chrétien (who thought his microphone was turned off) to Belgium’s prime minister about NATO enlargement in August 1997: “All this for short-term political reasons, to win elections. In fact [U.S. politicians] are selling their votes, they are selling their votes. . . . It’s incredible. In your country or mine, all the politicians would be in prison.”

EVERY VOTE COUNTS

The skeptical reader will wonder if the case here is not being made too strongly. After all, foreign policy issues seldom decide elections in the United States. Does it not follow that American diplomacy and party politics must have only minor influence on each other? Not necessarily. It is true that in the United States, as in other countries, voters tend to give their chief attention to domestic matters. But foreign policy questions, though of less importance, have in most years been significant enough to merit the attention of practicing politicians. The professionals in politics have always realized that when domestic issues are in the forefront, diplomatic questions can still shift a few votes in swing districts in critical states. This can mean the difference between victory and defeat for a national ticket or decide control of Congress. That, essentially, has always been the politician’s interpretation of the politics of American foreign policy—both for those who are in and those who are out of office.
This is still true and can be seen in the care with which presidential aspirants take on Israeli questions and the related matter of the Jewish vote. Small in national totals, this vote is critically important in New York, California, and other states with major urban centers. Even in 1948, Clark Clifford and other Truman aides were thinking partly about electoral politics in urging the president to extend recognition to the new State of Israel. Since 1876, Clifford knew, every winner of a presidential election had carried New York State, where in the 1940s Jews constituted 14 percent of the population. Extending recognition to Israel would help deliver the state to Truman in November and could also help the president in other states with sizable Jewish populations. The Emergency Committee on Zionist Affairs, and later the American Zionist Council and the American Israel Public Affairs Committee—the latter self-described as “the most powerful, best-run, and effective foreign policy interest group in Washington”—proved effective in exploiting the potential power of the Jewish vote to gain continued material and diplomatic backing for Israel.

True, the close U.S.–Israel relationship after 1948 was the product of many things. Israel had the strongest military force in the Middle East, and there were good geostrategic reasons why Washington sought to maintain close ties with Israel and work together on matters of common interest. Moreover, the convictions of evangelical Christians, as well as the feelings of other Americans touched by the courage of Israel, meant that a broad cross-section of Americans could be counted on to back firm U.S. support for Israel’s security. Nevertheless, it would be foolish to deny that electoral imperatives influenced American policy toward the Middle East at all points after the late 1940s.

Likewise, America’s policy toward Cuba after 1959 was deeply affected by the influence of the Cuban-American community in South Florida and the desire of presidential contenders to win Florida’s sizable chunk of electoral votes. In October 1976, for example, Cyrus Vance, then a foreign policy adviser to Jimmy Carter’s presidential campaign, advised that “the time has come to move away from our past policy of isolation. Our boycott has proved ineffective, and there has been a decline of Cuba’s export of revolution in the region.” If the United States lifted the long-standing embargo on food and medicine, Vance speculated, the Castro government might reduce its

level of support for the leftist Popular Movement for the Liberation of Angola (MPLA) in Angola. Carter was sympathetic, but he acted cautiously in the campaign. “There were no votes to be won, and many to be lost, by indicating friendliness toward Castro,” the historian Gaddis Smith wrote of Carter’s thinking. Subsequent presidents would encounter the same dilemma when they contemplated a change in Cuba policy: the need to weigh an alteration to a failed and indeed counterproductive embargo policy against the perceived power of the militantly anti-Castro Cuban American National Foundation (CANF) to sway the Florida vote.

These kinds of calculations were nothing new in American politics. From 1865 to 1895, for example, most Americans were too absorbed in goings-on at home to spare much time for overseas developments. Voter attention revolved around such domestic concerns as the reconstruction of the South, sagging prices, and recurrent depressions. Nevertheless, national politicians labored hard on the diplomatic sections of their party platforms, and candidates spent time outlining or camouflaging their opinions on foreign policy. The reason was plain. The Republicans and Democrats were evenly balanced, and presidential and congressional elections were decided by razor-thin margins. The least slip, even on diplomatic positions, might mean the loss of a handful of votes, which could spell calamity at the polls.

It is well to remember that, when domestic questions rule, they often relate closely to foreign policy. This has been the case with tariffs, immigration, witch hunts against radicals, and, in the early twenty-first century, with agricultural prices and production and trade deals such as the North American Free Trade Agreement of 1994. The relation of these problems to party politics—which is often very close—again draws diplomacy into the domestic political arena.

CONCLUSION

In an interview in the summer of 1965, McGeorge Bundy, a former Harvard dean who served John Kennedy and Lyndon Johnson as national security adviser and was an architect of the Americanization of the Vietnam War, was asked what was different in the actual conduct of American diplomatic affairs from how it had seemed to be “from the safety of Harvard Yard.” According to the
interviewer, Bundy replied that the first thing that stood out was “the powerful place of domestic politics in the formulation of foreign policies.”

It was a revealing comment, but not a surprising one (except to the extent that officials seldom make this admission on the record). The relationship between domestic politics and foreign policy has been an intimate one throughout the nation’s history. It may be debated whether the connection is a good thing or a bad thing—whether overall it has been beneficial to the nation’s record on the world stage. For the moment, though, it is enough to say that the connection is there and is important. Just why so many students of American diplomacy seemingly have lost sight of this reality over the years is somewhat of a mystery. Partly, the inattention can be explained by the historiographical trends outlined early in this essay, which moved many diplomatic historians away from giving serious and sustained attention to domestic politics. Partly, too, it may reflect an overreliance by scholars on official U.S. government documents in their research; essential though these documents are, they can mislead. American statesmen have always been averse to admitting, even to themselves, that their foreign policy decisions could be affected by private political interest. As a result, a reader of the vast archival record, finding little or no evidence of partisan wrangling or election year strategizing, could (wrongly) conclude that these must have mattered little in shaping American policy.

Whatever the case, it is clear that the influence of party politics on the American approach to international affairs needs to be identified, measured, and explained. Foreign policy, it turns out, is always a political matter. It is not always a crass partisan matter. It is well to remember that the parties historically have tended to speak for different constellations of values and interests, different constituencies with genuine philosophical differences about America’s place in the world, and that those differences have sometimes also been evident within parties. But it is always political.

“Peacemaking” appears to be a commonplace term, easily understood and frequently used in public discourse and in peace movements. The Internet reports more than 50,000 entries containing the term “peacemaking.” On closer examination, it is much more elusive. Dictionaries define it tautologically as “the making of peace”; standard encyclopedias do not recognize it as a topic for separate entry (though it does appear in two encyclopedias of peace); and there is surprisingly little on “peacemaking” in academic texts on international politics.

Where it does appear, the term “peacemaking” is used primarily in four senses:

1. Settlement or termination of a war or dispute by explicit agreement among the belligerent parties or others (“peace settlements”).
2. The process of transition from hostility to amity, or from war to peace (“ending hostilities and preferably also resolving the active issues of war”), with or without explicit agreement.
3. The development of procedures and institutions to facilitate conflict resolution, or termination or prevention of wars or conflicts (“pacific settlement of disputes”).
4. Efforts to create the foundations or conditions for lasting peace (“peacebuilding”).

THE STUDY OF PEACEMAKING

The number of scholarly works explicitly devoted to peacemaking has been relatively small as compared to studies of war and its causes, but there is now a substantial literature available to scholars and practitioners. Until about 1985, almost all of the scholarly studies devoted to peacemaking limited their concern to peace settlements, particularly settlements of interstate wars by explicit agreement. Since that time, the focus has shifted to related topics such as conflict resolution and prevention, preventive and multitrack diplomacy, humanitarian intervention, peacekeeping, and peacebuilding. In addition, a large body of work has emerged that examines or applies these concepts in regard to specific conflict areas in various parts of the world.

There have been many works on specific peace settlements, such as Richard B. Morris’s *The Peacemakers* (1965), dealing with the negotiation of the settlement of the American Revolution, and Harold Nicolson’s *Peacemaking 1919* (1965) as well as Arno J. Mayer’s *Politics and Diplomacy of Peacemaking, 1918–1919* (1967), dealing with the settlement reached at the end of World War I. Robert Randle, in *The Origins of Peace: A Study of Peacemaking and the Structure of Peace Settlements* (1973), broadened the scope to a wider range of examples, but made clear in the preface: “Although I have dealt with a number of aspects of peacemaking, I have concentrated mainly upon the structure and content of peace settlements.” In a later work, while recognizing that peacemaking studies embrace “all matters relating to the transition from a state of war to a state of peace,” including “an analysis of the conditions prompting the parties to move toward peace,” Randle still placed central emphasis upon settlements by explicit agreement. Thus, in Randle’s summation, peacemaking studies include, first, study of the peace negotiations; second, “an analysis of the form, content and meaning of the peace settlement”; and third, “a study of the impact of the war and its settlement, including consideration of any postwar negotiations aimed at completing, amending or improving the settlement, a history of the implementation of its terms, and its value as precedent for the management or resolution of future disputes.”

This focus on agreed peace settlements was consistent with the position, then generally accepted in the field of international law, that “The most frequent mode of terminating a war . . .
is a treaty of peace, negotiated either while operations continue or after the conclusion of a general armistice.” This was true of wars between recognized members of the international system in the period prior to World War II, but since 1945 fewer peace treaties have been concluded, and truce or cease-fire agreements have “tended in some respects to move forward to the place of the old treaty of peace.”

For a general understanding of peacemaking, however, it must be recognized that a great many wars, or large-scale hostilities, ended without any agreed settlement—for example, by outright conquest, annexation, or military rule of foreign territory, by suppression of insurrectionary forces, or by overthrow of an existing regime and its replacement by a new government. The number of armed conflicts ending with any kind of agreement diminished significantly over the last half of the twentieth century, and many were transformed into long-term protracted conflicts. Of ninety post–Cold War conflicts in the years 1989–1993, only forty-one were terminated in that period, the rest remaining active years later. Of the forty-one, only six ended with a peace accord, the others ending either with a clear-cut victory by one side (seventeen), some form of cease-fire or truce without a peace settlement, or various patterns of decline in armed hostilities.

Study of the causes of war has engendered a vast literature since at least the monumental work of Quincy Wright, A Study of War, first published in 1942. Analysis of peacemaking, or “the causes of peace,” is a more recent project that presents difficulties even greater than analysis of the causes of war. While the latter has received much more attention, there is no consensus among scholars on the solution of either problem. With respect to the causes of making peace, however, debate has centered upon the relative importance of selected events, conditions, or policies in inducing the parties to make peace. Battle victories, war costs, “unconditional surrender” policies, misperception, coalition diplomacy, secrecy, the role of mediators, and domestic politics are among the factors often treated as primary to the process of ending or prolonging hostilities. In reality, all these and other factors enter into the calculations of belligerents weighing the prospects for peace, and it is unlikely that any simple formula could lead us to predict which would be “decisive” in any given case.

As the decade of the 1960s drew to a close, special issues of the Journal of Peace Research (December 1969) and of The Annals of the American Academy of Political and Social Science (November 1970) were devoted to the topic “How Wars End,” providing illuminating early analyses of war termination. Robert F. Randle’s The Origins of Peace (1973) was followed by David Smith’s From War to Peace: Essays in Peacemaking and War Termination (1974). In subsequent years, the number of works addressing peacemaking grew rapidly and expanded the information base, the scope, and the analytical complexity of knowledge and theory on the subject. Nevertheless, peacemaking remains a relatively neglected area of study as compared with warmaking.

**ATTITUDES TOWARD PEACEMAKING**

Throughout its history, the United States has sought to project an image of dedication to peace and to peacemaking. George Washington, in his Farewell Address in 1796, exhorted Americans to avoid “overgrown military establishments which, under any form of government, are inauspicious to liberty,” and urged Americans: “Observe good faith and justice toward all nations. Cultivate peace and harmony with all.” Nearly two centuries later, President John F. Kennedy was obliged to acknowledge that, far from “cultivating peace and harmony,” the United States found itself “caught up in a vicious and dangerous cycle in which suspicion on one side breeds suspicion on the other and new weapons beget counter-weapons”; nevertheless, he too exhorted Americans to turn their attention to “the most important topic on earth, world peace”:

What kind of peace do I mean? What kind of peace do we seek? Not a Pax Americana enforced on the world by American weapons of war. Not the peace of the grave or the security of the slave. I am talking about genuine peace...not merely peace for Americans but peace for all men and women, not merely peace in our time but peace for all time.

But the record of the behavior of the United States in regard to both “peace in our time” and “peace for all time” has been ambiguous at best.

Certainly there have been strong traditions of antimilitarism, internationalism, and pacifism in American society. The history of peace movements in the United States, reaching back at least to the formation of the New York, Massachusetts,
and Ohio Peace Societies in 1815, is long and rich, and can lay claim to having influenced the peace settlements in a number of wars or other conflicts, most prominently in World War I. On the level of governmental action, the long-term peacemaking efforts of the United States have focused on the development of international legal and institutional instruments for pacific settlement of disputes and peacekeeping by international organizations. The Rush-Bagot Convention (1817) established a lasting basis for disarmament on the long border between the United States and Canada, and the Treaty of Washington (1871) provided for the resolution of other outstanding issues (boundary and fisheries questions, and the Alabama Claims) by a court of arbitration.

The United States has also given strong support to the formulation of treaties of arbitration, both voluntary and compulsory, though the Senate has as strongly resisted acceptance of compulsory arbitration without significant reservations. The United States has also shown itself willing and even eager to extend its services as mediator, and has had some success in this role—for example, in mediating the Russo-Japanese peace settlement of 1905. In the protracted conflicts that troubled many parts of the world in the late twentieth century, the efforts of the United States to serve as mediator, as in the Middle East, Northern Ireland, and the former Yugoslavia, have had mixed success and have elicited charges of bias, hypocrisy, and even direct military aid to preferred parties in the conflicts.

Finally, the United States has sometimes adopted the role of peacemaker on a global scale, taking the initiative in the establishment of the Permanent Court of International Justice and the League of Nations. Although the United States never joined the league and even declined to become a party to the Statute of the Permanent Court, it later played a major role in the establishment and development of the United Nations, and has accepted (though with major reservations) the jurisdiction of the International Court of Justice as reconstituted under the United Nations Charter.

There has also been strong interest in the United States in the development of techniques of peacekeeping and other approaches to conflict resolution. On the governmental level, United States involvement in “peacekeeping” or “peace enforcement” operations has unfortunately been associated with the large-scale use of military force, especially in Korea, the Persian Gulf, and the former Yugoslavia.

Nevertheless, on the level of independent citizen action and professional research, there has been widespread interest in peacekeeping without the use of military force and in nonviolent modes of conflict resolution at international as well as domestic and interpersonal levels. The decades since World War II have witnessed the establishment of numerous peace studies programs, research institutes and centers, journals and professional associations devoted to peace and peacemaking, in the United States and around the world. In 1978 a citizen campaign in the United States led to the appointment by Congress of a commission to consider the establishment of a national academy of peace that would carry out and support research about international peace and peacemaking; educate and train persons from government, private enterprise, and voluntary associations about peace and peacemaking skills; and provide an information service in the field of peace learning. In 1984 legislation to create the United States Institute for Peace was passed by Congress, providing for an agency to support research but not to serve as a teaching and training academy. Since that time, Congress has increased funding and other forms of support for the institute's programs, including grants and fellowships, conferences, publications, library resources, and other activities, and has designated a tract of land for the institute's permanent headquarters, “in recognition of the Institute's accomplishments and the heightened relevance of its work in a dangerous and uncertain world.”

**FORMAL PEACE AGREEMENTS**

In the period between 1775 and 1945, the United States entered into a great many treaties or other formal peace agreements, of which the overwhelming majority were treaties with the Indian nations or tribes. Five major wars between the United States and recognized foreign states were concluded by peace treaties: the American Revolution (Treaty of Paris, 3 September 1783), the War of 1812 (Treaty of Ghent, 24 December 1814), the Mexican War (Treaty of Guadalupe Hidalgo, 2 February 1848), the Spanish-American War (Treaty of Paris, 10 December 1898), and World War I. The U.S. Senate declined to ratify the Treaty of Versailles and associated treaties negotiated by President Woodrow Wilson at the conclusion of World War I, but the United States
subsequently signed separate treaties of peace with Germany (Berlin, 25 August 1921), Austria (Vienna, 24 August 1921), and Hungary (Budapest, 29 August 1921). No treaties were signed and ratified by the United States with Bulgaria and Turkey, and the Soviet Union was absent from the entire peace settlement.

A number of lesser foreign wars or partial engagements of the United States were also concluded by treaties of peace: the Moroccan War (treaty of 28 June 1786), the Tripolitan War (Treaty of Tripoli, 3 June 1805), two Algerian wars (treaties of 1793 and 1815), the second Opium War (Treaty of Tientsin, 18 June 1858), and the Boxer Rebellion (Treaty of Peking, 7 September 1901). The undeclared naval war with France (Quasi-War) of 1798–1800 was also settled by a formal convention of 30 September 1800.

### WAR ENDINGS WITHOUT FORMAL SETTLEMENTS

The United States has been involved in a considerable number of undeclared foreign wars or “interventions,” particularly in the twentieth century. Such wars typically were not concluded by formal agreement but were ended rather by U.S. suppression of opposition, military rule, unilateral imposition of terms, or, in some cases, unilateral withdrawal of American forces. These undeclared wars included the suppression of the Philippine independence movement in 1899–1902, the Siberian interventions of 1918–1921, and numerous interventions in Cuba, Haiti, Mexico, Nicaragua, Panama, the Dominican Republic, and Grenada. They also included military interventions in civil wars in Greece, China, Korea, Lebanon, Vietnam, and others since World War II; covert actions and coups or attempted coups in Iran, Chile, and elsewhere; enforcement actions under “coalition” or North Atlantic Treaty Organization authority against Iraq and Serbia; and “antiterrorist” bombings in Libya and Afghanistan.

A study of American peacemaking must give some attention to the way the United States has handled the conclusion of civil wars and insurrections. The distinction between these and “foreign wars” becomes somewhat doubtful when we recall that the United States itself originated in an insurrectionary war. When an incumbent government is obliged to concede statehood and separate territorial sovereignty to rebel belligerents, the ending of the conflict takes on the character of a settlement between sovereign states. On the other hand, the treatment accorded to defeated belligerents in civil wars and insurrections often is not significantly different from the treatment accorded to defeated foreign nations in colonial wars of conquest or interventions.

The United States has experienced a substantial number of insurrections or rebellions, including at least thirty-five slave uprisings, at least five significant domestic insurrections or civil conflicts, the great Civil War of 1861–1865, and other types of conflicts such as large-scale riots, vigilante expeditions, and mass protests in labor, civil rights, and antiwar struggles. The United States government has consistently refused to give rebels, rioters, or protestors any recognized status as belligerents or negotiating partners, and these conflicts have been terminated by piecemeal suppression of the uprisings by military or police forces or by tacit concessions.

This was true even for the Civil War, in which the refusal of the U.S. government to negotiate with the rebel forces affected both the duration of hostilities and the character of the outcome. Efforts of the Confederate generals Robert E. Lee and Joseph E. Johnston to negotiate terms of general surrender with Union generals Ulysses S. Grant and William T. Sherman were expressly rejected by both President Abraham Lincoln and President Andrew Johnson. Far from welcoming the opportunity to put a rapid end to the fighting, on 3 March 1865 Lincoln instructed Grant “to have no conference with General Lee, unless it be for the capitulation of General Lee’s army, or on some minor or purely military matter.” Furthermore, Grant was “not to decide, discuss, or confer upon any political questions. Such questions the president holds in his own hands, and will submit them to no military conferences or conventions. Meantime you are to press to the utmost your military advantages.”

Similarly, when Sherman, unaware of this directive to Grant, later met with Johnston and drafted terms for a general surrender of the Confederate forces remaining after Lee’s surrender at Appomattox, the draft agreement was sharply rejected by President Johnson and his cabinet. Sherman was authorized to accept only the surrender of the army commanded by Johnston, and to engage in no negotiations. As Sherman observed, this policy meant that the war might continue indefinitely in sporadic engagements with dispersed “guerrilla bands.” Indeed, while the Civil War formally terminated one year later
with a proclamation by President Johnson (2 April 1866), some hostilities continued even after that date and a separate proclamation was required to end the fighting in Texas (20 August 1866).

While the position taken by Lincoln and Johnson appears at first sight to be based primarily on the principle of civilian control over vital political and civil questions, it must be observed that it was not particular political terms drafted by the generals that were rejected, but any conference or negotiation between the military leaders for terms of general surrender. Nor was the United States government itself willing to negotiate with the Confederate government or its generals. In contrast, in both World War I and World War II, general surrender or armistice agreements were received and signed by military leaders of the Allied armies. Marshal Ferdinand Foch, general-in-chief of the Allied armies in France, signed the armistice agreement for the Allies in World War I. In 1945, Lieutenant General Walter Bedell Smith, chief of staff to General Dwight D. Eisenhower, signed the German instrument of surrender, while General Douglas MacArthur signed the Japanese surrender agreement for the Allied powers in World War II. Although the terms of these documents were determined ultimately by the civilian authorities, the Allied governments did not hesitate to have the military leaders receive the surrenders and, indeed, accorded them considerable influence on the formulation of surrender terms and occupation policies.

It seems probable that the refusal of the presidents during the Civil War to approve the receipt by either Grant or Sherman of general surrender by Lee or Johnston was less a question of military versus civilian control of policy than it was a question of refusing to treat with any party claiming to represent or exercise general authority in or over the Confederate states or forces. Such a position is characteristic of incumbent governments faced with insurrectionary forces, not only at the cost of prolonging armed hostilities but even at the cost of making impossible a settlement based on mutual accord and amity.

**PEACEMAKING WITHOUT PEACE:**

**THE INDIAN WARS**

In *Custer Died for Your Sins* (1969), Vine Deloria wrote that “Indian people laugh themselves sick” when they hear American whites charge Soviet Russia with breaking treaty agreements: “It would take Russia another century to make and break as many treaties as the United States has already violated” in its dealings with American Indians. In the century between 1778 and 1871, the United States government made some 370 treaties with Indian tribes and nations. About one-third of these were peace treaties, but it is open to question what relationship should be understood between these treaties and “peacemaking” as construed above.

Since 1871 the United States has declined to sign treaties with Indian tribes, though it has continued to sign “agreements” understood to have the same binding force as treaties. The difference lies in rejection of the notion that the Indian tribes should be recognized as independent nations. Prior to 1871 this had been a matter of dispute, subject to varying interpretation and practice. In 1828, President John Quincy Adams declared that at the establishment of the United States, “the principle was adopted of considering them as foreign and independent powers.” But in 1831, in the case of *Cherokee Nation v. Georgia*, Chief Justice John Marshall gave the majority judgment of the Supreme Court that the Indians were “domestic dependent nations,” not to be considered “a foreign state in the sense of the Constitution.” However, the Supreme Court was closely divided on the issue. In their dissent, Justices Smith Thompson and Joseph Story argued that the history of past treatment of the Indians led irresistibly to the conclusion that “they have been regarded, by the executive and legislative branches of the government, not only as sovereign and independent, but as foreign nations or tribes, not within the jurisdiction nor under the government of the states within which they were located.”

Moreover, while Chief Justice Marshall maintained that the Indians were not “foreign states in the sense of the Constitution” with respect to the jurisdiction of the Supreme Court, he acknowledged that for other purposes the Cherokee nation clearly did have the character of a state, as a distinct political society, separated from others, capable of managing its own affairs and governing itself . . . . The numerous treaties made with them by the United States recognize them as a people capable of maintaining the relations of peace and war, of being responsible in their political character for any violation of their engagements, or for any aggression committed on the citizens of the United States by any individual of their community.

The following year, in the related case of *Worcester v. Georgia*, Marshall reaffirmed as the judgment of
the Court that treaties with the Indians had the same standing as treaties with other nations:

The constitution, by declaring treaties already made, as well as those to be made, to be the supreme law of the land, has adopted and sanctioned the previous treaties with the Indian nations, and consequently admits their rank among those powers who are capable of making treaties. The words “treaty” and “nation” are words of our own language, selected in our diplomatic and legislative proceedings, by ourselves, having each a definite and well understood meaning. We have applied them to Indians as we have applied them to the other nations of the earth. They are applied to all in the same sense.

The first treaty of peace ever made by the U.S. government was with the Delaware Indians in 1778, at Fort Pitt (Pittsburgh). This was in fact a treaty of alliance between the United States and some of the Delaware tribes, at a time when most of the Indians of Ohio and New York, including the Delaware, were fighting on the side of the British in the revolutionary war. The treaty repudiates the allegations of “enemies of the United States” who have endeavoured by every artifice to possess the Indians with an opinion that it is our design to extirpate them, and take possession of their country; to obviate such false suggestions, the United States guarantee to said nation of Delawares, and their heirs, all their territorial rights in the fullest and most ample manner as bounded by former treaties.

Similar guarantees were reiterated numerous times in succeeding years—for example, in 1790, when President George Washington assured the Iroquois Nations that the U.S. government would “protect you in all your just rights. . . . You possess the right to sell, and the right of refusing to sell your lands. . . . The United States will be true and faithful to their engagements.” In reality, the United States repeatedly violated these engagements, systematically dispossessing the Indian tribes of their lands and depriving them of their traditional means of subsistence, utilizing every means at hand including force and fraud, trickery and bribery, and finally murder, arson, and massacre. Although no war was ever declared by Congress against an Indian nation, one may well name the entire period of white colonization of the territory now comprising the United States the “Four Hundred Years’ War.” This protracted war reduced the Indian population of some twelve million in the area of the continental United States before the arrival of the colonists to about 300,000 in 1872. By that time the Delaware, who had been assured in 1778 that it was only the “false suggestions” of “enemies of the United States” that it was “our design to extirpate them, and take possession of their country” had been driven from their native territory and so reduced and dispersed that the report of the commissioner of Indian affairs for 1872 mentioned only eighty-one Delaware, living with the Wichita in Indian Territory.

In the present context, three main points are salient about the relations between the United States and the Indian nations: first, the consistent failure of the U.S. government to adhere to commitments made in numerous treaties of peace and amity; second, the outright resistance of many officers of the U.S. Army, and many state and federal government officials, to making peace with Indians on any terms other than unconditional surrender, removal to reservations, or, if necessary, extermination; and third, the use of peace treaties as weapons of war.

Although the full history of “broken peace pipes” has yet to be written, one may read parts of it in such works as Helen Hunt Jackson’s A Century of Dishonor (1881), Dee Brown’s Bury My Heart at Wounded Knee (1971), Vine Deloria’s Of Utmost Good Faith (1971) and Behind the Trail of Broken Treaties (1985), and M. Annette Jaime’s collection The State of Native America: Genocide, Colonization, and Resistance (1992). With respect to peacemaking, the effect of the most glaring atrocities, such as the Sand Creek massacre, was to shut all doors to peace. On 29 November 1864, Colonel John M. Chivington and Major Scott Anthony led seven hundred men to mutilate and slaughter some two hundred Indians, encamped at Sand Creek under assurances from Anthony himself that they would be under the protection of Fort Lyon. As Dee Brown concludes: “In a few hours of madness at Sand Creek, Chivington and his soldiers destroyed the lives or the power of every Cheyenne and Arapaho chief who had held out for peace with the white men. After the flight of the survivors, the Indians rejected Black Kettle and Left Hand, and turned to their war leaders to save them from extermination.”

Despite the hideousness of this and other massacres, far more Indians were killed and driven off their lands by the devices of dishonest, dictated, and disregarded peace treaties. Among the clearest examples of this was the case of the Cherokee. First persuaded by treaty commitments in 1785–1791 that the United States “solemnly guarantees to the...
Cherokee nation all their lands” not expressly ceded in the treaties, the Cherokees refrained from making war despite many hostile encounters with whites and the illegal entry onto their lands of numerous white settlers. Pressured into ceding more territory by treaty in 1817, some of the Cherokee began to move west of the Mississippi; but many refused to sign the treaty and most of the Cherokee clung stubbornly to their traditional lands. In 1829, however, the state of Georgia adopted an act that annexed their whole territory to the state and deprived them of all legal and political rights, annulling “all laws made by the Cherokee nation, . . . either in council or in any other way,” and providing that “no Indian . . . shall be deemed a competent witness in any Court of this State to which a white man may be a party.” The Cherokee sought to challenge this in the Supreme Court, but were discouraged by the Indian Removal Act of 1830, the refusal of the Supreme Court to hear their case in 1831, and the refusal of President Andrew Jackson to implement the more favorable decision of the court in Worcester v. Georgia (1832).

Under these circumstances, some of the Cherokee were induced to sign the Treaty of New Echota (1835), relinquishing all the Cherokee lands east of the Mississippi (encompassing territory in four southern states exceeding in size the states of Massachusetts, Rhode Island, and Connecticut) in return for five million dollars and seven million acres west of the Mississippi. The treaty again assured the Cherokee that the new lands ceded to them “shall in no future time, without their consent, be included within the territorial limits or jurisdiction of any State or Territory.” Whether they recognized that these assurances would be as worthless as earlier ones, or simply preferred their ancestral lands, most of the Cherokees refused to sign the Treaty of New Echota; in 1837, General John Ellis Wool reported that the Cherokee people “uniformly declare that they never made the treaty in question.” Nevertheless, at the expiration of the stipulated time the U.S. Army appeared to carry out the removal, “in obedience to the treaty of 1835.” Fifteen thousand Cherokee were forcibly evicted under conditions of such inadequate food, shelter, and sanitation that four thousand died on the long trek west. Thus, in retrospect, treaty-making takes on the appearance of the most deadly weapon employed by the whites in their war to wrest the continent from the Indians; to persuade, trick, or coerce them into giving up their lands; and to reduce them to a remnant of their former numbers.

Nevertheless, with the emergence of Indian activism in the Americas and other indigenous movements around the world since the 1970s, there was a revival of interest in past treaties and contemporary treaty-making to clarify and reaffirm the rights of Indian tribes and other indigenous groups promised in earlier treaties and agreements, resolve the destructive conflicts over these rights that persist today, and restore the dignity and lands of indigenous peoples. In 1974 the International Indian Treaty Council (IITC) was established to press for the rights of indigenous peoples across the Americas and around the globe. The IITC has worked through the United Nations and through autonomous meetings and action to secure recognition and redress, with some degree of success.

For example, in 1995, Queen Elizabeth II signed an apology to the Maori people of New Zealand and announced the return to the Maori of 39,000 acres of land the British had confiscated from them illegally in 1863, and the provision of a $42 million fund for the repurchase of privately owned land. Although the amount restored was far less than had been taken, and hundreds of tribal claims remained in litigation, this was an unprecedented and important gesture of reconciliation. In the United States some lands and rights were restored to Native Americans through the Indian Claims Commission between 1946 and 1978, the Indian Civil Rights Act of 1968, and other legislative acts. However, the claims settlements have been very limited, and since 1978, Indian claims have been pressed mainly through the federal courts and acts of Congress. Some of these have been settled, notably the Seneca Nation Settlement Act of 1990, which provided a settlement award of $60 million to the Seneca, but in 2001 many claims were still pending, including the long-fought Black Hills land claim of the Lakota Nation, and there was little ground for optimism about early resolution of the major claims and issues.

In 1996 a subcommission of the United Nations Commission on Human Rights issued a Draft Declaration of the Rights of Indigenous Peoples. While the General Assembly did not vote to approve the draft, it recognized the adoption of such a declaration as one of the main goals of the International Decade of the World’s Indigenous People (1995–2004). Article 36 of the Draft Declaration states: “Indigenous peoples have the right
to the recognition, observance and enforcement of treaties, agreements and other constructive arrangements concluded with States or their successors, according to their original spirit and intent, and to have States honour and respect such treaties, agreements and other constructive arrangements."

TREATY MAKING VERSUS PEACEMAKING

The experience of the American Indians is the most glaring example, but by no means unique, illustrating the limitations of treaty-making as a model for peacemaking. It is widely recognized that so-called "peace settlements," explicit agreements for the termination of a particular war or dispute, may fail to resolve key issues in dispute, and may even plant the seeds for new hostilities.

In the case of World War I, for example, President Woodrow Wilson resisted strong pressures from political opponents at home to demand "unconditional surrender" as the only basis for a settlement of the war with Germany, but he was later obliged to make many concessions weakening or contradicting the principles of his Fourteen Points, and forcing Germany to accept dictated terms of peace. When the Senate declined to ratify the resulting Treaty of Versailles, it was in the setting of a national campaign portraying the treaty terms and even the Covenant of the League of Nations as a betrayal of hopes for a lasting peace. Senator Henry Cabot Lodge argued before the Senate on 12 August 1919:

Whatever may be said, it [League of Nations] is not a league of peace; it is an alliance, dominated at the present moment by five great powers, really by three, and it has all the marks of an alliance. The development of international law is neglected. The court which is to decide disputes brought before it fills but a small place . . . it exhibits that most marked characteristic of an alliance—that its decisions are to be carried out by force. Those articles on which the whole structure rests are articles which provide for the use of force; that is, for war.

Nor did the opposition to the treaty as a provocation of future wars come only from the right. Indeed, the first organized group to condemn the Treaty of Versailles was the Women’s International League for Peace and Freedom, whose international congress at Zurich, meeting 12–17 May 1919, declared:

This International Congress of Women expresses its deep regret that the terms of peace proposed at Versailles should so seriously violate the principles upon which alone a just and lasting peace can be secured, and which the democracies of the world had come to accept.

By guaranteeing the fruits of the secret treaties to conquerors, the terms of peace tacitly sanction secret diplomacy, deny the principles of self-determination, recognize the right of the victors to the spoils of war, and create all over Europe discords and animosities, which can only lead to future wars.

By the demand for the disarmament of one set of belligerents only, the principle of justice is violated and the rule of force continued.

One may argue that the Treaty of Versailles was not so bad as its opponents portrayed it, that its terms were less harsh than they might have been, that the disarmament of Germany was a first step toward the general disarmament that the treaty envisaged for the future, and that the League of Nations, imperfect as it was, offered a framework for international cooperation and peace that would have been effective had it been given responsible support and leadership by the United States and other great powers. One may argue that the failure of the peace settlement of 1919 was less a consequence of its internal flaws than of its abandonment in the subsequent years, first by the withdrawal of the United States and then by successive retreats by other major signatories (especially Great Britain and France), particularly from the treaty’s provisions for general disarmament and for collective action against breaches of the peace. These questions are still debated; nevertheless, it is probable that disillusionment with the settlement of 1919 contributed to the failure to arrive at any general peace settlement in World War II, and perhaps to the near abandonment of treaties of peace as a mode of terminating hostilities in the period since 1945.

Doubts concerning the necessity and advisability of concluding a treaty of peace at the end of World War II were expressed in the work on planning for peace during the last years of the war. In the report “Procedures of Peacemaking: With Special Reference to the Present War,” the Legislative Reference Service of the Library of Congress pointed out in August 1943 that the Declaration of the United Nations bound the signatories not to conclude a separate peace. Nevertheless, the report noted:

The worldwide scope of the present war and the multitude of problems which its settlement
entails constitute a strong temptation for the solution of certain questions independently of the overall settlement. . . . Even the major problems of boundaries, of federations, and of economic and political alliances among foreign States, insofar as the United States is not directly committed, might be thus decided without these decisions ever appearing in the text of a treaty which the United States would be called upon to ratify. . . . The cessation of hostilities in different parts of the world may be far from simultaneous. . . . And should a prolonged interval intervene between the end of the fighting in the main theatres of war and the definitive peace, the situation might become so deeply influenced by decisions made and regimes established in the meantime, that the peace conference might find its freedom of action considerably prejudiced. As a result of this development, the peace treaty or treaties may lose a great deal of their importance.

This analysis proved remarkably close to the actual course of events at the end of World War II. As one text summed it up, "peacemaking was a long drawn-out process which never quite ended but turned into the Cold War between the Soviet Union and its wartime allies." The wartime conferences at Casablanca, Teheran, Yalta, and Potsdam laid down some of the principles and specific terms of the postwar arrangements, including the demand for "unconditional surrender" of the Axis powers, the policy of "complete disarmament, demilitarization and dismemberment of Germany," the establishment of the United Nations, and various specific provisions relating to the Far East and Eastern Europe, particularly Poland. Nevertheless, many key issues were left imprecise or totally unresolved, and all the agreements were understood to be provisional pending a final peace treaty. By the time the peace conference convened in Paris, however, the situation had indeed become "so deeply influenced by decisions made and regimes established in the meantime" that the formulation of a general peace settlement acceptable to all the major participants had become impossible.

Thus, no general treaty settlement of World War II in Europe was concluded; the peace treaty with Japan was delayed until 1951, and was not signed by the Soviet Union. Nor were peace treaties concluded in other wars fought by the United States since then. No peace treaty followed the armistice in the Korean War, concluded at Panmunjom in July 1953. The withdrawal of U.S. forces from Vietnam was arranged by a cease-fire agreement of 28 January 1973. Although this was called "An Agreement Ending the War and Restoring Peace in Vietnam," it was actually, as Randle notes, "a military settlement without the concomitant political settlement that completes the peacemaking process." Moreover, the withdrawal of U.S. uniformed forces did not end the war or restore the peace; fighting continued among the Vietnamese and other Indochinese belligerents in subsequent years.

On the whole, the United States has held an image of peacemaking as "sitting down around the table to negotiate." But with the exception of the early period of its history in relations with European powers, especially Great Britain, the United States has not had a strong record of making peace on negotiated terms, such as to establish a lasting basis of concord. The terms of the treaties with Mexico in 1848, Spain in 1898, and Germany in 1919 were essentially dictated, as were the terms of surrender of the Axis countries in World War II. In the latter cases, the United States was obliged to negotiate at least with its own allies. In World War I, negotiation with allies may have cost the United States the freedom to negotiate with the opposing belligerents, but in World War II, it was the declared policy of the United States to achieve "unconditional surrender." This was also the policy most often adopted by the United States in dealing with insurgents, both domestic, as in the Civil War, and foreign, as in the Philippines. Moreover, in dealing with Native Americans, the United States has shown that negotiating treaties may be a device not to establish peace but to disarm, defeat, and gradually drive an opponent into a dependent condition.

The United States has sometimes sought to ameliorate the harshness of terms imposed on defeated opponents by financial awards (payments and annuities to Native Americans, $15 million to Mexico for 40 percent of its territory from Texas to California) or postwar programs of aid and rehabilitation (loans to Germany after World War I, the Marshall Plan after World War II). Even in this respect, however, the provision of aid has been more generous and given on less humiliating terms to powerful opponents, especially those of white race, than to those peoples of different race and culture who have found themselves in the path of "manifest destiny" and U.S. global expansion, whether Native Americans, Filipinos, or Vietnamese.
RACE AND PEACEMAKING

In the scholarly literature focusing on peacemaking in the international arena, surprisingly little attention has been given to issues of race. Although “ethnic” conflict is recognized as a cause of war or internal armed conflict and as sometimes especially intractable, the treatment of racial conflicts as such in works on “peacemaking” has been limited mainly to those concerned with conflict resolution in the schools, in the criminal justice system, or in community relations. Yet the salience of race as a factor in international relations and peacemaking has been called to our attention repeatedly, from W. E. B. Du Bois’s declaration that “the problem of the twentieth century is the color line” to a number of contemporary works that emphasize the international and transnational importance of race. These include, in particular, George W. Shepherd, Jr., Racial Influences on American Foreign Policy (1970); Hugh Tinker, Race, Conflict, and the International Order (1977); and Paul Gordon Lauren, Power and Prejudice: The Politics and Diplomacy of Racial Discrimination (1988).

As Shepherd argued in 1970, “all great powers must face the reality of racial attitudes in their policies.” This includes recognition of the dominant group interests as well as attitudes of racial superiority that may drive foreign policy choices and decisions and may shape support or disaffection from those choices at home. It has been suggested, for example, that the failure of the United States and other powers to support preventive action in Rwanda, while intervening at much higher levels of commitment in the Middle East and the Balkans, reflected a racially biased choice. Another aspect of the influence of race in international politics is that of transnational communication and interaction. As in the case of indigenous peoples, the transnational force of race identity and solidarity may have a powerful influence on policies relating to conflicts both at home and abroad. At the same time Shepherd called upon us to engage “a more perceptive study of the special contribution of nonwhite and non-Western peoples within and among nations.”

Lauren later expanded on these themes, recognizing the problematic nature of the very concept of “race” but arguing that it has nonetheless profoundly influenced global politics and diplomacy. As he sums it up, race issues have affected relations between and among states and have posed serious threats to international peace and security. They have “motivated domestic groups concerned with racial discrimination to exert noticeable pressure upon the foreign policy of their own governments and to seek the active support of other nations for their protection.” Despite the silence on these issues in most of the “peacemaking” literature, they have held a very high place on the international agenda of matters relating to a broad conception of peace. The first global attempt to speak for equality focused upon race. The first human rights provisions in the United Nations Charter were placed there because of race. The first international challenge to a country’s claim of domestic jurisdiction and exclusive treatment of its own citizens centered upon race. The first binding treaty of human rights concentrated upon race. The international conventions with the greatest number of signatories is that on race. Within the United Nations, more resolutions deal with race than with any other subject. It may be hoped that as work continues and grows in the peacemaking field, more direct attention will be accorded to the issues of race at the international level.

GENDER AND PEACEMAKING

Given the widespread and persistent popular association between women and peace, and the worldwide presence of women’s peace movements, it is not surprising that we now have several large bodies of literature on women, war, and peace. These include histories and biographies of women’s peace activism, collections of women’s poetry, fiction, and other writings on war and peace, sociological and political studies on women’s peace movements, the gender gap on peace issues, and women’s roles in peace and war, grueling accounts of women’s losses, sufferings, displacement, and subjection to torture, rape, and sexual slavery in situations of war and armed conflict. Also portrayed are inspiring accounts of women’s creativity, intellectual brilliance, courage, daring, and solidarity in the use of nonviolent direct action or other techniques of resistance, and a wide variety of theories to explain and comprehend women’s struggles to overcome violence and subjection and build peace.

It may seem surprising, however, to find that in all this wealth of theory and knowledge there is relatively little about women and the processes of peacemaking as such. Less surpris-
ing, but more troubling, is that there is even less on women and gender in the mainstream studies on peacemaking, suggesting that women's peace work remains nearly as invisible to scholars and experts in the academy as the male political and military establishments would like it to be in the arenas of “real world” conflict. Of course the reason for this invisibility is above all the practical exclusion of women from most of the official and even unofficial avenues of peacemaking. At peace talks for Burundi in Arusha, a delegation of women was not welcomed to participate—male delegates declared: “The women are not parties to this conflict. This is not their concern. We cannot see why they have come, why they bother us. We are here and we represent them.” While these sentiments may not be so readily expressed aloud in other contexts, they are in fact all too common in practice. On a positive note, women have gained high-level positions in U.S. foreign relations, including Madeleine Albright as secretary of state under President Bill Clinton and President George W. Bush’s national security adviser Condoleezza Rice. However, the number of women admitted to the sacrosanct premises of peace or cease-fire negotiations is minuscule, and the adage, “out of sight, out of mind,” is all too accurate here. The women themselves, their proposals for peace, and their concerns with regard to peace settlements, are steadfastly relegated to the sidelines. Nonetheless, the multiple roles women play relative to settling conflicts and restoring peace are in fact highly important, sometimes decisive, and the gendered character of all wars and armed conflicts is central to a clear comprehension of the context and path to resolution.

There are a number of works that are especially valuable in this regard, including: Gita Sen and Caren Grown, Development, Crises, and Alternative Visions: Third World Women’s Perspectives (1987), Betty A. Reardon, Women and Peace: Feminist Visions of Global Security (1993), and Sanam Naraghi Anderlini, Women at the Peace Table: Making a Difference (2000). The latter, a publication of UNIFEM (United Nations Development Fund for Women), deals most directly with women’s participation in peace movements during wars and conflicts and in the processes of negotiation and peacebuilding to end the conflicts and secure a sustainable peace with benefits not only for the “winners” but for women and people at the grassroots. Anderlini interviews women who have been engaged in the peace processes, including Hanan Ashrawi, and explores both the obstacles the women have faced and the importance of their contributions to the peace processes. Further research and analysis in this area are urgently needed.

**PEACEMAKING AND THE PERILS OF “VICTORY”**

It was long held in the scholarly literature that wars for the most part end in victory for one side and defeat for the other. Stalemates and settlements with no discernible victor or defeated were regarded as relatively rare. This was not often stated as a general principle and was sometimes subjected to challenge. Nevertheless, it appeared repeatedly, sometimes as an empirical observation on selected groups of wars, sometimes as an underlying assumption in the theoretical analysis of war endings.

Thus, Melvin Small and J. David Singer in *The Wages of War: 1816–1965, A Statistical Handbook* (1972), assigned victor or defeated status to the belligerents in all but one of fifty interstate wars and forty-three “extra-systemic” wars that they included in their study. Similarly, George Modelski found that some four-fifths of one hundred internal wars since 1900 ended in an “outright win” or victory of one side or the other. The theoretical significance of assigning victory had been set forth earlier by H. A. Calahan, who held that the key to peacemaking lies simply in the recognition of defeat on the part of the vanquished: “war is pressed by the victor, but peace is made by the vanquished.”

This view was echoed later by others, including Paul Kecskemeti and Lewis Coser, but its fullest theoretical statement appears in Nicholas S. Timasheff’s *War and Revolution* (1965). Timasheff views war as “a means of solving an inter-state conflict by measuring the relative strength of the parties.” Timasheff goes on to make clear that the return to peace must take place through the initiative of the defeated, concluding that in studying the “movement from war to peace” (that is, war endings), the determination of victory is central: “Therefore, the study of the causal background of the return of political systems from war to peace is tantamount to the study of the premises of victory and of the mechanism converting victory into peace.”

This preoccupation with victory and defeat persists in some measure today despite the fact that, as James D. Smith and others have pointed out, there has been a significant trend away from
the conclusion of wars and armed conflicts by clear-cut victory of one side. Negotiated settlements, stalemates, and withdrawals of all parties are increasingly prevalent as outcomes of war in the late twentieth century. “Victory,” then, is becoming increasingly elusive in modern warfare.” Yet in their text How Nations Make Peace (1999), Charles W. Kegley, Jr., and Gregory A. Raymond center their entire analysis on “situations in which there was a clear winner and loser,” exploring the “policy problems and moral dilemmas victors face,” the choices to be made by “victors” after a “decisive military victory,” and particularly “the relative merits of compassionate versus punitive peace settlements.” In posing these issues, Kegley and Raymond express the laudable hope that their work may help to “bring the ethical dimension of decision making into the study of international relations.” However, by narrowing the focus to exclude the great diversity of contemporary armed conflicts and their different kinds of endings, Kegley and Raymond obscure the broader question of “how nations make peace” and direct disproportionate attention to the relatively few instances in which the winner/loser, victor/defeated model prevails. Meanwhile, the elusive goal of victory continues to command the imaginations of both military and civilian leaders, often standing as a significant obstacle to timely and effective peacemaking, as illustrated in a number of case studies examined by James D. Smith in Stopping Wars (1995).

ON THE ROAD TO PEACE: PEACE PROCESSES SINCE WORLD WAR II

With the decline of formal peace settlements as the prevailing mode of terminating wars in the period since World War II, studies of peacemaking have shifted to the analysis of peace processes: the factors influencing parties in a conflict to move toward peace, procedures to facilitate the process, methods and techniques to bring about cessation of hostilities and implement cease-fire terms, and approaches to peacebuilding for the longer term. In these processes, the United Nations has been called on with increasing frequency to play a central part, yet often side-stepped to suit great-power interests.

In his 1992 report An Agenda for Peace, Secretary-General Boutros Boutros-Ghali spelled out the multiple roles that the United Nations has taken in regard to peace, under the rubrics of preventive diplomacy, peacemaking, peace enforcement, and peacekeeping. It may be noted that “peacemaking” appears here in a specific sense as one of a series of stages in the peace process, though the term is still widely used to denote the entire process, and the designations cover actions and procedures that are overlapping and interrelated.

“Preventive diplomacy” refers to efforts to resolve disputes before violence occurs. Such efforts may be conducted by the secretary-general or other offices of the United Nations, or by diplomatic engagement of others such as neutral states or regional associations, or by multitrack diplomacy involving both public and private parties. These may lead to a variety of steps to encourage resolution of the disputes without armed force, such as confidence-building measures, fact finding, early-warning systems, preventive deployment, and demilitarized zones. As Gareth Evans notes, in some circumstances “the preventive diplomacy techniques—negotiation, enquiry, mediation and so on—which are aimed at averting armed hostilities, are also appropriate if fighting does break out.”

“Peacemaking” in the specific sense used here refers to efforts to bring together parties already engaged in hostilities to seek agreement for peaceful resolution of their conflict. The United Nations role in this context is spelled out under chapter 6 of the UN Charter, which specifies the options of mediation, negotiation, conciliation, arbitration, judicial settlement, sanctions, and “other peaceful means.” Mediation, negotiation, arbitration, and judicial settlement have been central to the theory and practice of peacemaking over the course of history and have been treated in numerous historical, legal, and political works. Two noteworthy contemporary examples are Paul R. Pillar, Negotiating Peace: War Termination as a Bargaining Process (1983), and I. William Zartman and J. Lewis Rasmussen, eds., Peacemaking in International Conflict: Methods and Techniques (1997). Peacemaking efforts in the last decades of the twentieth century sought less to arrive at any comprehensive peace agreement than to achieve a cessation or pause in hostilities in the form of a cease-fire, truce, or “suspension of arms.” The processes of arriving at a cease-fire have been somewhat neglected in the existing literature, but have been addressed particularly by James D. Smith in Stopping Wars: Defining the Obstacles to Cease-fire (1995).

Sanctions, which are conceived in this context as an inducement to bring parties to the
negotiating table, have also been invoked to bring international pressure on a state in favor of internal change, as in the case of sanctions imposed upon South Africa to end its apartheid policies. Here it can be argued that the combined impact of economic, strategic, social, and cultural sanctions imposed by the international community played an important peacemaking role in promoting an end to a violent system. On the other hand, sanctions used as a form of peace enforcement can become punitive action, amounting to a weapon of war. Sanctions imposed upon Iraq in conjunction with the Persian Gulf War of 1991 were maintained (though with some modifications) for over a decade at the insistence of the United States, with devastating consequences for the Iraqi people.

“Peace enforcement” under United Nations auspices is authorized under chapter 7 of the UN Charter. This provides for the use of any measures deemed necessary by the Security Council, including the use of armed force, to “maintain or restore international peace and security.” In general, the United Nations has been somewhat reluctant to resort to this provision of the Charter, the main exceptions being the two major military enforcement actions spearheaded and directed by the United States in Korea and the Persian Gulf. In contrast, the efforts of Secretary-General Boutros-Ghali in 1994 to assemble a peace enforcement mission of five thousand troops to prevent the genocidal violence that eventually claimed over half a million lives in Rwanda were rebuffed by the United States and other powers. The United States also spearheaded the military enforcement action against Yugoslavia in 1999, under the aegis of NATO, declining to take the matter to the United Nations.

“Peacekeeping” refers to intervention by unarmed or lightly armed forces of the United Nations or other intergovernmental bodies, to monitor or supervise implementation of cease-fires, troop withdrawals, or other agreements reached through preventive diplomacy or peacemaking efforts. Peacekeeping bodies may include military personnel, police forces, or civilians and, as Evans points out, their presence usually presupposes “that the governments or parties involved in the conflict are willing to cooperate and are able to reach and maintain agreement.” In the decades since the establishment of the United Nations Truce Supervision Organization for Palestine in 1948, the United Nations and other international bodies have accumulated extensive experience with scores of peacekeeping operations around the world. A large body of works reporting, analyzing and assessing these operations has appeared, ranging from individual case histories such as Connor Cruise O’Brien’s To Katanga and Back: A UN Case History (1964) and overviews such as The Blue Helmets: A Review of United Nations Peacekeeping (United Nations, 1990, 1996), to collections of scholarly and interpretive studies such as Tom Woodhouse et al., eds., Peacekeeping and Peacemaking: Towards Effective Intervention in Post-Cold War Conflicts (1998), and Olara A. Otunnu and Michael W. Doyle, eds., Peacemaking and Peacekeeping for the New Century (1998).

“Peacebuilding” is a newer concept, emerging from a growing recognition that termination of armed conflict is no guarantee of “peace,” which depends on underlying social, political, and economic conditions. Peace studies as a field has moved away from an exclusive focus on “negative peace,” conceived simply as the absence of organized warfare and other forms of armed violence, to the study of “positive peace.” In the context of peacemaking, this means going beyond cease-fire or even peace accords to address underlying issues of justice and the structural violence of exploitation, racism, patriarchy, and other forms of oppression and dominance relations. This is sometimes described as a process of “conflict transformation,” designed to build “cooperative, peaceful relationships capable of fostering reconciliation, reconstruction, and long-term economic and social development.” John Paul Lederach, in Building Peace: Sustainable Reconciliation in Divided Societies (1997), sets out to provide “a set of ideas and strategies that undergird sustainable peace.” As summarized in the foreword by Richard H. Solomon, a president of the United States Institute for Peace: “Sustainable peace requires that long-time antagonists not merely lay down their arms but that they achieve profound reconciliation that will endure because it is sustained by a society-wide network of relationships and mechanisms that promote justice and address the root causes of enmity.” Peacebuilding thus expands the field of vision in peacemaking to encompass a broad range of individual, group, and societal and international problems and action.

It may be that there is no better symbol of the paradoxes in the history of United States peacemaking than dubbing the Colt .45 gun “the Peacemaker.” Yet it may be hoped that the voices
will be heard of those other peacemakers who hold with Jane Addams that peace cannot be secured merely by the temporary conclusion of fighting, but “only as men abstained from the gains of oppression and responded to the cause of the poor; that swords would finally be beaten into plowshares and pruning hooks, not because men resolved to be peaceful, but because the metal of the earth would be turned to its proper use when the poor and their children should be abundantly fed,” and when peace came to be conceived “no longer as an absence of war, but the unfolding of worldwide processes making for the nurture of human life.”

The idea of peace is ancient, reaching back to the beginnings of organized society and perhaps even earlier; but until the Renaissance it had not passed beyond the stage of individual thought. Society was rural, save for a few towns and cities. Nationalities, while recognized, were not well formed. International relations did not exist. The relations of the Greek city-states were casual and unorganized, moving from hostilities to lack of hostilities without much of a dividing line. The very basis of international organization—existence of different peoples, organized in states, usually speaking different languages, was not present in the Greek world. Nor was it present in the world of Rome, where a single city, through extension of citizenship, recognized no equals in the area of the Mediterranean. To the Romans the people with whom they came in touch were either to submit to the domination of the empire or forever remain barbarians. There was no such thing as interstate relations. The same lack of international relations marked medieval life, where princes and principalities might fight or not fight, for whatever reason, conducting warfare as if it were a natural state of affairs and halting it when convenient, without much or any formality. In such disorganized relations between the peoples of Europe there was, to be sure, little reason to try for a better order of affairs when all that people knew was chaos or domination. In any event, the generality of the citizens or subjects was not consulted in advance of fighting or its conclusion.

The appearance of peace movements awaited both the formal division of Europe into nation-states and a notable intellectual development often overlooked by analysts of modern European history—the division of international relations into times of peace and times of war. This latter change came during the Thirty Years' War in the seventeenth century, and did not occur so much in the statecraft of the time as in the thinking of jurists and students of law, who began to see not merely that the primitive international customs and traditions of the era must be ordered but also that the task of ordering involved division into laws for fighting and laws for peaceful existence. In this regard the Dutch jurist Hugo Grotius proved most influential. A citizen of one of the major maritime states of the era, and therefore interested in the freest possible trade on the high seas, he found the military forces of his countrymen outnumbered by the professional armies of the monarchs whose territories surrounded the States-General. The convenience of trading with many European states had fascinated the Dutch, and they wanted to continue this commerce. At the same time they needed guarantees of freedom of trade. Life during the Thirty Years' War was almost insufferable for so rich a group as the Dutch burghers. Grotius was imprisoned, and friends contrived his escape in a large chest. With reason he wished to try to order the international relations of his time, and the result was De jure belli ac pacis (1625). In it he drew a sharp line between what was war and what was peace. It was, incidentally, a line that was not recognized until the nineteenth century, when there were no major European wars except the Franco-Prussian War (1870–1871). Grotius's distinction between war and peace would be blurred by the statesmen of the twentieth century, who through cold wars and other such undeclared conflicts pushed international relations back toward the pre-Grotian chaos. In any event, the drawing of a war-peace line—however theoretical, and thereafter slowly accepted and eventually violated—set the stage for popular peace movements. In a real sense Grotius and his supporters among the legal theorists were the originators of peace movements.

The essentially theoretical nature of peace movements was observable from the outset, and it may well have been one of the reasons why the innumerable drawings of ideal international societies, the perfect renderings of international rela-
tions, have never been translated even approximately into reality.

The first designs of men of peace in modern times, which themselves were not characterizable as the programs of peace movements but received a good deal of attention during their periods of interest, were markedly theoretical. One of the leaders of France in the early seventeenth century, the duc de Sully, was the author of the “great design” of King Henry IV, which, though it stipulated an international force, asked for one so small that it amounted to disarmament. Much notice was taken of this hope for peace, and it was speculated upon for years thereafter. The supporters of later peace movements were also accustomed to cite the hopes of Benjamin Franklin, who was convinced that standing armies diminished not only the population of a country but also the breed and size of the human species, for the strongest men went off to war and were killed. He pointed out obvious waste in the maintenance of armies. His analysis made sense to many Americans who themselves, or whose ancestors, had come to the New World to escape the constant wars of the Old. The Farewell Address of President George Washington in 1796 was plain about the need for peace and the wastefulness of war: “Overgrown military establishments are, under any form of government, inauspicious to liberty, and are to be regarded as particularly hostile to republican liberty.” Here was another rationale that would recur in the pronouncements of the nineteenth-century peace movements in both the United States and Europe.

The intellectual foundations of peace movements were laid in the years prior to 1815. Beginning in that year, with the wars of the French Revolution and Napoleon at an end, and the emperor of France on his way to St. Helena in a British frigate, it was possible to bring together the formalities of the international lawyers and the philosophical hopes of Sully, Franklin, and Washington, and to enlarge upon and systematize ideas about how American or European—or even world—peace might be achieved.

The years from 1815 to 1848 saw major developments in organization of peace groups in the United States. For a while it appeared as if they might carry everything before them. Peace seemed secure between the United States and Great Britain. In the Rush-Bagot Convention (1817) the two English-speaking nations undertook a virtual disarmament of their borders upon the Great Lakes, across New York State, and along the northern borders of the New England states. Why could not such an arrangement between erstwhile enemies spread to the entire world? This was the era of the founding of the American Peace Society in 1828 and of state peace societies. It was an ebullient time, often characterized by later historians as an age of reform: the antislavery movement, prison reform, insane asylum reform, experiments in communitarian living, and the rise of reformist religions such as the Church of Jesus Christ of Latter-Day Saints.

Members of the new peace organizations advanced their ideas with unwonted vigor and with a very considerable intellectual precision. The principal organizer of the American Peace Society, William Ladd, arranged for distribution of tracts and advocated a congress of nations, together with the riddance of war through treaties of arbitration. Elihu Burritt established the League of Universal Brotherhood in 1846, which soon was claiming an American membership of twenty thousand and a similar number of British members; Burritt’s organization was largely responsible for a series of “universal peace congresses” held in European cities over the next years.

The peace groups of the first half of the nineteenth century took interest in international law, as Grotius had two centuries before, and the American Peace Society in the person of Ladd, as well as the reformer Alfred Love, founder of the Universal Peace Union (1866), looked to a stronger law of nations that, they were certain, would make war more difficult, perhaps even impossible.

As for precisely how influential the peace groups were, during the years from Waterloo to the revolutions of 1848 and the Crimean War (for Europe) and to the Mexican War and the passing of the slavery issue into national politics, and ultimately the coming of the Civil War (for the United States), it is impossible to say. The problem of analysis here is that during an age of reform there was goodwill in so many directions, often expressed by the same individuals, that its forcefulness or lack thereof cannot be easily determined. Moreover, the absence of even fairly small international conflicts was probably not a result of the peace movement, but of contemporary circumstances in the international relations of Europe—the unpopularity of war after the wars of the French Revolution and Napoleon, and the momentary sense of community among the great powers known as the Concert of Europe. To many people of the time, peace nonetheless seemed a
logical outcome of the peace movement; and the workers for peace tended to pursue their plans and purposes—abolition of standing armies, development of international law on land and sea, organization of peace congresses—with a confidence that was unjustified by the international relations of the time.

In the latter half of the nineteenth century, peace workers began to have a new sense of urgency because of an armaments race that at first was not very noticeable but later became highly evident. By the 1860s and 1870s the stresses and strains incident to the rise of a Prussia-dominated German state in Europe began to send armament expenditures on an upward trend that continued into the twentieth century. The sharpening of nationalisms everywhere, and the increasing authority of national bureaucracies, impelled nations to increase their armaments. Weapons also began to increase in complexity and costliness. Muskets gave way to rifles. Smooth-bore cannon were replaced by rifled guns, and projectiles went farther and penetrated deeper. The navies of the world converted from sail to steam. They armored their ships. Transport—first the railroad and then, after the end of the century, motor transport over paved roads—made land armies mobile in ways unknown to generals during the age of Napoleon, Gebhard von Blucher, and the duke of Wellington.

The Industrial Revolution allowed nations with heavy industries to produce arms for themselves and sell arms to their agricultural neighbors in exchange for foodstuffs. Introduction of such weapons as the French 75, a new field gun, forced all the leading European states to purchase the new ordnance. By the 1890s men of goodwill everywhere were alarmed at the dreadfully costly battles and campaigns of any new war, given the new equipment. They were alarmed at the talk about military might by the leaders of Germany after Bismarck. The surge of imperialism in the 1890s momentarily took European and American energies into the Far East. Earlier the Europeans had devoted themselves to the imperial task of dividing Africa. Shortly after the turn of the century, there was no more territory to divide, and rivalries began to concentrate in Europe, as they had just before outbreak of the Napoleonic wars. It was a vastly troubled situation; and peace groups began to look for solutions, to try to do what statesmen seemed incapable of doing—to contrive some kind of international arrangement of ideas and interests so that war could be prevented.

Limitation of armaments was the task of the peace movements prior to 1914, and the result was disappointing. Calvin D. Davis has justly remarked that a strange dichotomy of thought existed in the United States and Europe. International rivalries never had burned so brightly, and never had there been so much talk about national interest; yet never had there been more popular interest in peace. Peace groups received broad public support, even from statesmen, who perhaps saw them as so important, so obviously influential, that it would be best to join them, at least in appearance. Universal Peace Congresses began to assemble, the first such meeting being held in 1889. The men and women who attended these meetings favored disarmament and the advance of arbitration through treaties. The dissenting churches of Great Britain heartily supported disarmament during the 1890s, before the British army and navy were modernized on the eve of World War I. British members of these groups looked anxiously to their American cousins, hoping that from unity of language could come unity of national purposes. The English-Speaking Union was a reflection of this hope. During the years from the turn of the century until 1914, a rapprochement became apparent between the two countries and was much remarked upon. The two countries together could join their European friends in a peace movement that would overwhelm the forces for war. It was thought by people who were interested in peace that the two English-speaking nations might well be considered impartial in urging a disarmament conference because of their separation from Europe by water—not very much in the case of Britain but a vast expanse in the case of America.

The pre–World War I years seemed to promise a great peace reform. Baroness Bertha von Suttner in 1889 published a book titled Die Waffen Nieder (Lay Down Your Arms). It was perhaps the greatest peace novel of all times and was translated into almost every known tongue. The British journalist W. T. Stead reprinted it in English in 1896, and sold the book at the nominal price of one penny. The Russians appeared to be interested in world peace, or at least it was clear that the great novelist Leo Tolstoy was fascinated by the idea. At the suggestion of Baroness von Suttner, the inventor of dynamite, Alfred Nobel, became devoted to the peace movement. Nobel, who believed that he could cooperate with the baroness through making dynamite, wrote to her on one occasion, “Perhaps my factories will put
an end to war even sooner than your Congresses; on the day when two army corps may mutually annihilate each other in a second, probably all civilized nations will recoil with horror and disband their troops.” Little did Nobel know that this day to which he looked mystically, albeit seriously, would arrive in the latter twentieth century, but civilized nations not only would fail to recoil with horror and disband their troops, but also would prove willing to allow the weapons of destruction to proliferate.

Nobel characterized the hopes of his generation by endowing a peace prize that was to go annually “to that man or woman who shall have worked most effectively for the fraternization of mankind, the diminution of armies, and the promotion of Peace Congresses.” This was the spirit that produced the most notable product of the peace movement of the turn of the century, the Hague Peace Conferences of 1899 and 1907.

Unfortunately, the first conference did little for peace. The czar of Russia called it in the vain hope that it would limit adoption of French 75 rifles by the armies of Europe, so that the Russian government could put available funds into modernizing its navy. This purpose was well understood by representatives of the nations meeting at The Hague, and nothing came of it. Evidence of how little the administration of President William McKinley expected from the First Hague Peace Conference could be seen in the composition of the American delegation, which included Captain William Crozier of the U.S. Army and Captain Alfred Thayer Mahan, who had recently retired from the U.S. Navy. Crozier was coinventor of an ingenious disappearing gun carriage, and Mahan was the philosopher of a large American navy; neither was about to let the czar’s government get away with anything. The first conference did, however, define the rules of civilized warfare. It arranged for an international tribunal that nations thereafter promised to use, albeit excepting so many of their national interests that such use was virtually a symbol of the court’s uselessness.

The Second Hague Peace Conference was delayed until after the Russo-Japanese War, by which time the European armaments race was so far developed that the conference’s prospects were almost zero. President Theodore Roosevelt knew that 1907 was not a good year for peace, yet felt that he had to do something, for many of his Republican friends in New England were members of peace societies and anxious for achievement. He sent the American fleet around the world that year, and later wrote that the voyage was the best thing he had done for peace. He considered doing more, and urged the British government to limit the size of battleships to fifteen thousand tons displacement. Apparently he was seeking to halt the naval arms race begun by the British with the launching of the battleship Dreadnought the preceding year. But then Roosevelt’s idea disappeared, as naval architects pointed out to him that fifteen thousand tons was too small a platform for the best combination of the essentials of fighting ships—guns, armor, and propulsion machinery. Neither the British nor the German government wished to do anything serious about disarmament at the Second Hague Peace Conference, and so the idea languished and the conferees contented themselves with tidying up the projects for judicial settlement and international law advanced at the initial conference. The Third Hague Peace Conference was scheduled just about the time World War I broke out; and the Hague idea, as it was called, then blended into the larger notion of a League of Nations.

The American peace groups in these years concentrated not merely on congresses and conferences but also on a national program of bilateral treaties of arbitration and conciliation. Secretaries of State Richard Olney, John Hay, Elihu Root, Philander C. Knox, and William Jennings Bryan sought to negotiate such treaties, and Hay, Root, and Bryan concluded several dozen. The only way that this program of the American peace groups could have ensured world peace was for the United States to have signed up every nation—and the other nations would have had to arrange their own treaty networks. Because of the outbreak of World War I there was not enough time for so many instruments to be signed and ratified. Although the American network remains on the statute books, nothing came of the hope for peace through treaties of arbitration and conciliation.

**THE INTERWAR YEARS**

World War I marked the end of the program of the peace movement of preceding years. The war was a chilling experience. Although statesmen had anticipated the war, they and people everywhere were shocked when it did not end quickly, like the Franco-Prussian War, and lasted more than four years. The United States intervened. It became necessary, so it seemed, for the New World to redress the balance of the Old. It was necessary,
Americans believed, to get the Europeans off dead center, to move them toward peace.

The principal accomplishment of peace-minded Americans during the war and in the months of negotiations afterward in Paris was to draw up the constitution, or Covenant, of the League of Nations. Participation in the war convinced many Americans that they had not merely repaid their debt to the marquis de Lafayette but that their country, as President Woodrow Wilson said, comprised all nations and therefore understood all nations, and American organization of the peace would ensure a decent future for mankind.

But then came another shock for the millions of Americans who looked forward to world peace—rejection of the Treaty of Versailles and thereby of the Covenant, which constituted the first twenty-six articles of the treaty, by the Senate in 1919–1920. President Wilson had told everyone who would listen that Article X, which promised international action to prevent war, was the “heart” of the Covenant. To the millions of League of Nations supporters in the United States, it seemed that the Senate had broken the heart of the world.

The American peace groups of the interwar era divided over the wisdom of establishing a League of Nations, and perhaps the best way to understand the division is to characterize it as pro-league and anti-league—or conservative and radical—because of differing outlooks on the organization of peace. Most conservative peace groups—including the Carnegie Endowment for International Peace, the World Peace Foundation, the League of Nations Association, and the Woodrow Wilson Foundation—had originated in the eastern portion of the country. They possessed financial strength—at its foundation in 1910 the Carnegie Endowment received $10 million in bonds of the United States Steel Corporation. Those bonds had been insured by the profits of World War I, a situation presenting the odd picture of a peace organization operating on the profits of war. The World Peace Foundation had also begun its work in the same year, with $1 million. The Woodrow Wilson Foundation, created in 1923, received initial contributions of nearly $1 million.

The work of the conservative wing of American peace organizations varied, for their members realized that all sorts of activity could come under the general heading of peace. The Carnegie Endowment annually spent $500,000 sponsoring such projects as a monthly bulletin, International Conciliation, and “international mind alcoves” in small libraries throughout the United States. Its publishing program included the monumental Economic and Social History of the World War in one hundred volumes. It financed smaller peace organizations in the United States and abroad, maintained the Paris Center for European Peace, rebuilt the library of the University of Louvain in Belgium, endowed university chairs in international relations, and advanced codification of international law. The World Peace Foundation worked in favor of the World Court and distributed League of Nations publications in the United States. The Woodrow Wilson Foundation worked to perpetuate Wilsonian ideals.

Radical peace organizations of the interwar era were far less staid and restrained. Almost all had come into existence as a result of World War I. Names of these groups changed as finances and memberships waxed and waned, but altogether there were perhaps forty operating at the national level, with many more local organizations. These were groups of believers in world peace, filled with hope for their programs. Often their purposes were revealed in their names: the American Committee for the Outlawry of War, the American Committee for the Cause and Cure of War, the Women’s International League for Peace and Freedom, the National Council for the Prevention of War, the Committee on Militarism in Education, the Fellowship of Reconciliation, the Parliament of Peace and Universal Brotherhood, the Peace Heroes Memorial Society, the War Resisters’ League, the Women’s Peace Society, the World Peace Association.

Operating procedures of the radical peace organizations, the evangelists among the peace workers, varied markedly. Some were virtually one-man operations, such as the American Committee for the Outlawry of War, financed by the Chicago lawyer Salmon O. Levinson, who spent $15,000 a year to spread the idea that war should not be permitted under international law—it should be outlawed. The Women’s International League for Peace and Freedom had as many as six thousand members and thousands of dollars each year for expenses, much of the money provided by friends of the Chicago social worker Jane Addams. The National Council for the Prevention of War was the creation of the Congregational minister Frederick J. Libby to work against arms manufacturers during the Washington Naval Conference of 1921–1922, and after the success of that meeting Libby continued his group in sup-
port of other causes. It acted as a Washington lobby for peace groups, but always reflected the pacifism of its founder. It spent $100,000 a year; in 1928 its office roster included twelve secretaries and eighteen office assistants. Among other radical groups the Women’s Peace Society had two thousand members; the Fellowship of Reconciliation, forty-five hundred; and the War Resisters’ League, four hundred. Their financial situations were relatively modest.

How, one might ask, could even substantial groups (in terms of finances) like the conservative organizations, or small groups such as the radical peace organizations, hope to influence the millions of American citizens in the years after World War I? How can one speak of the peace movement in America when the organizations for peace, affluent or otherwise, were composed of such disparate groups and often of committees dominated by a few persons or even one individual?

An important reason for their influence was their ability to act through a maze of supporting peace groups and interlocking committees. Membership of the radical peace organizations was astonishingly small, and within it the core of full-time peace workers was less than one hundred individuals in Washington and New York. But individuals could join more than one group or otherwise obtain cooperation between peace organizations. And the ardent peace worker Carrie Chapman Catt federated organizations not primarily interested in peace; she brought together as many as a dozen of these national organizations—such as the American Association of University Women and the Young Women’s Christian Association—into the American Committee for the Cause and Cure of War.

Peace organizations were influential because of their frequent claim to represent the female voters of the United States. After World War I the franchise had been extended to all American women. Their voting preferences were highly uncertain, and Catt was able to threaten the nation’s political leaders with a unified female vote in support of whatever she was advocating.

Still another reason for the extraordinary influence of American peace groups during the 1920s and 1930s perhaps needs to be explained. Elected officials of the time were sensitive to pressure from voters advocating a program. Of course there has always been pressure upon officials. But to leaders of the postwar period a new force, an aroused public opinion, seemed to be at work. Participation in the war had brought interest in propaganda, and in turn produced much learned and unlearned speculation about public opinion. Walter Lippmann published a book on the subject during the early 1920s. The science of persuasion, as applied to mass consumption, came into vogue, with advertising taking on the proportions of a national industry. Political leaders felt that they were being watched, their actions scrutinized, as never before. Any individuals or small groups who could claim to represent larger groups or great organizations received instantaneous attention. It was a nervous, rather unsophisticated era in which claims to importance, carefully advanced, could propel their bearers toward success in whatever they were advocating.

American peace organizations indulged in a pressure politics that for years proved far more successful than it should have been—because of the hypersensitive political climate. They did everything possible to give the impression that their programs represented the thoughts of the American people. In their letter-writing campaigns to members of Congress, workers for peace learned early on that it was advisable to make each letter appear different, even if it was for the same purpose and said the same thing; the technique was to have separately written appeals, individually signed—never should there be forms that, apparently, had been signed without much thought or purpose. They also engaged in the tactic of presenting petitions, and in the time-honored activity of interviewing members of Congress. In the latter work Catt was an expert; she warned one of her workers that she never believed a senator’s attitude was sincere unless he had been interviewed by several people and said the same thing to each one.

As for the ideas of American peace workers during the period from the Armistice in 1918 to the Japanese attack on Pearl Harbor, Hawaii, in December 1941, ideas about world peace, or peace for the United States, proliferated but most Americans interested in peace found a reason for advocacy of one of several major plans or purposes. The League of Nations was the greatest source of hope for peace, and many Americans looked to the future, if not immediate, membership of their country in that organization. The force of the league idea owed a great deal to its novelty. The United Nations has never captured the imagination of Americans in the way that the League of Nations did. The idea of a league had not been a part of earlier American peace programs, which had looked either to the codification of interna-
tional law, including treaties of arbitration and conciliation, or to a working out of more diplomatic arrangements through periodic congresses like the Hague Peace Conferences.

Only during World War I did the idea of a more political League of Nations find favor in the United States. Interest had risen to a considerable height by the summer of 1919—so far, indeed, that Senator Henry Cabot Lodge found himself forced to temporize during hearings of the Foreign Relations Committee until popular sentiment lessened. During passage of the Treaty of Versailles through the tortuosities of Senate maneuver, Lodge always avoided criticism of the league idea; if he criticized, it was because the League of Nations was Wilson’s league, not because of the idea itself. As the years passed, it became evident that American membership in the league was, practically speaking, impossible, because the league seemed too concerned about the smaller points of European politics. But many Americans—Wilsonians, they frequently called themselves—continued to feel that the Senate amendments of the League Covenant had broken the heart of the world and that the turning of the world toward war during the 1930s was a direct result of failure of the United States to join the League of Nations.

A second program for American peace workers during the 1920s and 1930s was membership in the World Court. Advocates of the League of Nations often were advocates of the court, which, though technically separate from the league, was actually one of its organs. The World Court reflected the traditional American concern for codification of international law. Its protocol stated, in classic form, that among the sources of this law (in addition to treaties, decisions of international conferences, and writings of publicists) were decisions of jurists. It seemed sensible to assist in codification in this way, just as municipal law was organized through daily work of the courts. Yet connection of the league with the World Court, the proviso that the court could give advisory opinions to the league’s council, encouraged the league’s enemies in the Senate to affix so many onerous conditions to membership in the World Court as to make it impossible. Peace organizations did their best to secure membership, but failed to anticipate the importance of the league connection.

Disarmament was a popular program, and at least in the realm of naval disarmament (a better term would be “limitation” of armaments) there was some progress. As is now fairly evident, limitation of American, British, Japanese, Italian, and French naval arms was a useful activity during the 1920s. In the next decade it made less sense. It was not a major support of peace, for the peace of Europe was conditioned upon the size of armies, not navies. Germany and the Soviet Union were unaffected by the naval conferences sponsored by the allies of World War I. Germany and the Soviet Union attended the World Disarmament Conference held at Geneva in the early 1930s, and the Soviet spokesman, Maxim Litvinov, was eloquent in support of proposals for peace. But these two powers placed little trust in disarmament. Peace workers in the United States never really understood the peripheral importance of disarmament. It seems safe to say that they attached far too much meaning to it, spending too much time and energy working for it. Like the World Court, disarmament acted as a magnet, drawing their attention away from German and Japanese aggression that in the 1930s brought the collapse of world peace.

Another fascination of Americans interested in peace after World War I was the Kellogg-Briand Pact (1928), in which almost all nations of the world promised to renounce and outlaw war. The pact was the crowning achievement of American peace groups in the interwar period. Despite Secretary of State Frank B. Kellogg's initial and private feeling that peace workers were “a set of God-damned fools” and “God-damned pacifists,” the groups managed to coerce and then convert Kellogg to support the Pact of Paris. The secretary received the Nobel Peace Prize in 1929. Unfortunately, the Kellogg-Briand Pact was too ethereal a creation, too impossible in terms of practical world politics, to assist world peace. It was an illustration of the traditional American liking for pronouncement, for doctrine and dogma. Peace movements, by their nature doctrinaire, were much attracted to formulas officially announced. Insofar as American groups occupied themselves with Kellogg’s pronouncement, they failed, as in other programs, to work realistically for peace.

In the interwar years Americans continued to adhere to their traditional faith in freedom of world trade—in a trade largely unrestricted by tariffs, quotas, and other regulations. The American peace groups frequently championed this path to peace, although the idea of freedom of world trade failed to attract them in the manner of such programs as the League of Nations, the World Court, naval disarmament, and the Kellogg-Briand Pact, for it seemed to be a less direct
attack on war. Secretary of State Cordell Hull was fascinated by the problem of lowering tariff barriers. An old Wilsonian, he received much favorable public comment by promoting what to his mind was almost a substitute for American membership in the League of Nations, the Reciprocal Trade Agreements Act (1934).

In the late 1930s, with war beginning to be talked about in Europe and then becoming a reality, many Americans interested in peace restricted their concerns to their own country's neutrality. The idea of neutrality flourished, an ancient American hope embodied in belief in a New World and an Old. There was a desire to restrict the merchants of death, the dealers in the international arms trade. Another belief of the time was that President Wilson's interpretation of neutral rights to include the right of Americans to travel aboard belligerent ships had taken the country into World War I; and if this interpretation and other latitudinarian views of neutrality were avoided, with the nation seeking only the most narrow of rights upon the sea, then the forthcoming European war would not touch the United States. The series of neutrality enactments beginning in 1935 attracted immense attention from American workers for peace. Congress eventually changed this legislation to permit American trade with the democratic nations of Europe, but the changes were made in gingerly fashion so as to avoid offending the predominantly isolationist peace organizations.

**AFTER 1939**

To speak of an American peace movement in the years after 1939 is to look to a far more complicated effort to preserve the peace of Europe and the world than had been made in the years before. Americans interested in peace realized the need for much more organization and much more money.

FROM THE KELLOGG-BRIAND PACT (1928)

> “The president of the German Reich, the president of the United States of America, his majesty the king of the Belgians, the president of the French Republic, his majesty the king of Great Britain, Ireland and the British Dominions beyond the seas, emperor of India, his majesty the king of Italy, his majesty the emperor of Japan, the president of the Republic of Poland, the president of the Czechoslovak Republic,
> “Deeply sensible of their solemn duty to promote the welfare of mankind;
> “Persuaded that the time has come when a frank renunciation of war as an instrument of national policy should be made to the end that the peaceful and friendly relations now existing between their peoples may be perpetuated;
> “Convinced that all changes in their relations with one another should be sought only by pacific means and be the result of a peaceful and orderly process, and that any signatory Power which shall hereafter seek to promote its national interests by resort to war should be denied the benefits furnished by this Treaty;
> “Hopeful that, encouraged by their example, all the other nations of the world will join in this humane endeavor and by adhering to the present Treaty as soon as it comes into force bring their peoples within the scope of its beneficent provisions, thus uniting the civilized nations of the world in a common renunciation of war as an instrument of their national policy;
> “Have decided to conclude a Treaty. . . . and for that purpose have appointed as their respective Plenipotentiaries . . . who, having communicated to one another their full powers found in good and due form have agreed upon the following articles:

**Article I** The High Contracting Parties solemnly declare in the names of their respective peoples that they condemn recourse to war for the solution of international controversies, and renounce it as an instrument of national policy in their relations with one another.

**Article II** The High Contracting Parties agree that the settlement or solution of all disputes or conflicts of whatever nature or of whatever origin they may be, which may arise among them, shall never be sought except by pacific means.”
The number of peace groups proliferated beyond the imagination of workers during the 1920s and 1930s. A survey of peace groups in 1988 found that there were 500 with budgets of more than $30,000 annually, and 7,200 groups with budgets of less.

The programs to which the new and old peace groups turned were remarkably diverse. Most groups took interest in the United Nations, notably the surviving conservative groups of the interwar era, which easily changed their support from the League of Nations to the United Nations. During World War II the country concentrated on victory, but there was much interest in the Department of State’s plans for a United Nations, which were well advanced by 1944, when the Dumbarton Oaks Conference met to draw up a draft of the United Nations Charter. Undersecretary of State Edward R. Stettinius, Jr., carefully encouraged the formation of a network of committees and organizations across the country that was to give advice on the structure of the new world organization. He provided for public representation at the San Francisco Conference (1945). The resultant charter and the constitutions of its many supporting organs showed that the people of the United States this time considered the maintenance of peace to be more than a political task, and that it comprised social, economic, and intellectual concerns.

In the immediate years after World War II, peace groups found an almost dizzying group of issues to focus upon, but principally their concern was the developing Cold War with the Soviet Union. This turned attention to the American and Soviet buildup in armaments, both conventional and nuclear.

After such foreign policy developments as the Truman Doctrine and support of Greece and Turkey against the Soviet Union; Soviet explosion of a nuclear test device in 1949; the Korean War; the Suez crisis of 1956, involving intervention in Egypt by Britain, France, and Israel; and continuing troubles in the Middle East, notably American occupation of Lebanon in 1958, there came the intervention in Vietnam, which for a dozen years in the 1960s and early 1970s, until withdrawal in 1975, brought a coalition of American peace groups in strident opposition.

When the issue of the Vietnam War arose, could it be said that the many youthful dissenters represented a revival of the older peace movements, which were generally against war rather than advocating special causes? Some of the antiwar protesters generalized their feelings about Vietnam to include all wars. In the 1960s young people everywhere, not merely in the United States, found war distasteful. It might have appeared that they were reconstituting the world peace movement of the interwar years. Or perhaps they were harking back to the views of Tolstoy and other philosophical pacifists at the end of the nineteenth century. Yet in the United States the antiwar protesters focused on involvement of the country in Vietnam. Their special cause set them apart from older peace movements. Their tactics also were markedly different; they took inspiration from the Indian protest movement of Mohandas K. Gandhi, a generation and more earlier, against British imperialism. Gandhi’s movement had been a means of registering dissent and forcing change. In the United States the civil rights protesters in the South were employing civil disobedience, with marked success. The Vietnam protesters similarly employed it to persuade the American public to stop supporting the Vietnam War.

Americans interested in peace after World War II were necessarily attracted to the problems of nuclear disarmament, but here the technicalities proved so complex that no single assemblage, such as another Washington Naval Conference, and certainly no campaign by private individuals, could hope to resolve them. The contentions of the 1920s over gun calibers and tonnage and the thickness of armor plate now appeared to represent an antediluvian age. In the years after 1945 much initiative passed to the federal government, which sponsored nuclear disarmament programs and organized the Arms Control and Disarmament Agency. Private organizations assisted in its work. The atomic physicists organized themselves through the Bulletin of the Atomic Scientists and through the Federation of Atomic Scientists.

Such efforts tended to attach to aspects of nuclear disarmament, and in the early years after World War II peace groups in America concentrated on an end to nuclear testing, once the dangers of tests became evident. The limited test ban of 1963 appeared to be the initial result—although it might be argued that for the nuclear powers testing by that time no longer was of advantage. Another factor, seldom mentioned, in passage of the test ban treaty through the U.S. Senate was an arrangement for Republican support in exchange for a promise by President Lyndon B. Johnson not to undertake an investigation of the income tax returns of President Dwight Eisenhower’s chief of staff, Sherman Adams—a deal negotiated by former president Eisenhower.

The Vietnam protesters similarly employed it to persuade the American public to stop supporting the Vietnam War.
States concentrated on limitation of intermediate-range ballistic missiles in Europe, and the success of this endeavor raised a question as to what tactics—those of the movement in America and Europe, or the competitive rearmament sponsored by the Ronald Reagan administration vis-à-vis the Soviet Union—were successful. The administration sponsored the B-1 bomber, the MX missile system, and the Strategic Defense Initiative (“Star Wars”). The last sought a defense against Soviet missiles by an antiballistic missile system. The movement cited the enormous cost of competition over many years, and it was easy to show all the alternatives, peaceful alternatives, available for the same price: construction of schools, of roads and dams, of rail lines between cities, of new or improved airports; better health care; housing for the poor. Groups cited the risk of destruction of cities and national infrastructures, not to mention the millions of people who would die in a nuclear war.

The attack against the nuclear programs of the Reagan era led to the nuclear freeze campaign, an issue that appeared on ballots in many states during the November 1982 elections, and 11.5 million people, 60 percent of those voting on the freeze issue, voted in favor. State legislatures, city councils, and national labor unions declared themselves in favor of a freeze on testing, production, and deployment of nuclear weapons. All this resulted in the Intermediate-Range Nuclear Forces (INF) Treaty with the Soviet Union in 1987. Not long afterward the Soviet Union collapsed, and with it a considerable part of the world’s nuclear competition, although the remaining nuclear powers constituted a considerable threat to peace and a very real complexity in negotiating further arms cuts.

Continuing concerns meanwhile were arising over threats to peace of a conventional sort, including American actions in scattered places around the world. Each threat or action gathered its groups in opposition. Here one speaks of interventions in Grenada (1983), Panama (1989), and Somalia (1992), the last two occurring during the George H. W. Bush administration. The Reagan administration’s support of the contras in Nicaragua led to clashes with peace groups opposing sponsorship of right-wing partisans against a left-wing government.

In 1990 another opportunity arose for protesting intervention, again in the Middle East, where the U.S. government and the United Nations sought to press the regime of the dictator of Iraq, Saddam Hussein, whose troops had invaded and occupied the neighboring country of Kuwait and threatened Saudi Arabia. The immediate concern of the movement during the time of negotiation, prior to the UN military attack, Desert Storm, was to give sanctions time to work rather than rushing to war. Some American groups supporting the need for time believed that it was also an opportunity to spread their message and recruit new members. Most groups simply desired more time than President Bush and his increasingly supportive UN allies were willing to offer.

The older generation of peace movement supporters, one should remark, was not altogether pleased with the diffuse concerns of the younger generation, and beheld weakness rather than strength in the much larger numbers of American groups and their far larger finances. Their criticisms perhaps had a point, and are worth mentioning. The historian Arthur Ekirch, who had been a conscientious objector during World War II, was disgusted with the postwar peace workers. He wrote of the factionalism, self-examination, and debate over alternatives after 1945. He thought that the only purpose of a peace movement was opposition to militarism and war.

And what to say of this criticism? Of the factionalism there could be no question, for each of the bewildering number of American groups, numbering into the thousands, had its purpose. A Canadian group in the 1970s began publication of a periodical—a digest of peace books, articles, and conference papers—on the principle that chemists and other scientists possessed such digests, and so should the peace movement. The span of the books, articles, and papers was almost unlimited, displaying the way in which the post–World War II groups had edged into subjects never hitherto deemed of much, if any, interest to a peace movement. One conference participant advocated tourism, because seeing other cultures would produce tolerance, and therefore understanding, and maybe peace. The confusion of purposes, the welter of what Ekirch described as factionalism, was evident in the categories of the digest’s editors, who changed their categories every few years, to the confusion of readers.

In the factionalism of the post-1945 movement it was evident that only two general distinctions, which might be described as organizing principles, marked the new movement. The authors of the survey of peace groups in 1988 wrote that pacifist groups tended to lead the entire movement; in times of slumps of interest in
peace, they tended to stay together and offer new ideas. Pacifist groups served as “halfway houses” to ensure the movement’s survival during the doldrums. They were especially persistent during troubling experiences, as when in Iran they sought to “do peace” but found the task difficult in the midst of violence. Their task of testimony was also difficult. How could they be heard when the United Nations engaged in peacekeeping, and its proposals and programs dominated public attention?

According to the analysts of the movement, the nonpacifist groups sought to change foreign policy by working within the political system. In the United States this entailed proposing legislation to halt development of particular weapons or generally cut spending for programs, creating support for such efforts through lobbying, and making positions known during elections.

Another point made in the survey, somewhat countering the accusation of factionalism, was that constituents of groups were not themselves divided into a few factions: women, students, professionals. Constituents were more diverse than expected, among both pacifist and nonpacifist groups. With the exception of religious persons, the often cited constituent groupings were small proportions of any of the peace groups. Students were found in small-budget groups and professionals in nonpacifist groups, but differences otherwise were not large.

Self-examination also was a characteristic of the post–World War II American groups. Interviewers of “persistent peace activists” developed a theory of sustained commitment that included creating an activist identity, integrating peace work into everyday life, building beliefs that sustain activism, bonding with a peace group, and managing burnout. Ekiö’s third criticism, that the American peace advocates were fond of debate, was undeniable, as all readers of the Peace Research Abstracts could see.

But in retrospect one might conclude—despite present-day factionalism and self-examination and debate over issues, and the failure of peace movements of the past—that groups everywhere have done much good. In the United States they have had public support based on the nation’s history. The resort to colonies in the New World was in part to escape the incessant wars of Europe, including enforced military service. Through experience involving the exploitation of a great new continent, Americans became hopeful people, and the age-old hope of peace naturally appealed to them. The very success of the American experiment in democracy raised the possibility of changing the ways of other peoples. E pluribus unum has succeeded beyond all expectation in the United States, and Americans have expected this motto to have meaning for Europe and the world.

Another factor has entered into support for the peace movement in the United States that was not present in earlier years. The American people have come to realize that the bounties of geography and the rivalries of other nations have given their country protection for many decades longer than they could have expected, and it is time now for them to take part in the organization of world order. Jules Jusserand, France’s ambassador to the United States (1902–1920), was fond of saying that America was bordered on north and south by weak nations, and on east and west by nothing but fish. During the American Revolution, and throughout the nineteenth century, the United States benefited from what President Washington described as the ordinary combinations and collisions of the European powers. The noted twentieth-century historian of American foreign relations, Samuel Flagg Bemis, was accustomed to write regarding this era that “Europe’s distress was America’s advantage.” C. Vann Woodward aptly labeled it a time of “free security.” Beginning with World War I, this remarkable period was no more. After World War II most Americans realized that fact. When the nuclear age opened, the problems of world peace became so omnipresent, so persistent, that they no longer were possible to ignore.

The idea of philanthropy, of concern for the welfare of the human race, has from the beginning been so tightly interwoven with other aspects of the American experience that the strand is difficult to disentangle. To many, the survival of the colonies and the success of the new nation were works of philanthropy: John Winthrop, colonial governor of Massachusetts, spoke of the “city on a hill”; aspiring revolutionaries felt themselves to be forwarding “humanity’s extended cause”; to the young Herman Melville “national selfishness [was] unbounded philanthropy”; to Abraham Lincoln the nation was the last best hope of earth. In the active sense, as well, the philanthropic purpose appeared with the first attempts at colonization. The Virginia Company and Massachusetts Bay Company charters included the propagation of the Christian religion among the principal ends of these enterprises; this aim was reflected in the work of John Eliot, the apostle to the Indians, and in the concern of Cotton Mather and Samuel Sewall for the evangelization of Mexico.

Despite this background, accomplishments during the colonial period were small: the requirements of survival governed; missionary work among the Indians proved unrewarding and among black slaves was precluded as an interference with local self-government. The development of active American philanthropy dates from the first half-century of independence, which in this area, as in so many others, imposed an abiding structure upon American attitudes and institutions. Success in the Revolution produced a confidence in an American worldview in which philanthropy and self-interest happily appeared to coincide, and which led, in the external sphere, to a beginning export of American answers to the problems of the human race. In politics this brought forth a bias in favor of liberal revolution, self-determination, and economic freedom that would inform the conduct of foreign affairs through the period of Woodrow Wilson’s missionary diplomacy, and beyond.

Faith in applied science and in the educability of mankind encouraged Americans to take service with foreign rulers in order to teach a generalized modernity, which focused in the early years on military skills, agriculture, and the mechanic arts. While proffering the gift of salvation, the greatest gift of all, an expanding foreign missionary movement took with it powerful cultural influences: literacy, educational systems, new techniques, civil servants, and advisers. With the growing wealth of America there developed a notable philanthropy in the narrower sense of the giving of money or goods or skills, first for the relief of disaster and subsequently for measures of constructive social policy and cultural preservation. Originally manifested in extemporized individual or group activity, these endeavors in time became institutionalized in such organizations as the American Red Cross and the major foundations, while their political and modernizing aspects attracted increased government participation.

The efforts to transfer American ideas, skills, and institutions to those “dwelling in darkness” had, prior to the development of American funding agencies, an inevitable admixture of careerism; nevertheless, the early work of individuals established precedents on which organized philanthropy, with its inherited assumption of the malleability of mankind, could subsequently build. The latter years of the eighteenth century saw the work of the American Tory, Benjamin Thompson, Count Rumford, in Bavarian administrative reform, and John Paul Jones’s brief command of the Russian Black Sea fleet. The French Revolution attracted the helpful efforts of Joel Barlow, Thomas Paine, and Robert Fulton. New waves of revolution, first in the New World and then in the Old World, emphasized the relation between military skills and the universal benefits of freedom and self-determination: Americans held important posts in the revolutionary navies of Argentina and Mexico; the Greek War of Inde-
pendence drew American philhellenes across the Atlantic; American naval constructors rebuilt the Ottoman navy after Navarino.

LIMITED GOVERNMENT

Over its course, American philanthropy has often reflected constitutional scruples about separation of powers. As secretary of state, Thomas Jefferson urged that, if government were to engage in philanthropy, it should be state governments—not the federal government—that should take up the cause. In 1793–1794 refugees from the black revolution in Saint Domingue (present-day Haiti) received assistance from a mixture of private, state, and federal funds. In 1812, Congress appropriated $50,000 for earthquake victims in Venezuela. Generally, however, reservations as to the constitutional propriety of federal government action prevailed, the work remained voluntary, and help from the United States was limited to the occasional loan of a public ship to transport and distribute relief supplies.

Outside the area of federal funding, however, the situation was less clear-cut and constitutional scruples have not been so engaged. Rather than charge the federal government, Jefferson paid out of his own pocket for the transport of different types of plants to further agriculture while he tried via personal correspondence and private groups such as the American Philosophical Society to advance knowledge to those who would benefit, domestic and international. President Andrew Jackson, “acting in his private capacity,” recommended a naval constructor to the Turks, and the Turkish request for agricultural experts brought favorable response from the Department of State. In various far places, missionaries, as citizens residing abroad, by mid-century became the occasional beneficiaries of diplomatic interposition or show of naval force, while their local knowledge at times made them helpful in diplomacy, as in the missions of Caleb Cushing to China and of Matthew C. Perry to Japan.

As contact with non-European societies increased, Americans served as generals in the Afghan and Chinese armies and as diplomatic representatives of the Hawaiian kingdom and the Chinese empire. The early nineteenth century also saw the first efforts to encourage economic modernization: the attempts of William Maclure to improve Spanish agriculture (1819) and the condition of the Mexican Indians (1828) proved abortive, but the 1840s witnessed the railroad building of G. W. Whistler in Russia and the response of American agronomists to a Turkish request for assistance in the introduction of cotton culture.

In contrast to the sporadic work of individuals in the antebellum years was the organized and continuing effort of the foreign missionary movement. The Reverend Samuel Hopkins's ideas of “disinterested benevolence,” the sense of urgency deriving from the felt imminence of the millennium, new knowledge of far places, and the example of Great Britain stimulated interest in overseas evangelism: the founding of the American Board of Commissioners for Foreign Missions in 1810 was followed by that of denominational boards. From the small beginnings of the mission to India the work grew rapidly: by 1860 the American Board alone had deployed 844 men and women overseas, and the country's expenditures on foreign missions, concentrated on the Indian subcontinent and the Near East, exceeded $500,000 a year.

The effort to evangelize the world had significant secondary consequences. The emphasis on a Bible religion called for the translation of Scripture into the vernacular and stimulated the founding of schools. The imperative to do good and the need for access to closed societies encouraged the dispatch of medical missionaries: Peter Parker's dispensary at Canton in China, founded in the 1830s, was the first of many mission-supported health care centers. The stress on the importance of the individual, whether in the conversion experience, in education, or in medical care, was emphasized, in a manner startling to the traditional societies, by the prominent role of women in mission work and by the early establishment of schools for girls; from this attitude also stemmed the attacks on caste, polygamy, suttee, prostitution, foot binding, opium, and rum.

But of all these by-products of the missionary enterprise, work in education proved the most important. The success of lower schools created a demand for more advanced instruction, a prospect so congenial to American preconceptions that the 1860s brought the founding of overseas colleges at Constantinople and Beirut. And whether in the area of conversion, medicine, education, or the status of women, the missionary enterprise emphasized not only the American view of the importance of the individual but also the idea of change, and of the possibility of breaking through layers of custom into a more open and modern world.
The emergence of a free black population in the United States following the Revolution had led an unstable coalition of antislavery advocates and slaveholders to found the American Colonization Society (ACS) in 1817, which sought to establish a refuge for free black men and women on the African coast and to further the evangelization of Africa. Even many genuine evangelicals believed that blacks and whites could not live together peaceably on the basis of equality; so strong was the racism prevalent in the North and South. Expecting black immigrants to serve as missionaries to Africa, the ACS helped purchase the land for Liberia in 1821 and the settlement of Monrovia was established in 1822. By the eve of the Civil War, some 15,000 free black men and women lived in Liberia, about 12,000 of them having voluntarily immigrated with the assistance of the ACS. The ACS had joined with state and federal governments to form the freedman’s colony on the African coast, modeling their plan on the British colony for free blacks at Sierra Leone.

The period before the Civil War also saw the development of a tradition of relief of disaster, whether natural or human-made. In 1816 and 1825 the citizens of Boston and New York assisted Canadian victims of great conflagrations. Support of the Greek War of Independence in the years after 1823 led not only to the departure of volunteers but also to contributions totaling perhaps $250,000 and to the relief work of Samuel Gridley Howe. In the 1830s and again two decades later, famine relief was sent to the Cape Verde Islands. Despite the distractions of the Mexican War, the years 1847–1848 saw the greatest effort thus far, as more than $1 million worth of supplies was sent to the victims of the great Irish famine in more than a score of ships, two of which were on loan from the U.S. Navy. In 1860, when civil war and massacres in Lebanon led to a major refugee problem, missionary influence brought about the creation of an Anglo-American relief committee and the dispatch of supplies by naval store ship. In 1862–1863, at the height of the American Civil War, further funds were raised in response to another failure of the Irish potato crop, while humanitarianism and policy combined to provide $250,000 to assist Lancashire mill operatives suffering from the cotton famine.

Like much else in post–Civil War America, the philanthropic effort grew larger, richer, and more highly organized, while the transfer of skills to countries striving to modernize themselves continued on an expanded scale. American military men served the governments of Egypt, China, Japan, and Korea; and Americans advised the Japanese Foreign Office, the king of Korea, the Dalai Lama, and the Chinese viceroy Li Hungchang. In economic development, mining engineers like Raphael Pumpelly and agronomists like Horace Capron provided their expertise. In Japan, American teachers contributed notably to the new educational structure; in China, W. A. P. Martin became the first president of the Imperial University in Peking; in Siam, S. G. McFarland served as head of the royal school in Bangkok and superintendent of public instruction.

Although many of the teachers were laymen, some of the most distinguished—Martin and McFarland, for example—were products of the foreign missionary movement, which in these years increasingly concentrated its efforts on East Asia. Assisted by their new allies from the Student Volunteer Movement for Foreign Missions and the Young Men’s Christian Association, and supported by large gifts from the new fortunes of William E. Dodge, John F. Goucher, H. J. Heinz, John D. Rockefeller, and Louis H. Severance, the missionaries continued to export, together with their sectarian versions of God’s word, their American bias in favor of modernization, resource development, health care, and education.

By the end of the century the effort overseas had created a network of Christian colleges reaching from the Balkans to Japan and had opened wide, for those who wished to enter, the doors to Western knowledge and to informed participation in the activities of an increasingly westernized world. So valued, indeed, had the educational enterprise become, that governments came to embrace the cause, as in proposals within the administration of Abraham Lincoln for the establishment of a Sino-American college, in the Chinese employment of the remitted excess of the Boxer Rebellion indemnity, and much later (and most notably) in the Fulbright Act of 1946, which transmuted overseas war surplus into an extensive program of educational exchanges.

If the missionary movement and its associated enterprises provided the chief vehicle for late nineteenth-century philanthropy in Asia, the new wealth deriving from finance and industry also found outlets in the Old World. In this area in the 1860s the pioneer modern philanthropist George Peabody led with gifts, in part intended to diminish Civil War tensions, of $2.5 million for English working-class housing. A concern for the preservation of other countries’ valued pasts was evidenced...
in the founding of the American School of Classical Studies in Athens (1881) and the American Academy in Rome (1894). These years also saw the beginning of gifts by immigrants who had prospered in the United States to churches, libraries, orphanages, and the like in their countries of origin. With the new century the social concern evidenced in the Peabody gift reappeared in the contribution of Edward and Julia Tuck, retired in France, of a hospital, school, and park to the environs of Paris, and in the work of Joseph Fels, who, abandoning the manufacture of soap, spent largely to promote the single-tax doctrine abroad.

A similar solicitude for the social and cultural improvement of the advanced countries of western Europe informed the philanthropies of a most successful immigrant, Andrew Carnegie. Beginning in 1873 with a gift of baths to his Scottish birthplace, Carnegie subsequently gave Dunfermline a library, a park, and an endowment. His contribution of public libraries to American towns and colleges was repeated abroad; 660 in Great Britain and Ireland, 156 in Canada, and others in other dominions and colonies. In 1901 Carnegie gave $10 million to revive the Scottish universities, and in 1913 a like sum for the Carnegie United Kingdom Trust for “the improvement of the well-being of the masses.” His gifts to the British Empire totaled $62 million.

For many philanthropists, Carnegie's philosophy regarding philanthropy remains the essence of the philanthropic ideal, as spelled out in The Gospel of Wealth (1900):

This, then, is held to be the duty of the man of wealth: first, to set an example of modest unostentatious living, shunning display; to provide moderately for the legitimate wants of those dependent upon him; and, after doing so, to consider all surplus revenues which come to him simply as trust funds which he is strictly bound as a matter of duty to administer in the manner which, in his judgment, is best calculated to produce the most beneficial results for the community.

Carnegie spent his later years implementing this ideal and in the process gave new shape to American philanthropy. His grants to Marie Curie and Robert Koch inaugurated American support of foreign scientific research. Transcending all national boundaries and reflecting the aspirations of the Progressive Era, he supported the peace and arbitration movements, as evidenced in his 1907 gift of the Hague Peace Palace and (following Edwin Ginn's establishment in 1910 of the World Peace Foundation) in the $10 million Carnegie Endowment for International Peace for “the speedy abolition of international war between the so-called civilized nations.”

In contrast with the evangelical effort in the non-European world and the projects of individual donors in Europe and Canada, the relief of disaster long depended on the efforts of individuals on the spot and ad hoc appeals to the public at large. Such traditional methods provided relief for victims of revolution in Crete (1866) and for France during the Franco-Prussian War. On various occasions in the 1870s and 1880s missionary groups worked to mitigate hunger in Persia, China, and Turkey. But by this time new agencies were assuming an important role. A vigorous campaign by the New York Herald spurred relief of the Irish famine of 1880. Some $1 million in goods and services contributed to help victims of the Russian famine of 1892 owed much to the support of Western flour interests, concerned both for humanity and for the agricultural price level, and to the energy of Louis Klopsch, editor of the Christian Herald, whose subsequent campaigns—for example, in the Indian famines of 1897 and 1900—raised in the course of fifteen years more than $3 million in gifts averaging less than $3. Under the leadership of Clara Barton and with presidential support, the American National Red Cross (1881) provided both funds and an increasing continuity of administration for the relief of disaster abroad as well as at home.

Generally speaking, American relief efforts in the years before 1914 were unaffected by political developments. Famines in Japan and China drew generous response, but sympathy for Russia was seriously diminished by end-of-the-century violence against Russian Jews. In 1895–1896 concern for Armenian victims of Turkish atrocities led to congressional agitation for American intervention; and in 1897–1898 the collection of funds for Cuban relief was encouraged by President William McKinley, among others, in the hope of dampening pressures to intervene.

**GROWING INFLUENCE**

During the twentieth century, American philanthropy was increasingly influenced by American foreign policy while the philanthropic ideal exerted a powerful influence on the formulation of foreign policy. Before World War I, as European colonial powers sought to acquire territory in the Americas, federal policymakers sought to prevent
European interventions in the Caribbean and Philippines, which led them to fund public works projects and schools in the region. The Messina earthquake of 1908 resulted in an unprecedented congressional appropriation of $800,000 and a reconstruction program supervised by American naval personnel. And a public-private partnership resulted in a proactive agenda to prevent flooding in China. The agenda aimed to extend cooperation between the American Red Cross, the federal government, and private bankers.

World War I produced a vast outpouring of philanthropic activity abroad, and resulted in remarkable federal-state-private cooperation and cooperation of philanthropic and foreign policy agencies. Early in the war, the American Red Cross attempted to provide hospitals for both sides, but an upsurge of sympathy for Belgium and France produced a pro-Allied tilt to American philanthropy. In the United States there sprang up numerous pro-Allied relief groups, for care of the wounded, and for aid to widows and orphans. Most important was the feeding of nine million Belgians, as Americans contributed some $34.5 million, and established the worldwide reputation of its director, Herbert Hoover.

Following the American declaration of war, military and philanthropic mobilization marched together. A significant development was expansion of the Red Cross, which, with new leadership from finance and industry and vastly expanded membership and contributions, deployed some 6,000 workers to France and provided hospitals, relief supplies, and an antituberculosis campaign, as well as refugee resettlement. At the same time the newly founded American Friends Service Committee (1917) sent volunteers to help with reconstruction.

Far from demobilizing after the war, American relief efforts expanded, owing to a large infusion of federal government funds. In 1919, with Europe suffering from destruction, starvation, and disease, Congress established the American Relief Administration (ARA) under Herbert Hoover with an appropriation of $100 million; within a year, public appeals yielded an additional $29 million for assistance. The ARA emphasized feeding undernourished children and delivered large quantities of food. The aid was intended, moreover, to bolster feeble East European parliamentary regimes against the Bolshevik threat.

Despite opposition to Bolshevism, famine in Russia brought forth a vigorous response. Congress raised $20 million, and by 1922 the ARA, under the direction of Colonel William N. Haskell, operated 18,000 feeding stations in Russia, as public and private contributions grew to a total of $80 million. The American Jewish Joint Distribution Committee contributed to the peoples of Poland and the Ukraine. Some liberal groups, suspicious of the ARAs presumed aims, contributed several million dollars more.

In the Near East, the Ottoman Empire was beset by revolutionary activity, ethnic conflict, and Greco-Turkish warfare. Some urged the United States to accept a philanthropic mandate for the former empire, but when Congress failed to respond, they turned to private initiative, and between 1918 and 1924, they raised almost $90 million for Near East relief. Moreover, chaotic conditions in Turkey, Persia, and Armenia stirred missionary interests to raise almost $7 million by 1917, while concern for coreligionists in central Europe and Palestine yielded contributions of $15 million from Jewish groups in America. Coincident with these initiatives, Chinese famine relief produced gifts from both churches and government, and gave rise to an extensive program of work relief.

Despite the Senate's rejection of the League of Nations, American philanthropists were not isolationist; indeed, between 1919 and 1939 the philanthropic expenditures of American voluntary agencies averaged $63.5 million annually. As at earlier times, the pattern of giving reflected cultural and ethnic affinities: Europe and Asia received the lion's share and Latin America lagged far behind, as did Africa. Protestants contributed 47 percent of the total, which focused on Europe, India, China, and Japan; nonsectarian donors contributed 34 percent of the total and focused on Europe, the Near East, and China; Jewish contributors gave 12 percent and it went mainly to Europe and Palestine; and the Catholic portion, 7 percent, went mainly to Europe and China.

During the interwar period, philanthropy’s attention focused on problem areas of the world involving large population groups. Civil strife in Ireland drew forth from the Irish-American community generous contributions for relief, as well as for support of independence. American Jewish donors provided more than one-third of the outside support for the Jewish community in Palestine, while it also aided the resettlement of some 200,000 Jews in the Ukraine, Crimea, Poland, and Germany. In the case of China, the American public responded to the disastrous famine of 1927 and the Yangtze flood of 1931.
Natural disasters also called forth American responses, the most dramatic being for the great Tokyo earthquake of 1923, which left some 200,000 dead and 2 million homeless. The U.S. Asiatic Fleet and the Philippine Department of the Army sent supplies costing $6 million for immediate help; private donations totaled more than $12 million, including $1.5 million donated by Rockefeller foundations to help rebuild the University of Tokyo. American contributions amounted to almost three-quarters of total relief, but such generosity was vitiated by the ban on Japanese immigration, which was imposed by the same Congress that had funded emergency relief.

Between the wars, American foundations assumed an increasingly prominent role in the totality of American philanthropy, especially in cultural activities and health care. The Carnegie Endowment rebuilt libraries and supported large-scale academic studies of war. John D. Rockefeller, Jr., built the League of Nations Library at Geneva, while the Rockefeller Foundation financed foreign policy studies and international scholar exchanges. The Harkness family founded the Commonwealth Fund (1918), which dedicated itself to the welfare of mankind; and in 1930 the Pilgrim Trust gave $10 million to Great Britain for its "future well-being." The Rockefeller Foundation helped rebuild the University of Louvain and the cathedral at Rheims, and it underwrote maintenance costs of Versailles and Fontainebleau, as it expanded the American schools at Athens and Rome.

Moreover, the Rockefeller Foundation, the Carnegie Corporation, and private individuals made sizable gifts to British, European, Canadian, and Mexican universities. Outside the Atlantic world, educational efforts were concentrated on the Near Eastern colleges, Hebrew University of Palestine, Chinese colleges, and surveys of educational programs in Africa and East Asia. James Loeb supported a psychiatric institute in Munich and George Eastman provided dental clinics in a number of European capitals. The Rockefeller Foundation funded work on parasitic and infectious diseases when it established Peking Union Medical College.

As world peace gave way in the late 1930s, American philanthropists watched with foreboding and, despite the U.S. Neutrality Acts, philanthropists engaged from the outset of the growing world crisis. In 1939 there developed a coordinated effort marked by cooperation between sectarian relief agencies, organized labor, and government. The Spanish Civil War drew American volunteers to the Loyalist side in opposition to fascism, but the Neutrality Acts dampened the spirit of giving and led to only $3 million raised for humanitarian assistance.

Relief funds followed the chronology of disaster and were sent to the Czechs after the Munich agreement, as well as the conquered Poles, Finns, Dutch, French, Greeks, and Russians as their countries were overrun. Especially notable was the rapid organization of a Russian relief effort and its impressive backing from professional and financial groups. In 1941 assistance provided to China by missionary organizations and the Chinese-American community gained new support when growing concern for Asia led to the organization of the United China Relief Agency with Eleanor Roosevelt as honorary chairperson.

By far the greatest assistance went to Britain, as the mother of parliaments stood alone against the Nazi threat. The Bundles for Britain campaign was followed by a dispatch of ambulances and medical personnel, and by the summer of 1941, British War Relief achieved backing from business and labor and raised more than $10 million and $90 million had been raised for overseas war relief by the time of the Japanese attack on Pearl Harbor. The U.S. Department of State coordinated these efforts, and by 1945 the number of relief agencies had been reduced from 300 to 90.

The Axis occupation of Europe posed the difficult ethical question of whether the subject populations should be helped, for fear of assisting the occupying Axis powers. Although Herbert Hoover strongly urged feeding the victims of Nazi aggression, the opposite view prevailed. Only about $2 million went to relief in Nazi Germany. Congress appropriated $50 million for relief, which was administered by the Red Cross, and more than half went to Britain and none to occupied areas.

By 1945 organized labor emerged as a major donor and together with religious and ethnic groups, it raised the annual total of private giving for overseas assistance to $234 million. By this time, government coordination had coalesced voluntary agencies, and total contributions, between 1939 and 1945, included $54 million for Russia, $38 million for Great Britain, $36 million for Palestine, $35 million for China, and $30 million for Greece.

However impressive, this private assistance was not nearly enough. As increasing needs called for increased response, and as relief supplies fol-
ollowed the armies into liberated areas, stop-gap governmental efforts were succeeded first by interallied coordination and then by the United Nations Relief and Rehabilitation Administration (UNRRA), headed by Herbert H. Lehman. The work of UNRRA, on a wholly new scale, was of necessity largely American-supported: of almost $4 billion dispensed between 1943 and 1947, 70 percent was provided by the United States. Again with victory the demands increased. In the theaters of conflict the destruction vastly exceeded that of World War I, an enormous refugee problem existed, and dislocations between city and countryside threatened a dangerously deteriorating food situation.

Although some Americans, relieved of the strains of war, evinced a willingness to let the world be, most still saw a compelling need to help, both on ethical and humanitarian grounds and for reasons of policy, as they sought to further democracy, stability, peace, and prosperity, reminiscent of the period after World War I. Given the tensions that later developed, it is worth noting that the appeal of Russian relief, so strong during the fighting, survived the moment of victory: $32 million in cash and kind was provided in 1945 and assistance continued into 1946. But soon the Soviets declared their independence of outside aid, while the coming of the Cold War brought the containment of communism into the forefront of motives for reconstruction.

The response of the voluntary agencies in the immediate postwar period was impressive: expenditures between 1943 and 1948 totaled $1.1 billion. For the government, withdrawal from UNRRA on grounds of bad administration and ideological conflict was followed by support of the International Refugee Organization; by implementation of the Marshall Plan, a mixture of policy and humanitarian objectives between 1948 and 1952; contribution of some $13 billion to the rebuilding of postwar Europe; and by the Food for Peace program inaugurated in 1954 under the Agricultural Trade Development and Assistance Act.

The postwar years were also marked by a “remarkable partnership” of public and private efforts founded on the extemporized successes of private agencies in postwar Germany and Japan; by the contributions of American Jews, who taxed themselves more heavily than any other sectarian group; and by the innovative Cooperative for American Relief Everywhere (CARE), which advanced from early shipment of surplus army rations to the large-scale movement of surplus agricultural products and whose deliveries grew in value from $500,000 in 1946 to $54 million in 1955. Whether all this generosity, if such it can be considered, was adequate to the need may be argued. Perhaps the best assessment comes through comparison of this treatment of liberated and conquered peoples with that provided by other nations in other campaigns.

In the 1950s, as European reconstruction progressed, the focus of overseas philanthropy shifted back to the less developed world: after 1958 more than half of disposable resources went to non-European areas. This shift also emphasized the surprising vigor of the missionary movement, now more than ever equated with social welfare, to which in 1956 American Protestants contributed some $130 million and American Catholics some $50 million. In the early 1950s, indeed, Protestant groups spent more for overseas technical assistance than the United States and the United Nations combined, and their accomplishments provided precedents for governmental action: the Point Four program, launched in 1950, early modeled itself on the Near East Foundation; a decade later the Peace Corps drew on the experience of the interdenominational International Voluntary Services (1953).

These private and public efforts were accompanied by expanded activity on the part of the larger foundations, which greatly increased their contributions to projects concerned with international affairs. Of these institutions, two were preeminent. Shifting its focus from its prewar concern with the eradication of disease, and following in the steps of such nineteenth-century pioneers as Horace Capron, Charles J. Murphy, and David Lubin, the Rockefeller Foundation took as its major goal the modernization of agriculture in the developing countries. Among the striking results were a doubling of Mexican food production between 1943 and 1963 and that of India between 1951 and 1971, and the establishment in 1960 of the International Rice Research Institute in the Philippines.

Important assistance in establishing the Rice Institute came from the Ford Foundation, a new giant of philanthropy, whose resources of $3.6 billion (1968) enabled it to provide more than a quarter of all foundation grants devoted to international affairs. In pursuit of its ambitious aims, reminiscent of Andrew Carnegie, of the “establishment of peace,” the Ford Foundation undertook extensive efforts to attack poverty, hunger, and disease, and to further social science and
planning. And as birth rates steadily threatened to outstrip production, notwithstanding the successes of plant geneticists in producing high-yield varieties ("Green Revolution"), foundations and government agencies alike edged delicately into stabilizing population growth.

Except for Liberia, American philanthropy had stayed away from Africa, but neglect shifted somewhat in the 1970s, partly owing to the emergence of an African-American lobby. During the 1920s and 1930s, African Americans had protested against U.S. occupation of Haiti and Italian aggression in Ethiopia via traditional channels like the National Association for the Advancement of Colored People, but it was in the 1970s that African Americans organized groups devoted solely to the purpose of influencing American foreign policy and leveraging private and government aid for Haiti and Africa. Following the congressional elections of 1970, African Americans in the House of Representatives organized the Black Caucus.

In March 1971 the Black Caucus urged President Richard Nixon to enact economic sanctions against minority white rule in South Africa. In Washington in May 1978, U.S. Congress Representatives Charles C. Diggs, Jr., and Andrew Young, among others, organized TransAfrica, Inc., a mass-based African-American foreign policy lobby. As leader of TransAfrica, Randall Robinson helped orchestrate an economic blockade against South African apartheid and TransAfrica established itself as the foremost voice for expressing African-American opinion on foreign policy issues. In 1986, when President Ronald Reagan vetoed a ban of loans and investments in South Africa, African Americans regarded it as hostile to their interests. In October, Congress overrode the presidential veto, as it responded to the lobbying of TransAfrica and white liberal opinion. South Africa is now free from apartheid partly because of the U.S. economic sanctions enacted following 1986. And once apartheid was eliminated, TransAfrica and other groups shifted their focus from imposing an embargo to leveraging increases in private and government grants to South Africans and to fighting the scourge of AIDS in Africa.

Meanwhile, as head of TransAfrica, Robinson's highly publicized twenty-seven-day hunger strike, which called upon President William Jefferson Clinton to restore democratic rule in Haiti, led the president to initiate new policies toward the repressive military dictatorship in Haiti. President Clinton intervened there with a force of 20,000 U.S. troops, which resulted in the restoration of the democratically elected leader, Jean-Bertrand Aristide, to the presidency of the former French West Indian colony. Robinson has helped leverage private and government assistance for Haiti while the George Soros Foundations provided private assistance to island republics and southern Africa.

GEORGE SOROS AND THE CAPITALIST THREAT

A leading global philanthropist, the Hungarian-born George Soros was attacked as a corporate raider, a speculator who achieved billionaire status via fluctuations in stocks, commodities, and currencies, but he has also been recognized as a billionaire who, like others before him, seemed determined to give away much of his money. He also received substantial attention because of the books he wrote that sought to explain his ambitious agenda for strengthening democracy and the rule of law on a global scale. Born in Budapest, he moved to England in 1947 and graduated from the London School of Economics; he moved to the United States in 1956 and founded the Open Society Fund (1979) and Soros Foundation–Soviet Union (1987). Soros's goals were "to help open up closed societies, to help make open societies more viable, and to foster a critical mode of thinking."

He established some thirty semiautonomous foundations, principally in central and eastern Europe and the former Soviet Union but also in Guatemala, Haiti, and southern Africa. Established in 1993 in New York City, his Open Society Institute provided administrative, financial, and technical support, as well as establishing network programs to address certain issues on a regional or network-wide basis. In 1997, the various Soros foundations spent a total of $428.4 million on philanthropic activities. Along with the Austrian philosopher Karl Popper and others, Soros juxtaposed totalitarian ideologies with recognition that nobody has a monopoly on truth. Different people have different views and different interests, and he notes a need for institutions that encourage people to live together in peace and respect democracy and the rule of law. His goal was to protect individual rights and ensure freedom of choice and freedom of speech, and as an ardent supporter of toleration, he sees questions of choice and freedom as keys to the open society. By 2001, Soros had donated $1 billion: $350 million in 1997,
including $50 million to a fund to help legal immigrants, and $100 million to set up Internet centers at universities in Russia. Soros’s donations strengthened U.S. commitments in Eastern Europe and helped compel the realization that the region was vital to American foreign policy.

TED TURNER AND PHILANTHROPIC COMPETITION

Robert Edward “Ted” Turner, CNN founder and Time Warner vice chairman, announced on 18 September 1997 that he would donate $1 billion ($100 million per year in Time Warner stock) over the next decade to United Nations programs. Speaking of his gift, Turner said, “This is only going to go for programs, programs like refugees, cleaning up land mines, peacekeeping, UNICEF for the children, for diseases, and we’re going to have a committee that will work with a committee of the UN so that the money can only go to UN causes.” He announced that his goal was to stimulate philanthropic competition, and his grant of $1 billion was intended to raise the bar to a new level.

Starting in 1970 with a single UHF television station in Atlanta, Turner’s business grew into a global colossus that included cable channels, movie studios, and professional sports teams. He started his TBS satellite superstation in 1976 and CNN in 1980. In 1996, Turner gave away $28 million, mainly to environmental causes, so the donation of $1 billion to the UN was a departure for him. Because the UN could not legally accept money from individuals, Turner created a foundation to spend the money and administer the programs, which he expected to focus on job creation, eradication of land mines, expansion of education, and research on global warming. He also became a fundraiser for the United Nations and actively sought publicity both for himself and for a number of causes, such as the environmental movement and world peace. His gift of $1 billion to support the United Nations was considered at the time the largest single donation by a private individual. By comparison, all charitable giving by Americans in 1996 was approximately $120 billion. “Few Americans,” noted Newsweek, “have cut such a swath through life.” Turner’s donations strengthened the United Nations as a platform for the resolution of world conflicts and a commitment to international peace.

BILL GATES

Bill Gates, in 2001 the world’s richest person, had a personal philosophy of philanthropy that seemed to reflect the views of Andrew Carnegie: “If they want to put in the consent decree that I’m going to give away 95 percent of my wealth, I’d be glad to sign that.” A Harvard dropout, Gates had seemed an unlikely successor to his overachieving parents. His father was a prominent Seattle attorney, and his gregarious mother served on charitable boards and ran the United Way. At age thirteen Gates wrote his first computer program, at a time when computers were still room-sized machines run by scientists in white coats. In December 1974, his friend Paul Allen showed Gates a Popular Mechanics cover featuring the Altair 8800, a $397 computer that any hobbyist could build. The only thing the computer lacked, besides a keyboard and monitor, was software. Following complex developments, the company Gates and Allen formed, Microsoft, introduced the Windows operating system, and by 1993 Microsoft was selling a million copies of Windows a month. In 1986, when Microsoft went public, Gates became a paper billionaire at the age of thirty-one. Meanwhile, he increased his charitable giving: He earmarked $750 million over five years to the Global Alliance for Vaccines and Immunization, which involved an alliance with the World Health Organization, the Rockefeller Foundation, UNICEF, pharmaceutical companies, and the World Bank.

In 1999 the Gates Foundations awarded more than $2 billion in grants, including what is believed to be the largest single private grant in U.S. history—$750 million to the global vaccine program over a five-year period. His vaccine project specifically targeted HIV and AIDS, which he identified in a speech in Redmond, Washington, on 18 October 2000 as having potentially dramatic consequences for the infrastructure of many countries, including Botswana. He also joined with Ted Turner on the vaccine program to give $78 million to eradicate polio from the world by the end of 2000. Gates’s donations helped alert the world to the problems of disease as problems of international relations and of American foreign policy.

CONCLUSION: THE CRITICS

At the beginning of the twenty-first century, American philanthropists could point with pride
to two centuries of giving and voluntary association for the good of humanity abroad. But as some critics have suggested, the American philanthropic tradition reached a crossroads arising from the broader context of American diplomacy and from unprecedented criticism from abroad and at home.

The advent of America’s hyperpower status since the collapse of the Soviet Union led many to turn a critical eye toward the United States and its philanthropy. As the hegemonic power in the world, even American allies and friends sought to portray the United States as part of the problem, not the solution. American missionaries were criticized as self-righteous meddlers and cultural imperialists and U.S. foreign aid as philanthropic imperialism. Foundations came under attack, as when missionaries were criticized for accepting tainted Rockefeller oil money. Critics suggested that American philanthropy was corrupted by excessively close connections to U.S. foreign policy. Some foreign critics interpreted American philanthropy as the last refuge of Western colonialism.

Some accusations were true enough, but the goals of salvation, survival, or modernization, were always among American philanthropy’s goals, and the foundations, like the missionaries, emphasized the unity of mankind and tried to downgrade the importance of nationalism, political frontiers, and political differences. Such attitudes were reflected in practice, for not all private charities cooperated with the U.S. government, and most had reservations. Fidel Castro’s victory in Cuba in 1959 moved the Ford Foundation to direct a major effort toward Latin America. Still, the philanthropic ideal remained deeply rooted in the American people.

Far more significant than any politicizing of philanthropy has been the continued influence of the philanthropic ideal on the conduct of American foreign relations. Persistent hope for liberal causes were exemplified in the nineteenth century by James Monroe and Richard Rush during the French and Latin American revolutions, in the reception accorded the Hungarian revolutionary Lajos Kossuth in the United States in 1851, and in Daniel Webster’s attacks upon the Habsburg Empire. Moreover, the U.S. view that expanding trade has advanced civilization informed early American commercial treaties with the Islamic world and the Far East and U.S. relations with the Soviet Union and the People’s Republic of China. Although open to charges of racism, an important domestic philanthropic concern underlay the founding of Liberia in 1847, as did a genuine desire to enhance the welfare of African Americans. Persistent American belief in self-determination gave American policy an anticolonial bias and led to diplomatic support for weak regimes against their more powerful oppressors.

President Jimmy Carter’s emphasis on human rights during the second half of the 1970s was well received around the world and seemed to be an extension or reflection of earlier pronouncements of his predecessors. Early in the twentieth century, Woodrow Wilson had noted that it was “a very perilous thing to determine the foreign policy of a nation in terms of material interest”; as Wilson had led the American nation into World War I, he had defined American war aims as seeking “no material compensation for the sacrifices we shall freely make.” In later periods of crisis, Franklin D. Roosevelt offered the Four Freedoms to the world, and his successor, Harry S. Truman, noted that “it must be the policy of the United States to support free peoples who are resisting attempted subjugation,” while John F. Kennedy in the 1960s promised that America would “pay any price . . . to assure the survival and the success of liberty.” At times, however, philanthropy has been ill advised; at times change has proved destabilizing, as expectations rose faster than performance. Often results did not materialize, as custom proved resistant and ruling groups were averse to the American plan. Some recipients were resentful of gifts and donations, feeling that being unable to reciprocate to a gift from the United States has brought dishonor upon them. Indeed, it would be possible to write about U.S. philanthropy from the perspective of recipients rather than donors and arrive at much different conclusions.

As critics have noted, a danger of both foreign aid and philanthropy has been entanglement in the local politics and power struggles occasioned by wars, famines, and natural disasters. In Africa, CARE unwittingly assisted a Somali dictator in building a political and economic power base; and the United Nations, Save the Children, and many other groups provided raw materials for ethnic rivalries. A case of frustrated ambitions has been that of India, where an assistance program measured in billions of dollars turned out to be a holding operation, ending in mutual disillusionment, even before population explosion, limited resources, and an energy crisis suggested a very different future.
Some critics have rejected American foreign aid and private philanthropy abroad, but they have failed to acknowledge the good that has been achieved, as in education and health care. Faced by such critics, some have suggested that, if America perfected its own ideals at home, perhaps America's greatest gift to the twenty-first century would be its example rather than its philanthropic aid packages and coercive powers. So, perhaps it is now possible, given current skepticism, to achieve a new balance, one that recognizes the virtue of limiting American political intervention abroad and yet acknowledges the genuine achievements of America's philanthropic tradition. And while seeking a new balance, it may be useful to keep in mind Bill Gates's insight that it is at least as difficult to give money away as it is to make money.

While the precise dates that marked the beginning and the end of the Cold War remain the subjects of scholarly debate, the era’s major foreign policy focus was unambiguous: containing the spread of Soviet power and international communism by supporting friendly governments with aid, arms, and, occasionally, troops; deterring nuclear attacks on the United States and its allies; and supporting economic institutions like the World Bank and the International Monetary Fund created at the Bretton Woods Conference in 1944. Deprived of a global enemy, American foreign policy since the Cold War seemingly became more diffuse, perhaps even incoherent. But, though political elites awaited the arrival of a reincarnated “X” (the pseudonym senior State Department official George F. Kennan used in his famous article on the strategy of containment in 1947) to articulate a crystalline, new strategy, several discernible and related themes and concepts have, nevertheless, characterized post–Cold War American foreign policy.

At least six themes and concepts have steered U.S. foreign policy since the Cold War:

1. the preservation of American global hegemony
2. the fostering of globalization through the continued development of liberal international economic institutions
3. the promotion of an ever-growing “zone of democratic peace”
4. the repeated employment of military power to ease humanitarian disasters
5. the isolation and punishment of a handful of “rogue” states that allegedly threatened regional stability and American security;
6. growing concerns about the vulnerability of the United States to attacks from these regimes as well as from transnational terrorist groups.

Efforts to formulate concrete policies from these themes and concepts have provoked both domestic and international dissent about their appropriateness and feasibility.

American foreign policy officials almost never use the word “hegemony” in their public discourse. When Henry Kissinger did so at his first press conference after being named President Richard Nixon’s special assistant for national security affairs in 1968, puzzled reporters scurried to their dictionaries for help. Presidents and their advisers prefer more positive terms such as “global leadership” or “indispensable nation” to describe America’s role in the world, yet “hegemony,” because it is less loaded, better captures the essence of recent U.S. strategy. The ancient Greeks understood “hegemony” to mean preponderant international influence or authority, and preserving such preponderance has been a fundamental goal of all post–Cold War administrations.

At century’s end the American economy had experienced the longest peacetime expansion in its history. Low inflation, sustained growth, and rising worker productivity had made it the engine of global prosperity and technological change. Americans owned more than half of the world’s computers and received more than half of the world’s royalties and licensing fees. The eight largest high-tech companies were headquartered in the United States. American pop culture was virtually ubiquitous, with Michael Jordan posters, McDonald’s golden arches, and Hollywood movies its most familiar symbols.

The United States retained the globe’s most powerful and expensive military establishment with expenditures larger than all of the other nations combined. Its forward presence in Europe, East Asia, and the Persian Gulf was secured by a host of garrisons, air bases, and aircraft carrier task forces. U.S. regional commanders often acted like Roman tribunes, not only leading American forces but also initiating direct diplomatic contacts with foreign governments. The technological gap
between American weapons systems and those of other nations, already evident in the Gulf War of 1991, had become enormous by the 1999 Kosovo air campaign against the Yugoslav strongman Slobodan Milosevic.

At the same time, American global commitments expanded. U.S. ground troops landed in Somalia in 1992 to help end a famine (only to be withdrawn the next year as a result of casualties that were incurred after the mission had grown); returned Haiti to its ousted democratically elected president in 1994; and entered Bosnia in 1995 and Kosovo in 1999 as “peacekeepers.” American aircraft carriers protected Taiwan from the People’s Republic of China, patrolled the Persian Gulf, and sailed the Indian Ocean. Its warplanes routinely bombed Iraq for more than a decade, helped end the war in Bosnia in 1995, and brought Yugoslavia to its knees in 1999.

Far from disappearing after the collapse of the Soviet Union in 1989, the North Atlantic Treaty Organization, at Washington’s insistence, expanded into central and eastern Europe. In Asia, American planners anticipated maintaining troop levels at around 100,000 for at least twenty more years. And at the United Nations, the United States, under congressional pressure, prevented Boutros Boutros-Ghali from being reelected secretary-general, primarily because he had criticized the United States for failing to play a more active role in UN peacekeeping efforts in Somalia and Rwanda.

Surely such power and influence constituted “global hegemony,” and American leaders, as well as those of a surprisingly large number of foreign nations, wished to preserve it. But domestic divisions surfaced about whether it could best be accomplished unilaterally or by working closely with allies and international organizations. This debate began in the immediate aftermath of the Gulf War and by the millennium remained unresolved. President George H. W. Bush, envisioned America’s role as that of benevolent hegemon, protecting the growing “zone of democratic peace” against regional outlaws, terrorists, nuclear proliferators, and other threats to world order. It would do so in concert with others, if possible, as in the Gulf War, or unilaterally, if necessary.

Work soon began in the Department of Defense to make this concept operational, and in March 1992 the results were leaked to the press. The main Pentagon planning group outlined a strategy of “global leadership” that presumed America’s continuing international preeminence and argued that the United States should actively prevent the emergence of states that could challenge it. By using existing security arrangements to ensure the safety of its allies, Washington would view as potentially hostile any state with sufficient human and technological resources to dominate Europe, East Asia, or the Middle East. This strategy acknowledged that within a decade Germany or Russia might threaten Europe; Japan, Russia, and eventually China might do likewise in East Asia; and that the domination of either region would consequently imperil the Middle East. But this group suggested that the United States could create incentives for Germany and Japan to refrain from challenging American preeminence. No mention was made of the United Nations or any other international organization, and because the strategy smacked of unilateralism, a number of allies, led by France, condemned it. And, although its untimely release embarrassed the George H. W. Bush administration, these recommendations nevertheless reflected the thinking of an important segment of the foreign policy community.

Upon entering office in 1993, President Bill Clinton adopted—initially, at last—“muscular” or “assertive” multilateralism to preserve America’s position in the post–Cold War world, while he concentrated on reviving the domestic economy. But the poor performance of the United Nations in Somalia and the European Union’s failure to halt the war in Bosnia gradually persuaded the administration that American leadership was, indeed, “indispensable.” Nevertheless, many Republicans in Congress, fresh from their historic 1994 triumph at the polls, remained deeply suspicious of international organizations because they allegedly threatened American sovereignty and freedom of action. During the 1996 presidential campaign, Robert Dole, the Republican nominee, promised that when he was in the White House, “no American fighting men and women will take any orders from Field Marshal Boutros Boutros-Ghali.” Republican unilateralists opposing aiding Mexico during its peso crisis in 1994 and 1995, repeatedly criticized the International Monetary Fund and the World Bank, refused to pay American dues owed to the United Nations, and tried to abolish the Agency for International Development (AID). Jesse Helms, chairman of the Senate Foreign Relations Committee, called for AID’s replacement with a new international development foundation with a mandate “to deliver block grants to support the work of private relief agencies and faith-based institutions.” The Senate defeated the Comprehensive Test Ban Treaty in
2000 with many members convinced that it represented “unilateral disarmament,” and a majority in Congress opposed U.S. membership in the new International Criminal Court, fearing that U.S. military personnel stationed overseas could be hauled before it.

Although the Clinton administration attempted to discredit these critics by calling them isolationists, they were, in fact, determined to preserve American global hegemony by protecting it against the encroachments of international organizations. In effect, Republican unilaterals echoed many of the arguments made by Senator Henry Cabot Lodge against U.S. membership in the League of Nations after World War I.

While certain nations clearly resented America’s preeminent position in the post–Cold War world, none was able to mobilize an international coalition against the United States. China grumbled about American “hegemonism,” France complained about the U.S. exertion of “hyperpower,” Russia deeply resented the expansion of NATO, and states like Iraq and Iran tested Washington’s patience. Yet the stability and protection afforded by America’s global predominance were welcomed, or at least tolerated, by the vast majority of foreign nations. East European states clamored for admission to NATO, Israel and the Palestinian Liberation Organization participated in a U.S.-led “peace process,” and countries from South America to Africa invited the United States to serve as an honest broker to help settle regional disputes.

Global preeminence, of course, has never been permanent. Previous hegemons were eventually humbled by overextension, a weakening domestic social fabric, or by rising competitor states. No doubt the “American century” would not endure forever, but in the absence of some unanticipated catastrophe like a nuclear war or a massive biological attack, it remained difficult to imagine an imminent end to American primacy.

**FOSTERING GLOBALIZATION**

The makers of post–Cold War American foreign policy believed that by fostering globalization, the growth of both the U.S. and the world economy would be increased. Globalization was not a wholly new phenomenon, but it did attain unprecedented prominence in the public discourse during the 1990s. Indeed, one of its chief articulators, the journalist Thomas L. Friedman, suggested that the post–Cold War world be dubbed “the age of globalization.” Although difficult to define precisely, scholars and policymakers appeared to understand globalization as the integration of markets, finance, and technologies in a way that shrunk space and time. Some observers even predicted that the ultimate consequence of this process would be the elimination of all national borders and, thus, the nation-state.

That was clearly not the aim of U.S. foreign policy officials. Rather, they saw globalization as an economic tool that could be managed to open foreign markets, stimulate American exports in goods and services, and bring economic growth and prosperity to large portions of the world. The Clinton administration had a strategy for accomplishing these goals—the “big, emerging markets” (BEM) strategy—though its origins can be traced to Robert Zoellick, a senior policymaker in both Bush administrations. From Zoellick’s perspective, the United States could best serve its economic interests by acting as the primary catalyst for a series of integrative economic structures that would substantially increase global prosperity.

First, it would deepen the institutionalized economic and security relations with western Europe and Japan. Second, the United States would reach out to a second tier of potential partners in Latin America, East Asia, and Eastern Europe to develop dense institutional linkages such as the North American Free Trade Association (NAFTA) and the Asia-Pacific Economic Cooperation Forum (APEC). And third, even farther on the periphery loomed Russia, China, and the Middle East, areas that in the more distant future might be brought into this global economic system too.

This foreign economic strategy asserted the indispensability of American global leadership, for it strongly supported the creation of a host of regional economic institutions in which the United States would function as the common linchpin.

By elaborating and refining Zoellick’s ideas, the Clinton administration developed the BEM strategy that lay at the core of its foreign policy. The strategy identified ten regional economic drivers supposedly committed to trade-led economic growth and reasonably cordial relations with the United States. The “Big Ten,” as they were called, included China (plus Taiwan and Hong Kong), India, Indonesia, South Korea, Mexico, Brazil, Argentina, Poland, Turkey, and South Africa—states whose expansion could benefit neighboring markets as well. Clinton officials
projected that by 2010 American trade with these countries would be greater than combined trade with the European Union and Japan. Jeffrey E. Garten, undersecretary of commerce for international trade and a chief architect of this strategy, argued that the BEMs possessed enormous potential for the expansion of U.S. trade in goods and services, because they purchased heavily in economic sectors dominated by the United States: information technology, health and medical equipment, telecommunications, financial services, environmental technology, transportation, and power generation.

To achieve these goals the Clinton administration launched a global effort to persuade the BEMs to open their markets to both trade and investment. The push for financial liberalization was directed at East Asia and Southeast Asia, in particular, largely because it was seen as especially fertile ground for American banks, brokerage houses, and insurance companies. To further this strategy, Secretary of the Treasury Robert Rubin persuaded the G-7 nations (the world's leading industrial democracies) in April 1997 to issue a statement "promoting freedom of capital flows" and urging the International Monetary Fund to amend its charter so it could press countries for capital account liberalization. But other Clinton economic officials like Laura D’Andrea Tyson and Joseph Stieglitz, successive chairs of the president’s Council of Economic Advisers, warned of the dangers of opening these capital markets too rapidly; and soon Rubin and Deputy Secretary of the Treasury Lawrence H. Summers began to publicly caution that financial liberalization in the BEMs must be accompanied by banking and other fundamental economic reforms. Yet, convinced that the International Monetary Fund would bail them out of any trouble (as the United States had done in Mexico in 1994), the leaders of many of these states ignored this advice.

In 1997 and 1998 the dark side of globalization appeared in the form of a series of currency collapses in Thailand, Indonesia, South Korea, Malaysia, the Philippines, and Taiwan. Social unrest in Indonesia claimed one thousand lives and led to the forced resignation of its long-serving president. The so-called Asian dynamos fell like dominoes as currency speculators undermined their financial systems. Deeply shaken by these events and fearful that the crisis would spread to the United States, the Federal Reserve Bank cut short-term interest rates three times within six weeks, and President Clinton called on Rubin to devise ways to reform the global financial system in order to avert future disasters. The secretary responded with a series of speeches in which he called for the creation of a new global financial “architecture” that involved improving transparency and disclosure in emerging markets, giving the International Monetary Fund additional power, encouraging the private sector to share some of the economic burden in times of crisis, and strengthening the regulation of financial institutions in emerging economies. Rubin implicitly acknowledged what many economists had argued for years: any attempt to liberalize capital markets lacking the structures to support the subsequent inflow in foreign investment was dangerous.

In fact, the seemingly inexorable growth of globalization produced both academic debates and public protests. Globalization enthusiasts celebrated the unprecedented extent to which poorer economies had been incorporated into the international system of trade, finance, and production as partners and participants rather than colonial dependencies and believed that this condition had produced greater economic growth. But skeptics worried that since substantial numbers of nations were landlocked and isolated, they would find it extremely difficult to attract trade and investment. Furthermore, other countries, such as the Persian Gulf oil states, in possession of huge natural resource bases, found it impossible to establish competitive, and more sustainable, manufacturing sectors. Hence, the process of globalization was far from global. Second, while proponents of increased capital flows across borders argued that they gave to developing nations an enhanced ability to borrow and lend (and thus better control patterns of investment and consumption), others pointed to the destabilization and financial panics that these unfettered capital flows had allegedly caused in Latin America and Asia during the 1990s as worried investors hurriedly withdrew their assets at the first sign of weakening currencies. Third, economists disagreed about the impact that globalization had on domestic and international income distribution. Some suggested that since the United States exported high technology products to Asia in return for less expensive labor-intensive goods, American workers in certain industries had suffered a loss of income in the face of low-wage foreign competition, while, at the same time, skilled workers in Asia incurred similar dislocations. On the other hand, the number of U.S. workers directly competing with unskilled
workers in emerging markets appeared to be too small to explain widening income disparities among Americans.

The age of globalization also produced contradictory political impulses. On the one hand, it fostered a host of new international organizations, including, most prominently, the World Trade Organization (WTO). Some observers feared that the proliferation of such institutions, accompanied by rules regulating the behavior of its members, posed a threat to national sovereignty. On the other hand, defenders of the nation-state also worried about the growing tendency of local governments, regions, and ethnic communities to pursue greater political and cultural autonomy as a way to ward off the demands of globalization. In his Farewell Address, President Clinton, while noting that the global economy was giving “more of our own people and billions around the world the chance to work and live and raise their families with dignity,” acknowledged that integration processes “make us more subject to global forces of destruction—to terrorism, organized crime and narco-trafficking, the spread of deadly weapons and disease, the degradation of the global environment.”

Indeed, concerns such as these and others triggered a series of public, sometimes violent demonstrations against the World Trade Organization, the International Monetary Fund, and the World Bank in Seattle (November 1999), Washington, D.C. (April 2000), Prague (September 2000), and several other locations. Loose coalitions of protesters made up of union members, animal rights advocates, environmentalists, anarchists, and senior citizens claimed that wealthy countries and their institutional tools—the International Monetary Fund and the World Bank—had incurred an “ecological debt” to the Third World by draining its natural resources, destroying the environment, and causing human rights violations. They believed that this ecological debt should wipe out the monetary debt that poor countries owed to these organizations. They wanted the World Bank to order a moratorium on foreign investments in oil, mining, and natural gas projects because of their environmental threats. Others argued that fledgling democracies should be forgiven the debts incurred by previous, repressive regimes. All were convinced that multinational corporations—most of them based in the United States—behaved more like robber barons than responsible global citizens.

In sum, the nature and consequences of globalization remained deeply contested in the post–Cold War world. The Clinton administration’s initial desire to foster its spread had been tempered by foreign financial crises and public dissent. Yet it was not even clear whether globalization should be viewed as a conscious national policy or as an unstoppable force ultimately immune to either governmental management or control.

**PROMOTING DEMOCRACY**

By the late 1980s, as Mikhail Gorbachev allowed anticommunist revolutions to sweep through Moscow’s satellites, President Bush called for a Europe “whole and free.” Soon he began to speak more broadly of a growing “zone of the democratic peace,” tacitly accepting the academic thesis that democracies did not fight wars against one another. According to this view, the roots of which can be traced back at least as far as Immanuel Kant in the late eighteenth century, democracies (or “republics” as he called them), shared certain characteristics that precluded conflict among them. His claims were expanded by several American political scientists, including, most prominently, Michael Doyle and Bruce Russett. They and others advanced several arguments to account for the “democratic peace.” Some emphasized that because of the internal structures of democratic states, leaders could not mobilize their publics to support any wars except those against authoritarian and totalitarian regimes. Others stressed the norms of peaceful resolution of conflicts within democracies because of the habit of compromise and the rule of law. Still others argued that the transparency of democratic institutions and the easy flow of information between democracies made violence extremely unlikely. Another group of scholars was impressed by the shared social purposes of democratic states and an underlying identity of interests that sharply limited the rise of disputes worthy of war.

Indeed, virtually every president since Woodrow Wilson accepted the basic tenets of this “liberal” argument about how democracies behave. He believed that militarized, autocratic regimes had caused World War I and that American security depended on the successful transition of these states to democracy. Franklin Roosevelt and Harry Truman shared similar sentiments about the origins of World War II and the
requirements of U.S. security in the postwar world. In the 1980s, the Reagan Doctrine, which reserved to the United States the right to assist groups attempting to overthrow Marxist dictatorships, sprang from the same set of assumptions. All of these presidents were convinced, as the political scientist G. John Ikenberry put it, that democracies were “more capable of developing peaceful, continuous, rule-based, institutionalized relations among each other than [was] possible with or between non-democracies.”

Nevertheless, a lively scholarly debate arose after the Cold War about the merits of these arguments and assumptions. Christopher Layne examined four instances when democracies nearly went to war against one another and found that conflict was averted not because of shared values but because of national self-interest. Further, he argued that the War of 1812 and the American Civil War should be seen as wars between democratic states. David Sprio claimed that because the chance that any given pair of states will be at war at any given time is low, and because before 1945 few democracies existed, the absence of conflict between them might be the result of random chance. He also complained that proponents of the democratic peace thesis often failed to offer clear definitions of “democracy.” Finally, Henry Farber and Joanne Gowa concluded that only after 1945 were democracies significantly less likely to be involved with disputes with one another, and that was because most democracies were aligned against the Soviet threat. With the ending of the Cold War, the chief impediment to intrademocratic conflict had been removed.

These counterclaims notwithstanding, democracy promotion represented a fundamental theme in post–Cold War American foreign policy and was closely tied to the preservation of U.S. hegemony and the fostering of globalization. In its efforts to create a successor to the strategy of containment and to rally domestic support for the Gulf War, the George H. W. Bush administration offered a “new world order,” which, among other things, included the notion that the United States should help to widen the “zone of the democratic peace.” Although Bush quickly dropped this phrase from his public rhetoric in the face of heavy media criticism and the need to focus on domestic issues in advance of the 1992 presidential campaign, the administration, nevertheless, acted to promote democracy in Eastern Europe, Russia, Latin America, and Africa through a variety of diplomatic and economic initiatives. Bush officials could not help but be impressed by the democratization process then occurring in many parts of the world.

The Clinton administration, also groping for a post-containment strategy and similarly taken by the sweep of democratization, soon unveiled “engagement and enlargement” as its lodestar. In a September 1993 speech tellingly entitled “From Containment to Enlargement,” Anthony Lake, Clinton’s first special assistant for national security affairs, attempted to explain this strategy. After noting that its geography and history had continually tempted the United States to be wary of foreign entanglements, Lake argued that the Clinton administration intended “to engage actively in the world in order to increase our prosperity, update our security arrangements, and promote democracy abroad.” Beyond engagement, then, lay enlargement, and Lake identified four components of such a strategy. First, the United States would “strengthen the community of major market democracies . . . which constitutes the core from which enlargement is proceeding.” Second, the Clinton administration would “help foster and consolidate new democracies and market economies, where possible, especially in states of special significance and opportunity.” Third, America “must counter the aggression—and support the liberalization—of states hostile to democracy and markets.” And fourth, “we need to pursue our humanitarian agenda not only by providing aid, but also by working to help democracies and market economies take root in regions of greatest humanitarian concern.” At the same time, Lake hedged “engagement” with several caveats. He warned that the tide of democratic advance could slow and even reverse; he stressed that this strategy had to be tempered by pragmatism, for other national interests would doubtless require the United States to befriend and defend nondemocratic states for mutually beneficial reasons; and he noted that this strategy must view democracy broadly and not insist that all adhere rigidly to the American example.

In the short term, this strategy was seemingly discredited by the bloody battle in Mogadishu, Somalia, the following month as well as the embarrassment suffered when a U.S. ship carrying training personnel to Haiti was turned back by a protesting mob in Port-au-Prince. Furthermore, opinion polls repeatedly indicated that only one in five Americans thought it important to promote democracy abroad. Nevertheless, to a remarkable degree, Lake’s speech anticipated
much of the Clinton administration's democratization efforts, which, in turn, adhered closely to those of the first Bush presidency.

Both gave primacy to Eastern Europe and Latin America—those regions that were already the most democratized—to initiate a policy of “democratic differentiation” in order to urge further movement toward democracy and open markets. A variety of carrots and sticks were employed to nudge these nations along. In the case of Haiti, the Clinton administration threatened force to reinstall the democratically elected president, but this action was taken more for domestic political reasons than from any confidence that genuine democracy would take root in that troubled country.

Initially, Clinton tried to link the continuance of most-favored-nation trading status to improvements in China’s human rights record, but by 1994 he was forced to abandon that approach in light of Beijing’s intransigence. Indeed, neither administration wanted to allow democracy promotion to undermine the opening of markets throughout Asia. And in the Middle East the need for energy security and fears about Iraq and Iran dissuaded both George H. W. Bush and Bill Clinton from evincing any interest in democratization. Post–Cold War American foreign policy was frequently frustrated in its attempts to foster democracy in Russia because of a combination of rampant corruption, the physical decline of Boris Yeltsin, and Moscow’s resentment of NATO enlargement. Yeltsin’s replacement by the enigmatic former KGB agent Vladimir Putin triggered a debate in Washington about his devotion to democracy. By the time of George W. Bush’s election in 2000, more Americans viewed Russia with hostility than at any time since the mid-1980s.

But in Africa, where there was palpable evidence of a democratization trend, American actions appeared inconsistent. On the one hand, economic assistance programs were restructured to reward those governments undertaking democratic reforms, and every embassy in Africa was ordered to formulate a strategy for democracy promotion. Yet when the dictatorship of Mobutu Sese Seko in the Congo collapsed in 1997, the United States encouraged Uganda and Rwanda to offer armed support to Laurent Kabila’s efforts to seize power. Kabila’s democratic credentials were questionable at best, yet the Clinton administration chose him over Etienne Tshisekedi, the popular prime minister who possessed the clearest claim on democratic legitimacy. Washington’s decision to endorse the strongman approach proved disastrous, as Kabila proceeded to wreck what was left of this long-suffering nation before being assassinated in a palace coup in 2001. Critics charged that despite official rhetoric about the importance of bringing democracy to Africa, the United States continued to patronize African nations and to tacitly believe that they remained unprepared for democratic governance.

On balance, however, post–Cold War American foreign policy generally promoted democracy where economic and security interests and discernible democratization trends existed. In those regions where U.S. interests required working with authoritarian regimes and where prospects for democratization were bleak, no effort was made to promote democracy. Indeed, a rough consensus emerged among American political elites in support of this pragmatic approach to democracy promotion.

**UNDEARTAKING HUMANITARIAN INTERVENTIONS**

Humanitarian interventions—the use of military force to save civilian lives in the absence of vital national interests—emerged as a major theme in post–Cold War American foreign policy and generated heated political and scholarly debates about their advisability, efficacy, and legitimacy. During the Cold War humanitarian interventions were rare, unilateral, and generally condemned by the international community. For example, in 1971 India invaded East Pakistan (Bangladesh) during a Pakistani civil war allegedly to save civilian lives, but the consequence was to split India’s traditional enemy in two. Comparable international skepticism greeted the 1978 Vietnam invasion of Kampuchea (Cambodia)—supposedly to end the “killing fields” of the Khmer Rouge—and the 1979 Tanzanian intervention in Uganda was not only designed to oust the abhorrent Idi Amin but also to retaliate against a Ugandan invasion the previous year.

But after the Cold War a commitment among democratic states to respond to humanitarian disasters became the norm, if not always the rule. The United States assumed a global humanitarian role, intervening both unilaterally and multilaterally in an unprecedented number of situations. In 1991, U.S. forces provided aid and protection to the Iraqi Kurds shortly after the con-
clusion of the Gulf War. Many commentators and members of Congress criticized President Bush for not intervening sooner.

In December 1992, U.S. troops were ordered to Somalia in an effort to end a disastrous famine and then to turn over responsibility to the United Nations. But when eighteen U.S. Rangers were killed in a firefight with hostile Somali clan members in October 1993, an outraged Congress pressured a panicked Clinton administration to withdraw all U.S. forces. Misery soon returned to southern Somalia. No doubt in reaction to this experience, the United States did virtually nothing to halt a full-scale genocide the following year in Rwanda that claimed the lives of hundreds of thousands of ethnic Tutsis. Europeans, in particular, criticized this inaction, and several years later Clinton apologized for his failure to provide more assistance.

In September 1994, in the face of an imminent U.S. invasion, Haiti's junta left the country and the democratically elected president, Jean-Bertrand Aristide, was reinstated. At the time, former President Bush and former Secretary of State James Baker publicly opposed this action on the grounds that no vital national interests were at stake. But confronted with a humanitarian disaster in the form of thousands of Haitian refugees attempting to reach the U.S. mainland, and pressured by the Black Congressional Caucus to return President Aristide to power, the Clinton administration—armed with a UN resolution—prepared to use military force.

A decade earlier, in 1984, Ronald Reagan's secretary of defense, Caspar Weinberger, suggested that six tests ought to be passed before dispatching U.S. troops: (1) “The United States should not commit forces to combat overseas unless the particular engagement or occasion is deemed vital to our national interest”; (2) the commitment should only be made “with the clear intention of winning”; (3) it should be carried out with clearly defined political and military objectives”; (4) it “must be continually reassessed and adjusted if necessary”; (5) it should “have the support of the American people and their elected representatives in Congress”; and (6) it should “be a last resort.” Believing that the outcome of the Vietnam War would have been vastly different if these stringent tests had been applied, the Weinberger Doctrine was quickly embraced by many senior military officers, including Colin Powell, who would serve as chairman of the Joint Chiefs of Staff from 1989 to 1993. And it was the fear of creating a “Balkan quagmire” that steered American policy toward Yugoslavia for much of the 1990s.

Prompted by the inspiring example of democratic revolutions sweeping Central and Eastern Europe in 1989, several republics in the Yugoslav confederation sought to break away from Belgrade’s rule. In June 1991, Slovenia and Croatia declared their independence. While Yugoslav President Slobodan Milosevic did little to oppose the Slovenian action, he directly supported an uprising of ethnic Serbs in Croatia, and a ghastly civil war ensued. In December, Germany recognized both new governments, and the European Union and the United States soon followed, even though Secretary of State James Baker had declared previously that “we don’t have a dog in this fight.”

Macedonia was allowed to secede from the federation, but after Muslims held an independence referendum in multietnic Bosnia-Herzegovina that was boycotted by its Serbian residents, a horrific war broke out among Croats, Serbs, and Muslims. The Bosnian Serbs, who were enthusiastically supported by Milosevic, undertook a systematic “ethnic cleansing campaign” designed to rid the republic of its Muslim population. The Bush administration, while recognizing the independence of a Muslim-led Bosnia, maintained that the Balkans constituted a European problem and refused to send U.S. forces there as part of a UN “peacekeeping” operation, even though several members of NATO did so. Some senior Clinton officials, led by Anthony Lake and UN Ambassador Madeleine Albright, argued that the United States should lift the arms embargo that the United Nations had imposed on all the warring parties and initiate air strikes against Bosnian Serb positions. But the Joint Chiefs chairman Powell repeatedly rejected the feasibility of this “lift and strike” option, while nations such as Britain and France, with peacekeepers on the ground, argued that their troops would be the first targets of Serb retaliation.

Despite the worst fighting in Europe since World War II, the Clinton administration did little until August 1995, when, after an exceptionally heinous slaughter of Muslim civilians in the town of Srebrenica, NATO carried out five days of bombing that had the ultimate effect of bringing all of the factions to the negotiating table in Dayton, Ohio. Soon, NATO peacekeepers with American participation entered Bosnia, but Clinton, under congressional pressure, announced quite
unrealistically that U.S. forces would remain there for only one year. Indeed, their continued presence became a major campaign theme in 2000 when George W. Bush and several of his advisers suggested that the Balkans should be policed exclusively by Europeans. On the other hand, in 1999, when reporting on the Srebrenica massacre, UN Secretary-General Kofi Annan warned that “the tragedy will haunt our history forever. A deliberate and systematic attempt to terrorize, expel, or murder an entire people must be met decisively with all necessary means and with the political will to carry the policy through to its logical conclusion.” He implied that the United States bore a major responsibility for providing that political will.

In early 1999, Milosevic indicated his intention to purge Kosovo—a province of Yugoslavia whose semiautonomous status he had revoked ten years earlier—of its ethnic Albanian (Muslim) majority. After rejecting a demand that NATO forces be allowed to enter Kosovo to prevent “ethnic cleansing,” Milosevic was subjected to an unprecedented seventy-seven-day bombing campaign. During Operation Allied Force, which ultimately threatened the cohesion of NATO, Yugoslav troops forced hundreds of thousands of Muslim Kosovars into neighboring Albania and Macedonia and thus created the very humanitarian catastrophe that the air strikes had been designed to avoid. From the outset, Clinton, fearing public and congressional criticism over possible casualties, ruled out the use of ground troops. American officials, remembering how quickly NATO bombing had ended the fighting in Bosnia four years before, expected a similar outcome in Kosovo. But it was not until Russia withdrew its support from Belgrade that Milosevic finally capitulated. Then he allowed peacekeepers under UN—not NATO—authority to enter Kosovo, where they encountered sustained hostility from both Muslims and Serbs.

All of these humanitarian interventions—as well as the decision to ignore Rwanda—provoked intense debate within the United States about the essential purposes of American foreign policy. Michael Mandelbaum, a leading scholar of American foreign relations, captured one side of the issue quite colorfully in a 1996 Foreign Affairs article entitled “Foreign Policy as Social Work,” in which he likened Anthony Lake to Mother Teresa for telling a newspaper reporter that “when I wake up every morning and look at the headlines and the stories and the images on television, I want to work to end every conflict, I want to save every child out there.” In rejoinder, Stanley Hoffmann, another renowned student of American foreign policy, predicted that the twenty-first century would be full of ethnic conflict and disintegrating states. While not all of them would be preventable or resolvable, instances of extreme violence should be considered as inherently dangerous for international peace and security and morally and prudentially unacceptable.

The national debate about humanitarian interventions involved at least four issues. First, under what circumstances would military power be used as opposed to other, less coercive tools of statecraft? Some observers, like Henry Kissinger, argued that unless a clear, vital interest could be found, military force should never be used. A substantial number of congressional Republicans shared his view. This position obviously reflected that of the Weinberger Doctrine. Yet no U.S. official or influential commentator suggested that the United States should intervene in all humanitarian crises, for the obvious reason that because resources were limited, priorities had to be set. Most political elites reached the conclusion that these situations should be decided on a case-by-case basis. Yet they disagreed about which ones warranted American action. Positions often were taken on the basis of ethnic identity. For example, the Congressional Black Caucus was especially eager to intervene in Haiti and Rwanda. Similarly, Cuban Americans, Armenian Americans, and American Muslims expressed other, predictable preferences.

Second, how much and what kind of force would be needed? Because there was a widely shared perception by civilian and military leaders that, after the Somalia “debacle,” the American public would not tolerate casualties suffered during humanitarian operations, the Clinton administration refused to deploy ground combat troops in the Balkans. Rather, it relied exclusively on airpower. In fact, the administration may have misread the “lessons” of Somalia, for polling data indicated that the public was considerably more tolerant of casualties as long as the intervention resulted in success.

Third, what kind of training should be given to U.S. troops who might become peacemakers or peacekeepers? This facet of the debate was primarily conducted within the Defense Department between those who believed that special peacekeeping units should be created and those who argued that all forces should be taught to be
potential peacekeepers. But some observers outside the Pentagon questioned the whole concept of training forces for what they compared to police duties rather than traditional military roles.

And, fourth, how central a role should humanitarian missions play in U.S. foreign policy? In general, liberals like Anthony Lewis of the New York Times contended that their role should be central. Moreover, the interventions should do more than simply restore order and feed and clothe civilians; they should also aim to rebuild failed states, arrest war criminals, and integrate ethnic groups. Conservatives, who remained skeptical that such operations should be undertaken at all, believed that they should occur infrequently and seek to achieve modest objectives. These disagreements became prominent during the 2000 presidential campaign when Condoleezza Rice, a top adviser to George W. Bush and his future special assistant for national security, called for the rapid return of U.S. peacekeepers from Bosnia and Kosovo at the same time that Vice President Albert Gore indicated that, if elected, he would devote even more resources to humanitarian missions.

**ISOLATING AND PUNISHING “ROGUE” STATES**

American foreign policymakers used the terms “rogue,” “outlaw,” and “backlash” states virtually interchangeably after the Cold War. As early as July 1985, President Reagan had asserted that “we are not going to tolerate . . . attacks from outlaw states by the strangest collection of misfits, loony tunes, and squalid criminals since the advent of the Third Reich,” but it fell to the Clinton administration to elaborate this concept.

Writing in the March–April 1994 issue of *Foreign Affairs*, Anthony Lake cited “the reality of recalcitrant and outlaw states that not only choose to remain outside the family [of democratic nations] but also assault its basic values.” He applied this label to five regimes: Cuba, North Korea, Iran, Iraq, and Libya and claimed that their behavior was frequently aggressive and defiant; that ties among them were growing; that they were ruled by coercive cliques that suppressed human rights and promoted radical ideologies; that they “exhibited a chronic inability to engage constructively with the outside world”; and that their siege mentality had led them to attempt to develop weapons of mass destruction and missile delivery systems. For Lake, “as the sole superpower, the United States [had] a special responsibility . . . to neutralize, contain and, through selective pressure, perhaps eventually transform” these miscreants into good global citizens.

The first Bush administration had agreed with Lake’s analysis and in 1991 adopted a “two-war” strategy designed to enable U.S. forces to fight and win two regional wars simultaneously against “renegade” nations. The second Bush administration emphasized the urgent need to develop a national missile defense to protect the United States from weapons launched by rogue states. In short, the “outlaw” nation theme pervaded U.S. foreign policy throughout the post–Cold War era.

Critics seized on these terms as inherently fuzzy, subjective, and difficult to translate into consistent policy. Although Lake had defined rogues as nations that challenged the system of international norms and international order, disagreement existed about the very nature of this system. For example, whereas the Organization for European Security and Cooperation (OSCE) and UN Secretary-General Annan advocated international norms that would expose regimes that mistreated their populations to condemnation and even armed intervention, others argued that such norms would trample on the traditional notion of state sovereignty. Nevertheless, the State Department sometimes included Serbia on its outlaw list solely because President Milosevic had violated the rights of some of his nation’s citizens, and NATO undertook an air war against him in 1999 because of his repression of an internal ethnic group.

In theory, at least, to be classified as a rogue, a state had to commit four transgressions: pursue weapons of mass destruction, support terrorism, severely abuse its own citizens, and stridently criticize the United States. Iran, Iraq, North Korea, and Libya all behaved in this manner during at least some of the post–Cold War era. Yet the inclusion of Cuba, which certainly violated human rights and castigated the United States, was put on the list solely because of the political influence of the American Cuban community and specifically that of the Cuban American National Foundation. Moreover, in 1992 Congress approved the Cuban Democracy Act, which mandated secondary sanctions against foreign companies who used property seized from Americans by the Castro government in the 1960s. Attempts to implement this law outraged some of Washington’s closest allies, and President Clinton, while
backing this legislation as a presidential candidate, tried hard to avoid enforcing it. On the other hand, states like Syria and Pakistan, hardly paragons of rectitude, avoided being added to the list because the United States hoped that Damascus could play a constructive role in the Arab-Israeli "peace process," and because Washington had long maintained close relations with Islamabad—a vestige of the Cold War.

The United States employed several tools to isolate and punish rogue states. Tough unilateral economic sanctions, often at congressional behest, were imposed on or tightened against Iran, Libya, Cuba, Sudan, and Afghanistan. Airpower was used massively against Serbia in 1999 and selectively against Iraq for years after the conclusion of the Gulf War in 1991. Cruise missiles were fired at Afghanistan and Sudan in retaliation for terrorist attacks against U.S. embassies in Kenya and Tanzania in September 1998. The Central Intelligence Agency supported a variety of covert actions designed to depose Saddam Hussein, while Congress approved the Iraq Liberation Act in 1998 aimed at providing Iraqi opposition groups with increased financial assistance. Several leading Republicans who would occupy high positions in the George W. Bush administration publicly urged President Clinton in February 1998 to recognize the Iraqi National Congress (INC) as the provisional government of Iraq. Some of these critics, including Paul Wolfowitz and Robert Zoellick, hinted that U.S. ground forces might ultimately be required to help the INC oust Saddam. In all of these anti-rogue efforts, however, Washington found it exceedingly difficult to persuade other nations (with the partial exception of Britain) to support its policies of ostracism and punishment.

In light of these difficulties, some observers suggested that the United States drop its "one size fits all" containment strategy that allegedly limited diplomatic flexibility in favor of a more dif-
ferentiated approach that addressed the particular conditions in each targeted nation. Indeed, the Clinton administration adopted this policy alternative with North Korea and, to a lesser degree, with Iran. Faced with the dangers posed by Pyongyang's ongoing efforts to develop nuclear weapons and missile delivery systems, the United States briefly considered air strikes against suspected nuclear facilities or stringent economic sanctions. Yet both options were rejected out of fear of triggering a North Korean invasion of the South. Consequently, the Clinton administration reluctantly entered into negotiations designed to compel Pyongyang's nuclear disarmament. In October 1994 the U.S.–North Korea Agreed Framework was signed, committing North Korea to a freeze on nuclear weapons development and the eventual destruction of its nuclear reactors. In exchange, the United States, South Korea, and Japan promised to provide two light-water nuclear reactors that would be virtually impossible to use to produce nuclear weapons, along with petroleum to fuel North Korea's conventional power plants and food assistance to alleviate near-famine conditions. During the last years of the Clinton administration, relations with Pyongyang warmed considerably. North Korea claimed that it had suspended its missile development program pending a permanent agreement, and Madeleine Albright, now secretary of state, made the first official American visit to North Korea in 2000. Nevertheless, because this conditional engagement with North Korea involved reaching agreements with a regime widely perceived as extremely repressive and untrustworthy; many in Congress attacked this approach as tantamount to appeasement and called on George W. Bush to cease negotiations with Pyongyang. He obliged, announcing that he had no intention of quickly resuming efforts to reach an agreement on North Korean missile development.

Interestingly, despite the budding rapprochement between these two states in the late 1990s, officials in the Clinton administration repeatedly argued that a national missile defense system needed to be constructed to protect the United States against nuclear missile attacks from rogue states such as North Korea. George W. Bush's decision to end talks with Pyongyang suggested to many observers that he preferred to pursue national missile defense. To critics of the rogue state concept, these actions merely reinforced their view that while the concept had proven to be very successful in garnering domestic support for punitive measures, the derogatory nature of the term necessarily complicated efforts to improve relations with states like North Korea.

Similarly, Iran represented another case in which altered circumstances challenged the rogue-state strategy. The surprise election of Mohammed Khatemi to the presidency in May 1997 and his subsequent invitation for a “dialogue between civilizations” led Secretary Albright to propose a “road map” for normalizing relations. Conservative Shiite clerics warned Khatemi against engaging the “Great Satan,” but the continued designation of Iran as a rogue state also contributed to the Clinton administration's difficulty in responding constructively to positive developments in Tehran.

The gradual realization that calling states “rogues” might in some cases have proven counterproductive induced the United States in June 2000 to drop this term in favor of the less fevered “states of concern.” Secretary Albright emphasized that the change in name did not imply that the United States now approved of the behavior of these regimes: “We are now calling these states ‘states of concern’ because we are concerned about their support for terrorist activities, their development of missiles, their desire to disrupt the international system.” Yet State Department officials acknowledged that the “rogue” term had been eliminated because some of these states—such as North Korea, Libya, and Iran—had taken steps to meet American demands and had complained that they were still being branded with the old label.

Regardless of the terms employed, however, on another level this post–Cold War strategy of regional containment reflected an effort by the United States to define acceptable international (and even domestic) behavior. As a hegemonic state it was, perhaps, appropriate that Washington attempted to write these rules. Yet it inevitably risked exposing the United States to charges of arrogance and imperiousness.

**DEFENDING THE AMERICAN HOMELAND**

The Cold War had barely ended before American policymakers began to worry about the possibility that hostile states and transnational terrorist organizations would soon be able to undertake nuclear, chemical, biological, and informational attacks against the continental United States. Recognizing that the United States, because of its
overwhelming military superiority, would not be threatened in the foreseeable future with traditional adversaries, national security planners pointed to the dangers posed by “asymmetrical” assaults on the American homeland. These might include nuclear missiles launched by rogue states, national plagues caused by the clandestine introduction of biological agents, and the destruction of the American financial system through the use of computer viruses by unknown enemies.

Such fears intensified in 1997 when the blue-ribbon National Defense Panel warned that the United States remained utterly unprepared for dealing with these threats. Three years later, the U.S. Commission on National Security, cochaired by former senators Warren Rudman and Gary Hart, concluded that “a direct attack against American citizens on American soil is likely over the next quarter century.” Consequently, the commission proposed that the Coast Guard, Customs Service, Federal Emergency Management Agency, and Border Patrol be unified as a new homeland security body, whose director would have cabinet status. The new agency would coordinate defense against attacks as well as relief efforts if deterrence proved unsuccessful. According to Rudman, “the threat is asymmetric, and we’re not prepared for it.”

American foreign policymakers responded to these alleged vulnerabilities in several ways. First, as we have seen, diplomatic and military instruments were used to prevent rogue states from developing weapons of mass destruction. These efforts proved to be only partially successful, and in 1998, Pakistan, formerly a close ally, enraged Washington by testing a nuclear device. Second, counterterrorism programs were intensified after the 1998 embassy bombings. But they could not prevent the attack on the USS Cole in Yemen in October 2000. Moreover, the bombing of a federal building in Oklahoma City in April 1995 by two Americans with homemade explosives, and the attempted destruction of the World Trade Center in New York City in February 1993 by foreign nationals, had demonstrated the extreme difficulty in defending the nation against asymmetrical assaults. And while a consensus about the need to make the U.S. homeland less vulnerable to these sorts of occurrences certainly emerged in the post–Cold War era, designing a strategy for doing so proved to be extremely difficult.

In March 1983, President Ronald Reagan had proposed that the United States build weapons capable of defending the nation against Soviet nuclear attack. His Strategic Defense Initiative proved to be very controversial and expensive, yet the program managed to survive the Cold War. In 1992 the Bush administration opened negotiations with Russia seeking to amend the Anti-Ballistic Missile (ABM) Treaty of 1972 that prohibited the deployment of sea-based or space-based missile defenses and placed strict limits on land-based defenses. President Bush wished to permit the construction of several hundred land-based ABM systems to protect the United States and its allies against between 200 and 250 ballistic missiles from any source. But these talks produced no agreement, and in late 1993 the Clinton administration withdrew Bush’s proposed amendments to the ABM Treaty and further reduced the scale of national missile defense (NMD) research and development.

The Republican Party, however, remained deeply committed to NMD, and upon capturing both houses of Congress in 1994 quickly increased appropriations for research and development. Moreover, Congress created a commission to assess the ballistic missile threat to the United States. Chaired by former (and future) Secretary of Defense Donald Rumsfeld, the commission issued its final report in July 1998. Directly contradicting a 1995 National Intelligence Estimate that concluded that the United States need not fear missile attacks until at least 2010, the Rumsfeld Commission claimed that such nations as Iran and North Korea could threaten the United States within five years of a decision to acquire this capability—and that Washington might not be aware of the point at which such a decision had been made.

Just six weeks later, on 31 August 1998, North Korea test launched a Taepo Dong-1 missile, which, to the surprise of the U.S. intelligence community, possessed a third stage, which meant that in theory, at least, this missile had intercontinental capability. Congressional Republicans seized on the Rumsfeld report, as well as the North Korean test launch, to pressure Clinton to sign the Missile Defense Act of 1999, which made it official policy to “deploy as soon as technologically possible an effective NMD system.” Strongly encouraged by Ted Stevens, chairman of the Senate Appropriations Committee, planning began on the construction of a radar system on an Alaskan island, but after a series of embarrassing failures by the Defense Department to intercept missiles from ground-based sites, in September 2000 Clinton decided to delay deployment.

President George W. Bush’s determination to
construct a national missile defense system as soon as possible unleashed a fractious and complex public debate. Opponents offered six main arguments against NMD. First, the deployment of even the limited system envisioned by Bush, which would be designed to intercept no more than twenty-five warheads, would be expensive. The Congressional Budget Office estimated that a ground-based NMD would cost at least $60 billion. Critics recalled that ambitious Defense Department programs had in the past frequently encountered significant cost overruns and warned that NMD could contribute to future budget deficits if pursued in tandem with President Bush’s proposed tax cuts. Second, opponents strongly doubted the technological feasibility of any NMD. They emphasized the difficulties of intercepting incoming warheads, likening it to hitting a bullet with a bullet, and suggested that the task would be made even more daunting if enemy ICBMs were equipped with decoys and other countermeasures.

Third, even if these enormous odds were somehow overcome and a reliable NMD system was deployed, critics worried that the creation of a Fortress America mentality among the public could be a major result. They warned that some congressional Republicans might seize on NMD and the consequent public retreat into isolationism as a pretext to reduce dramatically America’s international role. Fourth, even if Russia could be persuaded that a limited NMD posed no threat to its massive nuclear arsenal, China, in possession of only about two dozen ICBMs, would be likely to build more missiles in order to deter a U.S. nuclear attack. Beijing’s actions would trigger an Indian response to increase its nuclear capabilities, and that, in turn, would spur Pakistan to do likewise. Hence, an unintended consequence of NMD would be to heighten the likelihood of a South Asian nuclear war.

Fifth, critics contended that NMD constituted a quick technological “fix” that would serve as a poor substitute for patient diplomacy and nonproliferation efforts. Thus, instead of negotiating further agreements with North Korea, for example, armed with an NMD, the United States would have no incentive to try and help Seoul improve North-South relations or to attempt to alter peacefully the nature of the Pyongyang regime. Finally, opponents claimed that NMD represented a “Maginot Line” approach to nuclear defense. Recalling that the Nazis had invaded France in 1940 by simply circumventing the elaborate defensive fortifications known as the Maginot Line, critics predicted that NMD would, at best, defend the United States against an extremely remote sort of attack with ICBMs. Much more plausible was the so-called “man in a van” scenario, whereby a single terrorist could kill millions of Americans with a suitcase bomb or through the release of deadly biological agents into the water supplies of major cities.

While some NMD advocates, especially House Republicans, harbored isolationist sentiments, most in the Bush administration believed, at least privately, that a limited national missile defense system would enhance American global hegemony. Robert Joseph, Bush’s counterproliferation expert at the National Security Council, dismissed the likelihood of a rogue state launching a preemptive missile attack on the United States as a false issue created by NMD opponents. He argued that such regimes viewed weapons of mass destruction as their best means of overcoming the American technological advantages that would lead to their certain defeat in conventional wars. Rather, ICBMs would enable these states to hold American and allied cities hostage, thereby deterring the United States from intervention in regional crises. In other words, their missiles could reduce the likelihood of massive retaliation by the United States if they employed chemical and biological weapons regionally, even against American forces. Implicit in Joseph’s hypothesis was the assertion that a limited national missile defense system would cement the ability of the United States to intervene anywhere it deemed necessary. Russian and Chinese appreciation of this consequence doubtless explained much of their hostility to such a program.

Proponents furthermore claimed that only China had the ability to defeat an NMD system with decoys and that any effort to substantially increase its inventory of ICBMs would be extremely expensive and threaten future economic development. They also rejected the arguments of those who doubted the technological feasibility of such a system, noting that the United States only succeeded in placing a satellite in orbit after thirty failed attempts. Moreover, unlike Reagan’s “Star Wars” plans, this system would only be aimed at intercepting a small number of missiles.

Yet NMD advocates disagreed about what sort of national missile defense system to build. In order to adhere to the provisions of the ABM Treaty, the Clinton administration decided to pursue a land-based system, and three trials were conducted. As a result, a consensus within the
Pentagon developed that the Alaskan system could be finished more rapidly. Some in the Bush administration, however, preferred a sea-based NMD that would use and upgrade the navy's Aegis air defense system. They suggested that in addition to being less costly, it would also have the ability to defend U.S. allies against rogue attacks by simply moving ships close to Europe and Japan. Moreover, it would have the advantage of firing at ICBMs in their “boost” phase (that is, immediately after launch), when their speed is much lower than during the reentry phase. But others argued that such a system would take many more years to construct, because it could not, in fact, rely on existing Aegis technology. Some observers predicted that the Bush administration would attempt to pursue both land- and sea-based systems simultaneously despite the enormous costs involved. In any event, homeland defense and the closely related issue of national missile defense appeared ready to assume prominent roles in early twenty-first century American foreign policy.

For the Bush administration the post–Cold War era ended on the morning of 11 September 2001, when international terrorists used hijacked U.S. commercial airliners to destroy the World Trade Center in New York City and to damage the Pentagon. American foreign policymakers announced that the nation was at war with terrorism and girded it for a long and potentially frustrating struggle. Putting aside its early unilateralist inclinations, the administration immediately began to organize a broad international coalition to assist it in “draining the swamps” where terrorism thrives. For the first time since the fall of the Soviet Union, the United States apparently confronted a direct threat to its physical and moral well-being, albeit one that seemed extraordinarily elusive, ruthless, and hydra-headed. Some commentators suggested that the period between the breaching of the Berlin Wall in October 1989 and the attacks of 11 September 2001 be renamed “the interwar era.”

CONCLUSION

Inasmuch as the United States emerged from the Cold War as the world’s sole superpower, it should not be surprising that American policymakers worked hard to sustain this hegemonic situation. Eventually another state or coalition might attempt to challenge America’s preeminenence. Many conservatives became convinced that China had geopolitical goals that directly clashed with U.S. interests and predicted the onset of a Sino-American cold war. Others believed that the continuing integration of China into the international capitalist economy would discourage it from trying to undermine American primacy. As the post–Cold War era entered its second decade, it had become obvious that relations with the People’s Republic of China would occupy a central place in U.S. foreign relations. The future nature of that relationship, however, remained unclear.

In seeking to keep America the world’s “indispensable nation,” post–Cold War American foreign policymakers fostered globalization, promoted democracy, undertook humanitarian interventions, isolated and punished rogue states, and worried about homeland defense. Each of these initiatives proved controversial both domestically and internationally. None was pursued with perfect consistency, but all were designed to preserve America’s enviable position in the post–Cold War world.

On the level of international politics, power can take many forms, from moral suasion to the carrot of economic benefits to the stick of sanctions or military force. “Power politics” is one of the more equivocal terms in the lexicon of international affairs. In common usage, including that of politicians, it often is value-laden, usually in a negative sense. It implies using coercion—force or threats of force—to impose one’s will upon others. However, in academic usage, especially among scholars specializing in the history and theory of international relations, it is more often treated as a neutral phenomenon, descriptive of special or general characteristics of international politics. Further semantic or linguistic confusion results from the divergent shades of meaning that attach to the words in languages of Western scholarship such as German, English, and French. Among these three languages there is no precise equivalent for the phrase “power politics.”

Thus one can define power politics both as a term commonly used in political rhetoric and a theoretical description of how states interact in pursuit of their interests in the international arena. In American English it usually means politics based primarily on coercion rather than on cooperation, whether that coercion be military or economic. More often than not it also implies pursuit of national self-interest rather than broader ideals, principles, or ethics. Such a definition shows clearly the value judgment usually implied by use of the term. Those who are accused of practicing power politics are condemned for having abused power in pursuit of a self-serving political agenda.

As a description of political behavior rather than a condemnation of it, scholars use the term in a variety of ways. Some theorists of the “realist” school believe that states inherently seek power for its own sake, so that competition and struggle naturally characterize international relations. Others argue that power is not an end but a means. They propose that states seek security above all, that they try to attain or maintain security by identifying and working toward national interests, and that they require power to achieve such national interests and security. The fact that no state has complete power and that all states have some power creates what one political scientist has called the “power problem,” for each state must reckon with the potential hostility of other members of the international community. Relative security for one state all too often seems to mean relative insecurity for others, and so in this schema one must expect conflict and competition.

Another important theory about the nature of power and its effects in international affairs is set forth in the writings of the French political theorist Raymond Aron. By comparing the variant languages, philosophies, and practices of European and American states in regard to power politics, he has elaborated the important distinction between the politics of force and the politics of power. Power, he argues, is the ability to influence or control others. At times that may require the threat or use of force; at other times it will be possible to influence or control the behavior of other states with much less drastic methods. The latter two ideas are particularly useful in examining the history of American foreign affairs.

AMERICA’S POWER PROBLEM

Over the last two centuries, U.S. diplomatic history has been marked by varying attempts to solve the “power problem” in the form of debates, decisions, and divisions over the politics of force and of power. Some of these attempts and decisions shaped foreign policy for decades, so that, from 1775 to 1945, American diplomacy assumed distinctive and what might be termed traditional forms. After 1945 the changing position of the United States in international affairs altered, but did not destroy, such traditions.
Any discussion of early American foreign relations is complicated by Americans’ contradictory sense of themselves in two very different roles. One role was that of victims of Old World power politics—colonists vulnerable to imperial machinations and abuse of power from abroad. But these same Americans also saw themselves as an aggressive, powerful people destined to expand into “the West” as a new “rising American empire.” Both these self-images had foreign policy implications.

How Americans reconciled their sense of mission or “manifest destiny” in expanding over the continent with the dispossessions, and in the case of Indian tribes virtual extermination, of foreign competitors is discussed later. The American colonists’ sense of victimization by Old World power politics was ultimately dominated by the issue of independence from Britain. It is probably an error to assume that most Americans in 1776 sanctified liberty by force in revolution, notwithstanding Thomas Jefferson’s later glorification of bloodshed in the French Revolution, of which he remarked that the tree of liberty needed to be refreshed from time to time with the blood of patriots and tyrants. American colonists were, on the whole, reluctant to resort to force even to win independence. For many years they were more ready to negotiate than to fight.

The clearest indications of the ways in which Americans first hoped to resolve the problems of power, influence, and force in foreign affairs appear in explicit plans for the organization and conduct of foreign relations, the treaty plans of 1776 and 1784. In those documents American leaders recognized, and at the same time abhorred, the predominant features of international politics in their time: war, deception, and ruthlessness. In their view, international relations could be, and should be, harmonious. Americans devised plans for a diplomacy antithetical to that of Europe. Their treaty plans called for freer trade in an era of mercantilism and assumed national independence in the heyday of colonial empire. Americans proposed to influence nations great and small and to establish foreign ties by granting or withholding access to the riches of the nation’s commerce.

In sum, Americans hoped both to solve their initial power problem—the way in which they would deal with the threat posed by the power of France, Spain, Britain, and other great states—and to avoid the strenuous and immoral politics of force by basing foreign policy on neutral economies. In demoting the power of force and promoting the power and mutual benefits of commerce, they looked forward to a new nation freed from the immorality and violence of European-style power politics by the principle of mutual advantage. Finally, Americans of the founding generation hoped to guard themselves from baneful Old World powers by studious noninvolvement in the affairs of Europe. The warnings of President George Washington and President Thomas Jefferson against foreign alliances and entanglements, as well as the additional principles enunciated by John Quincy Adams and James Monroe in 1823, shaped and limited American foreign affairs well into the twentieth century.

**POWER IN PRACTICE**

Despite their best hopes and intentions, Americans soon encountered difficulties in conducting foreign affairs peacefully and without entanglements. As set out in the treaty plans of 1776 and 1784, their program contained contradictions and weaknesses that would lead to conflict. The great themes of America’s first century of foreign affairs—peace, commerce, and growth or expansion—proved incompatible in practice rather than mutually supportive, as they had seemed in theory. As for weaknesses in design, it was soon clear that those three themes would bring the new United States into contention with the powers of the time rather than solve America’s power problem or obviate the difficult politics of force.

The bright hopes of the revolutionary years dimmed almost before the nation had well begun its independent course in world affairs, for the French Revolution and Napoleonic wars revived the American power problem. Although in private and public life Americans vigorously contested the questions of political theory and governmental policy raised by the Revolution and the moribund Franco-American alliance dating from 1778, President Washington’s attempt to preserve the first solution to the American problem was clear. The principle of noninvolvement in European affairs during peacetime became the principle of neutrality in war as of 1794.

Greater difficulties attended American attempts to carry on business as usual—that is, to trade in and transport commodities and merchandise with and among belligerents, and yet remain at peace. The warring nations of Europe lost little time in denying the broadening interpretations of
neutral rights that Americans propounded, with the result that by the latter 1790s the United States faced the uncomfortable necessity of negotiating with the French for an end to the now-entangling Treaty of Alliance of 1778 and to the French practice of interfering with and seizing American merchant ships trading with France's enemies. The diplomatic mission sent from America in 1797 ended in the infamous XYZ affair, named for three French secret agents, who shocked their American counterparts by proposing that negotiations regarding American aid to the French in its war against Britain be facilitated by a substantial bribe. The American response was summed up in the slogan “millions for defense, not one cent for tribute” and the ensuing undeclared war between French and American naval forces in the Atlantic. Ironically, one may suspect that Americans fought the French at sea not so much over the larger questions of the day—the matter of the alliance and neutral rights at sea—as because of the almost insignificant issues of honor and propriety raised by the venality of the French court.

Later, during the Napoleonic wars, the contradictions between the goals of peace and commerce became more acute. In the years following the turn of the nineteenth century, American ideals and plans for foreign affairs based on economics failed the test. Attempts to maintain neutrality and neutral rights in trade amid the wars of the time led President Jefferson to close access to, or embargo, American trade. The results were catastrophic. Americans themselves were not willing to accept the interruption of foreign trade, for whatever reasons, and smuggled the Jeffersonian embargo of 1807–1809 into uselessness. When the Jefferson and Madison administrations attempted to play off the British and French against each other in the years of the Nonintercourse Act, wily European diplomats, especially Napoleon's foreign minister, the duc de Cadore, Jean Baptiste de Champagny, outsmarted the Americans and emphasized the weakness and consequent ineffectiveness of American economic diplomacy.

Finally, American economic coercions and maneuvers led to the almost disastrous War of 1812, an unnecessary conflict, since within weeks of its outbreak the British government rescinded the most offensive orders in council affecting American commerce with the Continent. But the people of the time, caught up in political and sectional quarrels and interests, apparently over-looked the flaws of design in foreign affairs. The War of 1812, which ended in 1814, did not prevent American statesmen from continuing to believe that peace rather than war was mankind's natural condition, and that the surest way to unnatural behavior (to war) was the politics of force.

EXPANSION AND POWER

Throughout the nineteenth century one notable American activity—continental expansion—regularly threatened to revive the power problem and to exacerbate disagreements over the relative merits of force and suasion in foreign affairs. Time and again Americans took advantage of opportunities for territorial expansion, but few such opportunities were without opposition from the established powers of the day. The United States had to face British opposition in the Old Northwest until the signing of Jay's Treaty in 1794. Within a generation there were the further complications of the Oregon question. Despite the jingoist cry of “Fifty-four forty or fight,” the Oregon question was settled peacefully, but there remained contentions over the Canadian-American boundary, including Alaska, until 1903. French resistance to American expansion seemed to disappear with the Louisiana Purchase of 1803, but it reappeared in the diplomacy and maneuvering surrounding the annexation of Texas, the war with Mexico, and during the Civil War in the ill-fated imperium of Maximilian in Mexico. Spanish-American antagonism over expansion marked the era of the 1790s and of separatism in the early American Southwest, flared in connection with the disputed boundaries and the American annexations of East Florida and West Florida as well as over use of the Mississippi River, and culminated in contests for predominance in Cuba and the Philippines in the Spanish-American War (1898).

The United States even managed to come into conflict with Russia in the matter of the Oregon boundary, which provided occasion for some of John Quincy Adams's most pointed démarches. Expansionism also affected those without sufficient power to resist or negotiate its progress across the continent. For four centuries expansion was the central theme of European-Indian relations. Much of the devastation of the Indian peoples in colonial America can be attributed to disease. But their fate was also the result of how white Americans used their power in dealing with Indians. A succession of treaties attempted to rec-
oncile the traditional cultural norms of hunting-gathering, often nomadic, communal peoples with the demands of an expanding agrarian, capitalist culture driven by an unprecedented immigration and population explosion. Twenty-five years before the American Revolution, Benjamin Franklin used demographic projections to prove the need for new lands in the west to support a population that doubled every twenty years. He also pointed out that such expansion would mean war with the Indians and their French allies—a price Franklin and others before and after him were willing to pay.

Other Americans wrestled with the “Indian problem.” Thomas Jefferson considered these “noble savages” possible candidates for assimilation. Andrew Jackson rationalized removal of the so-called Civilized Tribes of the Southeast to Indian Territory beyond the Mississippi as a version of protective custody. The reservation system continued this “Great White Father” paternalism. On both sides of the debate over Indian policy, what were termed humanitarians and exterminationists shared social Darwinism ideas of white racial and cultural superiority and faith in the inevitability of progress in the form of the economic development of the American frontier. The West, or frontier, was both a powerful myth in the American mind and in reality a colonial area to be exploited for its resources by the more developed East and investors from abroad. Indians, buffalo, the environment itself had to give way to this economic imperative wrapped in the myth of progress, prosperity, and “manifest destiny.”

Often Americans regarded continental expansion as a matter of destiny and strength, the strength of righteousness. Because the United States was a progressive, moral, humane country, its extension to the Pacific Ocean was foreordained, proper, and inexorable. In contrast to the repressive Old World empires, theirs was an “empire of liberty.” The end justified the means in this case, and most Americans believed that in the grand process of expansion, force was allowable and probably necessary. It was likewise necessary to counter the attempts of Old World governments to subdue other territories in the New World and reintroduce autocratic government and Machiavellian diplomacy into the hemisphere.

To a certain extent the enthusiastic expansion and protection of American interests by John Quincy Adams, James Monroe, James Polk, and the signers of the Ostend Manifesto (1854), which set forth American designs on the annexation of Cuba, were counterbalanced by the hesitations and objections of other prominent Americans. Some people doubted the wisdom and propriety of each expansion of national domain, especially beginning with the Louisiana Purchase. There were dissenters in each instance of armed conflict—for example, Henry David Thoreau’s civil disobedience and jailing during the Mexican War. Expansionist secretaries of state such as William Seward were succeeded by more restrained and prudent men such as Hamilton Fish, who rejected some of the grand imperial designs toward the Caribbean and Mexico that his predecessor had elaborated. Despite internal disagreements and external power problems, by the end of the nineteenth century the process of continental expansion had resulted in an American “imperial democracy” that stretched from Atlantic to Pacific and included Puerto Rico, Hawaii, Guam, and the Philippines. That continental expanse and newly acquired overseas empire was bolstered by an economic power that rivaled and in many cases surpassed that of the Old World colonial empires. By virtually any measurement the United States had become a world power.

**AMERICA AS A WORLD POWER**

The era of American prominence in world politics, which began with the twentieth century, occasioned reconsideration of traditional attitudes regarding foreign entanglements and the use of force. From a foreign perspective, the United States was too powerful to ignore but too unpredictable to deal with satisfactorily. From the American viewpoint, global interests and capabilities made for uneasiness and confusion. The new circumstances of American foreign affairs seemed to require reevaluation of traditional American policies and portended new military necessities.

Americans found themselves caught up in new difficulties rather suddenly; they had not fully appreciated the problems that policies and developments of the last decades of the nineteenth century had brought. They had traded as they always had, vigorously and aggressively. They had expanded their boundaries, sought naval strength (beginning in the 1880s), and acquired a position unchallengeable in the hemisphere—but they had not anticipated the effects of such changes on their position beyond the hemisphere. They had hoped to exert a considerable influence on the nations of the world, but by
example rather than by forcible instruction. American strength was meant to make the nation impervious to the caprice or malice of European governments and to enable it to vindicate rights and protect interests, but not to require U.S. participation in European political affairs.

Citizens of the United States took pride in the energy, growth, and strength of their nation. Only after they had acquired great power did they begin to consider the problems that national strength created. One idea was appealing: Could not the issue be resolved if the United States were to use force only in just causes, and thus make it the servant of morality? In such terms, Americans preferred to explain their “splendid little war” with Spain—a war, they said, to end Spanish tyranny and repression in Cuba, where the situation of the people had become intolerable. But the liberation of Cuba coincided with the “benevolent assimilation” of the Philippines. The brutal suppression of an insurrection by Filipinos who sought independence rather than assimilation was neither splendid nor little, and it sparked an anti-imperialist protest against what was termed an immoral, un-American abuse of power. The American anti-imperialists failed to alter U.S. counterinsurgency policy in the Philippines. But some of the issues they raised about the legitimacy of the use of force in pursuit of foreign relations objectives would arise again later in the century.

At the turn of the twentieth century, Theodore Roosevelt could confidently add his corollary to the Monroe Doctrine’s assertion of the separation of the New World from the Old by proclaiming the right of the United States to wield “police power” in the hemisphere to correct either incompetence or wrongdoing. For Roosevelt and those who shared his vision of America’s role in the world, righting wrongs in Latin America and elsewhere ultimately would be determined by American power.

Participation in World War I even more clearly demonstrated the determination to make power and force serve good ends. After two and half years of neutrality, during which he attempted to negotiate a “peace without victors,” President Woodrow Wilson called upon Americans to embark on a crusade to make the world safe for democracy. In that war to end all wars, the United States was not content to defeat enemies but fought for principles embodying the liberal features of American diplomacy. So, at least, Wilson explained his conversion from opposing force in 1914–1916 to calling for force without stint in 1917.

By the end of World War I, many Americans were no longer convinced that the United States could ensure that good intentions in the use of force would bring right results. Except for the defeat of the Central Powers, none of the things for which Americans had fought seemed to have been achieved. The keystone of Wilson’s fourteen-point peace plan, the League of Nations, was rejected by the U.S. Senate as a result of a combination of partisan politics and Wilson’s physical incapacity following a massive stroke. Lacking participation by the most important world power,
what has been called the Versailles system of world politics was, in the view of some historians, fatally flawed from its beginning. Others have argued that the peace Wilson sought might have endured but for the actions of revisionist powers such as Germany, Italy, and Japan. The lessons of Versailles and the failure of the League of Nations were even less clear to those who guided American foreign relations between the world wars.

POWER AND RESPONSIBILITY

After World War I, debate in the United States over the use of force in pursuit of national goals continued. What has been misleadingly called a period of isolation did not witness an American withdrawal from world power, only from an active leadership role in world politics. Americans in the 1920s pointed to the perversity of war and the perversion of the peace to prove that power—power politics, the old politics of Europe—was still corrupt and corrupting. They did not refuse to recognize that their country was powerful, but they proposed a narrower definition of the national interest than that proposed by Wilson. They also advocated restraint in the use of force and a partial withdrawal, at least at the political and diplomatic level, from the complicated and uncontrollable world arena. In opposition, other Americans, imbued with what was described as Wilsonian or liberal idealism, held out the prospect of harmonious, just, lawful international relations, dependent on the determination of upright men and a policing of the international community by moral nations—forcibly, if necessary.

For the ensuing interwar period the polarization of opinion on the proper uses of American power defined the limits of the nation’s diplomacy. Chastened by the experience of the world war, Americans were uncomfortable with the use of force and determined not to employ it except within the Western Hemisphere. Even there, American policy was noticeably uncertain; the days of repeated and prolonged military intervention slowly but surely came to an end. What emerged came to be known under Franklin Roosevelt as the Good Neighbor Policy, a shift from the use of military force to reliance on economic hegemony to lead hemispheric affairs in a direction consistent with U.S. national interests. But even earlier, in the 1920s, American foreign policy had turned once more to economics as an alternative to the politics of force; not to coerce economic diplomacy but to defensive diplomacy, the conservative economics of protection, sound money, and relatively equal treatment for all comers to the American marketplace. This was policy until the Great Depression overturned the conventional wisdom of economics and diplomacy and forced politicians to use untried and previously unimaginable expedients.

In one sense the limits on power imposed by divisions of opinion in the 1920s and 1930s proved a liability for policy and leadership, or so it seemed in retrospect. The same doubts about the uses of power and force that caused Americans to terminate interventions in Latin America later caused them to hesitate, equivocate, and delay too long in dealing with the aggressive European and Asian autocracies of the 1930s.

At the same time Adolf Hitler came to power in Germany, President Franklin D. Roosevelt, having learned the lesson of Woodrow Wilson’s failure in forging too far ahead of public and congressional opinion, focused on anti-Axis New Deal policies as the international system forged at Versailles began to come apart in Asia and Europe. Having tacitly endorsed the popular policy of appeasement as late as the 1938 Munich Conference, Roosevelt aligned U.S. economic power with the anti-Axis Allies after the outbreak of war in 1939, declaring that America would act as the “arsenal of democracy.” That policy of supplying both the British and later the Soviet Union with American-made arms and other matériel led by late 1941 to an undeclared naval war in the North Atlantic. In Asia and the Pacific, Roosevelt’s increasingly determined opposition to Japanese expansion included a show of force in the form of forward basing of American naval and air power and ever-tightening economic sanctions aimed at forcing Japan into abandoning its imperial aims. In what was perhaps the first test of the lessons of Munich, Japan responded by attacking the U.S. Pacific fleet at Pearl Harbor. In the end, the American dilemma of whether and how to use its power finally was settled not by Americans but by the course of events—that is, by the power and politics of Europe and Asia.

AMERICA’S RISE TO GLOBALISM

In World War II, Americans realized they could not wish or will away the implications and complications of power. As one leader of Senate Republicans and a former critic of international
commitments put it, after Pearl Harbor “isolationism was dead for any realist.” Autocrats in Europe and Asia threatened U.S. security in a drastic revival of the power problem. Americans had to face both the necessity and the consequences of force and violence in international affairs. Even such an idealist as Secretary of State Cordell Hull was led to believe that only total victory based on unconditional surrender would bring total peace. The greatest debates in the United States in the late months of the war focused less on the iniquity of force than on the question of who was a friend and who an enemy.

At war's end some Americans tried to grasp a second chance to internationalize their power problem and the specter of force. They believed or hoped that international organization might provide a solution to the power problem and a way to avoid perpetually violent international politics through collective security and peacekeeping. At the same time, other Americans, less confident in the future of international politics, favored unilateralism and national security based on America's unparalleled economic and military power. They relied especially on the newfound power of the atomic bomb as the ultimate or absolute weapon. What Harry Truman called America’s “sacred trust” would not be shared with the world or with the new international peacekeeping body until such time that Americans could be sure that there could be no abuse of this awesome power.

After the demonstrated weakness of the United Nations, which proved incapable of subordinating great-power conflicts of interest or of assuming responsibility for control of atomic technology and weapons, international idealism was supplanted in 1947 by a determined application of American power and force in every form and in virtually every forum. What was dubbed the Truman Doctrine committed American might to the containment of communism in whatever form, be it internal subversion or external aggression. However, in a larger sense, American leaders in the years following World War II redefined the idea of national security. The goal of this new postwar or Cold War policy was to establish and maintain a preponderance of American power throughout the world. This globalist approach to world affairs involved both military alliances such as the North Atlantic Treaty Organization (NATO) and massive economic programs such as the Marshall Plan. Although sometimes collective, these commitments were predicated on U.S. military and economic power. Looking back on this period, Truman’s secretary of state, Dean Acheson, aptly described it as the “creation” of modern American foreign relations.

After World War II, Americans accommodated themselves to the possession and exercise of economic power and military force on an unprecedented scale and sought new answers to the perennial problems of power. The various forms of traditional unilateralism—nonentanglement, neutrality, isolationism—gave way to a new structure of American globalism. Most important, Americans became reconciled to the use of force to such an extent that they entered a new era of interventionism that, with the Cold War, resulted in a huge standing military establishment.

THE BURDENS AND LIMITS OF POWER

Unfortunately but predictably, new solutions to the old problems brought new problems that in some ways were more complicated than the old ones. The societies of the United States and most other nations prominent in world affairs had to shoulder the enormous costs of standing military forces and modernization of rapidly changing technology. In the inflationary 1970s those costs would mean unpleasant choices of priorities in both internal and external affairs.

In some cases, as in Korea, the use of military force, despite critics on both ends of the political spectrum, was supported by most Americans as justified and, if not conclusive, at least an effective application of American power in pursuit of the Cold War goal of containment of communism. In other cases, such as the war in Vietnam, the prolonged and seemingly ineffective use of force destroyed the Cold War consensus, divided the nation, and contributed to moral and political uncertainty. For many Americans the protracted and ultimately unsuccessful involvement in Vietnam destroyed the Cold War consensus that containment of communist influence justified paying any price and bearing any burden anywhere in the world. In the face of the uncensored image of war, many in the United States rejected the idea of using force to destroy what one was trying to save.

In the years following the Vietnam War, American public attitudes regarding the use of force in foreign relations reflected what was termed, usually by its detractors, the Vietnam syndrome, or neo-isolationism—a reluctance to commit American power and prestige abroad. In
the face of public and congressional resistance, American foreign policymakers felt obliged to pursue power politics in a more circumspect and sometimes secret manner. A policy of covert or deniable applications of power, dating back at least to Dwight D. Eisenhower’s “hidden hand” presidency of the 1950s, was revived in the 1980s under President Ronald Reagan. Through circuitous and even questionable routes, American support went to anti-Sandinista contras in Nicaragua and anti-Soviet rebels in Afghanistan.

The danger of direct military intervention was dramatically brought home in 1983 by the deaths at the hands of a terrorist bomber of 241 U.S. marines who had been dispatched to Lebanon to protect an airfield in the midst of renewed Arab-Israeli fighting. The U.S. invasion of the Caribbean island of Grenada a few days later was an easy military victory, but it had little foreign policy significance. Perceived threats by anti-American regimes such as the one in Grenada might be dealt with effectively by decisive and “surgical,” or specifically targeted, military intervention. But terrorist violence frustrated attempts at retaliation at an elusive, often unknown enemy.

By the 1990s Americans had discovered that in some ways the resort to force was achieving less and less. The Cold War, which had cost trillions in military spending on both sides, ended not by military victory but as a result of the Soviet Union’s political and economic collapse. The breakup of the Soviet empire appeared to have left the United States the victor by default. But the world’s only remaining superpower still found that its power did not necessarily guarantee hegemony or control over world politics.

In the Gulf War of 1991, the single most massive application of U.S. military force in the post–Cold War era, the United States, in partnership with Arab and European allies, successfully expelled Iraqi forces from Kuwait. But that tactical military success did not translate into significant changes in the geopolitical power relationships in the region. At the time, President George H. W. Bush pointed to the stunning military victory and the successful coalition diplomacy as evidence that America had “kicked the Vietnam syndrome.” Yet that same victorious commander in chief was voted out of the presidency the following year. Short-term military success—the effective use of force—did not necessarily mean political success either abroad or at home.

THE DIFFUSION OF POWER
At the close of the twentieth century the United States continued to commit its military power for humanitarian purposes, such as famine relief in Somalia, or as part of multilateral peacekeeping efforts, such as in the Balkans. Nonetheless, it seemed that the subtleties of power—influence, suasion, nonmilitary coercion—often played more important roles in the post–Cold War environment.

Ironically, as the utility of force seemed to decline, the significance of economic diplomacy seemed to be growing more important, although its role differed from what it had been in early American foreign affairs. In many cases this meant that the game of power politics would be played by relatively small countries that hitherto had not participated in what the great powers had always considered their private pastime. The members of the Organization of Petroleum Exporting Countries (OPEC)—not all of which were Arab countries—had by the 1970s begun to play a substantial role in world affairs. Despite remarks by Secretary of State Henry A. Kissinger in response to OPEC’s 1973 oil embargo that force might be necessary to break the cartel’s stranglehold over so much of the world’s oil, the politics of force was not an effective course in the novel international circumstances.

This was particularly true in the case of economic competition by America’s allies, such as Japan and the European Economic Community, or in relation to multinational corporations’ growing power over national economies, particularly those of developing countries. In a post–Cold War atmosphere characterized by the diffusion of power, growing concerns about global environmental and health issues did not fit the established norms of international power politics. In this increasingly complex and challenging world order, there was the concurrently developing possibility that many small nations, and perhaps criminals and terrorist groups, might develop or acquire nuclear weapons.

In the face of such challenges, neither the hopes of a young nation nor the confidence of a strong one were sufficient to provide answers to the perennial problems of power. The only certainty was that the problems would endure, change form from time to time, and require new solutions. As it entered the new millennium, the United States would have to deal with the aspirations of newer and smaller nations from the position of an established power adjusting to the diffusion of power and the profusion of conflicting rights characteristic of the new world order. In such an envi-
environment American leadership and statesmanship would be tested. It was not inconceivable that one principle of early American diplomacy—mutual benefit, as proposed by Benjamin Franklin—might revive in importance along with the traditional virtues of caution, prudence, and modesty.

In his foreword to *Decision-Making in the White House* by Theodore C. Sorensen, President John F. Kennedy wrote:

The American presidency is a formidable, exposed, and somewhat mysterious institution. It is formidable because it represents the point of ultimate decision in the American political system. It is exposed because decision cannot take place in a vacuum: the presidency is the center of the play of pressure, interest, and idea in the nation; and the presidential office is the vortex into which all the elements of national decision are irresistibly drawn. And it is mysterious because the essence of ultimate decision remains impenetrable to the observer—often, indeed, to the decider himself.

After more than two centuries of experience, there is no longer any doubt concerning the formidability of the presidency. The spare and general presidential powers conferred by the Constitution have evolved and developed in proportion to the phenomenal growth of the nation, although until recently at a much slower rate. A list of the powers included in Article II of the Constitution contains the barest hint of presidential power and authority today: the vesting in the president of the executive power of government, his designation as commander in chief of the military forces of the United States, the power to make treaties and to appoint ambassadors and other public officers—powers exercised in both cases in partnership with the Senate of the United States, and the authority to receive ambassadors and other public ministers. Perhaps the most interesting of the president's constitutional powers, since it touches on the mysterious process of decision making, is this: “he may require the Opinion, in writing, of the principal Officer in each of the executive Departments.”

The Constitution created no executive departments. That was left to the Congress, which on 27 July 1789 created the Department of Foreign Affairs (later changed to Department of State). It was headed by a secretary who was to conduct its business “in such manner as the president of the United States shall, from time to time, order or instruct.”

It was hardly to be expected, however, that so formal a line of authority would be restrictive; and every president has to some degree relied on the counsel of advisers outside of and in addition to the Department of State. Indeed, in view of “the play of pressure, interest, and idea in the nation,” an important element in arriving at wise presidential decisions may well lie in the diversity and quantity of opinions or, as they are now referred to, options among which to select. Limits are indispensable, of course, and the quality of the opinions, as well as the president's capacity to discriminate, are of the highest importance.

Mystery is inherent in the presidency, and it may seem paradoxical that the office is at the same time the most exposed one in the land. From George Washington, reluctant first president and probably the only one who did not aspire to the office with some degree of cupidity, to Richard Nixon, perhaps at the opposite extreme, the presidency of the United States has usually been described as a lonely eminence. Even those presidents who relished the power and majesty of the office managed to convey a sense of the solitary nature of the presidential decision-making process.

But the ultimate solitude of the presidency is not mysterious; the singular and final responsibility of the president is generally visible. The mystery, the impenetrability, lies in the sources of presidential decision, which, as Kennedy noted, may be unfathomable even by the president himself. If the president cannot always know how he decides, how can even the closest observer know? After declining a request to rate the performance of previous presidents, Kennedy exclaimed to Arthur M. Schlesinger, Jr., then serving as a White House
special assistant: "How the hell can you tell? Only the president himself can know what his real pressures and his real alternatives are. If you don’t know that, how can you judge performance?"

Presidents have the further advantage of making their decisions in private. Unlike Congress and the judiciary who conduct their business, for the most part, in public, the president cannot only keep the decision-making process secret, but he can keep the records sealed even after leaving office. A president may publicly state one thing while secretly planning another, he may say one thing in public and another in private, and he may inexplicably—even to his advisers—change his mind. But even more difficult for the student of presidential decision making is the deliberate obscuring of presidential intentions from everyone. Intimates of Franklin D. Roosevelt have been unanimous in testifying to his delight in mystifying even his closest lieutenants and in setting them at cross-purposes. Schlesinger, a Roosevelt biographer, assessed the Rooseveltian technique thus: "Once the opportunity for decision came safely into his orbit, the actual process of deciding was involved and inscrutable."

However mysterious and inscrutable the processes of presidential decision, there can be no doubt that every president has recognized the need of advice and counsel, if not consent. Nor can there be any doubt concerning at least two aspects of the presidential use of advisers: in addition to the formal, almost cryptic constitutional provision relating to “principal Officers of executive Departments,” presidents have always solicited or received counsel from both public and private sources, and there has been an evolutionary growth in the number and variety of presidential advisers.

THE FOUNDERS

Understandably and characteristically, George Washington began his presidency by following the letter of the Constitution as closely as he could. Not only had he presided over the debates in the Constitutional Convention in 1787, but he was keenly aware that his every act as the first president of the United States would tend to set a precedent.

The first potential foreign crisis of Washington’s administration arose in 1790, when war between Great Britain and Spain appeared to be imminent over remote Nootka Sound on the northwest coast of America. Anticipating a British request to move troops through American territory to attack Spanish Louisiana, Washington requested written opinions on a possible answer from the three heads of departments—Thomas Jefferson, secretary of state; Alexander Hamilton, secretary of the Treasury; and Henry Knox, secretary of war—and of Attorney General Edmund Randolph and Vice President John Adams. Although the matter related most directly to the duties of the secretary of state, it obviously had implications much broader than simply diplomatic, and Washington evidently wanted to widen his range of advice as much as was constitutionally possible. On later questions of significant national or constitutional import, he adhered to much the same procedure.

On matters of direct personal concern, however, Washington turned to old and trusted friends for advice. He had decided by the spring of 1792 that he would retire from public life. As he had so often done, he wrote to a fellow Virginian, James Madison, for help: “namely, to think of the proper time, and the best mode of announcing the intention; and that you would prepare the latter.” Despite his long collaboration with Madison, his affectionate regard for Randolph, and his esteem for Jefferson, Washington’s foreign policy was nevertheless increasingly directed by Hamilton. Looking upon himself as a kind of prime minister in addition to being finance minister, after the British tradition that frequently combined the two roles, Hamilton secretly conducted his own foreign policy and consistently opposed the secretary of state in meetings of Washington’s official advisers. When Washington made his firm decision to retire at the end of his second term as president, he turned to Hamilton for advice on both the method and the substance of his farewell to public service.

Washington was, according to James David Barber’s model, a “passive-negative” type, a president who sought stability as the precondition to establishing the legitimacy of the American experiment in self-government, so it was natural that he should resist innovation and generally choose the path of least resistance. In a period of intense foreign and domestic turmoil, such a president would naturally be drawn to the adviser whose counsel seemed most likely to promise tranquility at home and safety abroad. That meant validating the power of the central government over its citizens while bowing to superior force in the conduct of foreign relations. Specifi-
cally, it meant a succession of centralizing fiscal and economic measures and a persistent tilting toward Britain in its war against revolutionary France. Hamilton's pro-British foreign policy, culminating in Jay's Treaty of 1794, could easily have been fashioned in London. In fact, Hamilton has been described as the effective minister of the British government to the American, although Washington never knew how intimate and cooperative were Hamilton's relations with the nominal representatives of George III.

By the end of Washington's second term, all dissenters to Hamiltonian policy had been purged and Hamilton himself had left office. But President John Adams, to his later undoing, kept the department heads he had inherited from Washington, most of them unswervingly loyal to Hamilton. The latter, who once wrote that he had not "lost my taste for a little politics," continued to run the government from his New York law office. Adams only later, in the midst of an undeclared war with France, realized that the advice he received from his subordinate officers originated with his arch rival. Perhaps Hamilton had this extension of his influence over the Adams administration in mind when, after Washington's death, he described their relationship: "he was an Aegis very essential to me" (Hamilton's emphasis).

After he had removed the Hamiltonian influence over his administration, Adams was able to end the Quasi-War with France. His son John Quincy Adams had recently been sent as minister to Berlin and, with the treachery of Secretary of State Timothy Pickering in mind, the president told his son to "write freely" to him but "cautiously to the office of State." It was the advice of John Quincy Adams that convinced the president that France sincerely wanted peace and led him to extricate the United States from a war only the Hamiltonian extremists wanted.

John Adams yielded to no one when it came to knowledge of foreign affairs, although until his break with the war faction in his Federalist Party, he had allowed himself to be influenced by the Hamiltonians in his cabinet and in the Senate. Jefferson, however, after the "revolution of 1800," was able to make a fresh start, with a cabinet of his own choosing and Democratic-Republican majorities in both houses of Congress. No American, save perhaps Benjamin Franklin, had had a richer diplomatic experience than the new president, and probably no president ever had a secretary of state who was closer, both personally and intellectually, than James Madison was to Jefferson.

The advice of his brilliant secretary of the Treasury, Albert Gallatin, was valuable to Jefferson, but the efficiency and subtlety with which Jefferson and Madison synchronized their efforts in pursuit of American foreign policy objectives probably have never been matched.

**THE NINETEENTH-CENTURY EXPERIENCE**

Two periods of intense involvement in foreign affairs have marked the history of the United States: the nation-forming period, when the new Republic sought to register its independence while the world was being shaken by the mortal conflict of the great powers of the time, France and Great Britain; and the period beginning with World War I, when the United States itself became the world's greatest power. A more striking contrast between two eras could scarcely be imagined, though the simple substitution of the roles of all the powers involved is a start.

In addition to the irrelevance of affairs outside of North America to the growth of the United States during the nineteenth century, those who would probe the sources of national action are faced with another problem: how to detect and analyze possible connections between domestic influences and foreign policy actions. It is probably safe to say of this period, however, that presidents generally felt little need of advice on foreign affairs except from their secretaries of state, and sometimes not even from them.

Some presidents, such as James Madison, acted as their own foreign ministers. Deprived by Senate hostility of his first choice for secretary of state, the able Albert Gallatin, Madison was forced to appoint the incompetent Robert Smith and for a time even found it necessary to rewrite Smith's dispatches. Historians still debate the influence on Madison in 1812 of such war hawks as Henry Clay, John C. Calhoun, and Felix Grundy; but Madison's most perceptive and thorough biographer, Irving Brant, believes that the president reached his own decisions.

President James Monroe, who had been secretary of state under Madison, relied almost exclusively on Secretary of State John Quincy Adams, except for the president's questions to his Virginia friends and predecessors, Jefferson and Madison, during the formulation of what became the Monroe Doctrine. Indeed, Adams, generally recognized as the greatest of all American secre-
taries of state, was responsible for the two major foreign policy achievements of the Monroe administration. It was Adams who negotiated the Transcontinental Treaty of 1819 (Adams-Onís Treaty) by which the United States not only acquired Florida but also laid claim to the Oregon territory. And it was Adams who persuaded the president and the cabinet to reject a British offer and instead have the United States alone declare itself the protector of the New World against European interference, and thus was responsible for the doctrine that bore Monroe's name.

President James K. Polk evidently had imbibed the elixir of “manifest destiny” long before John O'Sullivan coined the phrase in an editorial in the Democratic Review (1845). The idea of westward expansion was at least as American as the Declaration of Independence—it had been a fact since 1607—but the war with Mexico to advance it was mostly the president's idea. The accusation “Mr. Polk's war” was undoubtedly accurate.

The Civil War marked an end and a beginning to many things in America, but neither an end nor a beginning to expansionism. William H. Seward, secretary of state under Abraham Lincoln and Andrew Johnson, had in the 1840s believed that “our population is destined to roll its resistless waves to the icy barriers of the north, and to encounter oriental civilization on the shores of the Pacific.” Thus he welcomed the suggestion that Russia might be willing to sell Alaska. Presented with an opportunity to expand to “the icy barriers of the north,” ostensibly to guarantee Alaskan fishing rights and to repay Russian Unionist sympathy during the war, Seward rushed through a treaty to purchase Alaska in 1867.

THE RISE TO WORLD POWER

In the American rise to world power, which began in the 1890s, one man who was neither president nor secretary of state played a crucial role. Captain Alfred Thayer Mahan, naval strategist and historian, provided the theoretical framework for the extension of American power into the Pacific as the key to national security and world peace. If Seward can be called the precursor of American imperialism, then Mahan was its prophet. Mahan's influence upon American foreign policy is easy to demonstrate because he was so visible. His first book, The Influence of Sea Power Upon History, 1660–1783, achieved an instant success when it was published in 1890, and it had an effect on the Anglo-American world comparable with Charles Darwin's Origin of Species a generation earlier. A rising group of dynamic, nationalistic American leaders pondered Mahan and became his fervent disciples.

Theodore Roosevelt brought to the presidency a coherent program for the expansion of American power. The ideas of Mahan formed Roosevelt's frame of reference in almost all his discussions of foreign policy: a large navy that could control the sea-lanes; the acquisition of naval bases and coaling stations, and possibly colonies; the construction of an isthmian canal to connect the Atlantic and Pacific oceans by water, with bases to guard the approaches on either side; and the development of a large merchant marine to expand American foreign trade. By tireless propaganda (Roosevelt described the presidency as “a bully pulpit”), cajolery of Congress, and often by breathtaking expansion of presidential powers, Roosevelt was able to realize Mahan's program. Although it was not as large as he wished, he built the “Great White Fleet” and sent it around the world. He acquired naval bases in Cuba and the Philippines, and he carried out what Secretary of State Elihu Root described as the rape of Colombia in order to build the Panama Canal.

Personally much closer to Roosevelt was Senator Henry Cabot Lodge of Massachusetts who was also a disciple of Mahan. Lodge thought as Roosevelt did and consistently supported him in his imperialistic initiatives. Other notable members of Roosevelt's circle of intimates were the brothers Brooks and Henry Adams, grandsons and great-grandsons of the Massachusetts presidents. They were historians, as was the president himself, and they shared his expansionist views without, however, possessing his ebullient optimism.

If foreign policy had always been an unpleasant distraction to American government officials, it was no longer. The administrations of Theodore Roosevelt were the turning point, and the hopes of Mahan, Lodge, the Adamses, and Roosevelt himself for the growth of American power and influence were realized. The War with Spain, which Roosevelt and his friends had promoted so ardently, and World War I, even more so, thrust the United States into a commanding world position.

WILSON AND COLONEL HOUSE

Ironically, it was not Theodore Roosevelt but rather Woodrow Wilson who presided over this
breakthrough. Wilson brought to the White House not only a total lack of experience in foreign affairs but also a disinterest of similar proportion. He had been untouched by the muscular doctrines of Mahan, and he might have been content to establish his “New Freedom” only in America if it had not been for World War I. Wilson’s response to that challenge contrasted sharply with the aggressive Rooseveltian style, giving point to John F. Kennedy’s remark, “to govern . . . is to choose.”

Presidents choose their advisers and weigh the advice they receive. Probably more than any president before him, Wilson focused his confidence on one adviser, “Colonel” Edward M. House, a Texan whose only title was friend of the president. House and Wilson first met late in 1911, when the former was shopping for a Democratic presidential candidate he could support. They hit it off instantly, and House managed Wilson’s 1912 campaign. Thenceforth, he was Wilson’s alter ego. His New York City apartment and his summer home in Magnolia, Massachusetts, were both connected by direct telephone lines to the president’s study in the White House. Once, when asked whether House accurately reflected his thinking, Wilson replied: “Mr. House is my second personality. He is my independent self. His thoughts and mine are one.” House was the outstanding example of the species of presidential advisers whom Patrick Anderson called “distinguished outsiders.”

Wilson and House had extraordinarily complementary personalities. Both were extremely ambitious, but Wilson reveled in the limelight while House preferred the shadows. Wilson’s style was rhetorical, and he was at his best in public exhortation. House, on the other hand, liked to work behind the scenes; he once told an interviewer: “I do not like to make speeches. I abhor routine. I prefer the vicarious thrill which comes to me through others. . . . I want to be a myth.” Wilson saw this as selflessness: “What I like about House,” he told Secretary of the Navy Josephus Daniels, “is that he is the most self-effacing man that ever lived. All he wants to do is serve the common cause and to help me and others.”

It was House who, at the outbreak of war in Europe, tried to turn Wilson’s attention to foreign affairs, arguing that the president’s leadership would offer a unique opportunity to effect a revolution in international morals. House wanted Wilson to assume the mediator’s role in the war: “the world expects you to play the big part in this
mately he was isolated in the destructive rigidity that defeated, and then destroyed, him.

FDR AND HARRY HOPKINS

No other foreign policy adviser would exercise House's almost exclusive influence over presidential decision making until Henry Kissinger, save perhaps Franklin D. Roosevelt's Harry Hopkins. In some ways, Hopkins's relationship to Roosevelt resembled that of House to Wilson, whom Roosevelt had served as a rather free-floating assistant secretary of the navy. By 1941, as Hopkins's biographer Robert E. Sherwood explained it: “The extraordinary fact was that the second most important individual in the United States government . . . had no legitimate official position nor even any desk of his own except a card table in his bedroom. However, the bedroom was in the White House.” To the recently defeated Republican candidate, Wendell Willkie, who had asked why the president kept so close to him a man widely distrusted and resented, Roosevelt replied: “I can understand that you wonder why I need that half man around me. But someday you may well be sitting here where I am now as president of the United States. And when you are, you'll be looking through that door over there and knowing that practically everybody who walks through it wants something out of you. You'll learn what a lonely job this is, and you'll discover the need for somebody like Harry Hopkins who asks for nothing except to serve you.”

During his unprecedented three-plus terms as president, of course, Roosevelt had hundreds of advisers. But none wielded more than a transitory and peripheral influence on foreign policy, while Hopkins's brilliant talent for getting things done was exercised with authority throughout the government and the coalition against Germany and Japan. Sherwood described Hopkins's service thus: “Hopkins made it his job, he made it his religion, to find out just what it was that Roosevelt really wanted and then to see to it that neither hell nor high water, nor even possible vacillations by Roosevelt himself, blocked its achievement.”

But Hopkins was not without convictions of his own, although they usually coincided with those of the president. Eleanor Roosevelt once wrote that Hopkins “gave his opinions honestly, but because Franklin did not like opposition too well—as who does—he frequently agreed with him regardless of his own opinion, or tried to persuade him in indirect ways.” But Hopkins could intervene directly. Once, when Roosevelt was unable to join Winston Churchill and Joseph Stalin at a conference because of the 1944 election, he was about to send Churchill a cable implying that the prime minister could speak for him. Hopkins ordered the cable to be held and rushed to get Roosevelt to cancel it, which Roosevelt did. Hopkins had the respect of Stalin, who spoke to him with “a frankness unparalleled in my knowledge in recent Soviet history,” according to the American ambassador to Moscow, Averell Harriman, and the respect and deep affection of Churchill, who dubbed him “Lord Root of the Matter” and talked feelingly to Sherwood of “the great heart that is within that frail frame.” Hopkins successfully supported Churchill in persuading Roosevelt that France had to share in the postwar occupation of Germany, and he often toned down the president's communications with the haughty General Charles de Gaulle.

Roosevelt and Hopkins last saw each other after the Yalta Conference, when Hopkins, too ill to return home by ship with the president, flew back to enter the Mayo Clinic, where he was still hospitalized when Roosevelt died. He returned to Washington to brief the new president, Harry Truman, who later recalled that “I hoped that he would continue with me in the same role he had played with my predecessor.” Hopkins undertook one more mission to Moscow and succeeded in obtaining Russian concessions that opened the way to the United Nations founding conference at San Francisco, but he was too sick to continue. Six months later he was dead, leaving behind another fascinating historical “if”: How differently would subsequent Soviet-American relations have developed if Hopkins could have fulfilled the wish of President Truman?

CREATION OF THE NATIONAL SECURITY COUNCIL

Notwithstanding the preeminence of Harry Hopkins during the last years of the Roosevelt administration, far-reaching changes were in the making. During World War II, Roosevelt accelerated one developing pattern, the bypassing of the secretary of state and his department, and established another, what the veteran diplomat Charles Yost considered “an even more unfortunate precedent . . . the persistent and intimate involvement of the military in foreign-policy decision making.”
Another development of the Roosevelt years was the beginning of the growth of a large bureaucracy. However, since Roosevelt had an improvised and very personal administrative style, and there was no rationalization by statute, his personal assistants were scattered throughout the government. Truman introduced a significant degree of order, albeit with a large increase in the size of the White House staff. Moreover, under Truman the policymaking process was institutionalized through the creation of agencies responsible to the president. The National Security Act of 1947 created the Department of Defense and established the National Security Council (NSC) to serve as a top-level forum for thrashing out policy alternatives for the president's decision. An important corollary of the NSC was that it was provided with a staff, thus potentially giving the president his own mini Department of State.

Truman's belief in orderly administrative methods included a belief in a strong cabinet. He once said: “I propose to get Cabinet officers I can depend on and have them run their affairs,” and as a result his White House staff was singularly weak. Secretaries of State George Marshall and Dean Acheson were the principal architects of Truman's foreign policy, with Defense Secretary James Forrestal at times playing a significant role. But the star of the Truman White House, Clark Clifford, made a mark because of the confidence Truman placed in him. Clifford generally reinforced with the president the views of such activist department officers as Acheson, Forrestal, and Undersecretary of State Robert Lovett, with one notable exception. In May 1948, Truman followed Clifford's advice to recognize the new State of Israel over the objections of George Marshall and the Department of State.

As principal speechwriter, Clifford drafted the address enunciating the Truman Doctrine. George F. Kennan, then counselor of the United States embassy in Moscow, is usually credited with originating the doctrine of containment in his famous “long telegram” from Moscow, later published in Foreign Affairs under the title “The Sources of Soviet Conduct.” Truman read the message and was impressed, but then he asked Clifford to prepare a memorandum on United States-Soviet relations. After talks with Marshall, Acheson, Forrestal, Lovett, and others, Clifford presented to Truman in September 1946 a memorandum differing from Kennan's chiefly in its military emphasis. “The language of military power is the only language which disciples of power politics understand,” Clifford wrote. “The United States must use that language in order that Soviet leaders will realize that our government is determined to uphold the interests of its citizens and the rights of small nations.” Kennan had stressed political and economic measures to contain Soviet expansionism and in later years, notably in his Memoirs, repeatedly deplored the military interpretation placed on his thesis.

Clifford resigned at the beginning of 1950 and later became a “distinguished outsider,” advising Presidents John F. Kennedy and Lyndon B. Johnson, who in the last months of his presidency drafted him to be secretary of defense. Ironically, it was the man who had helped to militarize the American posture vis-à-vis the Soviet Union in 1946 who helped persuade President Johnson to end the bombing and seek a negotiated peace in Vietnam in 1968.

THE EISENHOWER AND KENNEDY YEARS

President Dwight D. Eisenhower brought to the White House an unprecedented experience with the military staff system and a settled conviction that it was the only sensible and efficient way to run the government. The White House was therefore reorganized to resemble a military table of organization: the assistant to the president became the chief of staff, and other positions were established under him to systematize the flow of paperwork and from the White House. Like Truman, Eisenhower believed that cabinet officers should run their departments, and he discouraged them from bringing their problems to the White House.

Like his successors Kennedy and Nixon, Eisenhower was most interested in foreign affairs. Eisenhower's passion for organization was exercised most closely in an attempt to perfect foreign policy decision making through formalizing and expanding the National Security Council. He converted the NSC staff into a planning board under a special assistant for national security affairs, with responsibility for preparing policy papers and coordinating them among interested government departments and agencies for NSC consideration. The Operations Coordinating Board was established to see that NSC decisions were carried out.

Despite this formal machinery, Eisenhower relied heavily on key advisers in deciding what policies to implement. While Secretary of State...
John Foster Dulles played an important role as the chief spokesman and negotiator for Eisenhower, the president gathered advice and counsel from such individuals as disarmament adviser Harold Stassen, psychological warfare advocate C. D. Jackson, Atomic Energy Commission Chairman Lewis Strauss, UN Ambassador Henry Cabot Lodge, and, after the launch of Sputnik, presidential science advisers James Killian and George Kistiakowsky. As a result, Eisenhower's foreign policy was never as rigid as the organizational charts suggested but instead included such innovations as Atoms for Peace, “open skies,” and an expanded and generous foreign aid program.

Under John F. Kennedy, the elaborate national security structure of the Eisenhower years gave way to a more modest and informal foreign policy apparatus. Distrusting bureaucracy, and disappointed in Dean Rusk, his choice as secretary of state, the president preferred to deal directly with desk officers in the Department of State who had operational responsibility for specific foreign policy issues. Kennedy did away with the cumbersome Operations Coordinating Board and relied instead on his special assistant for national security affairs, McGeorge Bundy, a former Harvard dean. Bundy assembled a small group of academic experts to staff the scaled-down NSC in the basement of the White House, where they attempted to reconcile the conflicting foreign policy recommendations of the Pentagon and the Department of State.

Several others on the White House staff had regular access to the president, among them Theodore Sorensen, special counsel, chief speech writer, and long Kennedy's closest aide; scientific adviser Jerome Weisner; and special military representative General Maxwell Taylor, former army chief of staff, whose advocacy of a “flexible response” defense strategy in opposition to the Eisenhower-Dulles “massive retaliation” doctrine suited the activist approach of the New Frontier. Kennedy also placed great reliance on Secretary of Defense Robert McNamara, who became a sort of “supersecretary.” But as the Cuban missile crisis of 1962 proved, Kennedy's most trusted and valued adviser was always his brother Robert, the attorney general.

JOHNSON AND THE TUESDAY LUNCH

Suddenly thrust into the presidency by the assassination of John Kennedy, Lyndon Johnson did what other “accidental” presidents had done under similar circumstances: he promised to continue unchanged the policies of his predecessor. Johnson also retained the Kennedy staff and, in general, the loose Kennedy system. As a formerly close aide, Bill Moyers, noted after he had left the White House, Johnson had regarded the National Security Council as “not a live institution, not suited to precise debate for the sake of decision.” Johnson much preferred to “call in a handful of top advisers, confidants, close friends.” Johnson also tried to emphasize the foreign policy leadership of the secretary of state and was persuaded to create a system of interdepartmental committees to promote this. Johnson leaned heavily on Secretary of State Rusk, but the system was less than successful. Rusk made little use of it and Johnson came to rely, as Kennedy had, on Bundy and his NSC staff as well as on Secretary of Defense McNamara.

When Bundy left the White House staff for the presidency of the Ford Foundation in 1966, he was succeeded by Walt W. Rostow, formerly his deputy and then chief of the Policy Planning Staff in the Department of State, who had been a professor of economic history at the Massachusetts Institute of Technology. The change was significant. Rostow had written extensively on American foreign policy, notably a book entitled The United States in the World Arena. As that title suggested, Rostow thought in terms of broad historical frameworks; he was a theoretician who from beginning to end saw American involvement in Vietnam as essential to the nation's world preeminence. Along with General Maxwell D. Taylor, who later changed his mind, Rostow had urged Kennedy in 1961 to bomb the Vietnamese insurgents and Rostow's advice to Johnson was always slanted toward escalation.

Like Wilson after 1914 and Roosevelt after the fall of France in 1940, Johnson became totally absorbed in a foreign war after the decision to escalate in 1965. Increasingly, his circle of advisers contracted, as the president immersed himself in the details of the Vietnam conflict and tolerated dissent less and less. Johnson continued to rely, however, on a small group of friends outside the White House, often speaking to them at length on the telephone or meeting with them individually and off the record. His intimates included Senator Richard Russell of Georgia, Supreme Court Justice Abe Fortas, and Clark Clifford, who replaced McNamara as secretary of defense in early 1968. On Vietnam, Johnson also relied on the advice of
a group of distinguished former government officials known as the Wise Men, who included Dean Acheson, Henry Cabot Lodge, and, by 1968, McGeorge Bundy. Initially strong supporters of the Vietnam War, the Wise Men had a change of heart after the Tet offensive and helped persuade Johnson to seek peace with Hanoi in March 1968.

Early in 1963, Johnson instituted the “Tuesday lunch,” which for the next four years represented the focal point of foreign policymaking. While Vietnam came to dominate the agenda, topics ranged across the globe, from the Dominican intervention in 1965 to the Six Day War in 1967. The initial grouping of Dean Rusk, Robert McNamara, and McGeorge Bundy gradually expanded to include the chairman of the Joint Chiefs of Staff, Earle Wheeler, CIA Director Richard Helms, and Johnson’s press secretary, first Bill Moyers, later George Christian. Johnson kept the proceedings informal to encourage give-and-take, but eventually Deputy Press Secretary Tom Johnson was added to keep a record of major points.

The Tuesday lunch helped the president hear a variety of views on important foreign policy issues. “They were invaluable sessions,” Rusk claimed, “because we all could be confident that everyone around the table would keep his mouth shut and wouldn’t be running off to Georgetown cocktail parties and talking about it.” Others, however, contended that the sessions were too disorganized and rambling, rarely leading to thoughtful decisions. The Tuesday lunch, however, was never intended to be a decision-making body. As H. W. Brands points out in The Wages of Globalism, Johnson used it as “a forum for receiving information and opinions. Sometimes he announced decisions at the Tuesday lunch. More often he took the information and opinions back to his private quarters, where he compared them with intelligence obtained from his night reading and from his telephoning to Fortas, Clifford, and who knew who else, and only then gave his verdict.”

THE KISSINGER YEARS
In April 1975 President Gerald Ford was asked whether he received advice on foreign policy from anyone besides Secretary of State Henry Kissinger. He replied that he was advised by the National Security Council, where decisions were made, but added that he met with Kissinger for an hour each day “on day-to-day problems.” Ford’s invocation of the NSC was ritualistic—there was presumed to be something reassuring to the public mind about it—and his comment was also circular, for to a hitherto unimaginable degree Kissinger was the NSC. The former Harvard professor had been chosen by president-elect Richard Nixon in 1968 to be his assistant for national security affairs. By September 1973, Kissinger so dominated foreign policy, which he had made his own, that he had won a Nobel Peace Prize (for negotiating an end to American involvement in Vietnam) and senatorial confirmation as secretary of state by an overwhelming vote. Significantly, Kissinger retained the title of assistant to the president; that was still the source of a power greater than that wielded by most other presidential advisers or even secretaries of state in American history.

During the Nixon years, it was almost always impossible to determine whether Nixon or Kissinger made foreign policy decisions, and commentators became accustomed to writing of “Nixon-Kissinger” policies. The judgment that that reflects is probably correct. The president’s unlimited personal confidence in Kissinger apparently was grounded in an identity and a congeniality of their respective views of the world and of the role of the United States in it. The two men favored similar operating styles: a driving, essentially immoral stance in which the end justified the means and results were what counted, and a secretive, almost conspiratorial approach that delighted in dramatic surprises. Neither Nixon, who had built a political career on hard-line anti-communism, nor Kissinger, whose writings of a decade and a half had accepted the Cold War stereotypes, was inhibited from engineering new approaches—detente—to the Soviet Union and the People’s Republic of China. The secrecy and then the carefully staged theatrics of the Nixon visit to China represented the epitome of Nixon-Kissinger collaboration.

Kissinger was Nixon’s resident philosopher, master planner, and personal executor of foreign policy. He provided Nixon with a coherent theory of international relations that postulated the maintenance of a balance-of-power equilibrium constantly adjusted to minimize friction. The principal problem was that it was initially impossible for “revolutionary” and status quo powers to negotiate: hence the necessity for painstaking planning to reduce international insecurity and create a “legitimate” world order. A supremely self-confident perfectionist, Kissinger believed that only he had the necessary conceptual expertise and skill to manage the slow process of accommodation.
Kissinger’s power depended not only on his unique relationship with the president but also on the bureaucratic machinery he created and controlled. The staff Bundy assembled in 1961 had grown steadily in size, but by 1971 Kissinger’s NSC staff was three times the size of Rostow’s, with more than fifty professionals and one hundred clerical employees. In addition, under Kissinger’s chairmanship there was a proliferation of new groups at the undersecretary and director levels, groups that exercised operational control over every aspect of national security policy, including the most comprehensive one of all, the Defense Program Review Committee, created to review “major defense, fiscal, policy and program issues in terms of their strategic, diplomatic, political, and economic implications.” When Kissinger became secretary of state, therefore, he merely acquired the added prestige of the title and direct authority over the vast Department of State bureaucracy. Little else changed, except that with the Watergate scandal Kissinger seemed to personify whatever legitimacy the sinking Nixon administration could claim.

In the post-Vietnam era much of the Kissinger structure of international relationships appeared to be coming unstuck. A coalition of liberal Democrats and conservative Republicans in Congress passed the Jackson-Vanik Amendment in 1973, which stymied the policy of détente by making the legal emigration of Jews a precondition for liberalizing American trade with the Soviet Union. In late 1975, growing opposition to détente from conservative Republicans led President Ford to strip Kissinger of the position of national security adviser to the president, but he remained as secretary of state. During the 1976 presidential campaign against challenger James Earl Carter, Ford felt compelled to stop using the term “détente.” Although Carter’s narrow victory turned primarily on domestic issues, especially energy and inflation, the outcome clearly was a rejection of the secretive and power-oriented diplomacy practiced by Kissinger under Nixon and Ford.

**DISSENSION UNDER CARTER**

As president, Jimmy Carter proved unable to stamp American foreign policy with his own imprint. Rhetorically, he did succeed in stressing human rights in contrast to Kissinger’s obsession with power politics. But his own lack of experi-ence with world affairs and a serious rift between his principal foreign policy advisers left him ill-prepared to deal with a series of crises overseas that eventually overwhelmed his presidency.

Carter relied on two very different men, representing conflicting foreign policy positions, to help him deal with world affairs. The first, Secretary of State Cyrus Vance, was an establishment figure who hoped to continue the policy of détente with the Soviet Union, stressing cooperation rather than confrontation between the superpowers, while at the same time expanding American aid and assistance to emerging nations. Carter’s appointment of civil rights leader Andrew Young as UN ambassador was a further attempt to appeal to Third World sensibilities. In contrast, the president’s choice of Zbigniew Brzezinski as national security adviser invited conflict within the administration. The Polish-born Brzezinski opposed Kissinger’s policy of détente and instead favored a hard line against the Soviet Union. Carter’s two primary foreign policy advisers could not have been more different. “While Mr. Vance played by the Marquis of Queensbury rules,” remarked one observer, “Mr. Brzezinski was more of a street fighter.” The president, however, believed that he could draw upon each man’s ideas in framing his foreign policy.

In the first two years, Carter sided with Vance and Young in seeking to improve relations with the Soviet Union and assist Third World countries. Policies such as the return of the Panama Canal to Panamanian sovereignty by the end of the century and support for black majority rule in southern Africa, especially in Rhodesia (Zimbabwe), together with the Camp David Accords between Egypt and Israel, marked early victories for the softer approach. But by 1978, as the result of aggressive Soviet moves in the horn of Africa and difficulty in negotiating a SALT II disarmament agreement with Leonid Brezhnev, Carter began to turn to Brzezinski more than to Vance for advice. The climax came when the administration extended full diplomatic recognition to China in 1979, a move advocated by Brzezinski as a way to bring pressure on the Soviet Union. The result was a return to Cold War tensions, especially after the Soviet invasion of Afghanistan in late 1979. At the same time, the growing conflict between the Department of State and the National Security Council had a paralyzing effect on the American response to the Iranian revolution. With Brzezinski backing the shah of Iran and Vance favoring change in
Iran, the Carter administration lost control of the situation and finally ended up in the hopeless hostage crisis.

Carter’s foreign policy failures were not entirely self-inflicted. The legacy of the Vietnam War, the rising tide of nationalism among emerging nations, and the reactionary leadership of the Soviet Union all worked against effective American diplomacy. But Carter’s belief that he could transform the conflicting views of such antagonistic foreign policy advisers as Vance and Brzezinski proved unfounded. By 1980, the American people had lost confidence in Carter’s ability to use American power effectively in the world and were responding instead to the promise of his Republican challenger, Ronald Reagan, to “make America great again.”

SUCCESS AND FAILURE UNDER REAGAN

Presidential advisers played an important, if sometimes unfortunate, role in the administration of Ronald Reagan. The president set forth the goals he sought to achieve—challenge the “evil empire” of the Soviet Union, assist those around the globe fighting against communist subversion, and do everything possible to spare the world a nuclear catastrophe. But Reagan had little interest in the details of foreign policy and delegated broad authority to his subordinates in the day-by-day conduct of diplomacy. As a result, his presidency helped pave the way for the end of the Cold War, but also was badly shaken by the Iran-Contra scandal.

At the outset, Reagan tried to avoid the internal tension that had hampered the Carter administration by relying on a strong secretary of state and downplaying the status of the national security adviser. Alexander Haig, his first secretary of state, proved too imperious and domineering and the White House staff finally forced him to resign in 1982. His successor, George Shultz, was much more successful. A conservative economist skilled at bureaucratic maneuvering, he ran the Department of State smoothly and became an effective advocate of negotiation with the Soviet Union. The first five national security advisers, on the other hand, lacked stature and yet were allowed a surprisingly large amount of discretion in carrying out their duties. Only the final two, Frank Carlucci and Colin Powell, had the high professional qualifications that the post required.

Within the Reagan administration, the primary tension was between Shultz, who favored a more cooperative policy toward the Soviet Union, and Secretary of Defense Caspar Weinberger, who championed Cold War confrontation. As president, Reagan tried to avoid siding with either antagonist, often seeking a middle course or avoiding a clear-cut policy decision. At the same time, Reagan turned to others in his administration for advice, notably two hard-liners. Jeane Kirkpatrick, the American ambassador to the UN, challenged Carter’s stance against aid to friendly dictators like the shah of Iran, arguing instead that the United States should support “authoritarian” leaders who believed in the free market and were cooperative. William Casey, the Central Intelligence Agency director, a wealthy lawyer and veteran of the wartime Office of Strategic Services, favored an active American role in challenging what he and Reagan saw as Soviet surrogates, notably Cuba.

Reagan’s reliance on Kirkpatrick and Casey proved most dangerous in Central America. The administration’s efforts to use the CIA to back the contras in Nicaragua, as well as to defeat the rebels in El Salvador, led Congress to use its power of the purse to cut off funding for the contras. The president, moved by the plight of American hostages in Lebanon, approved a plan to sell arms to Iran in exchange for the release of Americans held by groups friendly to Iran; the NSC staff, led by National Security Adviser Robert McFarlane and his successor Admiral John Poindexter, assisted by Colonel Oliver North, went much further. Follow the advice of CIA Director Casey, they channeled the money generated by the arms sales to Iran into the hands of the contras, in defiance of Congress. When the resulting Iran-Contra scandal became public in late 1986, McFarlane, Poindexter, and North all insisted that the president knew nothing of the illegal diversion of funds (Casey died of a brain tumor in early 1987). While Reagan took responsibility for the unwise decision to sell arms to Iran, he went along with his aides’ assertion that he was ignorant of the financial transaction.

Reagan finally was able to offset the damage done by the Iran-Contra affair by his success in a series of summit conferences with the new Soviet leader, Mikhail Gorbachev. Encouraged by the quiet diplomacy of George Shultz, the president abandoned his stinging rhetoric and instead embraced the new policies of glasnost and perestroika begun by...
When Saddam Hussein caught the United States by surprise with the Iraqi invasion of Kuwait on 2 August 1990, Bush reacted strongly, sending American troops to Saudi Arabia to protect the vital flow of oil from the Persian Gulf region. Once Saudi Arabia was secure, the critical issue was whether the United States should use force to liberate Kuwait or rely instead on economic pressure. Secretary of State Baker, along with the chairman of the Joint Chiefs of Staff, General Colin Powell, warned against getting involved in a ground war with Iraq. Scowcroft and Cheney, however, argued that sanctions would take too long to work, and the president sided with them. Cheney played an especially important role, criticizing the initial army plan to liberate Kuwait with a frontal assault and suggesting a flanking maneuver instead.

Bush's advisers also had considerable influence on the controversial decision to end the fighting short of full success. After five weeks of intense aerial bombardment, General Norman Schwarzkopf launched the ground offensive on 24 February 1991. When American armored units swept into southern Iraq in a daring flanking movement and coalition forces liberated Kuwait in just three days, Bush heeded the advice of Scowcroft and Powell to halt the attack after only a hundred hours of fighting. Powell was concerned that the United States not be seen as a heartless bully, commenting, “You don't do unnecessary killing if you can avoid it.” Scowcroft had strategic concerns, primarily a fear that a prolonged invasion of Iraq would alienate Arab allies and shatter the international coalition. He also saw the need for a postwar Iraq strong enough to balance off the power of Iran in the vital Persian Gulf region. After insisting on securing Schwarzkopf's consent, Bush followed the advice of Powell and Scowcroft, thus ending the war with Saddam, still in power in Baghdad. Later, when Schwarzkopf suggested he could have destroyed the Republican Guard on which Saddam relied so heavily with just a day or two more of fighting, Powell intervened to remind the theater commander that he had agreed to the early cease-fire.

Despite the regrets over the failure to depose Saddam, the Bush foreign policy team proved effective in action. The cautious policy toward the downfall of the Soviet Union prevented the United States from providing an excuse for a final effort by hard-liners in Russia to revive the Cold War. In the Middle East, the Bush administration had succeeded in forging a
remarkably broad international coalition to liberate Kuwait and thus uphold the principle of collective security. Bush's foreign policy advisers had accomplished these goals by displaying a high degree of teamwork. In contrast to the infighting that had characterized the Carter and Reagan presidencies, Bush, in the words of Baker, had "made the national security apparatus work the way it was supposed to work."

CLINTON: LEARNING ON THE JOB

In contrast to George H. W. Bush, William Jefferson Clinton delegated foreign policy to a secondary concern when he took office in 1993. As he put it, he focused "like a razor beam" on domestic issues—reviving the sluggish American economy, balancing the budget, and proposing a sweeping reform of the health care system. He delegated foreign policy to two veterans—Warren Christopher, the secretary of state, who favored a cautious, lawyerly approach to world affairs, working harmoniously with National Security Adviser Anthony Lake, a former aide to Henry Kissinger who had resigned in protest during the Vietnam War.

Two other foreign policy advisers came to play an important part in the Clinton administration. The first was Strobe Talbott, a journalist and expert on the Soviet Union, who had close personal ties with Clinton, his Rhodes Scholar roommate at Oxford. After brief service as ambassador-at-large to the countries of the former Soviet Union, Talbott became deputy secretary of state and oversaw the administration's efforts to support Boris Yeltsin's leadership of Russia. Talbott supervised the granting of $2.5 billion in economic aid as well as the Clinton administration's efforts to promote free market reforms and democracy in Russia.

Richard Holbrooke, another veteran of the Carter administration, emerged as a key player in the most critical foreign policy problem confronting the Clinton presidency—the civil war in Bosnia. Although Clinton had criticized Bush for failing to halt the bloodshed in this former Yugoslavian territory, the new president proved equally reluctant to intervene militarily to stop the fighting. In 1995, however, Clinton finally approved U.S. participation in North Atlantic Treaty Organization air strikes designed to halt Bosnian Serb shelling of the Muslim city of Sarajevo. Holbrooke, assistant secretary of state for European affairs, carried out the difficult task of negotiating a cease-fire among the ethnic rivals in Bosnia—Croats, Serbs, and Muslims. The accords that he succeeded in getting representatives of the three groups to sign in Dayton, Ohio, in November 1995 ended the fighting in Bosnia and led to a fragile but viable political settlement.

The ethnic tensions in the Balkans continued to create difficulty for Christopher's successor, Madeleine Albright, who became secretary of state at the start of Clinton's second term in 1997. The first woman to hold the office, Albright, the daughter of a Czech diplomat, had taught international affairs at Georgetown University and served as ambassador to the UN from 1993 to 1996. More activist than Christopher, she was a firm believer in democracy and was willing to use force to achieve American goals abroad. When Serbian leader Slobodan Milosevic began terrorizing the majority Albanian population in Kosovo, Albright was determined to halt his ethnic cleansing. After Holbrooke's efforts to negotiate a peaceful settlement had failed by early 1999, Albright helped persuade Clinton to intervene militarily to protect the Kosovars. For nearly three months, from March to June 1999, NATO aircraft bombed Serbia in an effort to halt Milosevic's attempt to drive all the Albanians out of Kosovo. The secretary of state defended this policy against fierce criticism and she and Clinton were vindicated when the air offensive began to target the infrastructure of Serbia (bridges, power plants, TV stations), finally forcing Milosevic to withdraw from Kosovo. Remarkably, not a single American life was lost in this military campaign. The outcome in Kosovo, however, was ambiguous—the territory was still nominally Serbian but only the presence of NATO troops kept an uneasy peace between the returning Kosovars and the minority Serbs.

Inevitably, foreign policy came to occupy more of Clinton's attention during his second term in office. The failure of his health care reform and the Republican control of Congress after 1994 limited his freedom of action on domestic matters. He became personally involved in two difficult efforts at mediation—trying to broker peace between the Protestant and Catholic factions in Northern Ireland and attempting to achieve a peaceful settlement of the Israeli-Palestinian rivalry in the Middle East. Although he relied on advisers in both cases (former Senator George Mitchell in Northern Ireland and troubleshooter Dennis Ross in Israel), Clinton took an active personal role,
most notably in negotiating the Wye River Accord between Benjamin Netanyahu and Yasir Arafat in Maryland in 1998. By the time he left office, Clinton had traveled to nearly every part of the world and felt much more confident, and less dependent on his advisers, than when he had entered the White House.

CONCLUSION

Modern presidents have learned that foreign policy is a major responsibility for the office they hold and that they must rely on talented and experienced advisers in handling the diverse problems they encounter in the world. The dual system of national security advisers and secretaries of state, while sometimes leading to great friction as under Carter, helps a president choose between two different sets of advisers, while still leaving him free to seek the counsel of others outside the government. But the days when one individual, such as Colonel House or Harry Hopkins, would act as the president's surrogate in foreign policy, are long past. Future presidents are likely to draw on a wide variety of experts, both within and outside their administrations, in seeking ways to fulfill their responsibilities as world leaders.

From the founding of the United States to the present, concerned citizens have debated the breadth of presidential power in foreign affairs. The Founders, from their reading of European history and their experience with the English Crown, feared extensive executive authority. Believing that broad control over the military over the shaping of relations with foreign nations and over the making of war paved the way to tyranny, in these matters they placed explicit constitutional curbs on the executive. As the nation grew, these restraints led often to tension between the president and Congress. Regardless, except in a few instances, the authority of the executive expanded along with the growth of the nation’s wealth and influence in the world.

The reasons why the executive prevailed and in the twentieth century presidential wars became virtually standard procedure are complex. Some scholars maintain the presidents could use massive force on their own because Congress abdicated its constitutional authority. Others saw as a cause the rise of the United States to the status of a world power, an imperial power, and a superpower. Many perceived the executive’s dominance in war as a logical consequence of the corrupting influence of vast power. Still others saw that power as politically and personally based. They maintained that presidents catered to popular sentiment because, often in the guise of patriotism, strong, violent muscle-flexing against foreign foes was rewarded at the ballot box.

CONSTITUTIONAL SOURCES
Writing in the 1830s, the French political theorist Alexis de Tocqueville described the American president as possessing, especially in foreign relations, “almost royal prerogatives.” More than a century later, Harry S. Truman claimed the presidency had “become the greatest and most important office in the history of the world.” Into the twenty-first century, the media and scholarly treatises repeated this concept so often it became commonplace.

Ironically, leaders of the generation that fought the revolutionary war had a deep distrust of wide-ranging executive power. When they drafted the nation’s first constitution, the Articles of Confederation and Perpetual Union, they omitted a permanent executive office. They feared concentrating immense power in any one person because they regarded executive authority the natural enemy of liberty and a potential repository for military tyranny. So they established a single legislature that chose a member as president. He could not serve more than one year in any three-year congressional term and had no special authority in the conduct of foreign affairs.

After the United States won independence, political leaders such as John Jay, George Washington, Alexander Hamilton, and James Madison perceived the Articles as inadequate, particularly in the making of foreign policy. They desired a permanent president with sufficient authority to carry out a unified policy toward the rest of the world. With this objective, they sought to amend the Articles in a manner that would provide for a stronger central government. They persuaded Congress to authorize a convention for that purpose. After delegates from seven states met on 25 May 1787 in Philadelphia, they decided to get rid of the Articles of Confederation and frame a new constitution.

The debate over the nature of the presidency consumed more time than did any other major problem before the convention. Framers supposedly influenced by an eighteenth-century doctrine of an inherent executive prerogative—advanced by political thinkers such as John Locke—desired “a vigorous Executive.” Others pointed out that the people opposed anything resembling an elective monarchy. After much dis-
discussion, the Founders created a presidential office with specific constraints as well as considerable power. They separated it from the legislative and judicial branches with a system of checks and balances designed to prevent the president from becoming a tyrant.

In keeping with this objective, the framers placed more curbs on the president's power in domestic affairs than in foreign relations. They also denied him the most vital of monarchical powers, that of initiating war. Envisaging him as the agent of Congress, they vested the war power in the legislature. They conferred on the president the authority, with the approval of the Senate, to appoint ambassadors and other emissaries and to receive similar diplomats from other countries. With the advice and consent of the Senate, given in a two-thirds vote, only he could make and negotiate treaties.

The new constitution also stated that the “President shall be Commander in Chief of the Army and Navy . . . and of the Militia of the several States when called into the actual Service of the United States.” This title did not give him authority to declare or instigate war. In The Federalist No. 69, Hamilton assumed, therefore, that the president's role as commander in chief would amount to nothing more than the supreme command and direction of the military and naval forces. The real power, as he perceived it, belonged to Congress. In the long run, Hamilton's assumptions proved wrong. Increasingly, presidents would use the commander in chief clause to expand their authority over foreign policy in its most vital aspect, the power to make war. For this reason, presidents, their political supporters, and others would come often to refer, incorrectly, to the clause as the president's war power.

Other powers, such as the president’s choosing heads of executive departments or cabinet members, his pardoning and veto authority as in budget matters, his right to inform and request legislation from Congress, and his duty to execute laws faithfully, all touched on foreign affairs. Regardless of the safeguards built into these various powers, the Founders created what they had tried to prevent, an office that in foreign affairs had the potential of becoming a kind of elective monarchy.

George Washington had an acute awareness that as the first president his behavior would set precedents for future occupants of the office, and it did. For instance, frustration in August 1789 in dealing with legislators over treaties with Indian tribes led him to abandon the constitutional requirement of obtaining the advice and consent of the Senate before or during negotiation of treaties. Instead, he concluded treaties and then asked for Senate approval, a procedure that since his time other presidents have followed. With a broad view of his authority, he viewed the president as having the power to enforce aspects of relations with foreign peoples even if his actions could lead to armed conflict. He first seized the initiative in using force in dealing with security on the western frontier, where he regarded the Native Americans as a foreign people who menaced white inhabitants. Beginning in October 1790, he sent three armies against Native Americans in the Northwest. In August 1794, the third expedition, headed by General “Mad” Anthony Wayne, crushed the Indian resistance.

Washington also acted with considerable independence in dealing with Europeans. After revolutionaries in France in September 1792 abolished the monarchy and established a republic, he used his power to receive foreign representatives to establish formal relations with the new regime. This decision established precedent for prompt de facto recognition of a government when it demonstrated effective control of a nation. The first significant controversy over the president's power in foreign affairs erupted after January 1793, when England and France went to war. France expected help from Washington because of its alliance with the United States during the American Revolution. Instead, on 22 April, he proclaimed neutrality. Critics regarded this policy as pro-British with the potential of provoking France to hostilities. Hence, they denounced it as usurping Congress’s war power. Supporters of the policy, such as Hamilton, defended it as flowing logically from the executive’s conduct of foreign affairs.

Writing under the pseudonym “Helvidius,” Madison denied the president possessed the power on his own to take actions that would precipitate war. “Those who are to conduct a war,” Madison wrote, “cannot in the nature of things, be proper or safe judges, whether a war ought to be commenced, continued, or concluded.” Regardless of the validity of this perspective, Washington had indeed taken a bold step in setting a precedent for presidents to claim the right to determine foreign policy unilaterally.

Meanwhile, despite the neutrality policy, friction with England over trade practices, over the frontier with Canada, and especially over the royal navy’s seizure of American shipping and
impressment of American seamen roiled relations with the mother country. Fearing possible hostilities, members of the newly formed Federalist Party pressed the president to send a special mission to London to resolve the differences. He chose John Jay, then chief justice, for the task and abandoned his usual practice of sharing an envoy’s instructions with the Senate. Washington’s action angered Democratic-Republicans, members of the opposition party, but the Federalist majority in the Senate approved the mission, and on 19 November 1794, Jay concluded a treaty that aroused harsh public criticism. Despite bitter controversy, the Senate approved the treaty and on 14 August 1795, the president ratified it. From this time on, Washington increasingly became a target of political abuse—“the head of British faction,” one critic characterized him. French leaders called the treaty a negation of their alliance. Opponents in the House of Representatives tried to kill it by withholding appropriations for carrying it out. They also demanded to see the documents of the negotiation, thus raising the question, To what extent did the constitutional right of control over funding give the House power to participate in the treaty-approving process?

Democratic-Republicans argued that the House, as the immediate representative body of the people, had a right, even a duty, to consider whether or not a treaty should go into effect. Federalists countered that the Constitution restricted the treaty power to the president and Senate. On this premise, Washington refused to release the Jay papers. Finally, on 29 April 1796, by the margin of one vote, the House agreed to appropriate funds to implement the treaty. Thus, on the basis of party-line considerations, Washington set another precedent that extended presidential power in foreign affairs, one that exemptions the executive in this process from close legislative oversight.

Washington reacted defensively to the criticism that he had wrongly inflated presidential authority. During the controversies over that issue, he maintained that the powers of the American president “are more definite and better understood than those of almost any other Country,” and that he had aimed “neither to stretch, nor relax from them in any instance whatever, unless imperious circumstances shd. render the measure indispensable.” Later, in discussing the content of his Farewell Address, in which he set the principles for an isolationist policy, he wanted to make clear to all that “he could have no view in extending the Powers of the Executive beyond the limits prescribed by the Constitution.” Regardless, when he left office and foreign policy became an issue in the presidential election of 1796, critics still believed he had aggrandized executive authority in a manner that placed the nation on the verge of war with France. Later generations of historians who characterized presidents as weak or strong would rank him as a strong executive.

THE QUASI-WAR AND AFTER

John Adams thought carefully about the powers of the evolving presidency. He believed in a strong executive because “the unity, the secrecy, the dispatch of one man has no equal.” To prevent abuses in the office, he felt that “the executive power should be watched by all men.” He described the president as the leader of “a monarchical republic” who exercised greater power than heads of government in various European countries. He perceived the American president’s prerogatives as “so transcendent that they must naturally and necessarily excite in the nation all the jealousy, envy, fears, apprehensions, and opposition that are so constantly observed in England against the crown.” While deploring limitations on the president’s authority, as “in cases of war,” he still acknowledged that “the legislative power in our constitution is greater than the executive.”

In July 1797, after the French stepped up attacks on American commerce, Adams moved to resolve the crisis, much of which he had inherited. When French officials humiliated his emis- saries, he asked his cabinet if he should recommend to Congress an immediate declaration of war. When the cabinet split, he decided against seeking a formalized war, sent copies of the envoys’ dispatches to Congress substituting the letters W, X, Y, and Z for the French officials involved, and asked the legislators to authorize preparations for war. He also took steps to protect the lives of American citizens from French attacks and to convey publicly the image of a vigorous executive. When Congress, under Federalist pressure, published the XYZ documents, much of the public reacted with a demand for war that brought Adams a popularity he had always lacked. He gloried in the role of a warrior-leader, delivering numerous combative speeches while sporting a military uniform and a sword. He told approving crowds, “Let us have war.” This bellacosity alarmed opposition Republicans. One of
them, George Logan of Pennsylvania, warned that ambitious executives launched wars more for their own aggrandizement than for the protection of their country.

Despite such sentiment, Federalists in Congress voted for warlike measures. For the first time under the Constitution, in recognition of undeclared hostilities at sea, Congress empowered the president to deploy naval forces on a scale larger than a short-term police action. When extreme Federalists pressured Adams to expand this Quasi-War, as it later became known, Adams wavered. He did so not because of an unwillingness to use more force but because he questioned his power to do so without the consent of Congress. He believed, furthermore, that minority Republicans, with some moderate Federalists, would vote against a declaration of war.

Extreme Federalists then characterized Adams as lacking the virile qualities they presumed necessary in the strong executive. Feeling betrayed by many of his own party on this issue, Adams changed his perspective toward a full-scale war. Consequently, when the French offered a second round of peace negotiations, Adams welcomed the overture. He then sent a second mission to France, and expansion of the Quasi-War became an issue in the presidential campaign of 1800. Republicans portrayed themselves as friends of peace and Federalists as partisans of war. On 1 October the American negotiators in France signed the Convention of Mortefontaine that ended the war. News of the peace arrived in the United States too late to benefit Adams in the election. Thomas Jefferson won. Nonetheless, Adams later regarded his decision for peace as the “most disinterested and meritorious action of my life.” It set a noble example for posterity but his use of naval force set a less admirable precedent. Future presidents would invoke it, under the concept of implied constitutional power, when they employed the military unilaterally in limited hostilities against weak foes.

Even though Jefferson took office as a believer in strict construction, meaning a narrow interpretation of the Constitution, he acted on the assumption of a magnified construction of presidential power in foreign policy in the pattern set by Washington. He claimed that only the president could carry on transactions with foreign governments. Within two weeks of his inauguration, Jefferson decided to send four warships to North Africa to protect American shipping against attack by alleged pirates along the Barbary Coast. Shortly thereafter he asked his cabinet if he should seek a declaration of war from Congress. Treasury Secretary Albert Gallatin responded that the president “cannot put us in a state of war,” but if other nations put us in that state the executive could on his own use military force. Without consulting Congress or receiving its sanction, he waged war, or what later would be called a police action, against the Barbary States. Later, Congress did authorize the president to employ the navy at his discretion.

Meanwhile, after Jefferson learned in May 1801 that France had reacquired Louisiana from Spain, his strict constructionist views clashed with his concept of a strong executive power in foreign affairs. He considered the possibility of war to block consummation of the transfer and to safeguard the American right of deposit at New Orleans. First, in January 1801, he sent a special emissary to France with a proposal to purchase New Orleans and territory at the mouth of the Mississippi River. When Napoleon Bonaparte offered to sell all of the Louisiana Territory, Jefferson hesitated to act on his own. Soon, though, he decided to act “beyond the Constitution” and not let “metaphysical subtleties” stand in the way of a great bargain that would benefit the nation. He thus added to the precedents for extending presidential authority in international matters beyond its original constitutional limits. Under the concept of enlarged authority, Jefferson claimed, on questionable ground, Spain’s West Florida as part of the Louisiana Purchase. He threatened force if Spain did not acquiesce. Although most cognizant Americans approved of his bellicosity as proper presidential vigor, he backed off from hostilities mainly because of deteriorating relations with England and France. In a crisis with Britain in June 1807, when a British warship attacked the American naval frigate Chesapeake, Jefferson at first appeared eager for war, but when public sentiment for it dwindled he retreated. When he left office, he retained faith in the strong executive willing to use military force with the support of Congress and in some circumstances on his own.

When James Madison took over the White House, he had the experience of having helped create the presidency and, as Jefferson’s secretary of state, of having administered foreign affairs for eight years. Still, he had less confidence in executive authority than did Jefferson. He had frequently expressed the view that the president, “being a single individual, with nothing to balance his faults and deficiencies, was as likely to go
wrong as the average citizen.” His views fluctuated over time, leading him later to believe “in the large construction of Executive authority,” notably in the conduct of foreign affairs.

As president, Madison secretly backed American settlers who in July 1810 seized West Florida from its Spanish authorities. For a time he hesitated in annexing it to the United States, fearing such openly unilateral action would raise “serious questions as to the authority of the Executive.” Within four months he overcame his qualms and took over the territory. Many Americans applauded what they saw as proper presidential power. One senator said that if the president had not taken West Florida, he would have been charged with imbecility.

For almost three years, Madison resisted pressure from hawks in his own party to take bold measures against Britain, action that would most likely precipitate war. Federalists, however, opposed hostilities. When on 1 June 1812 he requested a declaration of war, he used his power to persuade wavering legislators to support him. During the hostilities he could not, however, capitalize on that power without encountering considerable public defiance. The war went badly and became unpopular. Critics denounced him for lacking effective leadership. Some scholars would later characterize him as a failed executive and a weak war leader. Yet in annexing West Florida he had been high-handed and as tough as his predecessors.

James Monroe, too, acquired a reputation as a passive leader, but he contributed to the enlarging of presidential power in international affairs through the use of an executive agreement. In the Rush-Bagot Agreement in April 1817 with Britain that limited naval armaments on the Great Lakes, he bypassed the Senate’s veto power over treaties. He thus set the precedent for unilateral action that technically operated only during the term of a president who negotiated an agreement. Nonetheless, executive agreements became an effective means for presidents to exercise power in foreign affairs without congressional consent.

Monroe faced the possibility of war with England and Spain when Andrew Jackson, at the head of a small army, in April 1818 raided East Florida and executed two English subjects. Although Monroe had not authorized the incursion, Secretary of State John Quincy Adams defended Jackson, stating that his actions involved “the Executive power to authorize war without a declaration of war by Congress.” He believed that if the president disclaimed such power he would set “a dangerous example; and of evil consequences.” Monroe quickly embraced this argument, calling Jackson’s invasion of a neighbor’s territory self-defense. Critics denounced the invasion as an act of war without the consent of Congress. “If it be not war . . .,” one of them stated, “let it be called a man-killing expedition which the President has a right to direct whenever he pleases.”

Several years later, when militants wanted Monroe to defend Spain’s rebelling colonies against reconquest, he decided to act on his own but not with force. On 2 December 1823, he warned European powers not to intervene in the New World struggles. This concept, in what became known as the Monroe Doctrine and accepted by future presidents, demonstrated another aspect of executive power in foreign matters, the ability to influence with words.

Through deed as well as word, Andrew Jackson acquired the reputation of a vigorous no-nonsense president in both foreign and domestic affairs. His concept of an expansive authority surfaced in an incident in 1831 with Argentinian authorities in the Falkland Islands (Islas Malvinas). On the basis of slim evidence, he accused them of endangering the lives of American seal hunters. He threatened force that critics said brought the nation to the brink of war, but he did not go much beyond words.

In another dispute, when marauders from the town of Kuala Batu, Sumatra, killed three American pepper traders, Jackson used force. On his orders, on 6 February 1832, an assault force of 262 heavily armed marines attacked the town, torched it, and slaughtered more than a hundred Sumatrans, some of them women. Political opponents wondered, “If the President can direct expeditions with fire and sword against the Malays . . . why may he not have the power to do the same in reference to any other people.” In this manner, “a very important provision of the Constitution may in time become a mere nullity.” Defenders, though, praised Jackson for his executive energy.

Jackson also secretly aided American rebels in Texas in their fight in 1836 to secede from Mexico. In addition, he occupied militarily Mexican territory, ostensibly to protect Louisiana from cross-border raiders. John Quincy Adams, who had now abandoned his earlier advocacy of a presidential war authority, condemned this “most extraordinary power” as illegal. When Congress approved Jackson’s action, Adams com-
mented, the startling “idea that the Executive Chief Magistrate has the power of involving the nation in war even without consulting Congress” had taken root. It had grown, he maintained, out of fifty years of presidents’ de facto exercise of such power.

Contemporaries characterized John Tyler as a man with talents not above mediocrity while historians rate him a weak president. Yet, he came up with a tactic for placing more power in the hands of the executive at the expense of Congress that later presidents would adopt. He wanted to acquire Texas but could not obtain a two-thirds majority in the Senate for a treaty of annexation. So, he asked the whole Congress to approve annexation with joint resolution that required only a mere majority. It agreed. Opponents, who called this action an abuse of power that evaded constitutional restraint, urged impeachment. Tyler prevailed, he explained later, because in handling foreign affairs he had been “freer of the furies of factional politics than he had been in domestic affairs.”

THE MEXICAN AND CIVIL WARS

James K. Polk came to the presidency belittled as another mediocrity. He vowed to reverse this popular perception by asserting vigorous leadership. He defended the annexation of Texas, with its potential for war with Mexico, and quickly stoked a quarrel with Britain over title to the Oregon territory. Despite some saber rattling, in the spring of 1846 he resolved the Oregon dispute peacefully. All the while he took a tougher stance against Mexico, which refused to recognize its loss of Texas.

Polk ordered troops to occupy disputed territory between Texas and Mexico implicitly, if not explicitly, with the intent to provoke hostilities. This tactic led a critic to ask, “Why should we not compromise our difficulties with Mexico as well as with Great Britain?” The answer could be found in the classic policy of aggressive leaders—compromise with the strong but bash the weak. So, when Mexican forces killed several of the American soldiers occupying the no-man’s land north of the Rio Grande, the president claimed the Mexicans had shed American blood on American soil, an assertion disputed by Abraham Lincoln and other Whigs. Nonetheless, on 13 May 1846, a majority in Congress ratified the president’s action by resolving that a state of war existed.

Dissenters charged that “a secretive, evasive, and high-handed president himself had provoked Mexico into firing the first shots.” John C. Calhoun of South Carolina denounced Polk’s procedure as “monstrous” because “it stripped Congress of the power of making war.” The war bill “sets the example,” he warned, “which will enable all future presidents to bring about a state of things, in which Congress shall be forced, without deliberation, or reflection, to declare war, however opposed to its convictions of justice or expediency.” John Quincy Adams stated, “It is now established as an irreversible precedent” that the president “has but to declare that War exists, with any Nation upon Earth . . . and the War is essentially declared.” Critics called the Mexican War an “Executive War” or “Mr. Polk’s War.” The House of Representatives voted to censure Polk for “unnecessarily and unconstitutionally” bringing on war. Lincoln stated that by accepting Polk’s rationale, Congress allowed the president “to make war at pleasure.” Polk mustered support for his policies with a quasi-official newspaper he established in Washington, D.C., but garnered most of his popularity by winning the war at low cost and bringing vast territory into the Union. In subsequent years, his aggressive style earned him the enduring admiration of the strong-presidency cult. In all, Polk stretched the president’s power as commander in chief more than had his predecessors.

Polk’s immediate successors readily accepted a narrow constitutional interpretation of their powers, sometimes called the Whig conception, and faced no foreign crises that tested that view. Although as a Whig congressman Abraham Lincoln had condemned Polk’s amplification of executive power, as president he exercised that power boldly in both domestic and foreign affairs. In waging war against the Confederacy, Lincoln enlarged the army and navy by decree, paid out funds from the Treasury without congressional appropriation, suspended the writ of habeas corpus, and closed the mails to reasonable correspondence. He proclaimed, with questionable legality, a naval blockade of Confederate ports that embroiled the Union in unnecessary foreign quarrels. In the Trent affair, his government claimed exaggerated powers but backed down when confronted with the possibility of hostilities with Britain.

In September 1864, when Western powers organized an international naval force to retaliate against the Japanese for assaults on their shipping
in the Strait of Shimonoseki, Lincoln cooperated with Britain and other nations. Thus, for the first time a president authorized a U.S. vessel to join a foreign armada in a police action to punish a foreign people for harming American nationals and others. American sailors remained engaged in this kind of policing, solely on presidential initiative, for a decade.

More importantly, during the Civil War critics denounced Lincoln’s exercise of presidential authority as despotic. He justified his use of military force as within the executive’s power to suppress rebellion, as within the scope of his authority as commander in chief, and as necessary for enabling him to take any necessary measure to subdue the enemy. His tough measures, he said, “I will not mobilize the army.” Cleveland’s standoff with Congress that lasted until he left office believing in a cautious interpretation of the Constitution’s clauses on executive functions. He also regarded the presidency as superior to any executive position in the world, implying it had divine sanction. In office, he bristled at legislative restraints. During his first term, Cleveland intervened with surprising toughness in a domestic uprising in Nueva Granada (later Colombia), when he exaggerated a threat to America’s right of transit across the Isthmus of Panama. Unilaterally, he dispatched more than twelve hundred marines backed with artillery to help crush rebels defying the central government. Jingooyer applauded his vigor but people in the region regarded him as an imperialist bully. When Germany threatened to take over Samoa, in a kind of police action, he sent three warships to the islands to preserve their independence. No hostilities ensued but the big-power confrontation continued.

In his second term, Cleveland acted with unnecessary bellicosity toward Britain in a dispute over the boundary separating British Guiana and Venezuela. Through an inflation of the Monroe Doctrine, he claimed unwarranted authority over the Western Hemisphere. Members of Congress and much of the public cheered the president’s stance as a proper defense of national honor. Historians and others perceived his saber rattling, with its risk of war over a quarrel posing no threat to the United States, as a dangerous exploitation of presidential power.

In a rebellion in Cuba, Cleveland resisted pressure from Congress, journalists, and much of the concerned public to lead the country into war to force Spain to relinquish its colony. He told legislators, “There will be no war with Spain over Cuba while I am president.” When one of them reminded him that Congress could on its own declare war, he responded that the Constitution also made him commander in chief. As such, he said, “I will not mobilize the army.” Cleveland’s perception of presidential power produced a standoff with Congress that lasted until he left office. Views vary on William McKinley’s exercise of power in foreign affairs. Historians depict him as both dominant and passive. He entered the presidency with respect for congressional authority and with a circumscribed view of its powers.
Instead of asking Congress for a declaration of war against Spain, he requested discretionary authority to use the armed forces. It led a senator to ask why legislators should “give the President power to intervene and make war, if he sees fit, without declaring war at all?” Congress granted McKinley the power he desired. He served an ultimatum on Spain, blockaded Cuban ports, and thus initiated hostilities. On 24 April 1898, Spain declared war, and the following day Congress voted that a state of war had existed since the date of the blockade. After that, the story goes, McKinley shed his passivity and became an aggressive, virile leader. He willingly took on the responsibility of war and, after victory, of policing another country’s possession. Also at this time, when he could not round up enough votes in the Senate to annex Hawaii by treaty, he did so with a joint resolution of Congress, following the precedent set by Tyler. McKinley then governed the islands with a presidential commission.

When Filipinos demanded the right to rule themselves, McKinley refused, and they fought the American occupiers. He then deployed large forces in an undeclared war he justified as a police action. Critics asked, “How can a president of the great republic be blind to the truth that freedom is the same, that liberty is as dear and that self-government is as much a right in the Philippines as in the United States?”

McKinley exerted his will in another military venture. As commander in chief, he sent five thousand troops to China to join an international expeditionary force to suppress Boxer rebels. Analysts point out that he intervened for political purposes, or to demonstrate hard-hitting leadership in foreign affairs in an election year. Publicly, though, he justified his “international police duty” with the now established principle of protecting American lives and property. The Philadelphia Times, however, termed the intervention “an absolute declaration of war by the executive without the authority or knowledge of Congress, and it is without excuse because it is not necessary.” Neither constitutional restraints nor the critics mattered much because both Congress and the public approved of McKinley’s conduct. Partisan biographers and analysts have viewed him as a courageous executive who maneuvered both Congress and the public into accepting presidential primacy in foreign relations. They praise him also for asserting executive power in external affairs in an era of purported congressional ascendancy.

THE STEWARDSHIP THEORY

Unlike his immediate predecessors, Theodore Roosevelt came to the presidency with an expansive view of its power and an appetite to use it. Immediately, he decided to continue the war in the Philippines, cloaking his reliance on force there with irrelevant rhetoric. For example, he justified it as part of a mission to keep “barbarous and semi-barbarous peoples” in line, or as “a necessary international police duty which must be performed for the sake of the welfare of mankind.” The casualties in this presidential policing, which he called the most glorious war in the nation’s history, were lopsided. Some 4,200 Americans died while they killed 18,000 Filipino military, and through war-induced hunger and disease well over 100,000 Filipino civilians died.

Roosevelt also claimed success for presidential power in thwarting Germany in a crisis involving debts owed by Venezuela and for extorting a favorable boundary for Alaska at Canada’s expense. In the Russo-Japanese War in 1904 and the Algeciras Conference in 1906 over the fate of Morocco, he meddled in foreign quarrels that only remotely touched American national interests. In haste to build a canal at the Isthmus of Panama, he used executive power to order warships and marines to wrench a province from Colombia, a weak country unable to counter with either effective diplomacy or force. Critics denounced his contention that he had a right to take Colombia’s land as the robber’s claim of might makes right. Admirers, though, perceived his Panama diplomacy as a symbol of presidential strength and a new American internationalism.

The president used similar big-stick tactics to coerce other small Latin American countries, rationalizing his actions with what became known as the Roosevelt Corollary to the Monroe Doctrine. Their “chronic wrong doing, or an impotence which results in a general loosening of the ties of civilized society,” he explained, required him on behalf of a civilized nation, to exercise “an international police power.” When he sent marines to occupy Cuba in September 1906, he defended his sidestepping of Congress with the argument “that it is for the enormous interest of this Government to strengthen and give independence to the Executive in dealing with foreign powers.”

This conduct reflected Roosevelt’s personal conception of executive authority. He believed “there inheres in the Presidency more power than
in any office in any great republic or constitutional monarchy in modern times." He perceived no harm “from the concentration of powers in one man’s hands,” boasting he had “been President most emphatically” and had “used every ounce of power there was in the office.” At another time he stated, “I believe in a strong executive; I believe in power.” This attitude stemmed from Lincoln’s exercise of executive power that Roosevelt adopted as his own and came to be known as the stewardship theory of the presidency. It claimed that “the executive power was limited only by specific restrictions appearing in the Constitution or imposed by Congress under its constitutional powers.” Historians, popular writers, and others credit Roosevelt with transforming the presidency by bringing to it a popularity, an aggressiveness, a dynamic leadership, and an empowerment greater than in the past. Roosevelt’s conduct marked a significant incremental change rather than a new transition from passiveness to strength.

Historians paint William Howard Taft as a passive executive who governed in the Whig tradition. Still, in foreign affairs he exercised his power aggressively in interventionist polices in Asia and Latin America, derided often as dollar diplomacy. Less flamboyantly than Roosevelt, he took upon himself the role of policeman. He ordered marines into Nicaragua and Honduras, ostensibly to protect American lives and property but basically to advance American economic interests. As in the past, Congress acquiesced in these uses of force. Some legislative skeptics, though, wanted to deny appropriations for these interventions without the consent of Congress, except in emergencies. When out of office, Taft defended his presidential style and attacked the stewardship theory. He maintained “that the President can exercise no power” unless granted by the Constitution or by an act of Congress. He had “no residuum of power which he can exercise because it seems to him to be in the public interest.” Even so, Taft did not regard himself a passive leader.

Well before reaching the White House, Woodrow Wilson held clear-cut views on presidential power. As a young academic, he regarded Congress as possessing the dominant federal power and the chief executive as feeble. Four years before running for president, he reversed his outlook on how much power a president could command in competition with Congress. Once a president assumed control with popular backing, he maintained, no single force could withstand him. He “is at liberty, both in law and conscience, to be as big a man as he can. His capacity will set the limit.” Wilson believed the president could exercise his greatest power in foreign affairs, primarily because of his ability to initiate policy. In sum, Wilson maintained that the executive “office will be as big and as influential as the man who occupies it.”

In 1914, in a minor incident involving American sailors and a Mexican revolutionary leader Wilson detested, he decided to use military force. He claimed constitutional authority to act as he wished “without recourse to the Congress” but said he preferred to have its consent. The House approved his request. Before the Senate acted on the measure, however, a German ship with arms for revolutionaries headed for Veracruz, and Wilson, on his assumed authority as commander in chief, ordered warships to bombard the city and troops to occupy it. The legislators then consented to a fait accompli. Outside Washington, most observers found no satisfying justification for this violence. Many perceived it as a capricious use of executive power against a feeble opponent.

Wilson relied on the same personal conviction of being compelled to act in support of a righteous cause in policing Haitians. When he wanted to extend the occupation of Haiti, his secretary of state told him international law could not justify it but humane reasons might. The president said he too feared “we have not the legal authority to do what we apparently ought to do.” Nonetheless, he proceeded with the occupation. He reported his action to Congress only after he had taken control. As usual, by now in such unilateral intervention, Congress acquiesced. With similar reasoning, Wilson policed the Dominican Republic with U.S. troops commanded by a naval officer.

In 1916, when Mexican rebels command by Francisco “Pancho” Villa raided American border towns, raising demands in Congress and elsewhere for retaliation and even war, Wilson resisted. Then, for a number reasons, including an assumed need to appear tough to an electorate that would soon vote on his bid for a second term, he ordered an invasion of Mexico to capture and punish Villa. It brought the nation to the brink of war before the president pulled back to face a crisis with Germany.

When World War I erupted, Wilson proclaimed neutrality and, despite his feelings of kinship with England, tried to maintain a balanced policy toward the belligerents. When he took a
hard position against Germany because of its submarine warfare against Allied and neutral shipping, his secretary of state, William Jennings Bryan, resigned in protest. He said the country opposed the intervention in Mexico and to being drawn into the war in Europe. Nonetheless, on his own authority in defiance of Congress and “without special warrant of law,” the president armed merchant ships and took other measures against Germany.

Finally, Wilson declared German submarine attacks “a warfare against mankind” but did not ask Congress to declare war. Instead, he requested it to declare Germany’s actions “nothing less than a war against the . . . United States,” asserting that “the status of a belligerent” had been “thrust upon” the nation. People from all walks of life begged the legislators to vote against war, but Congress did as the president desired. As some biographers and others point out, Wilson’s will and his exercise of presidential power stand out as decisive in taking the nation from neutrality to armed neutrality and then to war. Immediately, as commander in chief, he requested, and Congress granted, vast authority to mobilize the nation’s resources, a power he used dictatorially because he believed it necessary to win the war. He curbed civil liberties and squelched dissenters at home more fiercely than had Lincoln.

At his own discretion, the president also thrust 14,000 troops into Russia to fight Bolshevism, or what skeptics dubbed “Mr. Wilson’s little war with Russia.” On his own authority, he also dispatched troops to Manchuria. Critics attacked these interventions as usurping congressional authority. In 1919, Wilson broke the tradition of having the secretary of state and others negotiate with foreign leaders by himself leading the American delegation to the Paris Peace Conference. He thus set the precedent for presidents to participate in summit conferences. At Paris he exploited the prestige of his office and the force of his personality to achieve personal goals he identified with those of the nation. In this instance, his use of power backfired. When, as a semiparalyzed invalid, he insisted that the Senate approve the Treaty of Versailles with the League of Nations embedded in it, his exploitation of presidential power came to an end that he refused to recognize. He had lost the confidence of both Congress and the public.

In subsequent years, evaluators differed sharply, and sometimes emotionally, over Wilson’s wielding of power in foreign relations. Friendly biographers and historians viewed his extension of presidential power, mostly in foreign affairs, as virtuous. They contend he performed extraordinarily well and praise him as a splendid example of the strong, decisive executive. Critics argue that he abused his powers, pointing out he had resorted to force more often than any previous president. Regardless of the varying perspectives on his handling of power, Wilson set new precedents for expanding the president’s role in foreign affairs and domestically in matters related to war.

In part as a backlash against Wilson’s perceived arrogance in wielding power, the electorate chose Warren G. Harding and then Calvin Coolidge to lead the nation. Both men usually left management of foreign affairs to their secretaries of state and diplomats in the field. Coolidge, though, drew on presidential authority according to precedent in what he termed police actions to protect American lives and property abroad. When he intervened in China with warships and marines, he said that the civil turmoil there had compelled him to employ force. When he deployed some 5,500 marines in Nicaragua, ostensibly to protect Americans and their investments but especially to battle revolutionaries he called bandits, Democrats called the clash his private war. Coolidge shot back that his actions no more constituted making war than those of a policeman carrying out his job. He demonstrated again that even a weak president could unilaterally use his power abroad on the basis of ideology or a personal agenda.

Herbert Hoover believed “the increasing ascendancy of the Executive over the Legislative arm . . . has run to great excesses” and that the legislature’s authority “must be respected and strengthened.” In his memoirs he stated that the “constitutional division of powers . . . was not designed as a battleground to display the prowess of Presidents.” Yet as president, he wanted to shape foreign policy in his own way. He repudiated dollar diplomacy and promised not to use his foreign relations power to intervene in small states, as in Latin America. When Japan in 1931 seized Manchuria, he withheld recognition of the conquest but resisted pressure to impose economic sanctions on Japan because he believed they would trigger war. He opposed employing force because “it would be a recommendation that Congress should declare war.” Contemporaries and numerous historians mark him as a failed president because he embraced what they called isolationism and refused to exercise his power expan-
sively to combat the Great Depression or to police Japanese, Cubans, and others. Yet he did not act as a weakling. Unlike some other presidents, he used his power in foreign affairs to keep the nation at peace when some advisers wanted to court war.

THE WAR POWER AS PREROGATIVE

Franklin D. Roosevelt believed a president should exude strength and use his power boldly to achieve what he perceived as desirable goals. In his inaugural address in 1933, alluding to the nation's economic crisis he said, "I shall ask Congress for ... broad Executive power to wage a war against the emergency, as great as the power that would be given me if we were in fact invaded by a foreign foe."

From the start, Roosevelt had to contend with the isolationist and revisionist theory that America's intervention in World War I had stemmed from a malign presidential discretion in foreign affairs. In 1936 his perspective on executive authority received a boost from the Supreme Court case United States v. Curtiss-Wright Export Corporation. This case involved the right of the president to ban the sale of arms to a belligerent, in this instance to Bolivia during the Chaco War with Paraguay. The Court's ruling, in the words of Justice George Sutherland, described the president incorrectly as "the sole organ of the federal government in the field of international relations." This decision would confer an erroneous legitimacy beyond the Constitution on the unilateral actions of executives in matters of war and peace. In contrast, the legislative branch wanted to prevent the president from manipulating the nation into war.

So, in legislation known as the neutrality acts, Congress placed restraints on the president's power in foreign affairs. Roosevelt disliked the laws but accepted them because they might quiet the public fear of "excessive fear of presidential control." In a speech in Chicago on 5 October 1937, he spoke out against the neutrality laws as favoring aggressors, whom he wanted to quarantine. He also expressed alarm over a referendum movement headed by Louis Ludlow, a Democratic representative from Indiana, that proposed a constitutional amendment requiring voter approval before a declaration of war could go into effect. Roosevelt contended it "would cripple any President in his conduct of our foreign relations." His opposition proved critical in defeating it.

As war loomed in Europe, Roosevelt became increasingly assertive about his foreign policy prerogatives, announcing in January 1939 he would as commander in chief provide arms to Britain and France for defense against Nazi Germany. In September, when Adolf Hitler triggered World War II by invading Poland, the president's standing in opinion polls shot up. Increasingly, he acted in foreign matters independently of Congress, as when Britain requested old warships in exchange for some of its bases in the Western Hemisphere. Even though legislation prohibited such a transaction, Roosevelt made use of Sutherland's opinion, circumvented the Senate, and made the deal. Critics condemned the swap as a breach of the Constitution and violation of international law, but it stood.

Proclaiming the United States the arsenal of democracy, Roosevelt in March 1941 persuaded Congress to pass the Lend-Lease Act, which permitted him to give arms to beleaguered Britain. Critics called it a qualified declaration of war and the most sweeping delegation of legislative power ever made to a president. When German submarines sank vessels carrying American munitions, he ordered the navy to patrol the North Atlantic sea lanes to protect the shipping. Patrol in this case functioned as a euphemism for convoy, an act of war under international law. By unilateral executive action he ordered troops to occupy Greenland, imposed increasingly stiff economic sanctions against Japan, and took over Iceland. By November, clashes with Axis submarines brought the United States into an undeclared naval war with Nazi Germany, a belligerent status he did not make clear to the American people. On his own authority, he also promised armed support to the British, Dutch, and Thais in Asia if Japan struck at them.

When Japan on 7 December 1941 attacked the United States, with Germany and Italy then declaring war, the president asked Congress to recognize that a state of war already existed. Political opponents and others charged him with leading the nation into war through deception via the back door of Asia rather than Europe and by maneuvering the Japanese into firing the first shot because he could not obtain enough support for a congressional declaration of war. No one had proof for these theories, but the president's supporters as well as his critics acknowledge that step by step he exploited his foreign relations power to move the nation toward active belligerency.
Roosevelt also utilized his augmented power to conduct the war with virtually dictatorial authority. He seldom referred to Congress, violated civil liberties by incarcerating with an executive order thousands of Japanese Americans, inaugurated secret security files on government employees, and instituted price controls. “This total war . . . ,” he told Congress, “makes the use of executive power far more essential than in any previous war.” He added, “I shall not hesitate to use every power vested in me” to win the war. With Winston Churchill and Joseph Stalin at Yalta, he slipped around Congress with personal promises on territorial questions and international organization. He assumed full responsibility for developing the atomic bomb. Viewing himself as the nation’s steward and his leadership role as personal and institutional, he rarely allowed anything to stand in the way of his exercise of power. The courts supported that role, upholding as constitutional every wartime measure he took. Nonetheless, his hoarding of power alarmed the enemies of executive aggrandizement.

In thirteen years, Roosevelt raised presidential power in foreign affairs to a level higher than that reached by any of his predecessors. As had Lincoln and Wilson, he upset the constitutional balance of checks and balances using the same justification of the need to rescue the nation from a great peril. Various scholars maintain he transformed the presidency, or, at least in the area of foreign policy, brought changes to it that have endured and influenced successors.

The public, together with academics who admired the strong president regardless of how he stretched his constitutional powers, welcomed the changes and praised Roosevelt and his leadership style. This admiration, along with the cumulative effect of the previous presidents who had swelled executive authority in dealing with foreign affairs, laid the basis for a kind of cult that exalted the presidency at the expense of Congress. The flowering of this cult could be seen during the presidency of Harry S. Truman and the start of the Cold War.

Roosevelt had kept Truman in the dark on the intricacies of foreign policy. For instance, Truman did not learn the details of the atomic arms project until several weeks into office, but he soon made one of his most controversial foreign policy decisions. He ordered the atomic bombing of Hiroshima and then of Nagasaki. Skeptics denounced this action as ethnically wrong and unnecessary, but he took full responsibility for it as necessary to save lives. Thereafter, he became accustomed to wielding power and was determined to prove himself a take-charge executive.

Truman asked Congress to extend the executive’s wartime power as Roosevelt had possessed it. In December 1945 the legislators agreed and Truman carried that authority into the Cold War. Largely at his insistence, in the Atomic Energy Act of August 1946, Congress placed control over nuclear weapons in the president’s hands. Proponents of the strong-executive concept then began to argue that atomic weapons and the need for quick response to foreign dangers increased the need for presidents to have more power as commander in chief.

In January 1946, with an executive directive, Truman created a central intelligence agency group directly responsible to the president. In July 1947, in the National Security Act, Congress converted the group into the Central Intelligence Agency, later freed it from budgetary controls imposed on other agencies, and with it amplified presidential power abroad. In addition to analyzing intelligence, the CIA quickly engaged in covert activities. It thus came to serve as a shield for secret executive decisions on the use of military force. The legislation also established the National Security Council, a body designed to advise the president on all matters affecting military power and national security as well as foreign policy. Since the law, amended in 1949, required neither the council nor the national security adviser to be approved by Congress or to report to it, the act had the effect of enhancing the president’s power in deploying the military on his own and on embarking unilaterally on foreign policy ventures that could lead to war.

As an avid anticommunist, Truman used his power to embark on a program, usually called the Truman Doctrine, of containing Soviet expansion, at first in Turkey and Greece and then in Western Europe with the Marshall Plan. This program, approved by Congress, became the vehicle for another expansion of executive authority in foreign affairs. It had precedents, as in Theodore Roosevelt’s policing in the Caribbean, but since Truman viewed communism as a global threat, he asserted a right to intervene militarily anywhere in the world when he deemed the action proper. He converted the nation’s military machine into the world’s foremost anticommunist police force with himself as its commander in chief.

During a crisis that began when the Soviets in June 1948 blockaded Berlin, 110 miles into East
Germany, the question of presidential power came up in the courts. As usual, they upheld executive activism, ruling that “the war power does not necessarily end with the cessation of hostilities.” Justice Robert H. Jackson, who had justified the stretching of executive authority in the destroyer-bases deal, objected to “this vague, undefined and undefinable ‘war power’” that presidents “invoked in haste” to deal with crises, often of their own making. “No one will question,” he wrote, “that this power is the most dangerous one to free government in the whole catalogue of powers.”

Truman nonetheless pressed ahead with his Cold War policy. He negotiated and persuaded Congress to approve a series of multilateral treaties that ended the nation’s traditional policy of avoiding formal alliances in time of peace. Consequently, the Inter-American Treaty of Reciprocal Assistance (1947, known also as the Rio Pact), the charter of the Organization of American States (1948), and the North Atlantic Treaty (1949) placed more of the war-making power in the executive branch.

In January 1950, as part of his anticommu-nist crusade, Truman on his own authorized the building of a hydrogen bomb. Five months later, he made another swift decision of world-wide significance. When communist forces from the north invaded the Republic of Korea to the south, he intervened militarily. In rushing into hostilities, he circumvented both Congress and the United Nations Security Council. When opponents in Congress wondered if Truman had arrogated to himself the authority of declaring war, he denied being at war. Using a traditional euphemism, he called the conflict a police action. Later, though, he contended that “when a nation is at war, its leader . . . ought to have all the tools available for that purpose.” When pressed to seek a congressional declaration, he dismissed the idea because public opinion polls indicated broad support for his stance. When the war went badly, with mounting costs and casualties, the polls reported a sharp decline in his popularity and support for what many called “Truman’s War.”

---

THREE VIEWS ON PRESIDENTIAL POWER

“In no part of the Constitution is more wisdom to be found than in the clause which confides the question of war or peace to the legislature and not to the executive department. . . . War is in fact the true nurse of executive aggrandizement. In war, a physical force is to be created; and it is the executive will which is to direct it. . . . In war the honors and emoluments of office are to be multiplied; and it is executive patronage under which they are to be enjoyed. It is in war, finally, that laurels are to be gathered, and it is the executive brow they are to encircle. . . . Hence it is the practice of all states, in proportion as they are free, to disarm this propensity of its influence: hence it has grown into an axiom that the executive is the department of power most distinguished by its propensity to war.”

—James Madison, “Helvidius” no. 4, 14 September 1793 —

“Allow the President to invade a neighboring nation, whenever he shall deem it necessary to repel an invasion, and you allow him to do so, whenever he may choose to say he deems it necessary for such purpose—and you allow him to make war at pleasure. Study to see if you can fix any limit to his power in this respect. . . . Kings had always been involving and impoverishing their people in wars, pretending generally, if not always, that the good of the people was the object. . . . [The Constitution maintains] that no one man should hold the power of bringing this oppression upon us.”

—Abraham Lincoln, 15 February 1848 —

“When the push of a button may mean obliteration of countless humans, the President of the United States must be forever on guard against any inclination on his part to impetuosity, to arrogance; to headlong action; to expediency; to facile maneuvers; even to the popularity of an action as opposed to the rightness of an action. He cannot worry about headlines; how the next opinion poll will rate him; how his political future will be affected.”

—Dwight D. Eisenhower, 4 November 1960 —
As the discontent grew, so did distrust of presidential authority as wielded by Roosevelt and Truman. In consequence, in February 1951 a movement for a two-term cap for any president succeeded in making the limitation part of the Constitution as the Twenty-second Amendment. As time would reveal, it did not curb presidential power in foreign matters. In April 1952, when Truman seized steel mills under the guise of his war power, his elastic use of executive authority received another setback. In one of its rare decisions against a president in time of war, the Supreme Court ruled the takeover unconstitutional because it considered neither the Korean War nor the Cold War full-scale emergencies that justified such an arrogation of executive power.

Again, a president had amplified the foreign policy powers of his office beyond his predecessors. Where others had employed the military on their own in small ventures abroad or had maneuvered Congress and the public into supporting major wars, Truman, without congressional assent, initiated a large-scale war against a sovereign nation backed by two great powers. He and his advisers cited earlier small commitments of troops as precedents for his actions, but legal scholars pointed out that reliance on previous executive breaches of the constitutional war power did not legitimate subsequent violations. He and his advisers, such as Secretary of State Dean Acheson, also claimed that as commander in chief he possessed a prerogative to initiate war. Other presidents had also theorized about inherent power, but he became the first to exploit that concept as though it were fact. Regardless of the questioned legitimacy of Truman’s use of the foreign policy power, other presidents would follow his lead.

COLD WAR INTERVENTIONISM

Dwight D. Eisenhower sought the presidency because he disliked the assaults on what he perceived, in his words, as “the President’s constitutional rights, in peacetime, to deploy and dispose American forces according to his best judgment and without the specific approval of Congress.” He regarded those rights as “unassailable” and wanted to thwart politicians in his own party, the Republicans, eager to diminish executive authority. He also had a Whiglike conception of the office based on his conviction that Franklin Roosevelt and Truman had upset the proper balance between the branches of government at the expense of Congress. So, despite his determination to protect executive authority, contemporaries viewed him as opposed to aggrandizing the presidency.

In practice, Eisenhower, like Jefferson, did not allow abstract considerations to stand in the way of actions he perceived appropriate. To end the Korean War, for example, he informed the North Koreans through several channels that he would employ atomic weapons against them if they refused an armistice. He acted with similar determination when conservatives in his own party, led by Senator John W. Bricker of Ohio, tried, with a proposed constitutional amendment, to eliminate the president’s power to make executive agreements. Eisenhower contended the measure would cripple executive authority in world affairs. “The President,” he insisted, “must not be deprived of his historic position as spokesman for the nation in its relations with other countries.” His opposition proved critical in the amendment’s narrow defeat.

When the French, involved in an anticolonial war in Southeast Asia, begged the president to intervene to save troops beleaguered in a fortress in northern Vietnam, despite his deep anticommunist convictions, Eisenhower refused. “Part of my fundamental concept of the Presidency,” he explained, “is that we have a constitutional government and only when there is a sudden, unforeseen emergency should the President put us into war without congressional sanction.” Despite this perspective and contrary to what many assumed, Eisenhower was not a dove. He was willing to use armed force in Vietnam but only on his own terms.

At the same time, Eisenhower expanded use of the CIA as a weapon in covert Cold War armed ventures. With secret anticommunist operations he put aside the constitutional restraints on the presidency he professed to value. He ordered the CIA to topple Mohammed Mossadegh, Iran’s nationalist prime minister, which with local help it did. Eisenhower also employed covert violence to overthrow the legally elected president of Guatemala, Jacobo Arbenz Guzmán, a populist he viewed as a communist. These episodes reveal that despite what contemporary pundits perceived as passive qualities in Eisenhower’s leadership, when determined to attain his own foreign policy objectives, he would use a heavy hand.

Eisenhower exercised his power as commander in chief more openly when the People’s Republic of China threatened to attack Chiang
Kai-shek’s Nationalist government on Taiwan (Formosa). When the mainland communists bombed Quemoy and Matsu, two offshore islands held by the Nationalists, his military advisers urged retaliatory strikes. Ike said no, indicating that against a major foe he would not use the war power lightly. Although Eisenhower assumed that in this situation as commander in chief he had authority to act on his own, he asked Congress for consent to deal with any emergency that might subsequently arise in the Taiwan Strait. He wanted to avoid the divisive debate that had followed Truman’s intervention in Korea. Congress responded with a joint resolution authorizing him to use the armed forces “as he deemed necessary” to protect Taiwan and other islands in friendly hands. In voting this blank check, Congress diminished its own war power, enhanced that of the president, and opened a door for later presidents to seek similar authority.

Meanwhile, with a secret CIA operation the president had launched a program to foment rebellion in Eastern European countries that would liberate them from Soviet domination. Then, in October 1956, as he campaigned for reelection, students in Budapest, Hungary, revolted. When Soviet troops crushed the uprising, Eisenhower admitted he could do nothing tangible to aid them without risking a major war, thus recognizing the limitations on executive power. His decision also reflected what he had stated many times, that he would “never be guilty of any kind of action that can be interpreted as war until Congress, which has the constitutional authority, says so.”

The foreign relations power also became an issue in a concurrent crisis. It began when Egyptian strongman Gamal Abdel Nasser seized the Suez Canal from its European owners. On 29 October 1956, Israeli troops, followed by British and French forces, invaded Egypt without informing their American ally. An angry Eisenhower condemned the attack, but when the Soviets threatened intervention, he ordered a partial mobilization of the armed forces. In addition, with economic and diplomatic pressure, he compelled the British, French, and Israelis to withdraw from Egypt. In this situation, he exercised his foreign policy power unilaterally, swiftly, and decisively.

Next, fearing that the Russians might still resort to force in the Middle East, Eisenhower moved to deter them. As during the Taiwan Strait crisis, he asked Congress to authorize him to employ the armed forces to defend the “independence and integrity” of Middle Eastern countries menaced by “communist armed aggression.” After two months of debate, the legislators voted him another blank check, this one termed the Eisenhower Doctrine, that endorsed his role as a global, anti-Marxist policeman. A year later, the president applied the doctrine indirectly to a civil war in Lebanon. In his only overt intervention, in July 1958, on his authority as commander in chief, he ordered troops to invade Lebanon. Insisting he had not committed an act of war, Eisenhower argued he had acted within his constitutional authority and in keeping with executive precedents. Critics, though, maintained he had initiated a presidential war. At the same time, he used the CIA in a secret intervention in Indonesia designed to crumble the regime of Achmad Sukarno, considered too cozy with communists. Popular sentiment could speak less clearly on Eisenhower’s overt and covert policy toward a left-wing revolutionary government in Cuba headed by Fidel Castro. At his discretion, the CIA clandestinely launched commando strikes against Castro, hatched schemes to assassinate him, and planned, with Cuban exiles in Florida, an invasion of the island. Before Eisenhower could unleash this operation, his presidency ended.

Analysts differ in their assessments of Eisenhower as president and his use of power in foreign affairs. Some say he delegated too much of his authority while others portray him as a strong executive who exercised his power with a hidden hand. He claimed to have had the final word in every major foreign policy issue and hence had served as an activist president. He also believed that he had curbed executive aggrandizement. Yet, through his aggressive anticommunist ventures, his covert operations, and the global reach of American power, under him the power of the president in foreign affairs as commander in chief continued to rise.

During the presidential election campaign of 1960, John F. Kennedy announced he would “be the Chief Executive in every sense of the word” and that the president should “exercise the fullest powers of his office—all that are specified and some that are not.” He also carried into office a preference for dealing with foreign over domestic affairs. For instance, he devoted most of his inaugural address to the Cold War. “Domestic policy,” he later repeated, “can only defeat us, foreign policy can kill us.”
Into his official family Kennedy brought intellectual young zealots “full of belligerence,” as one of them later remarked, who admired the concept of the tough, activist executive. With them he quickly immersed himself in the details of foreign policy, deciding at the outset to continue Eisenhower’s covert plan to crush Cuba’s Castro. Most of Kennedy’s intimate advisers backed the venture. Among the few who knew of it, Senator J. William Fulbright, chairman of the Senate Committee on Foreign Relations, objected. He pointed out that “the Castro regime is a thorn in the flesh, but it is not a dagger in the heart.” Dismissing this advice, Kennedy continued the practice of using the CIA to harass Cubans and prepare for an invasion, which, without the consent of Congress, he launched on 17 April 1961, on Cuba’s south shore at the Bay of Pigs. It turned into a fiasco, for which the president publicly accepted blame. Despite the bloody blunder, polls showed that his popularity shot up. In a private discussion of the disaster, he asked, “It really is true that foreign affairs is the only important issue for a President to handle, isn’t it? . . . Who gives a shit if the minimum wage is $1.15 or $1.25 in comparison to something like this?” As confidants noted, Castro then became a personal affront, an obsession that Kennedy transmuted into a threat to American security. He persevered, therefore, in covert efforts to overthrow the dictator.

At the same time, Kennedy had to deal with the Berlin question. Soviet premier Nikita Khrushchev renewed demands that Allied occupiers depart the city and set a deadline with an implied threat of war if not met. With a determination to show toughness, Kennedy prepared for possible hostilities. He expanded the armed forces, ordered reservists to active duty, and asked Congress for an additional $3 billion in military spending, which it granted. When this crisis passed, he again focused on Castro.

State Department officials and others reported the presence of Soviet troops and missiles in Cuba. Kennedy warned that if the communist buildup menaced American security, he would take forceful action. He said that “as President and Commander in Chief” he had full authority to act on his own. But he did request Congress to endorse the use of arms. It agreed overwhelmingly with a joint resolution. On 14 October 1962, when a U-2 surveillance plane reported Soviet launching pads in Cuba with medium-range missiles targeted on American cities, the crisis deepened. Initially, as his closest advisers urged, the president wanted to respond with air strikes on Cuba and even possibly on the Soviet Union. After six days of discussion, he chose to ring Cuba with a naval blockade he called a quarantine. If the Soviets challenged it, the world would face its first nuclear war. Except for a few friendly members whom the president had informed of his decisions, Congress had no role in this war scare. Fortunately, Khrushchev backed down and the crisis passed. With toughness, the president appeared to have won a great diplomatic victory.

Kennedy’s admirers praised his behavior as brilliant, as an example of “genuine statesmanship” that in thirteen critical days “dazzled the world,” and as the greatest achievement of his presidency. They cited his conduct as validation for supreme presidential control over foreign policy and war-making in the nuclear age. Skeptics, and even several close advisers, thought differently. They perceived his rattling of nuclear arms as irresponsible and reckless. One critic commented that he risked “blowing the world to hell in order to sweep a few Democrats into office” in forthcoming congressional elections. Others questioned the wisdom of placing so much power in the hands of one man. As for the public, that power did not bother it much. Polls showed that after the crisis, Kennedy’s approval rating climbed from 61 to 84 percent. Later, when Soviet sources revealed the presence of nuclear weapons in Cuba, Kennedy’s conduct proved more prudent than either the public or detractors had realized.

Elsewhere, Kennedy continued his armed interventionism, as in the Dominican Republic to get rid of an aging dictator and to aid Joaquín Belaguer, a leader he thought would edge the republic toward democracy. When elections brought to power a left-wing intellectual, Kennedy refused to help him because he saw him as tainted with communism. As in other instances, the personal perception of a president, as much as policy considerations, governed use of the foreign policy power.

This happened also in Southeast Asia, where Kennedy accepted Eisenhower’s domino theory that if communism prevailed in one country, as in Laos or Vietnam, it would spread over the entire region. Kennedy believed that if he tolerated communism there, he could not win reelection. So, he poured economic and military assistance into the anticommunist Republic of Vietnam. In addition, he sent in military advisers, who ferried troops into battle against local communists called Viet-
cong and against northern communists. Ultimately, he committed more than 16,000 troops to the anticommunist side in the civil wars in Laos and Vietnam.

Kennedy left a mixed legacy. Strong-presidency believers praise him as a vigorous, charismatic leader who understood the true art of statescraft. Other appraisers charge him with crisis mongering, escalating the arms race, and being enamored with military power. His unilateral use of power abroad, his conviction that he must make his mark primarily in foreign affairs, and his belief in an exceptional authority in those affairs, reflected the prevailing public approval of an expansive presidential power.

PRESIDENTIAL WAR IN VIETNAM

As an experienced politician, Lyndon B. Johnson moved swiftly to exploit this sentiment. Johnson told an aide, “Just you remember this: There’s only two kinds at the White House. There’s elephants and there’s pissants. And I’m the only elephant.” This attitude encapsulated Johnson’s conception of the presidency. He saw the president as the initiator of major legislation, the creator of the national agenda, and the dominant force in foreign affairs. “The congressional role in national security,” he maintained, “is not to act but to respond to the executive.” He proceeded with this perspective in dealing with the warfare in Southeast Asia. “I am not going to lose Vietnam,” he told an ambassador. Accordingly he sent more troops to South Vietnam and instituted secret incursions along North Vietnam’s coast and naval patrols in the Gulf of Tonkin. This activity led to escalating clashes with North Vietnamese forces. After an alleged second torpedo boat attack on U.S. naval vessels, without verifying the reality of the assault and determined to give the communists “a real dose,” Johnson ordered massive bombing of North Vietnamese coastal bases. Then he asked Congress for a resolution, modeled on that handed to Eisenhower in the Taiwan crises. With it, Congress promised to support all measures he would take against armed attacks or to prevent aggression. Only two senators objected to this open-ended grant of power. One of them pointed out that “the Constitution does not permit the President to wage war at his discretion.”

Johnson argued he possessed that power but covered everything.” He also made clear the decision to use force “was mine—and mine alone.” On this basis, initially with high public approval as measured by polls, he steadily enlarged the American war in Vietnam. Slowly, though, an antiwar movement gained support and spread over the country. Some of its leaders accused him of seeking support for a war that involved no vital national interest by lying to the public.

Briefly, Johnson’s intervention in a civil conflict in the Dominican Republic in April 1965 shifted attention from the Vietnam debate. He gave a variety of reasons for deploying 23,000 troops on the island. Most often, he said he acted to avert a communist takeover and to protect endangered American lives. The occupiers found no evidence of a communist plot or peril to American lives. At home and abroad, jurists and others denounced the intervention as a violation of international law. Domestic critics pointed out that he had invaded without seeking congressional consent. He responded that he merely exercised what had become traditional executive power in foreign affairs.

Johnson offered similar rationalization for making war in Vietnam. He cited the Tonkin Gulf resolution as evidence of congressional support for his policy but asserted that he did not need its approval because the “Commander in Chief has all the authority that I am exercising.” In the summer of 1966, as the public’s approval rating of his presidency plummeted, he said defiantly, “I’m not going down in history as the first American President who lost a war.” He persisted in viewing conflict largely in terms of his own stake in it, which he stretched to identify with the national interest. He spoke of “my troops” and of his war that he would run his way.

In an effort to refute critics, Johnson ordered the State Department to prepare a tract justifying the war. Dutifully, a subordinate argued that the president had ample authority to use force on his own, to decide what constituted an attack on the United States, and thus to commit troops anywhere in the world for such defense. He cited the Quasi-War and the Korean War as precedents, thus in the latter case using an example of dubious constitutionality to sanction another case of questionable validity. All the while, antiwar activists denounced Johnson as a “slob” and “murderer.” This personal disdain stained the presidency. Reverence for it declined. Polls indicated that about half the public considered the war a mistake. Johnson took criticism personally,
dismissing it usually as unpatriotic. He placed antiwar leaders under surveillance and violated their civil rights. At one point he blurted, “This is not Johnson’s war. This is America’s war.”

Finally, much of the public and various legislators, even in the president’s own party, could stand no more. They said he had come to exercise “virtually plenary power to determine foreign policy” and “it is time for us to end the continual erosion of legislative authority.” Gallup polls showed that the public view of the war as wrong had risen to 79 percent. Then, when a primary in New Hampshire indicated that Johnson could not win reelection, he withdrew his candidacy. The public did not turn against Johnson for using power illegitimately, for lying, or for waging war unilaterally. They wanted him out because of a failed use of the foreign affairs power in a war with high casualties and no benefits. Americans had tolerated, and even praised, comparable use of the war power by other presidents. None, though, had exploited that power as outrageously as he did. With that power he ran amok but did not, as some analysts claim, weaken the presidency. Although Richard M. Nixon, in his second bid for the presidency in 1968, benefited from the backlash against Johnson’s Vietnam policy, he too believed in the concept of executive supremacy in foreign affairs. Like Johnson, Nixon was a man of vaulting ambition well known for his hawkish views on the war. In his election campaign he stressed that “the next President must take an activist view of his office” and have a strong will. Nixon maintained that bold initiatives abroad always had come from strong presidents. In office, he acted on that premise.

From the start, Vietnam clouded Nixon’s administration. Even though he had promised to terminate the entanglement there, at his inaugural, antiwar demonstrators—shouting “Four more years of death!”—pelted his limousine with debris. Undeterred, he reshaped Johnson’s Vietnam policy while retaining its substance. He continued an air war in Laos and peace negotiations in Paris, began sustained bombing of North Vietnam, and launched secret air strikes in neutral Cambodia. We must, he explained, negotiate from strength and not withdraw unilaterally from the conflict in Southeast Asia.

Alarmed senators then passed a resolution that deplored past executive excesses and recognized no presidential commitment to continue the war. Claiming that as commander in chief he possessed sole authority over the armed forces and could order them abroad without specific congressional approval, Nixon ignored the resolution. He thereby charted a collision course with Congress. He did pull some troops out of Vietnam, but peace advocates complained about the slow pace. As antiwar demonstrations escalated, Nixon bristled. As had Johnson, he declared he would not be the “first American President to lose a war.” Polls taken at this time, October 1969, indicated majority support for his position.

In April of the next year, without consulting Congress, the president launched an invasion of Cambodia, justifying it with various explanations such as routing North Vietnamese ensconced there. “Bold decisions,” he said, “make history.” A substantial segment of the public viewed the action differently, as an unwarranted widening of the war. Peace demonstrations escalated across the nation. To counter the furor, Nixon asked the State Department to make a case for his decision. Accordingly, an assistant attorney general, William H. Rehnquist, argued that as commanders in chief, presidents had the authority to order troops “into conflict with foreign powers on their own initiative” and even to deploy them “in a way that invited hostile retaliation.” Hence, Nixon had acted properly. Historian Arthur M. Schlesinger Jr. dismissed Rehnquist’s contention as “persiflage”—compromising historical and legal scholarship for service to his client. Congress then revived an endeavor to restrain the president’s assumed power to make war unilaterally. The Senate passed a bill forbidding involvement in Cambodia without its consent and repealed the Tonkin Gulf Resolution. Nixon dismissed these measures, avowing that as commander in chief he could maintain the warfare on his own. At this juncture, for seemingly personal reasons, Nixon unilaterally made another controversial foreign relations decision. In a war between India and Pakistan that broke out in December 1971, despite considerable sentiment for at least neutrality, he sided with Pakistan. He ordered a naval task force into the Bay of Bengal to intimidate India. Critics pointed out that the United States had no vital stake in the conflict, yet he alienated India and risked possible war with the Soviets, who sided with India. In February he did enhance his image as a maker of foreign policy with a trip to the People’s Republic of China that initiated a détente with that old foe.

In December 1972, Nixon ordered twelve days of around-the-clock bombing of Hanoi and Haiphong. Critics denounced it as war by tantrum,
as violence beyond all reason, and called him a maddened tyrant. He responded that if the Russians and Chinese thought “they were dealing with a madman,” they might then “force North Vietnam into a settlement before the world was consumed by larger war.” Finally, public pressure drove him in January to conclude cease-fire accords with North Vietnam, but he continued secret bombing raids in Cambodia and Laos as well as aid to anti-communist regimes in the region. When these actions became known, Congress decided to enact “definite, unmistakable procedures to prevent future undeclared wars.” It compelled Nixon to end hostile actions in Indochina.

Meanwhile, the Cold War presidential practice of covertly aiding conservative candidates for high office in foreign countries backfired. Nixon had directed the CIA to block Salvador Allende Gossens, a socialist legally elected president in Chile, from taking office. When that effort failed, Nixon ordered the CIA to organize a military coup against Allende that on 12 September 1973 led to his murder and to a right-wing dictatorship in Chile.

In October, as Nixon’s involvement in the Watergate scandal came to light, the Yom Kippur War between Israel and Egypt and Syria erupted. He airlifted supplies to Israel. To counter an alleged Soviet plan to intervene, he ordered a worldwide alert of U.S. forces, including nuclear strike forces. Critics regarded this order as unnecessarily drastic. They suspected he issued it to divert public attention from his troubles with Congress, or as an example of using the foreign policy power to deal with domestic political exigencies. Then, on 7 November, after decades of debate over the war-making capacity in the president’s foreign-affairs power, Congress overrode Nixon’s veto to adopt the War Powers Resolution. It required the president, in the absence of a declaration of war, to report to Congress within forty-eight hours after ordering troops into a foreign conflict. Unless the legislators approved a longer deployment, he had to withdraw the force within sixty days. The law allowed an extension of thirty days if the president deemed that time necessary for a safe withdrawal. It also placed curbs on his ability to circumvent Congress, to deploy armed forces in hostile situations, and to engage in covert military ventures. But by permitting the president to deploy forces for a limited time without congressional consent, it subverted the aim of collective decision making in foreign policy. As skeptics pointed out, the resolution delegated to the president more power in foreign affairs than the Constitution allowed. It granted him freedom to wage war for several months anywhere in the world as he chose.

Despite his critics and facing impeachment, Nixon contended he had acted much like other strong executives who had taken for granted an inherent right to employ their foreign policy power to intervene unilaterally in other nations, especially weak ones. They, too, had lied, acted covertly, and had skirted Congress. Only he suffered punishment, and only because of evidence uncovered in secret tapes he made of White House conversations about his involvement in the Watergate scandal. This was true, but he did abuse the foreign policy power more than his predecessors.

While out of office, Nixon continued to defend his extravagant conception of the strong executive. He contended that in wartime the president has “certain extraordinary powers” that make otherwise illegal acts lawful when taken to preserve the nation. In this perspective, the president alone decided what served the best interest of the nation. Critics maintained that with such views and his behavior, primarily in foreign affairs, he demonstrated that unrestrained power in the hands of a paranoid president could endanger democratic government.

**REVIVAL OF THE STRONG PRESIDENCY CULT**

On taking over the presidency in 1974 after Nixon’s resignation, Gerald R. Ford made clear he would continue his predecessor’s war policy and that he had no intention of reducing what he perceived as the executive’s power in foreign affairs. In his first speech before Congress, he expressed briefly his view of that authority: “Throughout my public service, I have upheld all our Presidents when they spoke for my country to the world. I believe the Constitution commands this.” For example, he continued covert operations. So, in the Foreign Assistance Act of 1974, Congress placed minor restraints on this practice. With this law, for the first time it openly recognized the president’s assumed power to engage in covert ventures in the name of national security. Congress thus augmented the executive’s power to initiate warfare unilaterally.

Ford tried to salvage what remained of Nixon’s policy by asking Congress for $972 mil-
lion in military and other aid for South Vietnam. Congress refused. In April 1975 the government of South Vietnam collapsed and the northern communists took over, uniting Vietnam. Several weeks later, when a Khmer Rouge, or communist, gunboat seized an American merchant ship, the SS Mayaguez, sixty miles off the Cambodian coast, Ford called the capture piracy and demanded release of the vessel and crew. Tardily, the Cambodian communists said they would free the men and ship. Determined to demonstrate that the commander in chief could still flex muscle, Ford resorted to force. Furthermore, instead of consulting Congress as the War Powers Resolution required, Ford “informed” it of his decision to use force. He ordered air strikes on Cambodian bases and marine commandos to rescue forty crew members already out of danger at the cost of eighteen marines and twenty-three Air Force personnel dead. Ford's popularity zoomed upward because, as Senator Barry Goldwater commented, he had not allowed “some half-assed country” to kick him around. Admirers of the strong presidency called the venture Ford’s finest moment. Critics denounced this “indulgence in machismo diplomacy” as “another example of military overkill and trigger happiness.” Once more, a supposedly weak president, without significant restraint by law or Congress, for personal benefit used his foreign affairs power to magnify a minor incident into an unnecessary crisis.

In his bid for the presidency, Jimmy Carter promised a foreign policy that would distinguish the United States as “a beacon light for human rights throughout the world.” He also denounced covert military operations and intervention in the internal affairs of other countries. The foreign policy crisis that most bedeviled Carter's administration began with the overthrow of Shah Mohammad Reza Pahlavi of Iran. In November 1979 the trouble escalated when a mob in Teheran invaded the American embassy and seized a hundred people as hostages. When Carter failed to obtain their release through diplomacy and the crisis threatened to torpedo his chances for reelection, he decided on force in his capacity as commander in chief. He did not consult Congress, because, he contended, in this instance the War Powers Resolution did not apply. As had other presidents involved in questionable military strikes, he claimed an “inherent constitutional right” to act unilaterally. So, on his orders, on 24 April 1980, a commando group attempted by air to rescue the hostages. The operation failed, and much of the public viewed it as a fiasco. Carter did not, as some advisers urged, try to smother his failure with a massive show of force and possibly war.

A civil war in Afghanistan followed by a massive invasion of Soviet troops also led Carter to shift his attitude toward the use of his power in foreign affairs. He imposed sanctions on the Soviet Union and, when they did not work as desired, exaggerated the Soviet threat to American security. He warned the Soviets that if they seized the Persian Gulf, war would follow. When European allies opposed this bellicosity, Carter pulled back. He then embarked on a program of supposedly covert aid to the Afghans. Carter exhibited less reluctance to use force in perceived low-risk, undercover interventions in Central America and Africa. Despite his tough moments, Carter did use foreign policy power effectively but for human rights and peace rather than for war.

In campaigning for the presidency, Ronald Reagan disparaged Carter for bungling the Iranian crisis, described the Vietnam War as a noble cause, promised to deal harshly with terrorists, and declared he would regenerate American pride. He pictured communism as a monolithic enemy and the Soviet Union as an “evil empire.” He said little about theories of executive power, even when in office. In foreign affairs matters that interested him, however, he was an activist, hands-on executive. Reagan began using his power promptly by directing the CIA to engage in domestic spying, clandestine foreign ventures, and surveillance of Americans abroad. Within three years, he launched more than fifty covert operations, more than half of them in Central and South America. He claimed, in a form of intervention that became known as the Reagan Doctrine, the right to support with arms and other means “people fighting for their freedom against Communism wherever they were.” Most international jurists regarded this globalism untenable in law.

Reagan applied his doctrine most tenaciously in Nicaragua, where, starting in March 1981, he ordered the CIA to conduct military operations against a Marxist government. The agency created an army of military adventurers and anticommunists in Honduras, called contras, from the abbreviation in Spanish for counterrevolutionaries, to carry out this mission. When the intervention became known in the United States, several legislators charged Reagan with violating the War Powers Act, but he persisted with impunity. Finally, in three pieces of legislation
known as the Boland Acts, Congress cut off direct executive aid to the contras.

At the same time, in a quarrel with Libyan dictator Muammar al-Qaddafi, Reagan, as commander in chief, ordered the Sixth Fleet to Libyan waters. In a violent confrontation, it destroyed two Libyan warplanes. Reagan again defied the War Powers Resolution by twice deploying hundreds of troops in Lebanon to aid a conservative government fighting a civil war. After the fact, Congress approved this commitment. Rebels in Beirut attacked the troops, and U.S. warships shelled rebel positions. In October 1983 a rebel suicide bomber in a truck crashed through the American compound, slaughtering 241 marines. In December, after a minor confrontation, U.S. forces struck at Syria. Fearing that the casualties would become a damaging issue in the forthcoming presidential election, Reagan reluctantly removed the troops from the area.

Earlier the president had manufactured another crisis, this one on the island of Grenada in the Caribbean, reputedly to divert attention from the Beirut losses. He intervened there with some 2,000 troops to oust a far-left regime that, he said, without substantiation, threatened the lives of American students living there. He again violated the War Powers Act but defended his unilateral violence as within his power as commander in chief. Some Democrats demanded enforcement of the law and seven asked for impeachment, but Congress stood by the president. He called the events in Lebanon and Grenada “closely linked,” because “Moscow assisted and encouraged the violence in both countries.” Polls showed that Americans, by a margin of 90 percent, approved his bashing of Grenada.

Later, again on meager evidence, Reagan blamed Qaddafi for the bombing of a disco in Berlin frequented by American servicemen. In retaliation, he ordered the bombing of Benghazi, killing scores of civilians but not the dictator. Jurists maintained Reagan had unilaterally carried out an act of war, and again violated the War Powers Act. Similarly, in his proxy war in Nicaragua, he breached international law by having the CIA lay magnetic mines in three of that nation’s harbors. Later, the International Court of Justice at The Hague found the United States guilty of an unlawful use of force. Reagan dismissed the condemnation without qualm.

Finally, the president’s illegal use of his foreign policy power led to negative repercussions. Congress had banned the export of arms to Iran, but Reagan’s subordinates secretly sold it weapons to finance the undercover contras, contrary to the Boland laws. They also used some of the money for ransom for release of American hostages in Lebanon. When details of this Iran-Contra affair leaked to the public, the president’s popularity plummeted. Some legislators again talked of impeachment. Initially, Reagan denied knowledge of the affair. Later, he admitted that the decision to trade arms for hostages was his. Senate and House investigating committees concluded he had been responsible, but neither Congress nor the courts held him accountable for his illicit actions.

Reagan continued to use force in the Persian Gulf, in Nicaragua, and indirectly in covert aid in Afghanistan against the Russians. When the Russians withdrew in 1988, he and his aides touted their retreat as a victory for the Reagan Doctrine. When he left office, harsh critics stood by their characterization of him as an amiable dunce, but most of the public thought differently. It overlooked or forgave his illicit behavior to view him as a decisive leader who had regained for the presidency much of the foreign relations power it presumably had lost in the Watergate scandal.

In contrast to Reagan, George H. W. Bush initially seemed bland, but he sought to demonstrate qualities as a strong, activist leader in a clash with the small-time Panamanian dictator Manuel Antonio Noriega, who had been on the payroll of Washington intelligence agencies but lost favor because of criminal activity. The Reagan administration had imposed economic sanctions against Panama, and Bush quickly assigned high priority to Noriega’s removal, through various means including a coup. This strategy fizzled, leading hard-liners to speak of executive weakness.

When questioned about ousting the dictator, Bush answered, “Well, I want as broad a power as possible, and I think under the Constitution the President has it.” He “has broad powers, broader than some in the Senate or the House might think.” On this assumption, Bush exploited a clash between Panamanian soldiers and two American servicemen as a reason to resort openly to force. On 15 December 1989, on his own as commander in chief, he ordered the invasion of Panama. Six weeks later, U.S. troops captured Noriega. Ultimately a U.S. court tried, convicted, and jailed him.

Many Americans asked why this massive force over a minor quarrel? The president came up with a variety of answers, including self-defense, upholding democracy, and protecting
American lives. Skeptics dismissed the arguments as flimsy, pointing out that virtually every day in some part of the world somebody harassed Americans. To safeguard them or uphold nascent democracy everywhere with bayonets would commit the nation to endless hostilities. They accused Bush of using violence politically to dispel the wimp factor. The General Assembly of the United Nations condemned the invasion as a “flagrant violation” of international law, but Americans overwhelmingly approved the muscle-flexing. Hence, only a few legislators challenged the president’s defiance of the War Powers Act. The House even passed a resolution praising him for his decisive action.

Seemingly intoxicated by such commendation, the president turned on another international villain, Iraq’s Saddam Hussein. On 2 August 1990, some 80,000 Iraqi troops invaded and quickly overran Kuwait. Properly condemning the invasion as “naked aggression,” Bush took the lead in a movement to reverse it. The American public and the United Nations supported him in a policy of sanctions against Hussein. Impatiently, Bush decided sanctions took too long to work, prepared for war, and claimed he did not need congressional assent before taking military action. Many legislators disagreed. Senator Daniel P. Moynihan of New York pointed out that “the great armed force” created to fight the Cold War was now “at the president’s own disposal for any diversion he may wish, no matter what it costs.” Undeterred, Bush insisted that “I have the right, as commander in chief, to fulfill my responsibilities, and I’m going to safeguard those executive powers.” Fifty-four legislators filed suit in a federal court to prohibit the president from using force without congressional authorization. The court ruled the suit premature but reiterated that only Congress could declare war. Still, Bush announced that no matter what Congress or the people had to say, he would decide for or against war. As had various predecessors, he cited flawed precedents for presidential war-making. Most of the media sided with him.

Finally, the president gave in to pressure from advisers not to defy Congress but to persuade it to go along with him. He asked for a resolution approving force but not for a declaration of war. Congress agreed and on a partisan vote narrowly passed such a measure, thus sanctioning a presidential war. On 16 January 1991 he led the nation into war. Two days later, he informed Congress of his action, in a manner, he said, “consistent with the War Powers Resolution.” In the Gulf War of 1991, the U.S. military juggernaut blasted the Iraqis into a lopsided defeat, Bush’s popularity rating zoomed to an unprecedented height, and he bathed in the glory of a Caesar.

During Bush’s term, the Soviet Union broke up, the Cold War ended, and ethnic strife tore apart Yugoslavia. He campaigned for reelection as a successful war leader and the master of an aggressive foreign policy, who, along with Reagan, had finalized the winning of the Cold War. But he lost. Nonetheless, as a lame duck president, he once more exercised his power as commander in chief. For humanitarian reasons, or what he called “God’s work,” he intervened in Somalia, torn apart by civil war and famine. He ordered more than 30,000 troops to take “whatever action is necessary” to carry out their mission. As various analysts noted, Bush with his war-making pushed the presidential power in foreign affairs to its outer limits.

**THE INDISPENSABLE NATION AND PRESIDENT?**

During his run for the presidency, William Jefferson Clinton campaigned on a domestic program. When he did refer to foreign affairs, he tried to sound tougher than Bush. For instance, Clinton favored forcible intervention in the Bosnian civil war to punish aggressive Serbs. As president, his first major foreign policy decision was on the peacekeeping mission in Somalia. Initially, Clinton anticipated no difficulties because he planned gradually to withdraw U.S. troops and turn over the operation to the United Nations. When clan warriors killed Pakistani peacekeepers and wounded American soldiers, that goal changed. The president authorized U.S. troops to use force against what he called “two-bit” terrorists. When Somalis killed eighteen Americans and wounded seventy-four, Clinton ordered 5,000 more troops, heavy armor, and additional warships to Somalia. What had started as a humanitarian mission took on the coloring of a military occupation. This change alarmed many in Congress. Some talked of placing restrictions on how the president could deploy the armed forces. As had predecessors in comparable circumstances, Clinton contended unquestionably that the executive possessed the ultimate authority on the use of troops. Finally, without relinquishing this claim but in reaction to the criticism, he withdrew the forces from Somalia.
During this episode, the president also flexed muscle in the Middle East. He learned of an alleged plot to assassinate George Bush while the former president was visiting Kuwait in April 1993. The CIA attributed this conspiracy to Saddam Hussein. Denouncing it as “an attack against our country and against all Americans,” Clinton on 26 June ordered a missile attack on battered Baghdad. Constitutional lawyers commented that “calling the U.S. bombing of Iraq an act of self-defense for an assassination plot that had been averted two months previously is quite a stretch.” Other skeptics viewed this exercise in force as personal, or as countering a reputation for indecisiveness with an image of a strong, assertive leader. The tactic worked. According to polls, the public approved of the president’s rash resort to force by a large margin.

Concurrently, Clinton plunged into another sticky minor foreign problem, this one involving corruption in Haiti and special-interest group politics in the United States. In a coup, militarists ejected Jean-Bertrand Aristide, Haiti’s first elected president, from office. Various liberal groups, media pundits, and especially the congressional black caucus demanded that Clinton restore Aristide to power. The president agreed. He tightened sanctions against the island republic, ordered warships to patrol its waters, and placed troops on alert for a possible invasion. He justified his actions with what he designated as important national interests in Haiti, a need to protect American lives there, and an obligation to promote democracy. In Congress, dissenters came up with legislation to prevent Clinton from committing troops. He denounced the proposal as encroaching “on the President’s foreign policy powers.” Congress avoided a direct clash with a nonbinding resolution that opposed the executive actions. Involved legislators asked should a president act as a global gendarme with authority to intervene with force whenever dictators seize or hold power anywhere. Others perceived personal or domestic political considerations as motivating the president’s determination to move on his own. Advisers admitted that in this manner Clinton would demonstrate “the president’s decision making capability” and his firmness in using his foreign affairs power.

Clinton remained defiant, announcing that, like predecessors, he did not regard himself “constitutionally mandated” to obtain congressional approval before invading. He also repeated muddled justifications, such as a duty to secure the nation’s borders and safeguard national security, though neither was threatened. At the last minute, in September 1994, he avoided another clash with Congress by accepting an arrangement that permitted the Haitian militarists to retreat peacefully and made a hostile invasion unnecessary. American troops then occupied the country and returned Aristide to power. Clinton boasted, “We celebrate the return of democracy,” even though democracy had never flowered in Haiti. Two years later, the occupation officially ended without violent mishap. The administration touted it as a foreign policy triumph but others viewed it as a revival of big-stick paternalism. The intervention and $2.2 billion in aid produced neither democracy nor well-being. In Haiti viable politics and the economy crumbled.

Clinton also embroiled himself in controversy over brutal ethnic warfare in former Yugoslavia, expressing a desire to intervene for the laudable purpose of protecting human rights. “We have an interest,” he said, “in standing up against the principle of ethnic cleansing.” He intruded in a number of instances with food and medicine air drops for beleaguered Muslims in Bosnia, with deployment of a few hundred troops in Macedonia, and with bombings and other attacks on Serb forces. Finally, in a conference in Dayton, Ohio, in November 1995, Clinton brokered an end to the civil war in Bosnia. He considered the peace agreement a diplomatic triumph, but it had problems. The settlement called for deployment of 23,000 U.S. ground troops as part of a NATO peacekeeping mission. A majority in Congress and most Americans opposed the policing commitment. Regardless, Clinton deployed the troops, counting on the usual round-the-flag attitude of the public when soldiers were placed in harm’s way. As aides admitted, the decision in an election year also had a political dimension. It could increase his stature as a bold leader. He had learned, a staffer asserted, “that foreign policy can help your image. It makes him look like a president.” Ultimately, the Senate backed the troop commitment and, as anticipated, the public rallied behind the president.

Clinton also flexed muscle over an incident with Castro’s Cuba and another with China over Taiwan, and continued to blast Iraq with missile attacks. In these crises the president portrayed himself as a global crusader committed to combating evil. At the start of his second term, he explained this concept as part of doing “what it takes to remain the indispensable nation . . . for another fifty years.”
Two years later, on 7 August 1998, while Clinton was entangled in scandal over a relationship with Monica Lewinsky, a young White House intern, terrorists bombed American embassies in Kenya and Tanzania. Ten days later, he publicly admitted the sexual liaison and three days after that ordered missile attacks on suspected terrorists in Sudan and Afghanistan. Opponents accused him of using violence abroad to divert attention from a domestic problem. On 19 December, the House of Representatives voted to impeach Clinton on charges of perjury and abuse of power related to the Lewinsky affair. On 12 February 1999, after a five-week trial, the Senate acquitted Clinton. A month later, when asked if he had damaged the Office of the President, Clinton responded, “I hope the presidency has not been harmed. I don't believe it has been.”

Clinton continued to exercise his foreign relations power boldly, primarily against another international villain, Slobodan Milosevic, the hard-line president of what remained of Yugoslavia. Clinton accused him of brutal ethnic cleansing of Albanian residents in the Serb province of Kosovo and decided to employ force against him. Clinton explained this decision, as a skeptic pointed out, with an “orgy of analogy” that included an obligation to humanity to halt what he termed genocide, defend American interests, stop Serb aggression, and enforce democratic values. Critics asked, why the selective humanitarianism? Did not genocide in Rwanda, Chinese brutalities against Tibetans, Russian repression in Chechnya, ethnic horrors in the Sudan, and Taliban atrocities in Afghanistan call for comparable military intervention?

Regardless, on 24 March the United States, supported by eighteen other NATO countries that Clinton had persuaded to join him, launched an air war against Milosevic’s Yugoslavia. Clinton and his aides avoided the word “war,” describing the vast violence they unleashed with an impersonal euphemism, a campaign to “degrade” the enemy. In eleven weeks of war, or degrading, the NATO forces flew 37,000 sorties and dropped 23,614 bombs on Kosovo and other parts of Yugoslavia, most of them by American planes. The United Nations did not support the war, nor did many people even in NATO countries. Congress and the American public, though, as usual in the initial stages of hostilities, backed the executive but with less enthusiasm than in previous presidential wars.

With the rise of domestic opposition to the war, with its destruction of much of Serbia, Clinton resorted to the dubious contention that the executive as commander in chief needed no congressional declaration to fight a war. The House, mainly along party lines, voted against supporting him with a declaration of war, but it did not try to stop the hostilities. In addition, a bipartisan group of legislators filed suit seeking a ruling that the bombing violated the Constitution and laws such as the War Powers Resolution. Across the country a new antiwar movement began taking shape. Elsewhere, as in Japan, people viewed Clinton as an international bully.

On 10 June, before opposition to the war became full blown, it ended. The Serbs agreed to withdraw from Kosovo and to accept a NATO occupation of the province. Clinton then claimed another triumph for a presidential war. The victory proved tarnished when postwar investigators could produce no evidence of grand-scale genocidal Serb activities. Clinton had claimed that under Milosevic’s orders, Serbs had slaughtered tens of thousand of Albanians. In addition, when Albanians returned to Kosovo, they carried out ethnic cleansing of Serbs and Gypsies.

In other instances, Clinton used his foreign affairs power constructively, notably through diplomacy to help control ethnic violence in Northern Ireland and in the Middle East and to save Mexico from bankruptcy with some $25 billion in loans. To the end of his presidency, he liked the taste of power that enabled him to influence events the world over and stuck to his self-assumed role, which he often denied, of global policeman. He left office, according to polls, with most Americans approving of his handling of foreign affairs.

In the 2000 election, foreign policy played a minor role, though the Republican candidate, George W. Bush, criticized morally based armed interventions. He preferred using force only where tangible, perceivable American interests were at stake. He won the presidency even though his Democratic opponent received more of the popular vote, despite ballot snafus in Florida, and by surviving various court challenges. In the crucial challenge, the Supreme Court awarded him the office on the basis of shared ideology. In the aftermath, academics and others contended that this outcome tarnished the presidency. As critics pointed out, Bush’s awkward handling of foreign affairs during his first months in office indicated that this assessment had merit.

On 11 September 2001 this view of the presidency changed. Unknown Islamic terrorists
hijacked four commercial airplanes, smashed two of them into the twin towers of the World Trade Center in New York City and one into the Pentagon, outside Washington, D.C., and crashed the fourth in a field in Pennsylvania. They killed an estimated seven thousand people. The disaster galvanized the nation, rallying the citizenry, as usual in foreign affairs crises, around the flag and behind the president.

Bush responded with incendiary rhetoric laced with references to war and by asking Congress for expanded power to combat terrorism “with all necessary and appropriate force.” As had his predecessors, he claimed he already had the authority to initiate military action on his own but wanted a resolution of approval from the legislators to cement national unity. Polls indicated that more than 70 percent of the public supported his stance. Congress rushed to go along with the president’s request. On 14 September, unanimously in the Senate and with only one dissenter in the House of Representatives, Congress voted approval for the president to strike at “nations, organizations, or persons he determines planned, authorized, committed, or aided the terrorist attacks.”

A few in Congress maintained that this resolution, unlike the Tonkin Gulf Resolution, did not give the president blanket authority to make war. In substance, though, it amounted to that, and Bush interpreted it that way. Five days later, speaking to Congress and to the nation via television, he announced “a war on terror,” issuing an ultimatum to Afghanistan: deliver to the United States the prime suspects behind the attacks, especially Osama bin Laden, a shadowy anti-Western terrorist who had sanctuary in that country, or expect the consequences. Again, Bush’s standing in the polls soared. Afghanistan’s Taliban rulers, refused surrender of bin Laden without, they said, seeing convincing evidence of his guilt.

Once more, despite the War Powers Act and post-Vietnam War concerns over untrammeled presidential war power, the public, Congress, and most media pundits eager for retaliation backed the use of military force virtually as the executive saw fit. Moreover, for the first time in the role of a warrior who spoke of involvement in “the first war of the twenty-first century,” even to those who previously had belittled him, Bush appeared presidential.

This crisis reinforced what has been, virtually from the first presidency, a steady expansion of the executive power in foreign affairs at the expense of Congress. This happened often because of the force of strong executives’ personalities and their thirst for power. It happened also because the American public and its elected representatives, initially at least, in times of foreign crises willingly put aside original intent in the warmaking power as the framers had embodied it in the Constitution. Again, in the September 2001 crisis, without hesitation, they shifted this ultimate power to one person—the president.

Officially, American foreign policy is made by the executive branch of the federal government, led by the president, and by Congress, with rare involvement by the Supreme Court. Unofficially, other institutions—notably interest groups and the press (including electronic media as well as the print media)—typically play a large role in the often lengthy and politically charged policymaking process in Washington. Most voters also learn of impending and completed U.S. foreign policy initiatives through the news media. Roughly three-fourths of adult Americans read daily newspapers and many read magazines that discuss foreign policy issues. The press thus occupies a central place in the communication of ideas that lies at the heart of the ongoing political process both in Washington and in the two-way flow of information between officials and the voting public.

Because of its importance, journalist Douglas Cater and other writers have called the press the “fourth branch of government.” But neither the news media as institutions nor journalists as individuals have any formal power to shape U.S. foreign relations. The communication of ideas is different from making or implementing policy. Unlike specific presidential decisions or votes in Congress, moreover, the press’s influence on an issue normally cannot be measured precisely. And because the day-to-day influence of journalists on the thinking of policymakers and the public varies from individual to individual and from issue to issue, it is important not to overestimate the press’s impact. Yet Cater’s metaphor has considerable validity because the role of the press in foreign policy decisions—and in the reactions to those decisions that influence future actions—often has been substantial. Since the 1950s this fascinating, intellectually challenging topic has attracted the interest of numerous journalists, officials, and political activists. It also has lured scholars from several disciplines, notably communications, history, political science, and sociology.

DIVERSITY AND ETHNOCENTRISM

There is a diversity of views that exists within multifaceted institutions—“the government” and “the press”—that often are written about as if each were unitary and hence susceptible to broad generalizations and concise theories. The reality is much more complex. In establishing the federal government, the Founders set up an inherent competition between the prerogatives and powers of the executive branch and Congress. On both the proper goals of U.S. foreign policy and the best means to achieve them, moreover, there repeatedly have been strong differences of opinion within the executive branch, within Congress, and between the two branches. Thus, when scholars discover that as many as 70 or even 80 percent of sources used in news stories on some foreign policy issues are “government” sources (either executive branch alone or executive plus congressional), one normally need not be concerned that only one or two viewpoints are being presented. Such statistics do point to a lack of aggressiveness by journalists in gathering information outside official circles, however.

On any major foreign policy issue, the few thousand journalists who work in Washington are almost certain to present varied perspectives based on public statements, interviews, and “leaks” (information whose source or sources cannot be named) from the president and members of Congress and from the many thousands of officials who work for the White House, for the other executive agencies, and for Congress. Especially since the mid-1970s, journalists also have used as sources spokespersons for affected interest groups, academics, diplomats stationed in Washington, and experts from public interest groups and from the capital’s numerous liberal and conservative think tanks. As several scholars have shown, foreign policy stories in the 1990s generally were based less heavily on “government
The diversity of views from sources is paralleled by the diversity of views on foreign policy presented in the press. It is true that both the number of daily newspapers (about 1,600 by the 1990s) and the number of cities with more than one daily newspaper declined steadily throughout the twentieth century. But these declines have been at least partly offset by other developments: the widespread availability in recent decades of three national newspapers (the liberal New York Times, the moderate USA Today, and the conservative Wall Street Journal); the growing use by many dailies of foreign policy coverage and foreign stories from the news services of such papers as the New York Times, Washington Post, and Los Angeles Times; and the practice by many local-monopoly dailies of featuring both liberal and conservative columnists. Also, the widespread publication of weekly or biweekly alternative papers, many of which are distributed free of charge and feature liberal or mildly radical perspectives, and the availability of liberal and conservative viewpoints on the growing number of television and radio news programs and talk shows, as well as at numerous Internet sites, have all increasingly complemented the daily newspapers.

For Americans interested in foreign affairs, the greatest diversity of views and depth of analysis during the twentieth century typically were found in magazines. Mass-circulation weekly news magazines—Time, Newsweek, and U.S. News and World Report—generally were strong supporters of America’s anticommunist policies from the mid-1940s through the mid-1960s. Their coverage of foreign affairs generally has become more varied since then, though it sometimes comes across (like some newspaper stories) as simplistic or overblown. It must be remembered, however, that news magazines are intended to appeal to the general public, which normally is less interested in foreign affairs than the much smaller number of Americans who regularly read journals of opinion.

Among journals of opinion, such long-established liberal periodicals as the New Republic and Nation have flourished, as have conservative periodicals, including National Review and Commentary. In the center, with much in-depth analysis of foreign affairs, are journals like Foreign Affairs and Foreign Policy. Many religious and environmental periodicals also discuss foreign affairs regularly. Therefore, diversity thrives in foreign policy coverage in magazines.

The largest policy failure to which ethnocentrism—As in most other nations, ethnocentrism—the belief that one’s own nation and its values are superior to all others—has long been a standard feature of the American press’s reporting and commentary on U.S. foreign policy and on other nations. Throughout modern American history, most liberal, moderate, and conservative journalists have praised other nations that practiced political democracy and freedom for individuals (for example, Great Britain, Norway, and Costa Rica), and have criticized governments that quashed democracy and freedom (such as Adolf Hitler’s Germany, Joseph Stalin’s Soviet Union, and Fidel Castro’s Cuba). As the sociologist Herbert Gans has noted, the press’s “ethnocentrism comes through most clearly in foreign news, which judges other countries by the extent to which they live up to or imitate American practices and values.”

During the Cold War, many newspapers and magazines—often including the prestigious New York Times—applied the nation’s core values unevenly by being much more critical of the communist dictatorships that gave at least verbal support to the overthrow of noncommunist governments in other countries than they were of pro-Western dictatorships. Yet even during the long struggle against communism, many newspapers and magazines sharply criticized right-wing dictatorships in such allied nations as South Korea, South Vietnam, Chile, and the Philippines.

The press’s roles are what are called the “three I’s”—information, interpretation, and inter-

THE PRESS’S MANY ROLES

Among the press’s roles are what are called the “three I’s”—information, interpretation, and inter-
est. Roger Hilsman, a political scientist and State Department official in the John F. Kennedy administration, identified “the gathering and dissemination of information” as a major function of the press. The flow of information through the press—among all the people seeking to influence policy in Washington, from the capital to the public, and from the public back to officials partly through press coverage and reporters’ questions—is the lifeblood of America’s democratic system.

Information in press coverage of foreign affairs is almost always accompanied by interpretation. Journalists provide contexts (often called “frames”) in which information is conveyed. “By suggesting the cause and relationships of various events,” the political scientist Doris A. Graber observes, “the media may shape opinions even without telling their audiences what to believe or think. For example, linking civil strife in El Salvador [in the 1980s] to the activities of Soviet and Cuban agents ensured that the American public would view the situation with considerable alarm.” Among policymakers in Washington, Hilsman notes,

the press is not the sole source of interpretation.
The president, the secretary of state, the assistant secretaries, American ambassadors, senators, congressman, academic experts—all are sources of interpretation. But the fact that the press is there every day, day after day, with its interpretations makes it the principal competitor of all the others in interpreting events.

The press also can play an important role in stirring interest in an issue both in Washington and among the public. During the Ronald Reagan years media reporting awakened public interest on starvation in Ethiopia, a topic that Americans had shown little interest in prior to the appearance of illustrated stories about dying children in the press and on television. An example from the James Earl Carter years was the debate over whether to deploy enhanced radiation nuclear bombs (also called neutron bombs) in Western Europe. The debate began with a story by Walter Pincus in the Washington Post on 6 June 1977. A quotation in the story noted that the bombs would “kill people” while “leaving buildings and tanks standing.” Once the story was framed in this negative way—on television and radio as well as in newspapers and magazines—the administration was not able to gain public and congressional support for deploying the new weapon. The unfolding of this story illustrates a frequent pattern in foreign policy: print journalists often bring stories to public attention, after which they are covered by other print and electronic reporters.

Stirring interest through extensive news and editorial coverage is often called the agenda-setting function of the media. The political scientist Bernard C. Cohen explained this concept cogently: “The press is significantly more than a purveyor of information and opinion. It may not be successful much of the time in telling people what to think, but it is stunningly successful in telling its readers what to think about.”

Building on Cohen's path-breaking research, other scholars have refined the concept of agenda setting. While agreeing that the news media often play an important role in the agenda-setting process, most analysts now believe that agenda setting is a complex process in which unexpected events or administration officials or (less frequently) members of Congress or interest groups often play at least as significant roles as journalists. Because officials and other participants in the policymaking process in Washington frequently work hard to get their viewpoints into the press, the communications professor J. David Kinder notes, “[t]he news media are as much the target of agenda-setting as they are the source.” Moreover, the relative importance of journalists to other actors in agenda setting varies from issue to issue. Thus, although the press plays a significant role in deciding which foreign policy issues to cover and which ones to make into “big stories,” it shares the agenda-setting function with other actors in the political process.

In another important role, that of “watchdog,” the press ferrets out and publicizes questionable policies or abuses of authority. As a reporter for a Midwestern newspaper told Cohen: “We are the fourth estate, and it is our duty to monitor—to watch and interpret—what our government does.” Because officials often control the flow of information to the press in regard to secret operations, the press's performance as a watchdog has been mixed. During the Iran-Contra scandal of the mid-1980s, for example, American journalists were slow to learn about the operation—indeed, the story was broken by a publication in Lebanon well after the administration had engaged in illicit activity in the Middle East and in Central America. After the story broke, however, leading newspapers and magazines did an excellent job of bringing details to the attention of policymakers in Washington (including members of Congress) and the American people.
Journalists also can play an important role as critics of particular foreign policies. Although far fewer people read editorials and columns (opinion pieces) than read front-page news stories (or, for that matter, the comics and the sports pages!), the people most interested and involved in foreign affairs—officials, journalists, other leaders in society, and the “attentive public” (the roughly 10 to 20 percent of the public with the greatest interest in public issues)—not only read editorials and columns regularly, but they often discuss them with other people, thus enhancing their impact. In influencing the thinking of elites, editorial writers and columnists affect the public discussion of foreign affairs that gradually works its way down to many average voters. While the exact influence of editorials and columns cannot be determined, it seems clear that the serious questions that were being raised about the U.S. involvement in Vietnam on the editorial pages of numerous newspapers beginning in the mid-1960s helped to create the climate of opinion in which the continuation of the war by the Lyndon B. Johnson and Richard M. Nixon administrations became increasingly difficult.
